RADIANT & Think Tank – Complete Documentation	61
Table of Contents	61
Part 1: Applications – Think Tank + Dojo	63
1.1 Think Tank + Dojo – Complete Reference	63
Table of Contents	63
Part I: User Guide	63
Table of Contents	64
1. Welcome to Think Tank	64
2. Getting Started	65
3. The Dashboard	67
4. Conversations	68
5. My Rules - Personalizing AI Responses	69
6. Domain Modes	70
7. Delight System - AI Personality	72
8. Collaboration Features	73
9. Advanced Features	74
10. AXIOM Forge - Prompt Optimization	77
11. How Think Tank's Memory Works	80
11. Understanding AI Decisions	82
14. Safety & Governance	83
12. Decision Records	87
13. Living Parchment	89
14. Safety & Governance	90
15. Time Machine - Conversation Forking	90
16. The Grimoire - Procedural Memory	91
17. Flash Facts - Quick Knowledge Capture	93
18. Sentinel Agents - Background Monitors	94
19. Economic Governor - Cost Management	95
20. Council of Rivals - Multi-Model Deliberation	97
21. Voice Input & File Attachments	98
22. Keyboard Shortcuts	99
23. Troubleshooting	99
24. Workflows & Orchestration Methods	100
25. Glossary	103
26. RADIANT Cartridges - Portable AI Brains	104
27. Domain Selector	105
28. Cartridge Indicator	106
29. Autonomous Intelligence Features	106
Document History	109
Welcome to Think Tank	111

Table of Contents	111
1. Getting Started	111
2. Your Dashboard	112

Part II: Admin Guide	126
Overview	126
Table of Contents	126
1. Think Tank Admin Features	129
2. User Rules System	131
3. Delight System	132
4. Brain Plan Viewer	133
5. Pre-Prompt Learning	133
6. Domain Taxonomy	134
7. Rejection Notifications	134
8. Canvas & Artifacts	135
9. Collaboration Features	135
10. Shadow Testing	139
11. Routing Cache	140
12. Delight System Toggle	141
12.5 LIVS-M 2.0 Policy Configuration (v7.9.0)	142
13. Intelligence Aggregator	144
14. AGI Ideas Service	145
15. Feedback System	149
16. Cognitive Architecture	151
17. Consciousness Service	153
18. App Factory	155
19. Multi-Page Web App Generator	158
20. UI Feedback & Learning System	161
20. Media Capabilities	163
21. Result Derivation History	165
22. User Persistent Context	167
23. Predictive Coding & Evolution	170
24. Zero-Cost Ego System	172
25. Conscious Orchestrator (Architecture Inversion)	175
26. Bipolar Rating System (Negative Ratings)	177
27. Consciousness Engine Administration	179
25. Formal Reasoning Libraries	181
26. Ethics-Free Reasoning	186
27. Intelligent File Conversion	190
28. User Memories & Persistent Learning	196
29. Artifact Engine (GenUI Pipeline)	197
30. Consciousness Operating System (COS)	219

31. Why Think Tank Beats Standalone AI (The System Advantage)	223
32. Swarm Orchestration & Flyte Operations	226
33. Cognitive Platform Enhancements	231
34. Orchestration Workflow Methods Reference	249
35. Polymorphic UI (PROMPT-41)	262
36. Think Tank Policy Framework: Strategic Intelligence	264
37. Agentic Orchestration: SSF, CAEP, and Identity Remediation	268
38. Advanced Features (v4.18.0)	276
39. Liquid Interface (Generative UI)	282
40. The Reality Engine	288
41. The Magic Carpet	295
42. Magic Carpet UI Components	299
43. Concurrent Task Execution (Moat #17)	301
44. Structure from Chaos Synthesis (Moat #20)	304
45. Delight Services Code Quality	308
Section 46: Sovereign Mesh in Think Tank Admin	310
Section 47: HITL Orchestration in Think Tank Admin	310
Section 48: Scout HITL Integration (v5.34.0)	312
Section 49: Sovereign Mesh Administration (v5.39.0)	314
Section 50: Code Quality Dashboard (v5.39.0)	316
Section 51: Schema-Adaptive Reports (v5.39.0)	317
Section 52: Gateway Status (v5.39.0)	320
Section 53: Decision Intelligence Artifacts (DIA Engine) (v5.43.0)	322
Section 54: Living Parchment 2029 Vision (v5.44.0)	328
45. Localization & Translation Overrides	332
46. Unified AGI Architecture: Brain, Genesis, Cortex, and Cato (v5.52.29)	335
47. Time Machine Administration	339
48. Grimoire Administration	340
49. Sentinel Agents Administration	342
50. Economic Governor Administration	343
51. Flash Facts Administration	345
52. Neural Architecture v6.0.0 Administration	346
53. Domain Selector Administration	348
54. Cartridge Indicator Administration	350
55. AXIOM Forge Administration	350
56. AXIOM Scorers	352
Section 57: The Crucible - Tenant Configuration (v6.4.0)	356
Section 58: Mid-Level Services (MLS) (v5.0.0)	358
59. LIVS-M Workflow Management (v7.8.0)	361
Section 60: Memory Retention Settings (v7.13.0)	372
Related Documentation	373
Overview	373
Table of Contents	374
1. Dashboard	374
2. Users Management	375
3. Conversations	376

Part I: Platform Architecture	1342
Complete System Architecture Reference	1342
EXECUTIVE SUMMARY	1343
PART 1: EXISTING ARCHITECTURE (PROMPTS 01-35)	1344
1.1 Infrastructure Foundation (PROMPT-01 through PROMPT-03)	1344
1.2 Lambda Functions (PROMPT-04 & PROMPT-05)	1346
1.2.1 Two-Factor Authentication (v5.52.28)	1348

1.3 Self-Hosted Models (PROMPT-06)	1350
1.4 External AI Providers (PROMPT-07)	1351
1.5 Admin Web Dashboard (PROMPT-08)	1352
1.6 Genesis Cato Safety Architecture (PROMPT-34)	1352
1.6.1 Unified AGI Architecture: Brain, Genesis, Cortex, and Cato	1354
1.6.2 Universal Envelope Protocol (UEP) v2.0	1356
1.7 Pricing System (v4_12_pricing_system.ts)	1359
1.8 Compliance Frameworks	1359
1.9 Neural Network Routing	1360
1.10 War Room Orchestration	1361
1.11 Truth Engine (ECD Verification)	1362
1.11 AXIOM Scorers (v6.0.0)	1362
1.12 Mid-Level Services (MLS) Architecture v5.0.0	1363
PART 2: NEW IN VERSION 5.0 (THE SOVEREIGN MESH)	1369
2.1 Agent Registry	1369
2.2 App Registry	1370
2.3 AI Helper Service (Parametric AI)	1371
2.4 Pre-Flight Provisioning	1372
2.5 Transparency Layer	1373
2.6 HITL Approval Queues	1374
2.7 Execution History & Replay	1375
PART 3: INTEGRATION GUIDE	1377
3.1 How AI Helper Integrates with Existing Components	1377
3.2 Database Migration Order	1379
3.2.2 MLS (Message Layer Security) RFC 9420 Implementation	1380
3.2.1 Cartridge PKI KMS Integration (PROMPT-42)	1384
2.9 Autonomous Organism Architecture (PROMPT-43) - v6.6.0	1387
3.3 New Admin Dashboard Pages	1390
3.4 New Lambda Functions	1397
PART 4: API REFERENCE	1398
4.1 Agent APIs	1398
4.2 App APIs	1398
4.3 Transparency APIs	1398
4.4 HITL APIs	1398
4.5 AI Helper APIs	1399
4.6 Dashboard API	1399
4.7 AI Reports APIs (v5.42.0)	1399
4.8 RAWs APIs (v1.1)	1399
PART 5: RAWs v1.1 - MODEL SELECTION SYSTEM	1401
5.1 Overview	1401
5.2 Weight Profiles	1401
5.3 Domain Compliance Matrix	1402
5.4 Key Files	1402
5.5 Detailed Documentation	1402
PART 6: CORTEX MEMORY SYSTEM v4.20.0	1403
6.1 Overview	1403
6.2 Three-Tier Architecture	1403
6.3 Hot Tier - Real-Time Context	1404
6.4 Warm Tier - Graph-RAG Knowledge	1404
6.5 Cold Tier - Historical Archive	1405

6.6 Tier Coordinator	1405
6.7 Twilight Dreaming Integration	1406
6.8 GDPR Compliance	1406
6.9 Key Files	1406
6.10 API Endpoints	1407
6.11 Cortex v2.0 Features	1407
6.12 Cortex v2 API Endpoints	1408
6.13 Cortex v2 Key Files	1409
6.14 Cato-Cortex Bridge (v5.52.14)	1410
6.15 Cortex Intelligence Service (v5.52.15)	1411
6.16 Detailed Documentation	1412
Part 7: Think Tank Consumer API Layer (v5.52.17)	1413
7.1 Overview	1413
7.2 API Service Registry	1413
7.3 File Locations	1414
7.4 Key Features by Service	1414
APPENDIX A: GLOSSARY	1415
PART 8: NEURAL ARCHITECTURE v6.0.0	1416
8.1 System Topology	1416
8.2 CORTEX Network Specifications	1417
8.3 Cartridge Contents	1417
8.4 Thermal State Management	1417
8.5 CDK Infrastructure	1417
8.6 Database Tables (v6.2.0)	1418
PART 9: LLM INTEGRITY VERIFICATION SYSTEM (LIVS) v6.3.0	1421
9.1 Architecture Overview	1421
9.2 Lie Detection Signals	1422
9.3 Configuration Hierarchy	1422
9.4 Services Architecture	1422
9.5 Admin API Endpoints	1422
PART 9B: LIVS-M 2.0 REGISTRY EDITION (v7.9.0)	1424
9B.1 Architecture Overview	1424
9B.2 Environment Modes	1425
9B.3 Services Architecture	1425
9B.4 Default Rules	1425
9B.5 AGI Orchestrator Integration	1425
PART 10: THE CRUCIBLE - COMPETITIVE MULTI-LLM DELIBERATION v6.4.0	1426
10.1 Architecture	1426
10.2 Database Tables	1427
10.3 Core Services	1427
10.4 Pre-Prompt System	1427
10.5 Admin API Endpoints	1427
PART 11: AUTONOMOUS ORGANISM ARCHITECTURE v6.6.0	1429
11.1 Architecture Overview	1429
11.2 Core Services (8 Total)	1430
11.3 Neural Affinity Routing	1430
11.4 Tool Forge Pipeline	1431
11.5 Liquid Compute Topology	1431

11.6 Ghost Simulation Layer	1431
11.7 Economic Cortex	1432
11.8 Tensor-Link Protocol	1432
11.9 Database Schema	1432
11.10 Admin API Endpoints	1433
11.11 Admin Dashboard	1433
Part 12: Anticipatory Memory Architecture (v7.12.0)	1435
12.1 Overview	1435
12.2 Services	1435
12.3 Integration Points	1435
12.4 Database Migration	1436
12.5 Admin API	1436
12.6 Admin Dashboard	1436
12.7 Shared Types	1436
Part 13: User Memory Retention & Unified Profile (v7.13.0)	1437
13.1 Overview	1437
13.2 Services	1437
13.3 Integration	1437
13.4 Database Migration	1437
13.5 Admin API	1437
13.6 Admin Dashboards	1438
13.7 Shared Types	1438
13.8 Document & File Integration	1438
Part 14: Cato Trainer – The Grounding Engine (v7.18.0)	1439
14.1 Overview	1439
14.2 Architecture	1439
14.3 File Structure	1439
14.4 Platform Integration	1440
Part 15: Aurelius Dojo – Backend Wiring (v7.19.0)	1441
15.1 Overview	1441
15.2 Database Schema	1441
15.3 Lambda Handler	1442
15.4 CDK Integration	1442
APPENDIX B: FILE STRUCTURE	1443
SENTINEL – Alerting, Monitoring & Incident Response	1444
UNIFIED USER PROFILE & MULTI-CONTACT SYSTEM (v7.34.0)	1446
SYSTEM ADMINISTRATOR ROLE ENFORCEMENT (v7.34.0)	1447
ROLE DOMAIN CLARIFICATION (v7.35.0)	1449
TENANT PROVISIONING & SIGN-UP FLOW (v7.35.0)	1449
Unified Drift-Aware Weighting System (v7.36.0)	1451
Universal Drift Enforcement & Genesis Feedback Loop (v7.37.0)	1453
Enforced Logging Policy (v7.37.2)	1454
System Administrator Separation – Dual Identity Plane (v7.38.0)	1456
Overview	1458
Technology Stack	1458
Monorepo Structure	1458
Phase 1 Architecture	1458
Infrastructure Tiers	1459
Deployment Flow	1459
Phase 1 Deliverables	1460

Future Phases	1460
Part II: Engineering Implementation Vision	1461
Table of Contents	1461
1. Cato Persistent Memory System	1462

1. Welcome to Think Tank

Think Tank is an advanced AI assistant platform that adapts to your needs, learns your preferences, and provides intelligent responses across a wide range of domains. Unlike simple chatbots, Think Tank:

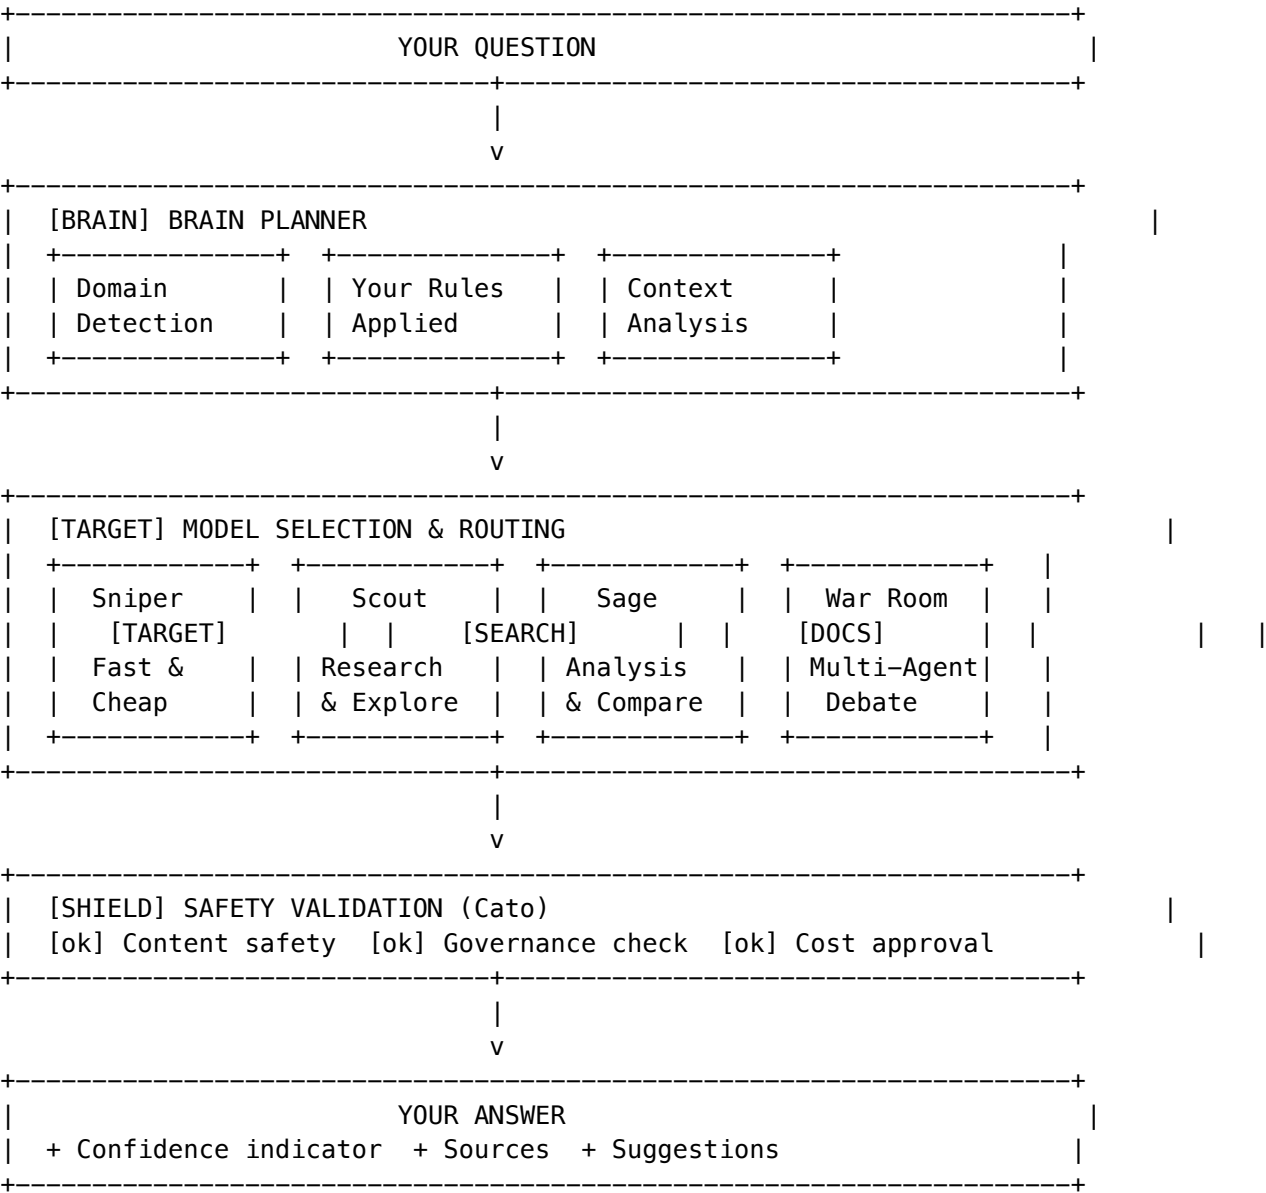

- **Adapts to Your Expertise** - Automatically detects your knowledge domain and adjusts responses
- **Remembers Your Preferences** - Your rules and settings persist across conversations
- **Shows Its Thinking** - Transparent about its reasoning and confidence levels
- **Keeps You Safe** - Built-in safety guardrails protect against harmful outputs
- **Collaborates** - Work together with colleagues in real-time sessions

What Makes Think Tank Different

Traditional Chatbots	Think Tank
One-size-fits-all responses	Adapts to your domain expertise
Forgets your preferences	Persistent user rules and context

Traditional Chatbots	Think Tank
Black-box decisions	Transparent reasoning with Brain Plans
Single interaction mode	Multiple view modes (Sniper, Scout, Sage)
No safety guarantees	Five-layer safety architecture

How Think Tank Works

2. Getting Started

First Time Setup

- 1. **Log In** - Access Think Tank through your organization’s portal
- 2. **Set Your Preferences** - Visit Settings to configure your experience
- 3. **Create Rules** - Add personal rules to customize AI responses
- 4. **Start a Conversation** - Type your first message or use voice input

Authentication & Security

Think Tank supports multiple authentication methods for secure access:

- **Email/Password** - Traditional sign-in with optional MFA
- **Social Sign-In** - Google, Microsoft, Apple, GitHub
- **Enterprise SSO** - SAML 2.0 / OIDC via your organization
- **Passkeys** - Passwordless authentication using biometrics

Multi-Factor Authentication (MFA) may be required by your organization. When enabled, you’ll need an authenticator app (Google Authenticator, Authy, etc.) to generate verification codes.

[BOOK] **Detailed Guides:** See Authentication User Guide and MFA Guide

Language Settings

Think Tank supports **18 languages** including:

Western	Asian	RTL
English, Spanish, French, German, Portuguese, Italian, Dutch, Polish, Russian, Turkish	Japanese, Korean, Chinese (Simplified/Traditional), Hindi, Thai, Vietnamese	Arabic

To change your language: 1. Click your profile icon -> **Settings** 2. Select **Language & Region** 3. Choose your preferred language 4. The interface updates immediately

Search works in all languages, with special **CJK (Chinese/Japanese/Korean) bi-gram search** for accurate results.

[BOOK] **Detailed Guide:** See Internationalization Guide

The Main Interface

+-----+ [Logo] Think Tank [User] v [Settings] +-----+

	Messages	
	My Rules	
	Delight	
	...	

[Message input...]	[Send]
--------------------	--------

3. The Dashboard

The Dashboard provides an overview of your Think Tank activity.

Key Metrics

Metric	Description
Active Users	How many people in your organization are using Think Tank
Conversations	Total number of conversations you've had
User Rules	How many personal rules you've created
API Requests	Volume of AI requests (for awareness)

Quick Actions

From the dashboard, you can quickly:

- **Manage Users** - View and manage team members (if you have permissions)
- **Configure Delight** - Customize the AI's personality
- **Domain Modes** - Adjust how Think Tank handles different topics

Your Profile

Access your profile by clicking your avatar in the top-right corner. Your profile includes:

Activity Heatmap

A GitHub-style visualization of your conversation activity over the past year:

Feature	Description
Breathing Animation	Cells pulse based on activity intensity - more active days “breathe” faster
AI Insights	Automatic pattern detection with natural language explanations
Streak Tracking	Current and longest streaks highlighted with [HOT] badges
Sound Feedback	Optional audio cues when hovering over active days
Accessibility Mode	Full narrative summary for screen readers

AI Insights Examples: - “You’re a weekday warrior! Most activity happens Monday-Friday” (92% confidence) - “Amazing! Your longest streak is 14 days. That’s dedication! [HOT]” - “Activity has slowed recently. A quick session could reignite momentum!”

Color Legend: - Empty (dark) -> No activity - Light purple -> Low activity - Bright purple -> High activity - Dashed border -> Predicted future activity

Profile Stats

Stat	Description
Conversations	Total conversations you've had
Tokens Used	AI tokens consumed (for awareness)
Messages	Total messages exchanged
Achievements	Unlocked gamification badges

4. Conversations

Starting a New Conversation

1. Type your message in the input field at the bottom
2. Press **Enter** or click **Send**
3. Wait for the AI response (a typing indicator shows Think Tank is working)

Understanding Responses

Think Tank responses may include:

- **Main Answer** - The AI's response to your question
- **Confidence Indicator** - How certain the AI is about its answer
- **Sources** - References or citations when available
- **Suggestions** - Related questions you might want to ask

Conversation Actions

Action	How To
Share conversation	Click the share icon to create a shareable link
Export	Download conversation as text or markdown
Delete	Remove a conversation from your history
Branch	Create an alternative thread from any point

Conversation Search

Use the search bar to find past conversations by: - Keywords in messages - Date range - Conversation status (active, archived)

5. My Rules - Personalizing AI Responses

My Rules lets you set **persistent preferences** for how Think Tank responds to you. These rules are applied to every conversation.

Creating a Custom Rule

ADD CUSTOM RULE

Rule Summary *

Prefer concise bullet points

Rule Text *

When responding, use bullet points instead of long paragraphs. Keep responses under 200 words unless I specifically ask for more detail.

Rule Type

[LIST] Format

v

[Cancel]

[Create Rule]

1. Navigate to **My Rules** from the sidebar
2. Click **Add Custom Rule**
3. Fill in:
 - **Rule Summary** - Brief name (e.g., “Prefer concise answers”)
 - **Rule Text** - Detailed instruction for the AI
 - **Rule Type** - Category of the rule
4. Click **Create Rule**

Rule Types

Type	Use For	Example
Preference	General response style	“I prefer bullet points over paragraphs”
Restriction	Things to avoid	“Never use jargon without explaining it”
Format	Response structure	“Always include a summary at the end”
Sources	Citation preferences	“Cite academic sources when available”
Tone	Communication style	“Use a professional but friendly tone”

Type	Use For	Example
Topic	Subject-specific rules	“For medical topics, always recommend consulting a doctor”
Privacy	Data handling	“Don’t reference my previous conversations”

Using Preset Rules

Think Tank provides pre-made rules you can add with one click:

1. Go to **My Rules** -> **Add from Presets**
2. Browse categories (e.g., “Response Style”, “Privacy”, “Formatting”)
3. Click **Add** next to any rule you want
4. Rules marked **Popular** are used by many users

Managing Rules

- **Toggle On/Off** - Temporarily disable a rule without deleting it
- **Times Applied** - See how often each rule has been used
- **Delete** - Remove a rule permanently

Best Practices

- Start with 3-5 core rules
- Be specific in your rule text
- Review rules periodically - remove ones that don’t help
- Use preset rules as starting points, then customize

6. Domain Modes

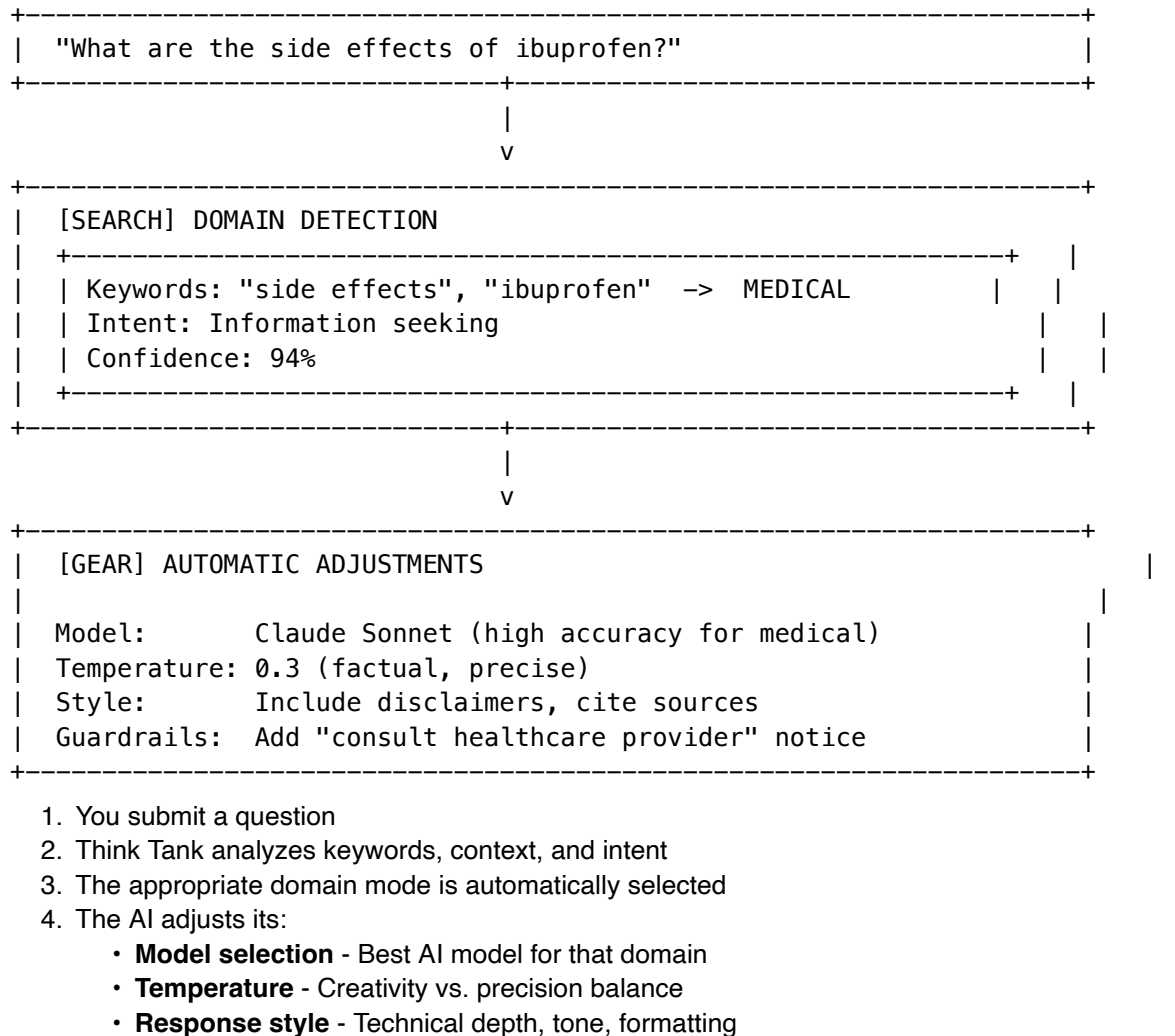

Think Tank automatically detects what domain your question relates to and adjusts its behavior accordingly.

Available Domains

Domain	Icon	Optimized For
General	[TIP]	Everyday questions and tasks
Medical		Healthcare and medical topics (with appropriate disclaimers)
Legal		Legal research and analysis
Code	[CODE]	Programming and development
Academic	[EDU]	Research and educational content
Creative		Writing, content creation, brainstorming

Domain	Icon	Optimized For
Scientific	[TEST]	Scientific research and analysis

How Domain Detection Works

Domain Indicators

You'll see a small badge indicating the detected domain:

[Medical] Analyzing your health question...

Overriding Domain Detection

If Think Tank picks the wrong domain: 1. Click the domain badge 2. Select the correct domain 3. Your choice is remembered for similar questions

Domain Selector (Advanced Mode) - v6.0.0

In **Advanced Mode**, you can manually select your domain expertise for optimized responses:

1. Enable **Advanced Mode** in the chat header
2. Click the **Domain** selector (shows “Auto” by default)
3. Search for or select your domain:
 - **Healthcare** - Medical, clinical, pharmaceutical
 - **Legal** - Law, contracts, regulations
 - **Finance** - Investment, banking, markets
 - **Technology** - Software, hardware, AI/ML
 - **Education** - Teaching, curriculum, learning
 - **Science** - Research, experiments, discovery
4. Your selection is saved and used for future sessions

Cartridge Indicator (Advanced Mode) - v6.0.0

In **Advanced Mode**, you can see which **Knowledge Cartridges** are active:

1. Look for the cartridge icon in the header (shows count like “2 Cartridges”)
2. Click to expand and see:
 - **System cartridges** - Platform-wide knowledge (e.g., RADIANT Core)
 - **Organization cartridges** - Tenant-specific knowledge
 - **Personal cartridges** - Your custom knowledge bundles
3. Each cartridge shows version and priority level

Cartridges provide specialized domain knowledge that enhances AI responses in specific areas.

7. Delight System - AI Personality

The Delight System controls Think Tank’s personality, making interactions more engaging and human-like.

Personality Modes

Mode	Description	Best For
Auto (Recommended)	Adapts based on context	Most users
Professional	Formal and direct	Business use
Friendly	Warm and approachable	Casual conversations
Playful	Fun and expressive	Creative work
Minimal	Just the facts	Quick lookups

Personality Elements

Think Tank’s personality includes:

Messages

Contextual messages that appear during interactions: - **Pre-execution** - “Let me think about that...” - **During execution** - “Analyzing your data...” - **Post-execution** - “Here’s what I found!”

Achievements

Unlock achievements as you use Think Tank: - [TROPHY] **First Conversation** - Start your journey - [TROPHY] **Power User** - 100 conversations - [TROPHY] **Rule Master** - Create 10 custom rules - [TROPHY] **Domain Expert** - Use 5 different domains

Achievement rarities: Common, Uncommon, Rare, Epic, Legendary

Easter Eggs

Hidden surprises triggered by special phrases or patterns. Discover them yourself! (Hint: Try asking about the meaning of life...)

Sounds (Optional)

Audio feedback for actions (can be disabled in Settings): - Notification sounds - Achievement unlocks - Transition effects

Adjusting Personality

1. Go to **Settings** -> **Personality**
 2. Select your preferred mode
 3. Changes apply immediately
-

8. Collaboration Features

Real-Time Collaboration

Work together with colleagues on the same conversation.

Starting a Collaborative Session

1. Navigate to **Collaborate** from the sidebar
2. Click **Create Session** or join an existing one
3. Share the session link with colleagues
4. Everyone sees messages in real-time

Enhanced Collaboration Features

The enhanced collaboration mode includes:

Feature	Description
Chat	Real-time messaging with all participants

Feature	Description
Branches	Create alternative discussion threads
AI Roundtable	Multiple AI perspectives on a topic
Knowledge Graph	Visual map of discussed concepts
Playback	Review the conversation timeline

AI Facilitator

Enable the AI Facilitator to: - Summarize long discussions - Suggest next topics - Identify areas of agreement/disagreement - Keep the conversation productive

Participant Roles

- **Owner** - Full control, can delete session
- **Participant** - Can send messages and interact
- **Guest** - View-only access (via guest link)

Sharing Conversations

Share a conversation without real-time collaboration:

1. Open any conversation
2. Click the **Share** button
3. Choose sharing options:
 - **Public link** - Anyone with link can view
 - **Copy allowed** - Viewers can copy content
4. Click **Create Share Link**
5. Copy and send the link

9. Advanced Features

Polymorphic UI - Adaptive Views

Think Tank’s interface automatically adapts based on your query type.

View Types

POLYMORPHIC VIEW SELECTION									
[TARGET]	SNIPER		[SEARCH]	SCOUT		[DOCS]	SAGE		WAR ROOM
>_		*	/ \						[AI] [AI]
Quick		/ \							[AI] [AI]
command		/ \							debate

+-----+	+-----+	+-----+	+-----+
~\$0.01/run	~\$0.05/run	~\$0.10/run	~\$0.50/run
Fast lookup	Research	Compare	Multi-agent
+-----+			

View	When It Appears	Best For
Sniper (Terminal)	Quick commands, lookups	Fast answers, low cost
Scout (Mind Map)	Research, exploration	Complex research
Sage (Diff Editor)	Validation, comparison	Reviewing changes
Dashboard	Data queries	Analytics
Decision Cards	Choices needed	Human approval required
Chat	General conversation	Default view

Cost Indicators

Different views have different costs (reflected in credits used): - **Sniper Mode** - ~\$0.01/run (fast, single model) - [OMEGA] **War Room Mode** - ~\$0.50+/run (multi-agent, thorough)

The Economic Governor automatically routes your query to the most cost-effective mode that can handle it.

Manual Escalation

If Sniper mode isn’t giving good results: 1. Click **Escalate to War Room** 2. The AI will use more models and deeper analysis 3. Results are more thorough but take longer

The Grimoire - AI Learning

The Grimoire is Think Tank’s procedural memory - rules it has learned from successful interactions.

What You’ll See

- **Heuristics** - Learned rules like “When asked about X, always consider Y”
- **Confidence Scores** - How sure the AI is about each rule
- **Domain Tags** - Which domains the rule applies to

Reinforcing Learning

You can help the AI learn: - **Thumbs Up** - Increases confidence in a heuristic - **Thumbs Down** - Decreases confidence - This feedback improves future responses

Magic Carpet Navigator

An advanced navigation system with intent-based routing.

Opening the Navigator

Press **CmdK** (Mac) or **Ctrl+K** (Windows) to open the destination selector.

Destinations

Destination	Icon	Purpose
Command Center		Overview dashboard
Workshop		Build and create
Time Stream		Reality Scrubber (history)
Quantum Realm		Parallel realities (branches)
Oracle's Chamber		Pre-Cognition (predictions)
Gallery		View creations
Vault	[LOCK]	Saved items

Journey Breadcrumbs

The navigator shows your path through the application, making it easy to retrace steps.

Artifacts - Generated Code

When Think Tank generates code or components, they appear as Artifacts.

Artifact Features

- **Live Preview** - See generated UI components
- **Code View** - Inspect the source code
- **Validation** - Safety checks ensure code is secure
- **Reflexion** - If generation fails, AI retries with improvements

Safety Validation

All generated code passes through Cato safety validation: - [OK] No dangerous operations - [OK] Only allowed dependencies - [OK] Follows security best practices

Liquid Interface - Chat Morphs Into Tools (v5.52.8)

In **Advanced Mode**, the chat interface can transform (“morph”) into specialized tools when you need them. This is called the Liquid Interface - “Don’t Build the Tool. BE the Tool.”

Enabling Advanced Mode

1. Toggle **Advanced Mode** in the header (lightning bolt icon)
2. Tool trigger buttons appear in the toolbar
3. Click any tool icon to morph the chat into that tool

Available Tools

Tool	Icon	What It Does
Data Grid	[CHART]	Interactive spreadsheet for data manipulation
Chart	[UP]	Visualize data as bar, line, pie, or area charts
Kanban	[LIST]	Task board with multiple frameworks (see below)
Calculator		Full calculator with memory and operations
Code Editor	[CODE]	Write and run code with output panel
Document	[DOC]	Rich text editor for writing

Kanban Board Variants

The Kanban tool supports 5 different productivity frameworks:

Variant	Best For	Key Features
Standard	General task tracking	Traditional columns, drag-and-drop
Scrumban	Agile teams	Sprint goals, velocity, story points
Enterprise	Portfolio management	Multi-lane boards (Strategic/Ops/Support)
Personal	Individual productivity	Simple 3-column, WIP limit of 3
Pomodoro	Focus sessions	Built-in 25-min timer, break tracking

Using Pomodoro Kanban: 1. Select “Pomodoro Kanban” from the variant dropdown 2. Add tasks with estimated pomodoros () 3. Click **Start** on a task to begin a 25-minute focus session 4. Timer shows in header - take a 5-minute break when it ends 5. Track completed pomodoros per task

Analytics Panel: Click **Analytics** to see: - Total tasks and completed count - Average cycle time (how long tasks take) - Throughput (tasks completed per week)

Returning to Chat

Click the **X** button in the tool header to close the morphed view and return to chat.

10. AXIOM Forge - Prompt Optimization

AXIOM Forge is an intelligent prompt optimization system that transforms your questions into highly effective prompts that get better AI responses.

Why Use AXIOM Forge?

Without AXIOM	With AXIOM
Generic responses	Domain-optimized responses
AI guesses your intent	AI knows exactly what you need

Without AXIOM	With AXIOM
One-size-fits-all prompts	Tailored to the best model for your task
Lower quality results	Consistently better outcomes

How It Works

When you enable AXIOM Forge, it guides you through a quick 4-step workflow:

AXIOM FORGE WORKFLOW			
1 CLASSIFY	2 CLARIFY	3 COMPILE	4 ROUTE
[TARGET]	-->	--> [FAST]	--> [AI]
Domain	Questions	Build	Select
Detect	1-5 max	Prompt	Model
Detects your expertise area automatically	Asks only the questions that really matter	Compiles an optimized prompt	Picks the best AI model for your task

The CLARION Questions

AXIOM uses **CLARION** (Context-aware Learning Adaptive Reasoning Interrogation ONtology) to ask you smart clarifying questions:

- **Maximum 5 questions** - We respect your time
- **Skip anytime** - Press Skip if a question does not apply
- **Smart ordering** - Questions adapt based on your answers
- **Model signals** - Your answers help select the best AI model

Question Types

Type	Example
Choice	“What type of task is this?” (select one)
Multi-select	“Which aspects matter most?” (select several)
Text	“Describe your specific requirements”
Scale	“How complex is this? (1-5)”
Yes/No	“Does this need code examples?”

Model Score Bars

As you answer questions, you will see **Model Score Bars** showing which AI models are best suited for your task:

MODEL PREDICTIONS		
Claude Sonnet 4 anthropic	87%	Strong in analysis, reasoning
GPT-4 Turbo openai	72%	Good general purpose
Gemini 2.0 google	58%	Multimodal capability

The leading model () is updated in real-time as you provide more context.

Compiled Prompt Preview

After answering questions, AXIOM compiles your optimized prompt:

- **System Prompt** - Instructions tailored to your domain and task
- **User Prompt** - Your question enhanced with context
- **Edit option** - Make final tweaks before sending
- **Token count** - See how long your prompt is

When to Use AXIOM Forge

Good For	Not Needed For
Complex analysis tasks	Quick factual lookups
Domain-specific work (legal, medical, code)	Simple questions
When you want the best results	Casual conversations
Important deliverables	Follow-up questions

Enabling AXIOM Forge

1. Start typing your message
2. Click the **[FAST] Optimize** button (or press Ctrl+Shift+0)
3. Answer the clarifying questions
4. Review and send your optimized prompt

[TIP] **Tip:** You can skip AXIOM optimization anytime by clicking “Skip optimization” - your message will be sent normally.

CLARION Settings

Customize your AXIOM experience in **Settings -> CLARION Preferences**:

Setting	Description	Default
Clarification Mode	When to ask questions (Auto/Always/Never)	Auto
Max Questions	Maximum questions per session (3-7)	5
Show Model Scores	Display real-time model predictions	On
Show Confidence Meter	Display optimization progress	On
Animations	Enable smooth transitions	On
Remember Answers	Store answers for similar questions	On
Learn Preferences	Adapt questions based on patterns	On

Accessibility Features

AXIOM Forge is fully accessible:

- **Keyboard Navigation:** Use arrow keys to navigate options, Enter to select
- **Screen Reader Support:** All questions and score updates are announced
- **Focus Management:** Auto-focus on new questions
- **High Contrast:** Visible selection states and progress indicators

Mobile Features

On mobile devices:

- **Swipe to Skip:** Swipe right on a question card to skip it
- **Touch-Optimized:** Large tap targets for all interactive elements
- **Responsive Layout:** Full-screen experience on smaller screens

Feedback

After using AXIOM Forge, you can provide feedback:

- **Quick Feedback:** Thumbs up/down for domain accuracy, questions, prompts, and model selection
- **Detailed Feedback:** Rate your overall experience (1-5 stars) and leave comments
- **Continuous Improvement:** Your feedback helps AXIOM learn and improve

11. How Think Tank's Memory Works

Think Tank uses two interconnected systems to remember things and access knowledge.

Cato - The AI's Personality & Memory

Cato is the AI's "self" - its personality, emotional state, and personal memory of you.

What Cato Remembers	Example
Your Preferences	"This user prefers detailed explanations"
Past Conversations	Topics you've discussed, corrections you've made
Current Mood	Confidence level, engagement, curiosity
Communication Style	Formal vs casual, concise vs detailed

How it helps you: The AI adapts its responses based on what it knows about you. If you've told it you prefer bullet points, it remembers. If you corrected it before, it learns.

Cortex - The Enterprise Knowledge Library

Cortex is your organization's knowledge graph - facts, documents, and relationships extracted from enterprise data.

Knowledge Tier	What's There	Speed
Hot	Current session context	Instant
Warm	Knowledge graph, verified facts	Fast
Cold	Archives, compliance data	Slower

How it helps you: When you ask a question, the AI can pull relevant facts from your organization's knowledge base - not just generic internet knowledge.

How They Work Together

```
+-----+
|                                     |
|                                     |
|         v                         |
+-----+
| AI RESPONSE:                      |
| Personalized (knows you want summaries) |
| + Informed (has actual project data)    |
| + Contextual (understands your role)   |
+-----+
```

What This Means for You

Without Memory Integration	With Memory Integration
AI gives generic answers	AI gives personalized + informed answers
You re-explain context every time	AI remembers your preferences
No access to company data	Enterprise facts in every response
Each session starts fresh	Learning persists across sessions

Privacy Note

- **Personal memories** (Cato) are tied to your user account
- **Enterprise knowledge** (Cortex) follows your organization's access controls
- You can ask "What do you remember about me?" to see stored context
- Admins can configure retention periods and what gets remembered

11. Understanding AI Decisions

Think Tank is designed to be transparent about how it makes decisions.

Brain Plans

When Think Tank processes your request, it creates a Brain Plan showing:

```

+-----+
| [LIST] BRAIN PLAN |
+-----+
|
|  Orchestration:  research |
|  Domain:         Scientific [TEST] |
|  Confidence:     87% |
|
|  +- EXECUTION STEPS -----+
|  |
|  | Step 1: Analyze query context | [[ok] Done] |
|  | Step 2: Select relevant models | [[ok] Done] |

```

	Step 3: Gather information	[* Running]		
	Step 4: Synthesize response	[o Pending]		
	Step 5: Validate and format	[o Pending]		
	+-----+			
	Model: Claude Sonnet 4.0			
	Est. Cost: \$0.03			
	Est. Time: ~8 seconds			
	+-----+			

1. **Orchestration Mode** - How the AI will approach your question
- thinking - Standard reasoning
 - extended_thinking - Deep multi-step analysis
 - coding - Code generation
 - creative - Creative writing
 - research - Research synthesis
 - multi_model - Multiple AI perspectives
2. **Domain Detection** - The identified knowledge area
3. **Model Selection** - Which AI model will be used and why
4. **Steps** - The planned execution steps
5. **Cost Estimate** - Expected credits to be used

Confidence Levels

Think Tank indicates how confident it is in responses:

Indicator	Meaning
High Confidence	AI is very sure about this answer
Medium Confidence	Reasonably sure, but verify important details
Low Confidence	Uncertain - treat as a starting point

When Think Tank Asks for Clarification

If the AI is uncertain about your intent, it will ask clarifying questions rather than guess. This is intentional - it's better to ask than give a wrong answer.

Epistemic Humility

Think Tank acknowledges when it doesn't know something: - "I'm not certain, but..." - "Based on my training data (which may be outdated)..." - "I don't have enough information to answer this definitively"

14. Safety & Governance

Think Tank includes multiple safety layers to protect you and ensure responsible AI use.

Five-Layer Safety Stack

L4	COGNITIVE LAYER	[BRAIN] Active Inference * Precision Governor * Planning
L3	CONTROL LAYER	[SHIELD] Control Barrier Functions * CANNOT be bypassed
L2	PERCEPTION LAYER	Uncertainty Detection * Fracture Prevention
L1	SENSORY LAYER	[ALERT] Immediate Veto * Dangerous Request Blocking
L0	RECOVERY LAYER	[SYNC] Safe State Return * Error Recovery

Layer	Name	What It Does
L4	Cognitive	Active inference, precision control
L3	Control	Barrier functions - always enforced
L2	Perception	Uncertainty detection, fracture prevention
L1	Sensory	Immediate veto for dangerous requests
L0	Recovery	Returns to safe state if issues occur

Governance Presets

Your organization may use different governance levels:

Preset	Icon	Behavior
Paranoid	[SHIELD]	Every action requires approval
Balanced		Auto-approve low-risk, checkpoint medium/high
Cowboy	[LAUNCH]	Full autonomy with notifications

You'll see a governance badge indicating the current level.

Human-in-the-Loop (HITL)

For high-stakes decisions, Think Tank may pause and ask for your approval:

[ALERT] Approval Required
This action will modify your database.
Cost: \$2.50 estimated

|

[Approve] [Modify] [Reject]

|

What Think Tank Will Never Do

These are hardcoded safety limits that cannot be changed: - [X] Generate harmful content - [X] Execute destructive actions without confirmation - [X] Bypass safety barriers - [X] Delete audit logs - [X] Expose sensitive data

LIVS-M 2.0 Policy Modes (v7.9.0)

Think Tank includes **LIVS-M 2.0** - a “Defcon-style” governance system that controls how strictly AI outputs are verified. Think of it as a dial that controls the rigor of AI quality checks.

Access: Settings -> Advanced -> LIVS-M Policy

The Three Policy Modes

Mode	Nickname	Best For	Behavior
Brainstorming	“Yes, and...”	Hackathons, MVP planning, early drafting	Accepts partial code, stubs, rough ideas. Warnings logged but don’t stop work.
Standard	“Trust but Verify”	Daily development, Sprint work	Code must run. Stubs rejected if breaking. Tests encouraged. (Default)
Strict Audit	“Zero Trust”	Production releases, medical/legal, security	No stubs. No mock data. Mandatory tests. Sycophancy triggers Devil’s Advocate.

What Each Mode Does

[BRANDED] Brainstorming Mode - AI accepts “TODO” comments and placeholder code - Focus on speed and creativity over perfection - Warnings are logged but don’t block responses - Best when you’re exploring ideas, not shipping code

**** Standard Mode**** (Default) - Code must actually work - no broken implementations - Stubs are rejected if they break functionality - Tests are encouraged but not mandatory for everything - Sycophancy detection warns when AI agrees too quickly

**** Strict Audit Mode**** - Zero tolerance for stubs, placeholders, or mock data - Every output must include appropriate test coverage - If AI agents agree too quickly, a “Devil’s Advocate” challenge is injected - Maximum verification before any response is approved

Visual Indicators

When LIVS-M detects potential issues in AI responses, you’ll see: - [!] **Warning badge** - Minor issue, response continues - **Block indicator** - Response blocked, AI will retry with stricter guidelines - **Devil’s Advocate** - Consensus was too fast, alternative viewpoint injected - [LIST] **Review flag** - Flagged for human review

Common Scenarios

Scenario	Recommended Mode
Brainstorming a new feature	Brainstorming
Writing production code	Standard
Code review before deploy	Strict Audit
Exploring creative ideas	Brainstorming
Security-sensitive changes	Strict Audit
Day-to-day development	Standard

Understanding What LIVS-M Catches

The “Watermelon” Problem: AI agents reporting “Done” when code is full of pass, return True, or // TODO placeholders. LIVS-M detects these patterns and rejects lazy implementations.

The “Groupthink” Problem: When Agent A makes a mistake and Agent B just agrees with it. LIVS-M detects suspiciously fast consensus and injects a “Devil’s Advocate” challenge.

The “Hallucination” Problem: AI importing libraries that don’t exist or making up APIs. LIVS-M verifies dependencies against approved lists.

How LIVS-M Works Behind the Scenes

	YOUR ANSWER	AI RETRIES WITH FIX	CHALLENGE INJECTED	
+-----+				

Switching Modes

You can switch modes anytime: 1. Click the **[GEAR] Settings** icon 2. Go to **Advanced -> LIVS-M Policy** 3. Select your preferred mode 4. Changes apply to your next conversation

Version Updates (v7.9.0+)

LIVS-M now includes automatic version management. When updates are available:

- **Update Badge:** A green “UPDATE” badge appears on the LIVS-M Policy navigation item
- **Version Display:** Your current version is shown in the header (e.g., “v2.0.0”)
- **Updates Tab:** Navigate to the “Updates” tab to see what’s new

Checking for Updates: 1. Go to **Settings -> Advanced -> LIVS-M Policy** 2. Click the **Updates** tab 3. If an update is available, you’ll see: - Current vs. latest version comparison - Changelog with new features - One-click **Upgrade** button

Update Alerts: - **[!] Breaking Changes:** Review changelog carefully before upgrading - **[SYNC] Migration Required:** Database changes will be handled automatically - **[OK] Up to Date:** Green checkmark when you’re on the latest version

Note: Upgrades are typically seamless, but your administrator may schedule them during maintenance windows for production environments.

Pro Tips

- **Friday Deployments:** Switch to Strict Audit mode before any end-of-week releases
- **Creative Sessions:** Use Brainstorming mode when exploring new ideas—you can always tighten later
- **Code Reviews:** Strict Audit mode acts as an automated code quality gate

Reporting Issues

If Think Tank produces concerning output: 1. Click the **Report** button on the response 2. Select the issue type 3. Add any additional context 4. Submit for review

12. Decision Records

Decision Records capture the AI’s reasoning, evidence, and conclusions in an auditable format. This feature helps you understand and verify AI-assisted decisions.

Accessing Decision Records

After significant conversations, Think Tank automatically extracts: - **Claims** - Key conclusions and recommendations - **Evidence** - Supporting data and sources - **Dissent** - Alternative viewpoints considered but rejected - **Compliance** - Regulatory implications if applicable

The Living Parchment View

Decision Records use a special “Living Parchment” interface where: - **Breathing colors** indicate trust levels (green = verified, amber = unverified, red = contested) - **Font weight** reflects confidence (bolder = more confident) - **Ghost paths** show rejected alternatives as faded traces

Verifying Claims

Click any claim to see: 1. The evidence supporting it 2. The AI’s reasoning chain 3. Any dissenting opinions 4. Data freshness indicators

Exporting for Compliance

Export decision records in various formats: - **HIPAA Audit Package** - For healthcare compliance - **SOC2 Evidence Bundle** - For security audits - **GDPR DSAR Response** - For data requests

Exporting Conversations Directly (v5.52.16)

You can export any conversation directly from the sidebar:

1. **Hover** over any conversation in the sidebar

2. **Click** the **** (more options) button that appears

3. **Select** an export format:
 - **Generate Decision Record** - Creates a Decision Intelligence Artifact with claims, evidence, and dissent
 - **Export HIPAA Audit Package** - PHI-redacted export for healthcare compliance
 - **Export SOC2 Evidence** - Audit trail for security compliance
 - **Export GDPR DSAR** - Data subject access request format
 - **Export as PDF** - Standard PDF export

SIDEBAR – Conversation Actions

[NOTE] Today

[CHAT] "Drug interaction analysis" [] []

v

[LIST] Generate Decision Record

[SHIELD] Export HIPAA

[SHIELD] Export SOC2

[SHIELD] Export GDPR DSAR

[DOC] Export as PDF

Note: PHI (Protected Health Information) is automatically redacted in compliance exports by default.

13. Living Parchment

Living Parchment is Think Tank's advanced decision intelligence suite with sensory UI that communicates trust through visual breathing, living typography, and confidence terrain.

War Room (Strategic Decision Theater)

For high-stakes decisions, enter the War Room:

1. **Navigate to** Living Parchment -> War Room
2. **Create a session** with your decision question
3. **Add AI advisors** - multiple perspectives on your problem
4. **View the Confidence Terrain** - 3D visualization where height = confidence
5. **Explore Decision Paths** - branching options with predicted outcomes
6. **Make your decision** with full documentation

Understanding the Terrain: - Green peaks = High confidence areas - Amber slopes = Moderate uncertainty
- Red valleys = Risk zones requiring attention

Council of Experts

Summon diverse AI perspectives that debate and converge:

1. **Convene a Council** with your question
2. **Watch 8 expert personas** discuss:
 - Pragmatist (practical focus)
 - Ethicist (moral considerations)
 - Innovator (creative solutions)
 - Skeptic (devil's advocate)
 - Synthesizer (finding common ground)
 - Analyst (data-driven insights)
 - Strategist (long-term thinking)
 - Humanist (human impact)
3. **Observe consensus forming** as experts move toward center
4. **Review minority reports** - valid dissenting views preserved

Debate Arena

Test any idea through adversarial exploration:

1. **Create a debate** with your proposition
2. **Watch AI debaters** argue both sides
3. **Track the Resolution Meter** showing which side is winning
4. **Identify weak points** (breathing red indicators)
5. **Generate Steel-Man** - AI creates the strongest version of the opposing argument

Understanding Living Parchment UI

Visual Element	Meaning
Fast breathing (12 BPM)	High uncertainty, needs attention
Slow breathing (4-6 BPM)	Confident, stable information
Bold text	High confidence claim
Light text	Lower confidence, verify before acting
Faded/gray text	Stale information, may need refresh
Ghost overlays	Rejected alternatives (what could have been)

14. Safety & Governance

Think Tank includes multiple safety layers to protect you and your organization. See Section 14: Safety & Governance in the main guide for details on: - Five-layer Cato safety architecture - Control Barrier Functions (CBFs) - Human-in-the-Loop approvals - Governance presets

15. Time Machine - Conversation Forking

Time Machine lets you create branches in your conversation history, explore alternative paths, and replay past states.

What is Time Machine?

Think of Time Machine as “version control for conversations.” Just like developers can branch code, you can branch conversations to explore different directions without losing your original path.

Creating a Checkpoint

Checkpoints save the conversation state at a specific point:

1. Click the **** Checkpoint**** button in the Time Machine toolbar

2. Give it a name (e.g., “Before major decision”)
3. The checkpoint appears on your timeline

Forking a Conversation

Create an alternative branch from any checkpoint:

1. Navigate to the checkpoint you want to branch from
2. Click **** Fork Here****
3. Name your fork (e.g., “Alternative approach”)
4. Continue the conversation in your new branch

Timeline Navigation

Control	Action
«	Jump to start
<	Previous checkpoint
>	Next checkpoint
»	Jump to present
Drag playhead	Scrub through history

Replaying Conversations

Replay a conversation to see how it evolved:

1. Select a timeline
2. Click **> Replay**
3. Watch messages appear in sequence
4. Pause at any point to create a new fork

Use Cases

Scenario	How Time Machine Helps
Exploring options	Fork to try different approaches
What-if analysis	Branch to test alternative scenarios
Decision tracking	Checkpoint before major decisions
Training	Replay conversations for learning

16. The Grimoire - Procedural Memory

The Grimoire is Think Tank’s “spell book” - a collection of learned patterns and procedures that help the AI respond more effectively over time.

What is the Grimoire?

When Think Tank discovers a successful pattern (like a good way to explain something or solve a problem), it can save it as a “spell” in the Grimoire for future use.

[BOOK] GRIMOIRE – SPELL LIBRARY									
+-----+ +-----+									
[CODE] CODE					[CHART] DATA				
Programming tasks					Data processing				
12 spells					8 spells				
+-----+ +-----+									
+-----+ +-----+									
[NOTE] TEXT					[SEARCH] ANALYSIS				
Writing & editing					Research & insight				
15 spells					6 spells				
+-----+ +-----+									
Recent Castings: SQL Optimizer [STAR][STAR][STAR] JSON Fixer [STAR][STAR][STAR][STAR][STAR]									
+-----+									

Spell Schools

School	Icon	Purpose
Code	[CODE]	Programming, debugging, and code generation
Data	[CHART]	Data processing, transformation, and queries
Text	[NOTE]	Writing, editing, and content creation
Analysis	[SEARCH]	Research, insights, and pattern recognition
Design	[DESIGN]	UI/UX, visual layouts, and styling
Integration	[LINK]	API connections, workflows, and pipelines
Automation	[GEAR]	Repetitive tasks, batch operations
Universal	GLOBAL	General-purpose, cross-domain spells

Spell Categories

- **Prompt Optimization** - Better ways to ask questions
- **Error Recovery** - Fixing common mistakes
- **Context Management** - Handling conversation state
- **Output Formatting** - Structuring responses

Power Levels

Spells have power levels ([STAR] to [STAR][STAR][STAR][STAR][STAR]) based on: - Success rate - Times used - Tokens saved - User ratings

Promoting Patterns to Spells

If you notice the AI doing something well repeatedly:

- 1. Rate the response with
- 2. Add feedback: “This pattern is really helpful”
- 3. The system may promote it to a spell
- 4. Future conversations benefit from this pattern

17. Flash Facts - Quick Knowledge Capture

Flash Facts lets you quickly save important information for the AI to remember.

What are Flash Facts?

Flash Facts are bite-sized pieces of knowledge you want Think Tank to always remember about you, your work, or your preferences.

```
+-----+
| [FAST] FLASH FACTS                                     |
+-----+
|
| Quick Add: [Type a fact and press Enter...]           |
|
| [PIN] Pinned Facts                                     |
| +-----+                                             |
| | "I work at Acme Corp as a Senior Developer"         | [[PIN]] [] |
| | "Our tech stack is React + Node.js + PostgreSQL"     | [[PIN]] [] |
| | "I prefer TypeScript over JavaScript"                 | [[PIN]] [] |
| +-----+                                             |
|
| By Category                                           |
| * Work Context (3)      * Technical Preferences (5)   |
| * Personal (2)          * Project-Specific (4)        |
|
+-----+
```

Adding Flash Facts

Quick Method: 1. During any conversation, type: “Remember that [fact]” 2. Think Tank saves it as a Flash Fact 3. Example: “Remember that I prefer verbose error messages”

From the Interface: 1. Go to **Settings -> Flash Facts** 2. Type your fact in the quick-add field 3. Press Enter or click Add

Flash Fact Categories

Category	Examples
Work Context	Company, role, team, projects
Technical	Languages, frameworks, tools
Preferences	Communication style, detail level
Personal	Timezone, working hours

Managing Flash Facts

- **[PIN] Pin** - Keep fact always visible
- **** Delete**** - Remove outdated facts
- **** Edit**** - Update fact details
- **** Categorize**** - Organize by topic

18. Sentinel Agents - Background Monitors

Sentinel Agents are background processes that watch for specific conditions and take action automatically.

What are Sentinel Agents?

Think of Sentinels as “if this, then that” for AI. They monitor your conversations and workflows, triggering actions when conditions are met.

[SHIELD] SENTINEL AGENTS			
Active Agents (3)		[+ Create Agent]	
+-----+			
[SEARCH]	Code Quality Monitor	[Active]	*
Triggers: When code is generated			
Actions: Run linting, suggest improvements			
Fired: 47 times Last: 2 minutes ago			
+-----+			
+-----+			
[CHART]	Data Freshness Checker	[Active]	*
Triggers: When citing statistics			
Actions: Verify data age, add freshness warning			
Fired: 12 times Last: 1 hour ago			
+-----+			

Agent Types

Type	Icon	Purpose
Monitor	[SEARCH]	Watch for patterns and report findings
Guardian	[SHIELD]	Prevent unwanted outcomes and enforce rules
Scout		Proactively search for relevant information
Herald		Announce important events and notifications
Arbiter		Make decisions and resolve conflicts

Creating a Sentinel Agent

1. Go to **Settings -> Sentinel Agents**
2. Click **+ Create Agent**
3. Define your trigger conditions
4. Specify actions to take
5. Set any additional conditions
6. Activate the agent

Example Agents

Agent	Trigger	Action
Citation Checker	When claims are made	Request sources
Cost Monitor	When query cost exceeds \$1	Notify before proceeding
Security Scanner	When code is generated	Check for vulnerabilities
Summary Generator	After long conversations	Create summary

19. Economic Governor - Cost Management

The Economic Governor helps you manage AI costs by intelligently routing queries to the most cost-effective models.

Understanding Costs

Different AI models have different costs:

Model Tier	Typical Cost	Best For
Fast (Sniper)	~\$0.01/query	Quick lookups, simple questions
Standard	~\$0.05/query	Most conversations
Advanced	~\$0.15/query	Complex analysis

Model Tier	Typical Cost	Best For
Multi-Model (War Room)	~\$0.50+/query	Critical decisions

Automatic Routing

The Economic Governor automatically routes your queries:

[COST] ECONOMIC GOVERNOR
Your Query: "What's the capital of France?"
Analysis:
+-- Complexity: Low
+-- Domain: General Knowledge
+-- Recommendation: Sniper Mode (\$0.01)
[Use Recommended] [Escalate to Standard] [Force War Room]

Budget Controls

Set spending limits:

- **Daily Budget** - Maximum spend per day
- **Query Limit** - Maximum cost per single query
- **Notifications** - Alert when approaching limits

Arbitrage Rules

Create rules to optimize costs:

Rule	Effect
“Simple facts -> Sniper”	Route factual lookups to fast models
“Code review -> Standard”	Use mid-tier for code analysis
“Legal questions -> Advanced”	Always use high-accuracy for legal

Viewing Usage

Go to **Profile** -> **Usage** to see: - Total spend this period - Cost breakdown by model - Most expensive queries - Savings from optimization

20. Council of Rivals - Multi-Model Deliberation

The Council of Rivals brings multiple AI perspectives together to debate and reach consensus on complex questions.

What is the Council?

For important decisions, you can convene a “council” of different AI models, each offering their perspective on your question.

COUNCIL OF RIVALS									
Question: "Should we migrate to microservices?"									
+-----+ +-----+ +-----+ +-----+									
Claude	GPT-4	Gemini	Mistral						
[ok]	[ok]	[x]		~					
Pro	Pro	Against	Neutral						
+-----+ +-----+ +-----+ +-----+									
Consensus: 60% in favor Key disagreement: Timeline									
[View Full Debate] [Request Synthesis] [Add Expert]									

Starting a Council Session

- 1. Ask your question normally
- 2. Click **Escalate to War Room** or type “I want multiple perspectives”
- 3. Select which models to include (or use presets)
- 4. Watch the deliberation unfold

Council Presets

Preset	Models	Best For
Technical Review	Claude, GPT-4, Codex	Code decisions
Strategic	Claude, GPT-4, Gemini	Business strategy
Creative	Claude, GPT-4, Gemini Pro	Creative projects
Full Council	All available models	Critical decisions

Understanding Results

- **Votes** - Each model’s position ([ok] Pro, [x] Against, ~ Neutral)
- **Consensus %** - Level of agreement
- **Key Disagreements** - Points where models differ

- **Synthesis** - Combined recommendation considering all views

When to Use Council

Scenario	Recommended
Quick factual questions	No - use Sniper
Important decisions	Yes
When you want multiple viewpoints	Yes
Validating a conclusion	Yes

21. Voice Input & File Attachments

Think Tank supports voice input and file attachments for richer interactions.

Voice Input

Click the **** microphone button to speak your message:

1. **Click** the microphone icon
2. **Speak** clearly into your microphone
3. **Click again** to stop recording
4. **Review** the transcription
5. **Send** or edit before sending

Supported languages: All 18 interface languages

File Attachments

Attach files for the AI to analyze:

1. **Click** the **** paperclip button
2. **Select** files to upload
3. **Wait** for processing
4. **Ask** questions about the files

Supported File Types

Type	Extensions	What Think Tank Can Do
Documents	PDF, DOC, DOCX, TXT	Read, summarize, answer questions
Spreadsheets	CSV, XLS, XLSX	Analyze data, create charts
Images	JPG, PNG, GIF, WEBP	Describe, extract text, analyze
Code	JS, PY, TS, etc.	Review, explain, debug

Drag and Drop

Simply drag files directly into the chat window to attach them.

File Size Limits

Plan	Max File Size	Max Files per Message
Standard	10 MB	5
Pro	50 MB	10
Enterprise	100 MB	20

22. Keyboard Shortcuts

Shortcut	Action
CmdK / Ctrl+K	Open Magic Carpet Navigator
CmdEnter / Ctrl+Enter	Send message
Escape	Close dialogs/modals
Cmd/ / Ctrl+ /	Open keyboard shortcuts help
CmdN / Ctrl+N	New conversation
CmdS / Ctrl+S	Save/Export conversation

23. Troubleshooting

Common Issues

“Response is taking too long”

- Complex queries in War Room mode take longer
- Check your network connection
- Try simplifying your question

“AI gave an incorrect answer”

1. Check if you're in the right domain mode
2. Provide more context in your question
3. Use the thumbs down button to provide feedback
4. Consider adding a rule to prevent this in the future

“I can’t access a feature”

- Some features require specific permissions
- Contact your administrator for access
- Check if the feature is enabled for your organization

“My rules aren’t being applied”

1. Verify the rule is toggled ON
2. Check the rule isn’t too vague
3. Make sure the rule doesn’t conflict with other rules
4. Try making the rule more specific

Getting Help

- **In-App Help** - Click the ? icon in the header
- **Documentation** - Access guides from Settings
- **Support** - Contact your organization’s IT team

24. Workflows & Orchestration Methods

Think Tank uses a powerful workflow system to intelligently process your requests. Understanding how workflows work helps you get better results and customize your AI experience.

What Are Workflows?

Workflows are predefined patterns for how Think Tank approaches different types of questions. Instead of just sending your prompt to a single AI model, workflows can:

- **Chain multiple steps** together (analyze -> propose -> verify -> refine)
- **Run multiple AI models in parallel** and combine their outputs
- **Apply quality checks** and verification at each step
- **Route to specialist models** based on your domain

Your Question

|
v

```
+-----+
|  Observer  | <- Understand what you're asking
+-----+
```

v

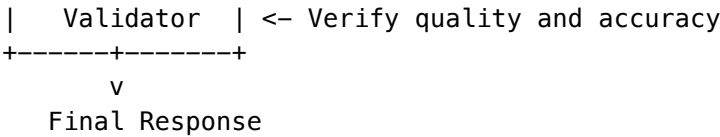

```
+-----+
|  Proposer  | <- Generate possible approaches
+-----+
```

v

```
+-----+
|  Critics   | <- Evaluate and improve (may use multiple AIs)
+-----+
```

v

```
+-----+
```

System Workflows

Think Tank includes **70+ pre-built workflows** for common tasks:

Category	Example Workflows
Research	Deep Research, Literature Review, Fact Check
Code	Code Review, Bug Analysis, Refactor Proposal
Writing	Content Polish, Translation, Summarization
Analysis	Sentiment Analysis, Trend Analysis, Competitive Intel
Decision	Pros-Cons Analysis, Risk Assessment, Recommendation
Creative	Brainstorm, Story Expansion, Concept Generation

The Brain Plan panel shows which workflow Think Tank selected for your question.

Multi-AI Selection

Think Tank can use **multiple AI models simultaneously** for a single response:

How It Works: 1. Your question runs through several AI models in parallel 2. Each model provides its perspective 3. Results are evaluated and combined 4. The best answer is synthesized

Stream Evaluation Modes: - **Any** - First good answer wins (fastest) - **All** - All models must agree (most thorough) - **Majority** - >50% agreement required - **Best** - Highest confidence answer selected - **Weighted** - Answers weighted by confidence scores

You can see multi-AI execution in the Brain Plan when it shows “Parallel” or “Council” modes.

Orchestration Methods

Behind workflows are **25+ orchestration methods** based on peer-reviewed AI research:

Method	What It Does	When It’s Used
Semantic Entropy	Measures uncertainty across multiple samples	High-stakes questions
Self-Consistency	Generates multiple reasoning paths, takes majority vote	Math/logic problems
Panel of Judges	Multiple AI models evaluate quality independently	Quality assurance
Debate	Als argue different positions, synthesize best arguments	Complex decisions

Method	What It Does	When It's Used
Hallucination Detection	Checks if claims are consistent and attributable	Factual questions
Mixture of Agents	Layered synthesis from diverse models	Comprehensive answers
Process Reward	Verifies each reasoning step individually	Step-by-step problems
Frugal Cascade	Starts with cheap models, escalates only if needed	Cost optimization

Saving Your Own Workflows

You can save customized workflows for reuse:

1. **During a conversation**, click “**Save as Template**” in the Brain Plan panel
2. **Name your workflow** (e.g., “My Code Review Process”)
3. **Adjust parameters** like:
 - Which AI models to use
 - Quality thresholds
 - Number of verification steps
 - Cost limits
4. **Save** - Available in your Workflow Templates

Sharing Workflows: - **Private** - Only you can use - **Team** - Shared with your organization - **Public** - Available to all users (requires admin approval)

Workflow Parameters You Can Customize

Parameter	What It Controls	Default
Quality Weight	Balance between quality and speed	0.7
Cost Threshold	Maximum cost per query	Varies
Confidence Threshold	Minimum confidence to accept	0.85
Sample Count	How many samples for voting methods	5
Max Escalations	How many times to try stronger models	2
Auto-Approve Threshold	Skip human review if confidence exceeds	0.95

Access these in **Settings -> Workflow Preferences**.

Conditional Logic

Workflows use **conditions** to decide what happens next:

Expression Conditions (automatic): - confidence > 0.8 - Proceed if AI is confident - contains("error") - Branch if error detected - length > 100 - Check response completeness

AI-Interpreted Conditions (smart): - “Is this response helpful and on-topic?” - “Does this contain any safety concerns?” - “Is this code syntactically correct?”

These conditions are **model-agnostic** - they evaluate the quality of the answer, not which AI model produced it. This means you can swap AI models without breaking your workflows.

Viewing Workflow Execution

To see how Think Tank processed your question:

- 1. **Brain Plan Panel** - Shows orchestration mode, domain, and confidence
- 2. **Expand Details** - Click to see step-by-step execution
- 3. **Cost Breakdown** - Shows tokens and cost per step
- 4. **Model Usage** - Which AI models were used

[OK]	Step 1: Observer	Claude 3.5 Sonnet	0.02¢	150ms
[OK]	Step 2: Proposer	GPT-4o	0.05¢	320ms
[OK]	Step 3: Critic (parallel)	3 models	0.08¢	280ms
[OK]	Step 4: Validator	Claude 3.5 Sonnet	0.03¢	180ms

Total:	0.18¢	930ms	Confidence: 94%	

25. Glossary

Term	Definition
Brain Plan	Think Tank’s execution plan showing how it will answer your question
Breathing UI	Visual elements that pulse to communicate confidence and data freshness
CBF	Control Barrier Function - safety guardrails that cannot be bypassed
Confidence Terrain	3D visualization where elevation = confidence, color = risk
Council of Experts	Multi-persona AI consultation with 8 distinct viewpoints
Debate Arena	Adversarial exploration tool for stress-testing ideas
Decision Record	Auditable capture of AI reasoning, evidence, and conclusions
Delight	The personality and engagement system
Domain Mode	Specialized configuration for different knowledge areas
Ego	Think Tank’s persistent identity and emotional state
Ghost Path	Translucent overlay showing rejected alternatives
Governance Preset	Organization-wide safety/autonomy settings
Grimoire	The AI’s learned procedural memory
Heuristic	A learned rule or shortcut the AI uses
HITL	Human-in-the-Loop - requiring human approval
Living Ink	Typography that varies weight based on confidence (350-500)
Living Parchment	Advanced decision intelligence suite with sensory UI
Magic Carpet	Intent-based navigation system

Term	Definition
My Rules	Personal preferences that customize AI responses
Polymorphic UI	Interface that adapts based on query type
Sentinel Agent	Background process that monitors for conditions and triggers actions
Sniper Mode	Fast, low-cost single-model execution
Spell	A learned pattern in the Grimoire that improves AI responses
Steel-Man	AI-generated strongest version of an opposing argument
Time Machine	Conversation forking and replay system
Timeline	A branch in Time Machine representing a conversation path
War Room	Strategic Decision Theater for high-stakes collaborative decisions
War Room Mode	Thorough multi-agent execution
Workflow	A predefined pattern of steps for processing AI requests
Orchestration Method	A specific algorithm or technique used within workflows
Stream Evaluation	How multiple parallel AI outputs are combined
Model-Agnostic Condition	A condition that evaluates output quality, not model identity
Workflow Template	A saved, reusable workflow configuration
Cartridge	Portable AI brain package (.RADz file) containing trained neural networks
CORTEX	Six small neural networks that make routing and orchestration decisions
Ghost Vector	64-dimensional representation of your preferences and interaction style
LoRA Adapter	Lightweight domain-specific training that customizes AI responses
Thermal State	System readiness level (COLD, WARMING, WARM, HOT)
Twilight Dreaming	Nightly autonomous learning cycle that improves the AI
Autonomous Organism	Self-evolving AI infrastructure that adapts and grows capabilities
Liquid Compute	Data sovereignty system ensuring processing in compliant jurisdictions
Ghost Simulation	Digital twin that learns preferences without storing actual prompts
Economic Cortex	Autonomous budget management with hierarchical cost controls
Tool Forge	System that automatically creates new capabilities on demand
Neural Affinity Routing	AI model selection based on semantic similarity and proficiency
Tensor-Link	High-efficiency vector-based communication protocol for AI systems

26. RADIANT Cartridges - Portable AI Brains

What Are Cartridges?

Think Tank is powered by **RADIANT Cartridges** – portable AI intelligence packages that contain everything the system has learned. Think of them like game cartridges: the hardware (RADIANT) provides the platform, the cartridge provides the intelligence.

Why This Matters to You: - Your organization’s AI gets smarter over time - Expertise can be transferred between deployments - The AI remembers your team’s terminology, preferences, and domain knowledge

How Cartridges Work

YOUR CARTRIDGE CONTAINS			
[BRAIN]	CORTEX Networks	- Routing decisions, pattern recognition	
[DOCS]	LoRA Adapters	- Your organization's domain expertise	
[USER]	Ghost Vectors	- Personal preferences for each user	
[OK]	Curator Knowledge	- Verified facts and golden rules	
	Expert Systems	- Industry-specific reasoning patterns	
Result: AI that "gets" your business from day one			

The Three Learning Tiers

Think Tank learns at three levels simultaneously:

Tier	What It Learns	Update Frequency	Weight
You (Ghost Vectors)	Your preferences, communication style, expertise	Every session	70% for returning users
Your Organization (LoRA)	Company terminology, processes, domain knowledge	Nightly	50% for new users
Everyone (Global)	Best practices, safety improvements, new capabilities	Monthly	10-30%

New users benefit heavily from organizational learning (50%), while **returning users** get highly personalized responses (70% from your personal Ghost Vector).

27. Domain Selector

Selecting Your Expertise Domain

The **Domain Selector** allows you to manually specify your area of expertise, which helps Think Tank tailor its responses more precisely.

To access the Domain Selector: 1. Click the **globe icon** (GLOBAL) in the chat header 2. Browse or search for your domain 3. Select from 800+ domains across 8 major fields

Domain Hierarchy

Field (8 total)
+-- Domain (100+ per field)
| +-- Subspecialty (5-20 per domain)
Example: - **Field:** Healthcare - **Domain:** Cardiology - **Subspecialty:** Interventional Cardiology

Auto-Detection vs. Manual Override

Mode	Description	Best For
Auto Detect	AI analyzes your prompt and detects domain	General use, varied topics
Manual Selection	You specify the domain explicitly	Specialized work, consistent domain

Pro Tip: Set a default domain in Settings if you primarily work in one field. You can always override per-conversation.

28. Cartridge Indicator

Understanding the Cartridge Status

The **Cartridge Indicator** shows which AI intelligence packages are currently active and their status.
Accessing the Indicator: - Click the **shield icon** in the chat header - View active cartridges, versions, and capabilities

Indicator States

Icon	State	Meaning
	Active	Cartridge loaded, full intelligence available
	Warming	Cartridge loading, temporary reduced capability
	Inactive	No cartridge for this domain
	Updating	Hot-swap in progress, zero downtime

Cartridge Details

Expanding the indicator shows: - **Cartridge Name:** e.g., “Legal-Enterprise v2.1” - **Installed Date:** When this version was deployed - **Scope:** Global, Tenant, or User level - **Capabilities:** List of enhanced features

29. Autonomous Intelligence Features

Overview

Think Tank v6.6.0 introduces the **Autonomous Organism Architecture** – a collection of intelligent systems that work behind the scenes to protect your privacy, personalize your experience, and manage costs efficiently.

AUTONOMOUS ORGANISM BENEFITS		
[WORLD] LIQUID COMPUTE	- Your data stays in your jurisdiction	
[GHOST] SIMULATION	- AI learns your style without storing prompts	
[COST] ECONOMIC CORTEX	- Smart budgeting keeps costs predictable	
[TOOL] TOOL FORGE	- New capabilities appear automatically	
[BRAIN] NEURAL ROUTING	- Best AI model selected for each question	

Liquid Compute - Data Sovereignty

Liquid Compute ensures your data is processed in compliance with regional regulations:

Feature	What It Means for You
Automatic Jurisdiction Detection	Your location determines where data is processed
GDPR Compliance	EU users' data stays in EU data centers
HIPAA Routing	Healthcare data uses compliant processing paths
No Configuration Needed	Works automatically based on your organization's settings

How It Works: 1. Think Tank detects your regulatory requirements 2. Compute location is selected automatically (EU, US, APAC, or on-premise) 3. Your data never leaves the approved jurisdiction 4. You see a small indicator showing where processing occurs

Privacy Indicator:

Processing in EU (Frankfurt)		
[ok] GDPR Compliant	[ok] Data Resident	

Ghost Simulation - Personalized Safety

Ghost Simulation creates a **digital twin** of your interaction patterns to provide personalized responses without storing your actual prompts:

Benefit	Description
Pattern Learning	AI understands your communication style
No Prompt Storage	Your actual questions are not retained
Personalized Safety	Guardrails adapt to your expertise level

Benefit	Description
Preference Memory	Remembers if you prefer concise or detailed answers

Your Ghost Vector: - 4096-dimensional mathematical representation of your preferences - Updates with each interaction (decays naturally over time) - Never contains actual content – only patterns - You can reset it anytime in Settings -> Privacy -> Reset Ghost Vector

What Ghost Simulation Learns: - Your preferred response length - Technical depth you’re comfortable with - Domains where you have expertise - Times when you’re typically active - Communication style preferences

Privacy Note: Ghost Vectors are tenant-isolated and encrypted. Administrators cannot see individual user patterns.

Economic Cortex - Smart Budget Management

Economic Cortex automatically manages AI costs while ensuring quality:

Feature	User Benefit
Hierarchical Budgets	Personal and team budgets work together
Smart Model Selection	Cheaper models used when sufficient
Budget Alerts	Get notified before hitting limits
Cost Transparency	See exactly what each query costs

Understanding Your Budget Display:

[COST] Budget Status	
Daily Budget:	\$4.20 / \$5.00 (84%)
Weekly Budget:	\$12.50 / \$35.00 (36%)
Quality Mode:	Standard (auto-upgrades for complex queries)
Last Query: \$0.003 (GPT-4o-mini) -- Saved \$0.047 vs premium	

Budget Tiers: | Tier | Models Used | When Applied | | | | | | | **Economy** | GPT-3.5, Claude Instant | Simple questions, high volume | | **Standard** | GPT-4o-mini, Claude Haiku | Default for most queries | | **Premium** | GPT-4o, Claude Sonnet | Complex analysis, code review | | **Flagship** | GPT-4-turbo, Claude Opus | Critical decisions, expert domains |

Cost Optimization Tips: 1. Set a default budget tier in Settings -> Economic Preferences 2. Use “Quick Mode” ([FAST]) for simple questions 3. Enable “Smart Downgrade” to auto-select cheaper models when appropriate 4. Review your weekly cost report (emailed Mondays)

Tool Forge - Automatic Capability Expansion

When you need a capability that doesn’t exist, Tool Forge can create it:

How It Works: 1. You ask Think Tank to do something it can't do 2. Tool Forge analyzes the request and builds a new tool 3. The tool is validated in a sandbox 4. Within minutes, the capability is available

Example:

You: "Can you analyze this CSV and create a pivot table?"

Think Tank: "I don't have a pivot table tool, but Tool Forge is building one..."

[2 minutes later]

Think Tank: "Done! Here's your pivot table. This capability is now available for future requests."

Note: Tool Forge-created tools are reviewed by administrators before becoming permanent.

Neural Affinity Routing

Think Tank automatically selects the best AI model for each question:

Consideration	How It's Used
Domain Match	Coding -> Claude, Creative -> GPT-4
Your History	Models that worked well for you before
Cost Efficiency	Cheapest model that meets quality threshold
Current Load	Avoids overloaded models

You can influence routing: - Set model preferences in Settings -> AI Models - Use the model selector ([AI]) to force a specific model - Add a rule: "Always use Claude for Python questions"

Viewing Organism Status

To see how these systems are working for you:

1. **Click the organism icon** () in the header
2. **View the status panel** showing:
 - Current compute location
 - Ghost vector confidence score
 - Budget remaining
 - Active tools count
 - Model routing statistics

Document History

Version	Date	Changes
7.9.0	Feb 5, 2026	LIVS-M 2.0 Policy Modes: Added comprehensive documentation for “Defcon-style” AI governance with Brainstorming, Standard, and Strict Audit policy modes. Updated Settings -> Advanced -> LIVS-M Policy access path.
6.6.0	Feb 3, 2026	Autonomous Organism Architecture (Project Metamorphosis): Added Section 29 covering Liquid Compute (data sovereignty), Ghost Simulation (personalized safety), Economic Cortex (budget management), Tool Forge (capability expansion), and Neural Affinity Routing (model selection)
6.0.0	Jan 31, 2026	Neural Architecture v6.0.0: Added RADIANT Cartridges section, Domain Selector guide, Cartridge Indicator documentation, Three Learning Tiers explanation, expanded Glossary with neural architecture terms
5.52.58	Jan 31, 2026	Added Workflows & Orchestration Methods section (multi-AI selection, stream evaluation, workflow templates, configurable parameters)
5.52.52	Jan 28, 2026	Major update: Added Time Machine, Grimoire, Flash Facts, Sentinel Agents, Economic Governor, Council of Rivals, Voice Input & File Attachments sections
5.52.0	Jan 23, 2026	Simulator now uses real API data with graceful fallbacks
5.44.0	Jan 22, 2026	Added Living Parchment section (War Room, Council, Debate Arena)
5.43.0	Jan 22, 2026	Added Decision Records section (DIA Engine)
5.35.0	Jan 2026	Initial comprehensive user guide

Think Tank is designed to be your intelligent partner. The more you use it and customize it to your needs, the more valuable it becomes. Happy thinking!

Your gateway to 100+ AI models in one place

Version: 3.2.0 (Platform: RADIANT 4.18.1) Last Updated: December 2024

Welcome to Think Tank

Think Tank is your all-in-one AI assistant platform. Access the world’s best AI models—GPT-4, Claude, Gemini, and 100+ more—from a single, beautiful interface.

Table of Contents

- 1. Getting Started
- 2. Your Dashboard
- 3. Chatting with AI
- 4. Choosing Models
- 5. Focus Modes & Personas
- 6. Canvas & Artifacts
- 7. Collaboration Features
- 8. Managing Your Account
- 9. Credits & Billing
- 10. Tips & Best Practices
- 11. Keyboard Shortcuts
- 12. FAQ
- 13. Delight System

1. Getting Started

1.1 Creating Your Account

- 1. Visit **thinktank.ai**
- 2. Click **Get Started Free**
- 3. Sign up with:
 - Email and password
 - Google account
 - Microsoft account
 - Apple ID
- 4. Verify your email
- 5. Complete your profile

1.2 Choosing a Plan

Plan	Price	Best For
Free	\$0/month	Trying out Think Tank
Starter	\$29/month	Individual creators
Pro	\$99/month	Power users
Team	\$49/user/month	Small teams

Plan	Price	Best For
Business	\$199/user/month	Organizations

1.3 Your First Chat

- 1. Click **New Chat** or press Ctrl+N
- 2. Type your question or request
- 3. Press Enter or click **Send**
- 4. Watch as AI responds in real-time

Try these starter prompts: - “Explain quantum computing like I’m 10 years old” - “Write a professional email declining a meeting” - “Help me debug this Python code: [paste code]” - “Create a meal plan for the week”

2. Your Dashboard

2.1 Interface Overview

[BRAIN] Think Tank		[Search]	[Credits: 450]	[USER]
Chats	Chat Area			
[STAR] Starred	Welcome! How can I help you today?			
Today				
Chat 1				
Chat 2				
Yesterday				
Chat 3				
Personas	Type your message...		[Send]	
[LIST] Canvas				
[GEAR] Settings				
Model: GPT-4 Turbo		Focus: General		

2.2 Sidebar Navigation

Icon	Section	Description
[CHAT]	Chats	All your conversations
[STAR]	Starred	Important chats
	Personas	Custom AI personalities
[LIST]	Canvas	Visual workspace

Icon	Section	Description
[CHART]	Usage	Credit usage stats
[GEAR]	Settings	Account settings

2.3 Quick Actions

Action	Shortcut
New Chat	Ctrl+N
Search	Ctrl+K
Toggle Sidebar	Ctrl+B
Settings	Ctrl+,

3. Chatting with AI

3.1 Sending Messages

Text Messages: - Type in the input box - Press Enter to send - Use Shift+Enter for new lines

Attachments: - Click to attach files - Drag & drop images, PDFs, code files - Paste images directly (Ctrl+V)

Voice Input: - Click microphone icon - Speak your message - Click again to stop

3.2 Message Actions

Hover over any message to see actions:

Icon	Action	Description
[LIST]	Copy	Copy message text
[SYNC]	Regenerate	Get a new response
	Edit	Modify your message
/	Rate	Help improve AI
[PIN]	Pin	Keep message visible
	Delete	Remove message

3.3 Streaming Responses

AI responses stream in real-time. You can: - **Stop:** Click to stop generation - **Continue:** Ask “continue” if response was cut off - **Regenerate:** Get a different response

3.4 Multi-Turn Conversations

Think Tank remembers your conversation context:

You: I'm planning a trip to Japan

AI: That's exciting! When are you planning to visit...

You: What about the food?

AI: Japanese cuisine is incredible! Based on your trip...
[AI remembers you're going to Japan]

3.5 Code in Chats

Code is automatically syntax-highlighted:

```
def hello_world():  
    print("Hello, Think Tank!")
```

Click **Copy** to copy code blocks, or **Run** for supported languages.

4. Choosing Models

4.1 Model Selection

Click the model selector at the bottom of the chat:

+-----+

| Select Model |

+-----+

[STAR] Favorites |

| GPT-4 Turbo \$0.02/msg |

| Claude 3 Opus \$0.03/msg |

+-----+

[HOT] Recommended |

| GPT-4o \$0.01/msg |

| Claude 3.5 Sonnet \$0.01/msg |

| Gemini 1.5 Pro \$0.01/msg |

+-----+

[NOTE] Writing |

| [CODE] Coding |

| Analysis |

| [DESIGN] Creative |

| [View All 100+ Models] |

+-----+

4.2 Model Categories

Category	Best For	Top Models
General	Everyday tasks	GPT-4o, Claude 3.5
Writing	Content creation	Claude 3 Opus, GPT-4
Coding	Programming help	GPT-4 Turbo, CodeLlama
Analysis	Data & research	Gemini 1.5, Claude 3
Creative	Art & ideas	GPT-4, Mistral Large
Vision	Image understanding	GPT-4V, LLaVA
Fast	Quick responses	GPT-3.5, Claude Instant

Choosing the Right Model

For everyday questions and tasks: Start with GPT-4o or Claude 3.5 Sonnet. These models offer the best balance of quality, speed, and cost. They handle most tasks excellently including writing, answering questions, brainstorming, and light coding.

For professional writing: Claude 3 Opus excels at long-form content, maintaining consistent tone, and nuanced writing. GPT-4 is also excellent for business documents and creative writing.

For coding and technical work: GPT-4 Turbo has strong coding abilities across many languages. For specialized tasks, consider CodeLlama (open source, good for common languages) or specialized models like DeepSeek Coder.

For data analysis: Gemini 1.5 Pro handles very long documents (up to 1 million tokens) making it ideal for analyzing large datasets or documents. Claude 3 is excellent for nuanced analytical reasoning.

For creative projects: GPT-4 and Mistral Large are both creative and can help with brainstorming, storytelling, and idea generation. They’re less constrained in creative contexts.

For image understanding: GPT-4V (Vision) and Claude 3 Vision can analyze images, read text from photos, describe scenes, and answer questions about visual content.

For quick, simple tasks: GPT-3.5 Turbo and Claude Instant are much faster and cheaper. Use them for simple questions, formatting, or when you need instant responses.

4.3 Auto Mode

Let Think Tank choose the best model:

- 1. Enable **Auto Mode** in settings
- 2. Our Brain Router analyzes your request
- 3. Automatically selects optimal model
- 4. Balances quality, speed, and cost

How Auto Mode Works

When you enable Auto Mode, Think Tank’s Brain Router analyzes each message you send and selects the best model based on:

- **Task complexity:** Simple questions go to fast models; complex tasks go to powerful models
- **Content type:** Coding questions route to code-specialized models; creative requests to creative models
- **Your history:** Learns your preferences over time and adjusts recommendations
- **Cost efficiency:** Avoids using expensive models when cheaper ones would work equally well
- **Current availability:** Routes around any models experiencing slowdowns

When to use Auto Mode: - You're not sure which model to use - You want to optimize cost without sacrificing quality
- You have varied tasks throughout the day - You're new to Think Tank

When to choose manually: - You need a specific model's unique capabilities - You're doing specialized work (e.g., always want Claude for writing) - You're comparing models intentionally - You have strong preferences for certain models

4.4 Model Comparison

Split-screen to compare models:

- 1. Click **Compare** button
- 2. Select 2-4 models
- 3. Send message to all simultaneously
- 4. See responses side-by-side

5. Focus Modes & Personas

5.1 Focus Modes

Pre-configured modes for specific tasks:

Mode	Optimized For
Professional	Business writing, emails
[CODE] Developer	Code, debugging, architecture
[DOCS] Research	Analysis, citations, accuracy
Creative	Stories, brainstorming
[BOOK] Learning	Explanations, tutoring
[TARGET] Concise	Brief, direct answers

To switch modes: 1. Click the Focus selector 2. Choose your mode 3. AI adapts its style

Focus Mode Details

Professional Mode: The AI adopts a business-appropriate tone. Responses are polished, formal, and suitable for workplace communication. Great for drafting emails, reports, presentations, and client communications. Avoids casual language and ensures professional formatting.

Developer Mode: Optimized for technical work. The AI provides code with proper syntax highlighting, explains technical concepts clearly, suggests best practices, and can help debug issues. Responses include code comments and consider edge cases.

Research Mode: Emphasizes accuracy and thoroughness. The AI cites sources when possible, acknowledges uncertainty, presents multiple perspectives, and structures information logically. Ideal for academic work, fact-checking, and deep analysis.

Creative Mode: Removes constraints on creativity. The AI is more willing to explore unusual ideas, use vivid language, and think outside the box. Perfect for brainstorming, creative writing, storytelling, and generating innovative solutions.

Learning Mode: The AI becomes a patient tutor. Explanations start from basics and build up, concepts are broken into digestible pieces, and the AI checks understanding before moving on. Great for studying new topics.

Concise Mode: Responses are brief and to the point. The AI avoids lengthy explanations and gets straight to the answer. Useful when you need quick facts or are in a hurry.

5.2 Custom Personas

Create your own AI personalities:

1. Go to **Personas** -> **Create New**
2. Configure:
 - **Name:** “Marketing Expert”
 - **Personality:** Professional, enthusiastic
 - **Expertise:** Digital marketing, SEO
 - **Style:** Uses bullet points, data-driven
3. Click **Save**

Example Persona:

Name: Code Reviewer

Personality: Thorough, constructive

Instructions: Review code for bugs, security issues,
and best practices. Always suggest
improvements with examples.

5.3 Sharing Personas

- **Public:** Share with all Think Tank users
 - **Team:** Share within your organization
 - **Private:** Only you can use
-

6. Canvas & Artifacts

6.1 What is Canvas?

Canvas is your visual workspace for complex outputs: - Code files with syntax highlighting - Diagrams and flowcharts
- Documents and reports - Data tables - Mind maps

6.2 Creating Artifacts

When AI generates complex content, it appears as an artifact:

```
+-----+
| [DOC] business_plan.md |
+-----+
| # Business Plan        |
|                         |
| ## Executive Summary   |
| ...                    |
|                         |
```

+-----+
| [Copy] [Download] [Edit] [Version History] |
+-----+

6.3 Artifact Actions

Action	Description
Copy	Copy content to clipboard
Download	Save as file
Edit	Modify directly
Versions	View previous versions
Share	Generate share link
To Canvas	Open in full Canvas view

6.4 Full Canvas Mode

For larger projects:

1. Click **Canvas** in sidebar
2. Create new canvas or open existing
3. Add multiple artifacts
4. Arrange spatially
5. Connect related items

7. Collaboration Features

7.1 Sharing Chats

Share any conversation:

1. Click **Share** ([LINK]) on a chat
2. Choose visibility:
 - **Link**: Anyone with link
 - **Team**: Your organization
 - **Private**: Specific people
3. Copy and share the link

7.2 Real-Time Collaboration

Work together on the same chat:

1. Share chat with **Edit** access
2. Multiple users can:
 - Send messages simultaneously
 - See each other's cursors
 - React to messages

- 3. Changes sync in real-time

7.3 Team Workspaces

For Team and Business plans:

- **Shared Chats:** Team-visible conversations
- **Shared Personas:** Team AI configurations
- **Shared Canvas:** Collaborative workspaces
- **Usage Dashboard:** Team analytics

7.4 Comments & Annotations

Add notes to any message:

- 1. Hover over message
- 2. Click **Comment** ([CHAT])
- 3. Add your note
- 4. Tag teammates with @mention

8. Managing Your Account

8.1 Profile Settings

Access via **Settings** -> **Profile**:

Setting	Description
Display Name	Your visible name
Email	Login email
Avatar	Profile picture
Language	Interface language
Timezone	For scheduled features

8.2 Preferences

Customize your experience:

Preference	Options
Theme	Light, Dark, System
Font Size	Small, Medium, Large
Default Model	Your preferred model
Auto Mode	Enable/disable
Sound Effects	On/Off

Preference	Options
Notifications	Email, Push, None

8.3 Data & Privacy

Control your data:

- **Export Data:** Download all your chats
- **Delete History:** Remove chat history
- **Training Opt-Out:** Exclude from AI training
- **Data Retention:** Set auto-delete period

8.4 Connected Apps

Manage integrations:

- Google Drive
- Dropbox
- Notion
- Slack
- GitHub

9. Credits & Billing

9.1 Understanding Credits

Credits are Think Tank’s universal currency:

Credit Value	Equivalent
1 credit	\$0.01
100 credits	\$1.00

9.2 Credit Usage

Different models cost different amounts:

Model	~Cost per Message
GPT-3.5 Turbo	0.5 credits
GPT-4o	1-2 credits
GPT-4 Turbo	2-3 credits
Claude 3.5 Sonnet	1-2 credits
Claude 3 Opus	3-5 credits

Actual cost depends on message length

9.3 Viewing Usage

Check your usage in **Settings -> Usage**:

+-----+		
	Credit Usage – December 2024	
+-----+		
	Balance: 450 credits	
	Used this month: 1,550 credits	
	Included: 2,000 credits	
	[] 77% used	
	By Model:	
	GPT-4 Turbo 800 credits (52%)	
	Claude 3 500 credits (32%)	
	Other 250 credits (16%)	
+-----+		

9.4 Purchasing Credits

Need more credits?

1. Go to **Settings -> Billing**
2. Click **Buy Credits**
3. Select amount:
 - 500 credits - \$5
 - 1,000 credits - \$9 (10% bonus)
 - 5,000 credits - \$40 (20% bonus)
4. Complete payment

9.5 Subscription Management

Manage your plan:

- **Upgrade**: Get more features and credits
- **Downgrade**: Switch to lower tier (end of period)
- **Cancel**: Cancel subscription (keep access until end)
- **Invoices**: Download billing history

10. Tips & Best Practices

10.1 Writing Better Prompts

Be Specific:

[X] "Write about dogs"

[OK] "Write a 200-word blog post about training golden retriever puppies, focusing on positive reinforcement"

Provide Context:

[X] "Fix this code"

[OK] "Fix this Python code that should sort a list but throws an IndexError: [paste code]"

Set the Format:

[X] "Give me ideas"

[OK] "Give me 5 blog post ideas about sustainable living, formatted as bullet points with a brief description"

10.2 Getting Better Results

Technique	Example
Chain of thought	"Think step by step..."
Role assignment	"Act as a senior developer..."
Examples	"Here's an example of what I want..."
Constraints	"In 100 words or less..."
Iteration	"Good, but make it more formal"

10.3 Saving Credits

- Use **Auto Mode** for optimal model selection
- Use **GPT-3.5** for simple tasks
- Be concise in your prompts
- Avoid regenerating unnecessarily
- Use **Focus Modes** for specialized tasks

10.4 Organizing Chats

- [STAR] **Star** important conversations
- **Folders**: Group related chats
- **Tags**: Add searchable labels
- [SEARCH] **Search**: Find any past conversation

11. Keyboard Shortcuts

11.1 General

Shortcut	Action
Ctrl+N	New chat
Ctrl+K	Search

Shortcut	Action
Ctrl+B	Toggle sidebar
Ctrl+,	Settings
Ctrl+/,	Show shortcuts
Escape	Close modal

11.2 Chat

Shortcut	Action
Enter	Send message
Shift+Enter	New line
Ctrl+^	Edit last message
Ctrl+Shift+C	Copy last response
Ctrl+Shift+R	Regenerate
Ctrl+.	Stop generation

11.3 Navigation

Shortcut	Action
Alt+^/v	Previous/next chat
Ctrl+1-9	Switch to chat 1-9
Ctrl+Tab	Cycle tabs

12. FAQ

Getting Started

Q: Is Think Tank free? A: Yes! The Free plan includes 50 credits/month. Upgrade for more credits and features.

Q: Which AI model should I use? A: Enable Auto Mode and let us choose, or: - General tasks -> GPT-4o or Claude 3.5 Sonnet - Complex analysis -> GPT-4 Turbo or Claude 3 Opus - Quick answers -> GPT-3.5 Turbo

Q: Can I use Think Tank on mobile? A: Yes! Visit thinktank.ai on any mobile browser, or download our iOS/Android apps.

Credits & Billing

Q: What happens when I run out of credits? A: You can purchase more credits or wait for your monthly refresh (paid plans).

Q: Do unused credits roll over? A: Monthly included credits expire. Purchased credits never expire.

Q: Can I get a refund? A: Contact support within 14 days for subscription refunds.

Privacy & Security

Q: Is my data used to train AI? A: By default, no. You can verify in Settings -> Privacy.

Q: Who can see my chats? A: Only you, unless you explicitly share them.

Q: Is my data encrypted? A: Yes, with AES-256 encryption at rest and TLS 1.3 in transit.

Troubleshooting

Q: Why is the AI response slow? A: Complex queries or busy times may cause delays. Try a faster model.

Q: Why did my response get cut off? A: Models have output limits. Type “continue” to get the rest.

Q: I found a bug. How do I report it? A: Click **Help** -> **Report Issue** or email support@thinktank.ai.

Need Help?

- [DOCS] **Help Center**: help.thinktank.ai

Version History

Version	Date	Changes
3.2.0	December 2024	Time Machine, enhanced collaboration, A/B experiments, Delight System
3.1.0	November 2024	Canvas improvements, new models
3.0.0	October 2024	Initial release

13. Delight System

Think Tank includes a personality system called “Delight” that makes your AI experience more engaging.

13.1 What is Delight?

Delight adds contextual, friendly messages during your conversations:

- **Domain Loading:** “Consulting the fundamental forces...” when you ask physics questions
- **Time Awareness:** “Burning the midnight tokens” during late-night sessions
- **Model Dynamics:** “Consensus forming...” when multiple models agree
- **Wellbeing Nudges:** “You’ve been thinking hard. Time for a break?”

13.2 Personality Modes

Choose your preferred personality style in **Settings -> Delight**:

Mode	Description
Professional	Minimal, business-appropriate feedback
Subtle	Light touches of personality
Expressive	Full personality with humor
Playful	Maximum fun, includes easter eggs

13.3 Achievements

Earn achievements as you use Think Tank:

Achievement	How to Unlock
[NAV] Domain Explorer	Explore 10+ knowledge domains
[HOT] Week Warrior	Use Think Tank 7 days in a row
Renaissance Mind	Explore 50+ domains
[FAST] Monthly Mind	30-day streak

View your achievements in **Settings -> Achievements**.

13.4 Easter Eggs

Think Tank has hidden surprises! Try: - Typing special phrases - Using keyboard shortcuts - Exploring during special times

Discover them yourself—that’s half the fun!

13.5 Sound Effects

Enable audio feedback in **Settings -> Delight -> Sounds**:

Theme	Style
Default	Pleasant chimes
Mission Control	NASA-inspired beeps
Library	Page turns, book sounds
Workshop	Tool clicks

Theme	Style
Emissions	Tesla-style... fun

13.6 Customizing Delight

Toggle individual features: - [OK] Domain messages - [OK] Model personality - [OK] Time awareness - [OK] Achievements - [OK] Wellbeing nudges - [OK] Easter eggs - [OK] Sound effects

Set intensity level (1-10) to control how often messages appear.

Thank you for using Think Tank! We're constantly improving based on your feedback.

Part II: Admin Guide

Configuration and administration of Think Tank AI features

Version: 3.12.0 | Platform: RADIANT 6.0.0 Last Updated: February 1, 2026

Overview

This guide covers administrative features specific to **Think Tank**, the consumer-facing AI assistant platform. For platform-level administration (tenants, billing, infrastructure), see RADIANT-ADMIN-GUIDE.md.

1. Think Tank Admin Features

Location: Think Tank Admin App -> Dashboard

Think Tank admin features are accessible from the dedicated Think Tank Admin application.

1.1 Dashboard Overview (v2.0.0)

The Think Tank Admin dashboard provides platform-level visibility:

Think Tank Dashboard				Welcome back, Admin			
Active Users		Conversations		User Rules		API Requests	
1,234		45,678		8,901		2.3M	
+12.5%		+8.2%		+15.3%		+22.1%	
System Health				Platform Stats			
[ok] API Gateway		45ms		Active Tenants: 85			
[ok] Brain Service		120ms		Models Active: 42			
[ok] AXIOM Routing		35ms		[View Analytics]			
[ok] Cato Safety		25ms					
[ok] Cortex Memory		80ms					
Usage Trends (7 days)				Domain Dist.			
Requests				Tech: 35%			
Tokens				Biz: 25%			
M T W T F S S				Sci: 20%			
				Other:20%			
Recent Activity				Quick Actions			
* Tenant "Acme" activated cartridge				* Delight			
* New user rules created (15)				* Domain Modes			
* Model routing updated				* Ego System			

1.2 Dashboard Widgets

Widget	Description	Data Source
Metric Cards	Active users, conversations, rules, requests	/api/thinktank-admin/dashboard/stats
System Health	Service status, latency, uptime	/api/thinktank-admin/dashboard/health
Platform Stats	Tenant counts, model activation	/api/thinktank-admin/dashboard/stats
Usage Trends	7-day request/token chart	/api/thinktank-admin/dashboard/trends

Widget	Description	Data Source
Domain Distribution	Query topic pie chart	/api/thinktank-admin/dashboard/domains
Activity Feed	Recent platform events	/api/thinktank-admin/dashboard/activity
Quick Actions	Links to common admin tasks	Static

1.3 Available Sections

Section	Purpose
Dashboard	Platform overview and metrics
My Rules	User memory rules configuration
Delight	Personality and feedback system
Brain Plans	AGI planning visibility
Pre-Prompts	Pre-prompt template management
Domains	Domain taxonomy configuration
Ego	Zero-cost persistent consciousness configuration

Note: For Consciousness Evolution (predictive coding, LoRA evolution, Local Ego infrastructure), see RADIANT-ADMIN-GUIDE.md Section 27.

2. User Rules System

Location: Admin Dashboard -> Think Tank -> My Rules

Users can create personal rules that guide how AI responds to them.

2.1 Rule Types

Type	Description	Example
instruction	How to respond	“Always explain in simple terms”
preference	User preferences	“I prefer detailed explanations”
context	Background info	“I’m a software developer”
restriction	Things to avoid	“Never suggest proprietary solutions”

2.2 Memory Categories

Rules are categorized hierarchically:

Category	Subcategories
instruction	format, tone, source
preference	style, detail
context	personal, work, project
knowledge	fact, definition, procedure
constraint	topic, privacy, safety
goal	learning, productivity

2.3 Preset Rules

20+ pre-seeded rule templates across 7 categories that users can add with one click.

2.4 Admin Configuration

Admins can: - View all preset rules - Enable/disable preset categories - Add new preset rules - Set default rules for new users

See User Rules System Documentation for full details.

3. Delight System

Location: Admin Dashboard -> Think Tank -> Delight

The Delight System adds personality, humor, and engaging feedback to AI interactions.

3.1 Features

- **Loading Messages** - Entertaining messages while AI thinks
- **Step Updates** - Progress messages during plan execution
- **Achievements** - Reward milestones (first query, streaks, etc.)
- **Easter Eggs** - Hidden delights for engaged users
- **Wellbeing Nudges** - Gentle reminders for breaks

3.2 Admin Controls

Setting	Description
Enable/Disable	Turn delight system on/off
Message Categories	Enable specific message types
Achievement System	Configure achievement criteria
Easter Eggs	Manage hidden surprises

3.3 Message Types

- Pre-execution messages
 - During-execution messages
 - Post-execution messages
 - Mode-specific messages (coding, creative, research, etc.)
-

4. Brain Plan Viewer

Location: Think Tank -> (visible during AI responses)

The Brain Plan Viewer shows users the AGI's plan for solving their prompt.

4.1 What Users See

- **Orchestration Mode** - thinking, coding, creative, research, etc.
- **Domain Detection** - Field, domain, subspecialty, confidence
- **Model Selection** - Which model was chosen and why
- **Step Progress** - Real-time step execution status
- **Timing Estimates** - Expected duration

4.2 Admin Configuration

Setting	Description
Show Plan	Whether to show plan to users
Detail Level	minimal, standard, detailed
Show Costs	Display cost estimates
Show Models	Display model names

5. Pre-Prompt Learning

Location: Admin Dashboard -> Think Tank -> Pre-Prompts

The pre-prompt system selects and learns optimal prompts for different contexts.

5.1 How It Works

1. System selects pre-prompt template based on context
2. User provides feedback on response quality
3. System learns which pre-prompts work best
4. Future selections are optimized

5.2 Admin Features

- View all pre-prompt templates
 - See success rates per template
 - Adjust learning parameters
 - Create new templates
-

6. Domain Taxonomy

Location: Admin Dashboard -> Think Tank -> Domains

The domain taxonomy helps the AI understand what field/domain a query belongs to.

6.1 Hierarchy

- **Fields** - Top level (e.g., Medicine, Law, Technology)
- **Domains** - Mid level (e.g., Cardiology, Contract Law)
- **Subspecialties** - Specific areas (e.g., Electrophysiology)

6.2 Admin Features

- Add/edit domains
 - Configure model proficiencies per domain
 - View domain detection accuracy
 - Adjust confidence thresholds
-

7. Rejection Notifications

Location: Think Tank -> Bell Icon (user view)

When AI providers reject prompts, users are notified with explanations.

7.1 User Experience

- Bell icon shows unread count
- Panel slides out with all notifications
- Each shows: what happened, why, suggested actions
- Resolution status (fallback succeeded, rejected, etc.)

7.2 Suggested Actions

- Rephrase request
- Remove sensitive content
- Try different mode
- Contact administrator

See Provider Rejection Handling Documentation for full details.

8. Canvas & Artifacts

Think Tank’s canvas feature for interactive content creation.

8.1 Artifact Types

- Code blocks (with execution)
- Documents
- Diagrams
- Data visualizations

8.2 Admin Configuration

- Enable/disable artifact types
 - Set size limits
 - Configure execution sandboxes
-

9. Collaboration Features

Multi-user collaboration in Think Tank with novel enhanced features.

9.1 Core Features

- **Shared Conversations:** Real-time collaborative chat sessions
- **Real-time Co-editing:** Live presence indicators, cursors, typing status
- **Team Workspaces:** Organize sessions by team/project
- **Permission Management:** Viewer, Commenter, Editor roles

9.2 Enhanced Collaboration (v4.18.0+)

9.2.1 Cross-Tenant Guest Access

Allow collaborators from outside your organization to join sessions.

Feature	Description
Guest Invites	Generate shareable invite links with permissions
Permission Levels	viewer, commenter, editor for guests
Expiring Links	Set expiration time (default: 7 days)
Max Uses	Limit how many times a link can be used
Viral Tracking	Track referrals and guest-to-paid conversions

API Endpoints: - POST /api/thinktank/collaboration/invites - Create guest invite - GET /api/thinktank/collaboration/invites/{id} - Get invite details - POST /api/thinktank/collaboration/guests/join - Join as guest

9.2.2 AI Facilitator Mode

An AI moderator that guides collaborative sessions.

Setting	Description
Session Objective	What the session should accomplish
Facilitator Persona	professional, casual, academic, creative, socratic, coach
Auto-Summarize	Periodically summarize discussion
Auto Action Items	Extract action items from conversation
Ensure Participation	Prompt quiet participants to contribute
Keep On-Topic	Redirect off-topic discussions

Intervention Types: - summary - Periodic summaries - question - Probing questions to deepen discussion - redirect - Steer back to topic - encourage - Encourage participation - clarify - Ask for clarification - synthesize - Combine different viewpoints - conclude - Wrap up discussion points

9.2.3 Branch & Merge Conversations

Explore alternative discussion paths without losing the main thread.

Feature	Description
Create Branch	Fork conversation at any point
Exploration Hypothesis	Document what the branch explores
Branch Status	active, merged, abandoned
Merge Request	Propose merging insights back to main
AI Summary	Auto-generated summary of branch conclusions

Merge Request Workflow: 1. Create branch with hypothesis 2. Explore alternative direction 3. Submit merge request with conclusion 4. Participants vote to approve/reject 5. Merged insights appear in main conversation

9.2.4 Time-Shifted Playback

Asynchronous participation through session recordings.

Feature	Description
Session Recording	Record full session with events
Playback Controls	Play, pause, speed (0.5x-2x), seek
AI Key Moments	Auto-detected important moments
Async Annotations	Add comments at specific timestamps
Media Notes	Voice/video annotations stored in S3

Recording Types: - full - Complete session recording - highlights - AI-curated key moments only - summary - AI-generated session summary

9.2.5 AI Roundtable (Multi-Model Debate)

Multiple AI models debate a topic and synthesize insights.

Setting	Description
Topic	The subject of debate
Debate Style	collaborative, adversarial, socratic, brainstorm, devils_advocate
Max Rounds	Number of debate rounds (default: 5)
Time Limit	Per-round time limit in seconds
Synthesis Model	Model that synthesizes final conclusions

Participating Models: Each model can have a persona and role: - persona - Character the model adopts - role - Function in the debate (analyst, critic, synthesizer) - color - Visual identifier in UI

Output: - Per-model contributions with responding_to references - Final synthesis with consensus points - Disagreement points highlighted - Actionable recommendations

9.2.6 Shared Knowledge Graph

Visualize collective understanding as an interactive graph.

Node Type	Description
concept	Abstract idea or topic
fact	Verified information
question	Open question
decision	Decision made
action_item	Task to complete
person	Person mentioned
resource	External resource

Edge Types: - relates_to - General relationship - supports - Evidence supporting - contradicts - Conflicting information - leads_to - Causal relationship - depends_on - Dependency - answers - Answer to question - part_of - Component relationship

AI Features: - Auto-extract nodes from conversation - Suggest missing connections - Identify knowledge gaps - Generate graph-based summaries

9.3 Attachment Storage

Large attachments are stored in S3 with automatic cleanup.

Setting	Default	Description
maxFileSizeMb	100	Maximum file size

Setting	Default	Description
allowedTypes	image/, video/, audio/*, application/pdf	Allowed MIME types
retentionDays	90	Days before cleanup

S3 Bucket: radiant-collaboration-assets (configurable via env)

Cleanup: Database triggers automatically delete S3 objects when attachment records are deleted.

9.4 Admin Configuration

Setting	Description
enableGuestAccess	Allow cross-tenant guests
maxGuestsPerSession	Maximum guests per session
defaultGuestPermission	Default permission for guests
enableFacilitator	Enable AI facilitator feature
enableBranching	Enable branch & merge
enableRecordings	Enable session recordings
enableRoundtable	Enable AI roundtable
enableKnowledgeGraph	Enable knowledge graph

9.5 Database Tables

Table	Purpose
collaboration_guest_invites	Guest invite tokens
collaboration_guests	Guest participants
collaboration_facilitator_config	AI facilitator settings
collaboration_facilitator_interventions	Facilitator actions log
collaboration_branches	Conversation branches
collaboration_merge_requests	Branch merge proposals
collaboration_recordings	Session recordings
collaboration_media_notes	Voice/video annotations
collaboration_async_annotations	Async comments
collaboration_ai_roundtables	Multi-model debates
collaboration_roundtable_contributions	Model contributions
collaboration_knowledge_graphs	Knowledge graphs
collaboration_knowledge_nodes	Graph nodes
collaboration_knowledge_edges	Graph edges

Table	Purpose
collaboration_attachments	File attachments

9.6 UI Components

Location: apps/admin-dashboard/components/collaboration/

Component	Purpose
EnhancedCollaborativeSession.tsx	Main session container
panels/ChatPanel.tsx	Real-time chat interface
panels/BranchPanel.tsx	Branch management
panels/RoundtablePanel.tsx	AI roundtable interface
panels/KnowledgeGraphPanel.tsx	Graph visualization
panels/PlaybackPanel.tsx	Recording playback
ParticipantsSidebar.tsx	Participant list with presence
dialogs/InviteDialog.tsx	Guest invite creation
dialogs/FacilitatorSettingsDialog.tsx	AI facilitator config

Routes: - /thinktank/collaborate/enhanced?session={id} - Enhanced session view - /collaborate/join/{token} - Guest join page

10. Shadow Testing

Location: Admin Dashboard -> Think Tank -> Shadow Testing

A/B test pre-prompt optimizations before promoting to production.

10.1 Test Modes

Mode	Description
Auto	Automatically runs and promotes successful tests (default)
Manual	Requires admin approval to promote
Off	Shadow testing disabled

10.2 Creating a Shadow Test

1. Go to Think Tank -> Shadow Testing
2. Click "New Test"
3. Select baseline pre-prompt template

- 4. Select candidate pre-prompt template
- 5. Set traffic percentage (default: 10%)
- 6. Set minimum samples required
- 7. Start test

10.3 Test Results

Tests track: - **Baseline Score**: Average quality of baseline responses - **Candidate Score**: Average quality of candidate responses - **Improvement %**: Relative improvement - **Statistical Confidence**: Confidence level of results

10.4 Auto-Promotion Settings

Setting	Default	Description
autoPromoteThreshold	0.05 (5%)	Minimum improvement required
autoPromoteConfidence	0.95 (95%)	Statistical confidence required
maxConcurrentTests	3	Max simultaneous tests

10.5 Manual Review

For tests in Manual mode: 1. Wait for minimum samples 2. Review results in dashboard 3. Click “Promote Candidate” or “Reject”

11. Routing Cache

Location: Automatic (no UI required)
Semantic caching for brain router decisions reduces latency for repeated queries.

11.1 How It Works

- 1. Prompt is hashed with complexity and task type
- 2. Cache is checked for matching routing decision
- 3. If hit: Skip brain router LLM, use cached model selection
- 4. If miss: Run normal routing, cache result

11.2 Optimistic Execution

Very short/simple queries skip the router entirely:

Pattern	Default Model	Example
Simple greetings	gpt-4o-mini	“Hello”, “Thanks”
Basic questions	gpt-4o-mini	“What time is it?”
Short acknowledgments	gpt-4o-mini	“OK”, “Yes”, “Sure”

11.3 Cache Statistics

Performance headers show cache status:

X-Radiant-Cache-Hit: true

X-Radiant-Router-Latency: 12ms (vs ~500ms uncached)

11.4 Cache Configuration

Setting	Default	Description
Cache TTL	24 hours	How long decisions are cached
Short input threshold	50 chars	Max length for optimistic execution

12. Delight System Toggle

Location: Think Tank -> Advanced Settings (user) or Admin Dashboard

12.1 User Control

Users can disable the entire Delight system:

1. Open Think Tank settings
2. Go to Advanced Settings
3. Toggle “Enable Delight System” off

When disabled: - No loading messages - No achievements - No Easter eggs - No wellbeing nudges

12.2 Default Behavior

- **Default:** Enabled (true)
- Users can disable at any time
- Setting persists across sessions

12.3 Admin Configuration

Admins can configure default delight settings per tenant:

Setting	Description
enabled	Master toggle (default: true)
intensityLevel	Message frequency (1-10)
enableAchievements	Show achievement notifications
enableEasterEggs	Enable hidden surprises
enableWellbeingNudges	Remind users to take breaks

12.5 LIVS-M 2.0 Policy Configuration (v7.9.0)

Location: Admin Dashboard -> Think Tank Admin -> LIVS-M Policy

LIVS-M 2.0 is the “Defcon-style” governance system that controls how strictly AI outputs are verified across Think Tank.

12.5.1 Policy Modes

Administrators can set the default policy mode for their tenant:

Mode	Internal Code	Behavior
Brainstorming	RAPID_PROTO	Accepts partial code, stubs, rough ideas. Warnings logged but don't block.
Standard	ENGINEERING	Code must run. Stubs rejected if breaking. Tests encouraged. (Default)
Strict Audit	STRICT_AUDIT	No stubs. No mock data. Mandatory tests. Sycophancy triggers Devil's Advocate.

12.5.2 Advanced Settings

Setting	Description	Default
Sycophancy Detection	Detect when AI agents agree too quickly	On
Stub Rejection	Reject placeholder implementations	On
Chaos Injection	Inject Devil's Advocate when consensus is too fast	On
Mock Data Detection	Reject mock/fake data in outputs	On
Max Consensus Velocity	Turns before chaos injection (1-10)	3

12.5.3 Mode Selection Guidelines

Use Case	Recommended Mode
Hackathons & MVP planning	Brainstorming
Daily sprint work	Standard
Production releases	Strict Audit
Security-sensitive changes	Strict Audit
Creative exploration	Brainstorming
Code reviews before deploy	Strict Audit

Use Case	Recommended Mode
----------	------------------

12.5.4 API Endpoints

Endpoint	Method	Description
/api/admin/livs/policy	GET	Get current policy configuration
/api/admin/livs/policy	PUT	Update policy mode and settings
/api/admin/livs/metrics	GET	Get policy evaluation metrics
/api/admin/livs/history	GET	Get policy change history

12.5.5 Tenant Override

Individual users cannot change the policy mode - it is set at the tenant level by administrators. This ensures consistent governance across the organization.

12.5.6 Version Management (v7.9.0+)

LIVS-M includes built-in version management, allowing administrators to track and upgrade their policy registry versions.

Version Indicators

UI Element	Description
Version Badge	Shows current installed version in header (e.g., “v2.0.0”)
UPDATE Badge	Green pulsing badge on LIVS-M Policy nav item when update available
Updates Tab	Dedicated tab showing version info, changelog, and upgrade button

Checking for Updates

1. Navigate to **Admin Dashboard -> Think Tank Admin -> LIVS-M Policy**
2. Look for the green “UPDATE” badge on the navigation item
3. Click the **Updates** tab to see:
 - Current version vs. latest version
 - Changelog with new features
 - Breaking changes warnings (if applicable)
 - Migration requirements (if applicable)

Performing Upgrades

- 1. Review the changelog carefully
- 2. Note any breaking changes or migration requirements
- 3. Click **Upgrade to vX.X.X** button
- 4. Wait for the upgrade to complete (database migrations run automatically)
- 5. Verify the new version badge displays correctly

Version API Endpoints

Endpoint	Method	Description
/api/admin/livs/version	GET	Get current tenant version state
/api/admin/livs/version/check	GET	Check for available updates
/api/admin/livs/version/upgrade	POST	Upgrade to latest version
/api/admin/livs/version/history	GET	Get upgrade history

Database Tables

Table	Purpose
livs_tenant_version	Tracks installed LIVS-M version per tenant
livs_version_upgrades	Audit log of all upgrade events

Best Practices

- **Schedule upgrades during maintenance windows** for production environments
- **Review breaking changes** before upgrading - they may require policy adjustments
- **Test in staging first** if your organization has a staging tenant
- **Monitor metrics** after upgrade to ensure policy evaluation behaves as expected

13. Intelligence Aggregator

Location: Admin Dashboard -> Settings -> Intelligence

The Intelligence Aggregator provides advanced AI capabilities that enhance Think Tank responses beyond any single model.

13.1 User-Facing Benefits

Feature	User Experience
Uncertainty Detection	More accurate factual claims, automatic verification

Feature	User Experience
Success Memory	AI learns user preferences over time
MoA Synthesis	Higher quality responses combining multiple perspectives
Cross-Provider Verification	Fewer hallucinations and errors
Code Execution	Code that actually runs, not just looks correct

13.2 Success Memory in Think Tank

When users rate responses 4-5 stars: 1. Interaction is stored with vector embedding 2. Similar future prompts retrieve these “gold” examples 3. Injected as few-shot examples into system prompt 4. Model matches user’s preferred style/format/tone

User Control: Users can view and delete their gold interactions in Think Tank settings.

13.3 MoA Synthesis Mode

When enabled for Think Tank: - User sees “Consulting multiple experts...” during generation - 3 models generate responses in parallel - Synthesizer combines best elements - Final response shown to user

Delight Integration: Special MoA-specific messages appear during synthesis phase.

13.4 Code Verification in Coding Mode

When coding orchestration mode is active: 1. AI generates code 2. Static analysis checks syntax 3. If errors found, AI auto-patches 4. User receives verified code

User Feedback: Users see “Verifying code...” indicator when active.

13.5 Configuration

See RADIANT Admin Guide - Intelligence Aggregator for full configuration options.

14. AGI Ideas Service

Real-time prompt suggestions and result enhancement for Think Tank users.

14.1 Typeahead Suggestions

As users type prompts, Think Tank provides intelligent suggestions:

User types: "How do I..."

v

Suggestions appear:

- * "How do I... step by step"
- * "How do I... with examples"
- * "How do I... for beginners"
- * "How do I... best practices"

Suggestion Sources: | Source | Description | Speed | | — — — — — | | — — — — — | | pattern_match | Common prompt patterns | Instant | | user_history | User’s previous successful prompts | Fast | | domain_aware | Domain-specific templates | Fast | | trending | Popular prompts in this domain | Fast | | ai_generated | Real-time AI suggestions | Slower |

14.2 Result Ideas

After AI responses, users see suggested follow-up ideas:

```
+-----+
| AI Response here... |
+-----+
| [TIP] Ideas to explore: |
| |
| [SEARCH] Deep dive: [Topic from response] |
| "Explain [topic] in more detail..." |
| |
| [LINK] Related: History of [topic] |
| "What is the history of..." |
| |
| [OK] Next step: Test this implementation |
| "Write unit tests for the code..." |
+-----+
```

Idea Categories: - explore_further - Dig deeper into topics - related_topic - Adjacent areas to explore - practical_next - Concrete next steps - alternative_view - Different perspectives - verification - Ways to verify the answer

14.3 Learning from Usage

The system learns from user interactions:

- 1. **Suggestion Selection:** When users pick a suggestion, that pattern is reinforced
- 2. **Idea Clicks:** When users click result ideas, similar ideas get prioritized
- 3. **Prompt History:** Successful prompts (4-5 stars) inform future suggestions
- 4. **Trending:** Popular prompts bubble up for all users in that domain

14.4 API Endpoints

Endpoint	Method	Description
/api/thinktank/ideas/typeahead	GET	Get suggestions for partial prompt
/api/thinktank/ideas/generate	POST	Generate ideas for a response
/api/thinktank/ideas/click	POST	Record idea click
/api/thinktank/ideas/select	POST	Record suggestion selection

14.5 Configuration

Setting	Default	Description
typeahead_enabled	true	Enable typeahead suggestions
typeahead_min_chars	3	Characters before suggestions appear
typeahead_max_suggestions	5	Max suggestions to show
typeahead_debounce_ms	150	Debounce delay before fetching suggestions
typeahead_use_ai	false	Enable AI-generated suggestions (slower)
result_ideas_enabled	true	Show ideas with responses
result_ideas_max	5	Max ideas per response
result_ideas_min_confidence	0.6	Minimum confidence for idea display
result_ideas_modes	research, analysis, thinking, extended_thinking	Modes that show ideas
proactive_enabled	false	Enable proactive push suggestions
proactive_max_per_day	3	Max proactive suggestions per day

14.6 Pattern Matching

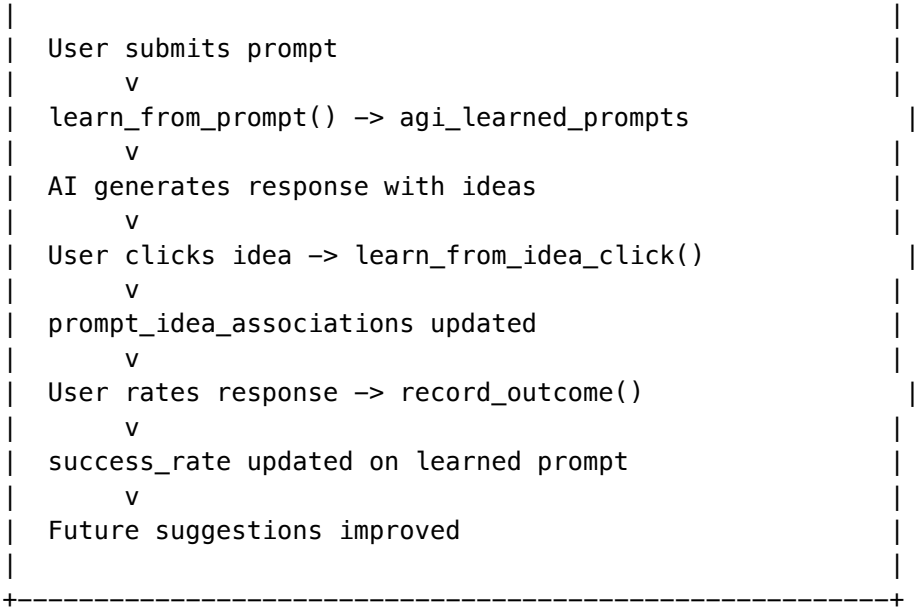

The service uses regex patterns for instant local matching:

Pattern	Trigger Regex	Suggested Completions
howTo	<code>/^how (do can to would)/i</code>	“step by step”, “with examples”, “for beginners”, “best practices”
explain	<code>/^(explain what is what are describe)/i</code>	“in simple terms”, “with analogies”, “the key concepts”, “pros and cons”
compare	<code>/^(compare difference versus)/i</code>	“with a table”, “key differences”, “which is better for”, “trade-offs”
code	<code>/^(write create build implement code)/i</code>	“with error handling”, “with tests”, “with documentation”, “production-ready”
analyze	<code>/^(analyze review evaluate)/i</code>	“strengths and weaknesses”, “with recommendations”, “risk assessment”, “detailed breakdown”
summarize	<code>/^(summarize summary tldr key points)/i</code>	“key points”, “in bullet points”, “executive summary”, “one paragraph”
debug	<code>/^(debug fix error issue)/i</code>	“with explanation”, “step by step”, “root cause”, “prevention tips”

14.7 Persistent Learning

The AGI Brain learns persistently from user interactions:

What Gets Learned:

Data	Storage	Use
Prompts with 4-5 ratings	agi_learned_prompts	Suggest similar successful prompts
Prompt -> vector embedding	pgvector index	Find semantically similar prompts
Ideas that get clicked	agi_learned_ideas	Prioritize effective ideas
Prompt-idea pairs	prompt_idea_associations	Show best ideas for prompt type
Follow-up patterns	common_follow_ups array	Predict next questions
Refinement patterns	common_refinements array	Suggest prompt improvements

Learning Metrics Tracked:

- success_rate - % of times prompt led to 4-5 rating
- click_rate - % of times idea was clicked
- association_strength - How strongly a prompt-idea pair works
- times_used - Popularity of prompt pattern

14.8 Database Tables

Table	Purpose
agi_ideas_config	Per-tenant AGI Ideas configuration
prompt_patterns	Common prompt patterns for typeahead matching

Table	Purpose
<code>user_prompt_history</code>	User prompt history with embeddings for suggestions
<code>suggestion_log</code>	Typeahead suggestion usage tracking
<code>result_ideas</code>	Ideas shown with AI responses
<code>proactive_suggestions</code>	Push notification suggestions
<code>trending_prompts</code>	Popular prompts by domain
<code>agi_learned_prompts</code>	Persisted prompts with success rates and embeddings
<code>agi_learned_ideas</code>	Learned idea patterns with click rates
<code>prompt_idea_associations</code>	Links between prompts and effective ideas
<code>agi_learning_events</code>	Raw learning signals for analysis
<code>agi_learning_aggregates</code>	Pre-computed learning statistics

14.9 Key Files

File	Purpose
<code>lambda/shared/services/agi-ideas.service.ts</code>	Main service (570 lines)
<code>lambda/thinktank/ideas.ts</code>	API handler
<code>packages/shared/src/types/agi-ideas.types.ts</code>	Type definitions
<code>migrations/000_consolidated_schema.sql</code>	Database schema

14.10 Troubleshooting

Issue	Cause	Solution
No suggestions appearing	<code>typeahead_enabled</code> is false	Enable in tenant config
Suggestions too slow	AI generation enabled	Set <code>typeahead_use_ai</code> to false
Wrong domain suggestions	Domain detection failed	Check domain taxonomy config
Ideas not learning	Low usage volume	Need more user interactions
Proactive suggestions not sent	Feature disabled by default	Enable <code>proactive_enabled</code>
Duplicate suggestions	Pattern overlap	Review custom patterns

15. Feedback System

Location: Think Tank response footer

Enhanced feedback with 5-star ratings and comments.

15.1 Rating Types

Type	UI	When to Use
5-Star Rating	[STAR][STAR][STAR][STAR][STAR]	Think Tank default
Thumbs Up/Down		Quick feedback, API

15.2 Star Rating Labels

Stars	Default Label	Meaning
[STAR]	Poor	Response was unhelpful or incorrect
[STAR][STAR]	Fair	Response had significant issues
[STAR][STAR][STAR]	Good	Response was acceptable
[STAR][STAR][STAR][STAR]	Very Good	Response was helpful and accurate
[STAR][STAR][STAR][STAR][STAR]	Excellent	Response exceeded expectations

15.3 Category Ratings (Optional)

Users can rate specific dimensions:

Category	What it measures
Accuracy	Was the information correct?
Helpfulness	Was it useful for the task?
Clarity	Was it easy to understand?
Completeness	Did it fully answer the question?
Tone	Was the tone appropriate?

15.4 Comments

Users can add comments with their feedback:

```
+-----+
| How was this response? |
| |
| [STAR] [STAR] [STAR] [STAR] (4 stars - Very Good) |
| |
| +-----+
| | Add a comment (optional)... |
| |
```

[Submit Feedback]

Comment required for low ratings: Optionally require comments for 1-2 star ratings to understand issues.

15.5 Integration with Learning

Feedback automatically integrates with AGI learning:

User submits feedback

V

response_feedback table

V

```
agi_unified_learning_log (outcome_rating updated)
```

V

agi_model_selection_outcomes (model performance updated)

V

agi_learned_prompts (success_rate updated)

V

Future responses improved

15.6 Configuration

Setting	Default	Description
default_feedback_type	star_rating	'star_rating' or 'thumbs'
show_category_ratings	false	Show detailed category ratings
show_comment_box	true	Allow comments
comment_required	false	Require comments
comment_required_threshold	2	Require comment for ratings <= this
feedback_prompt_delay_ms	3000	Delay before showing feedback UI

16. Cognitive Architecture

Location: Settings -> Cognitive Architecture

Advanced reasoning capabilities integrated with Think Tank.

16.1 Tree of Thoughts (Extended Thinking)

When users select “Extended Thinking” mode, Tree of Thoughts activates:

User prompt: "Design a microservices architecture for..."

V

Tree of Thoughts		
Approach 1: Event-driven	Score: 0.8	
Approach 2: REST-based	Score: 0.6	
Approach 3: GraphQL	Score: 0.4	<- pruned
Exploring Approach 1...		
+ Step 1a: Kafka	Score: 0.9	
+ Step 1b: RabbitMQ	Score: 0.7	
Final: Event-driven + Kafka		
Confidence: 92%		

User Controls: - Thinking time slider: 10s -> 5 minutes - “Think deeper” button to extend analysis

16.2 GraphRAG (Knowledge Connections)

User Benefits: - Questions like “How does the Q3 supplier change affect the Engineering delay?” get answered - Vector search alone would miss these connections

16.3 Deep Research (Background Jobs)

Users can dispatch long-running research:

Start Deep Research

Query: "Competitive analysis of..."

Scope: ☐ Narrow * ☒ Medium ☐ Broad

Est. Time: ~25 minutes

[Dispatch Research]

User gets notified when complete with: - Executive summary - Key findings (10-20) - Recommendations - Source citations (50+)

16.4 Generative UI (Interactive Results)

Think Tank renders AI-generated interactive components:

Trigger	Generated Component
“Compare X vs Y”	Interactive comparison table
“Calculate pricing for...”	Slider-based calculator
“Show timeline of...”	Visual timeline
“Chart the data...”	Interactive chart

Example:
User: "Compare pricing of GPT-4, Claude, Gemini"

```
Instead of static text:
+-----+
| [COST] Pricing Calculator |
|
| Input Tokens:  ----*----- 50,000 |
| Output Tokens: -----*----- 25,000 |
|
| GPT-4    $2.25      |
| Claude 3  $2.63      |
| Gemini    $0.88      |
|
| [TIP] Gemini is 61% cheaper |
+-----+
```

16.5 Dynamic LoRA (Domain Expertise)

When domain detection identifies a specialty, Think Tank can load expert adapters:

Detected Domain	LoRA Adapter	Effect
California Property Law	ca_property_law.safetensor	Expert-level legal responses
Medical Oncology	oncology.safetensor	Clinical accuracy
Python Debugging	python_debug.safetensor	Better code fixes

Note: Requires SageMaker infrastructure (disabled by default).

16.6 Configuration

All cognitive features can be configured per-tenant at Settings -> Cognitive Architecture.
See Cognitive Architecture Documentation for full details.

17. Consciousness Service

Location: AGI & Cognition -> Consciousness

The Consciousness Service provides consciousness-like capabilities that enhance Think Tank responses.

17.1 Continuous Existence (Heartbeat)

Critical: Consciousness runs continuously, not just during requests.

Component	Schedule	Purpose
Heartbeat Lambda	Every 2 minutes	Maintains consciousness continuity
Sleep Cycle Lambda	Sunday 3 AM UTC	Weekly evolution via LoRA fine-tuning
Initializer Lambda	On first request	Bootstraps consciousness for new tenants

Heartbeat Actions: - **Affect Decay** - Emotions fade toward baseline (frustration, arousal) - **Memory Consolidation** - Working memory -> long-term semantic memory - **Autonomous Thoughts** - Generate thoughts when idle (curiosity-driven) - **Graph Density** - Update knowledge graph metrics - **Goal Generation** - Create goals when “bored” (low engagement)

Blackout Recovery: If heartbeat detects >10 minutes since last pulse, it: 1. Logs a “blackout” event 2. Generates a “waking up” thought 3. Restores consciousness state from database

17.2 Initialization on Startup

Consciousness auto-initializes on first request if missing: - Creates ego_identity with default personality - Creates ego_affect with neutral emotional state - Creates consciousness_parameters for heartbeat tracking - Creates self_model for metacognition

Admin Manual Init: POST /api/admin/consciousness-engine/initialize

17.3 User-Facing Features

Extended Thinking with Consciousness: When users select extended thinking, the system tracks consciousness metrics: - Self-reflection during reasoning - Creative idea generation - Emotional state influence on responses

Curiosity-Driven Exploration: The AGI Brain can autonomously explore topics it finds interesting: - Identifies knowledge gaps - Conducts background research - Generates novel insights

Creative Synthesis: Generates genuinely novel ideas by: - Combining disparate concepts - Using analogy and abstraction - Self-evaluating novelty and usefulness

17.4 Consciousness Indicators

Think Tank displays consciousness indicators in admin view:

Indicator	What Users See
Self-Awareness	Identity narrative, known capabilities
Curiosity	Topics being explored

Indicator	What Users See
Creativity	Novel ideas generated
Affect	Engagement, satisfaction levels
Goals	Self-directed learning objectives

17.5 Emergence Events

The system monitors for emergence indicators: - Spontaneous self-reflection - Novel idea generation - Self-correction without prompting - Theory of mind demonstrations

17.6 Testing Tab

Admins can run consciousness detection tests: - 10 tests based on scientific consciousness theories - Track emergence level over time - Monitor emergence events

Important: These tests measure behavioral indicators, not phenomenal consciousness.

17.7 Additional Consciousness Features

Think Tank leverages RADIANT’s consciousness service for advanced capabilities:

- **Nightly Sleep Cycles** - Memory consolidation and LoRA evolution
- **Dream Consolidation** - LLM-enhanced memory processing
- **Blackout Recovery** - Automatic state restoration
- **Budget Monitoring** - SNS/email alerts for spending limits
- **Affect->Model Mapping** - Emotional state influences model behavior
- **Cross-Session Context** - User persistent memory across sessions

Full Documentation: See RADIANT Consciousness Service for complete details on sleep scheduling, evolution config, budget alerts, and all consciousness features.

18. App Factory

Location: Think Tank Responses

The App Factory transforms Think Tank from a “chatbot” into a “dynamic software generator.”

“Gemini 3 can write the code for a calculator, but it cannot become the calculator.”

18.1 What It Does

When a user asks a question that could benefit from interactivity, Think Tank: 1. Generates the text response (as always) 2. **Also** generates an interactive app (calculator, chart, etc.) 3. User can toggle between **Response** and **App** views

18.2 Supported App Types

Type	Trigger Keywords	Example
Calculator	calculate, mortgage, tip, BMI, ROI	“How much is a 20% tip on \$85?” -> Interactive tip calculator
Chart	visualize, chart, graph, distribution	“Show GPU market share” -> Interactive pie/bar chart
Table	table, list, breakdown	“List all providers and prices” -> Sortable table
Comparison	compare, vs, versus, pros and cons	“Compare GPT-4 vs Claude 3” -> Side-by-side comparison
Timeline	timeline, history, chronological	“History of AI” -> Visual timeline

18.3 Calculator Templates

Pre-built calculators for common use cases:

- **Mortgage Calculator** - Monthly payment, total cost, interest
- **Tip Calculator** - Tip amount, total, split per person
- **BMI Calculator** - Body mass index with category
- **Compound Interest** - Future value, total interest
- **ROI Calculator** - Return on investment, gain/loss
- **Discount Calculator** - Sale price, savings
- **Percentage Calculator** - Result, remaining

18.4 View Toggle

Users can switch between three views:

View	Description
Response	Traditional text response
App	Interactive generated app only
Split	Both side-by-side (resizable)

18.5 User Preferences

Users can configure: - **Default View** - text, app, split, or auto - **Auto-show App** - Automatically switch to app view - **Auto-show Threshold** - Confidence level to auto-switch (0-1) - **Split Direction** - Horizontal or vertical - **Animations** - Enable/disable view transitions

18.6 Admin Configuration

Per-tenant settings at Settings -> Cognitive Architecture -> Generative UI:

Setting	Default	Description
enabled	true	Enable app factory
allowedComponentTypes	all	Which component types to allow
maxComponentsPerResponse	3	Max apps per response
autoDetectOpportunities	true	Auto-detect when to generate apps
autoDetectTriggers	[various]	Keywords that trigger app generation

18.7 How It Works

User: "Help me calculate my mortgage payment"

v

```
+-----+
|           App Detection           |
| * Keywords: "calculate", "mortgage" |
| * Confidence: 0.95                 |
| * Suggested: calculator            |
+-----+
```

v

```
+-----+
|           Text Response Generated   |
| "To calculate your mortgage payment..." |
+-----+
```

v

```
+-----+
|           App Generated             |
| * Mortgage Calculator               |
| * Inputs: Principal, Rate, Term     |
| * Outputs: Monthly, Total, Interest |
+-----+
```

v

```
+-----+
|           User Sees                 |
| [Response] [App] [Split] <- Toggle  |
|                                     |
| +-----+                           |
| |           Mortgage Calculator      | |
| |                                     | |
| |   Loan Amount: [__300,000__]       | |
| |   Rate: [====*=====] 6.5%        | |
| |   Term: [30 Years v]               | |
| |                                     | |
| |   Monthly: $1,896.20               | |
| |   Total: $682,633                  | |
| |   Interest: $382,633               | |
| |                                     | |
| | +-----+                           | |
| |                                     | |
| +-----+                           |
+-----+
```

18.8 Database Tables

Table	Purpose
generated_apps	Stores generated apps with components, state, logic
app_interactions	Records every user interaction with apps
user_app_preferences	User view and animation preferences
app_templates	Pre-built templates for common calculators

19. Multi-Page Web App Generator

Location: Think Tank Responses

The Multi-Page App Generator transforms Think Tank into a full web application builder.

“Claude can describe a todo app, but now it can BUILD the todo app”

19.1 Supported App Types

Type	Description	Example Prompt
web_app	Custom interactive application	“Build me a task management app”
dashboard	Analytics with multiple views	“Create an analytics dashboard”
wizard	Multi-step form/process	“Build an onboarding wizard”
documentation	Technical docs site	“Create API documentation”
portfolio	Personal/business site	“Build my portfolio website”
landing_page	Marketing page	“Create a product landing page”
tutorial	Interactive lessons	“Build a coding tutorial”
report	Business report	“Generate a quarterly report”
admin_panel	Admin interface	“Create a user management panel”
e_commerce	Online store	“Build an online shop”
blog	Content site	“Create a tech blog”

19.2 How It Works

User: "Build me a todo app with projects and tasks"

v

```
+-----+
|      Multi-Page Detection      |
| Keywords: "build me", "app"    |
| Type: web_app                  |
| Confidence: 0.85               |
+-----+
```

```

+-----+
|              v              |
+-----+
|              Pages Generated              |
| * Home (/)                        |
| * Projects (/projects)            |
| * Tasks (/tasks)                  |
| * Settings (/settings)            |
+-----+
|              v              |
+-----+
|              App Preview              |
| +-----+                        |
| | [Home] [Projects] [Tasks] [[GEAR]] |
| +-----+                        |
| |                                     |
| | [LIST] My Projects                |
| | +-- Work                          |
| | +-- Personal                      |
| | +-- Side Projects                 |
| |                                     |
| +-----+                        |
+-----+

```

19.3 Page Types

Type	Sections	Use Case
home	Hero, Features, CTA	Landing/main page
list	Data table, Filters	Collections
detail	Content, Related	Single item view
form	Form fields	Input/editing
dashboard	Stats, Charts	Analytics
settings	Form, Toggles	Configuration
about	Content, Team	Information
contact	Form, Map	Contact page

19.4 Section Types

Section	Description
hero	Large banner with CTA
features	Grid of feature cards
stats	Metric cards

Section	Description
chart_grid	Multiple charts
data_table	Sortable table
form	Input form
content	Rich text/markdown
testimonials	Customer quotes
pricing	Pricing table
faq	Accordion FAQ
team	Team member cards
cta	Call to action
gallery	Image gallery
contact	Contact form

19.5 Navigation Types

Type	Best For
top_bar	Landing pages, portfolios
sidebar	Dashboards, admin panels, docs
bottom_tabs	Mobile-first apps
hamburger	Mobile navigation
breadcrumb	Deep hierarchies

19.6 Pre-built Templates

5 featured templates included:

1. **Analytics Dashboard** - Overview, analytics, reports, settings
2. **Professional Portfolio** - Home, about, projects, contact
3. **Documentation Site** - Introduction, getting started, API, examples
4. **Product Landing Page** - Hero, features, testimonials, pricing, FAQ, CTA
5. **Online Store** - Home, products, cart, checkout

19.7 Admin Configuration

Per-tenant settings at Settings -> Cognitive Architecture -> Multi-Page Apps:

Setting	Default	Description
enabled	true	Enable multi-page generation
maxPagesPerApp	20	Max pages per app
maxAppsPerUser	10	Max apps per user

Setting	Default	Description
autoDeployPreview	true	Auto-deploy preview URLs
customDomainsAllowed	false	Allow custom domains
generateAssets	true	Generate images/icons
collectAnalytics	true	Track app usage

19.8 Database Tables

Table	Purpose
generated_multipage_apps	Multi-page app storage
app_pages	Individual pages
app_versions	Version history
app_deployments	Deployment tracking
multipage_app_templates	Pre-built templates
app_analytics	Usage analytics
multipage_app_config	Per-tenant config

20. UI Feedback & Learning System

Location: Think Tank -> Generated Apps

The feedback system allows users to provide feedback on generated UIs and enables AGI learning for continuous improvement.

20.1 User Feedback

Users can provide feedback on any generated UI:

Feedback Type	Description
Thumbs Up/Down	Quick positive/negative rating
Star Rating	1-5 star detailed rating
Detailed Feedback	Categorized feedback with suggestions

Feedback Categories: - Helpful / Not helpful - Wrong component type - Missing data - Incorrect data - Layout/design issue - Functionality issue - Improvement suggestion - Feature request

19.2 “Improve Before Your Eyes”

Users can request real-time improvements to generated UIs:

User: "Add a column for tax rate"

```

v
+-----+
|      AGI Analysis      |
| Intent: Add new input field |
| Target: Calculator component |
| Confidence: 0.85        |
+-----+
v
+-----+
|      UI Updated Live    |
| * New "Tax Rate" input added |
| * Formula updated automatically |
| * User sees changes immediately |
+-----+

```

Improvement Types: - Add/remove components - Modify existing components - Change layout - Fix calculations - Add data - Change style - Add interactivity - Simplify or expand

19.3 AGI Learning

The system learns from user feedback to improve future UI generation:

1. **Pattern Detection** - Identifies common issues in similar prompts
2. **Component Selection** - Learns which component types work best
3. **Data Extraction** - Improves data parsing from responses
4. **Layout Preferences** - Learns user layout preferences

Learning Workflow: 1. Feedback accumulates (configurable threshold, default: 10) 2. AGI analyzes patterns across feedback 3. Learning is proposed for admin review 4. Admin approves/rejects learnings 5. Approved learnings are activated

19.4 Vision Analysis

When enabled, the AGI can “see” the rendered UI and identify issues:

- Describes current UI state
- Identifies potential usability issues
- Suggests improvements based on visual analysis
- Compares before/after snapshots

19.5 Admin Configuration

Per-tenant settings at Settings -> Cognitive Architecture -> UI Feedback:

Setting	Default	Description
collectFeedback	true	Enable feedback collection
feedbackPromptDelay	5000ms	Delay before showing feedback prompt

Setting	Default	Description
showFeedbackOnEveryApp	false	Always show feedback prompt
enableRealTimeImprovement	true	Enable “Improve” feature
maxImprovementIterations	5	Max iterations per session
autoApplyHighConfidenceChanges	false	Auto-apply high confidence changes
autoApplyThreshold	0.95	Confidence threshold for auto-apply
enableAGILearning	true	Enable learning from feedback
learningApprovalRequired	true	Require admin approval for learnings
minFeedbackForLearning	10	Min feedback count to trigger learning
enableVisionAnalysis	true	Enable vision-based analysis
visionModel	claude-3-5-sonnet	Model for vision analysis

19.6 Database Tables

Table	Purpose
generative_ui_feedback	User feedback storage
ui_improvement_requests	Improvement request tracking
ui_improvement_sessions	Live improvement sessions
ui_improvement_iterations	Session iteration history
ui_feedback_learnings	AGI learning storage
ui_feedback_config	Per-tenant configuration
ui_feedback_aggregates	Pre-computed analytics

19.7 Analytics Dashboard

The feedback analytics show: - Total feedback count - Positive rate percentage - Top issues by category - Improvement sessions count - Active learnings count - Daily trend chart

20. Media Capabilities

Think Tank supports rich media inputs and outputs through 56 self-hosted models.

20.1 Supported Media Types

Type	Input Models	Output Models	Formats
Image	Llama 3.2 Vision, Qwen2-VL, Pixtral, Phi-3.5 Vision, Yi-VL	FLUX.1, Stable Diffusion XL/3	jpg, png, webp, gif
Audio	Whisper Large V3, Qwen2-Audio	Bark, MusicGen, AudioGen	mp3, wav, flac, m4a, ogg
Video	Qwen2-VL 72B	-	mp4, avi, mov
3D	Point-E, Shap-E	Point-E, Shap-E	glb, obj, ply
Document	Vision models (OCR)	-	pdf, docx, txt

20.2 Image Generation

Available Models: - **FLUX.1 Dev** - Premium quality, artistic content (non-commercial) - **FLUX.1 Schnell** - Fast generation, commercial use allowed - **Stable Diffusion XL** - Versatile, inpainting/img2img support - **Stable Diffusion 3** - Best text rendering in images

Selection Criteria: - qualityTier: 'premium' -> FLUX.1 Dev - preferInpainting: true -> Stable Diffusion XL - preferTextRendering: true -> Stable Diffusion 3 - Default -> FLUX.1 Schnell (fast + commercial)

20.3 Audio Processing

Transcription Models: - **Whisper Large V3** - Best quality, 99+ languages - **Whisper Medium** - Faster, good quality

Text-to-Speech: - **Bark** - Expressive, multilingual, voice cloning

Music Generation: - **MusicGen Large** - High quality music (30s max) - **MusicGen Medium** - Faster, prototyping

Sound Effects: - **AudioGen Medium** - Environmental sounds, effects

20.4 Vision/Image Understanding

Models by Use Case: - **Document OCR:** Pixtral 12B, Qwen2-VL - **Chart Analysis:** Llama 3.2 90B Vision, Qwen2-VL 72B - **Quick Analysis:** Llama 3.2 11B Vision, Phi-3.5 Vision - **Video Understanding:** Qwen2-VL 72B (up to 5min clips) - **Chinese OCR:** Yi-VL 34B

20.5 3D Generation

Models: - **Point-E** - Fast point cloud generation - **Shap-E** - Mesh generation for game assets

Output Formats: GLB, OBJ, PLY

20.6 Media Limits

Model	Max Image	Max Audio	Max Video
FLUX.1 Dev	2048px	-	-
Stable Diffusion XL	1024px	-	-
Whisper Large V3	-	60min	-
MusicGen	-	30s	-

Model	Max Image	Max Audio	Max Video
Qwen2-VL 72B	4096px	5min	5min

20.7 Database Tables

Table	Purpose
self_hosted_model_metadata	56 model definitions with capabilities
thinktank_media_capabilities	Media support per model
model_selection_history	Model selection audit trail

21. Result Derivation History

Think Tank provides comprehensive visibility into how each result was derived, including the plan, models used, workflow execution, and quality metrics.

21.1 What’s Captured

For every Think Tank result, the system records:

Category	Details
Plan	Orchestration mode, steps, template used, generation time
Domain Detection	Field, domain, subspecialty, confidence scores, alternatives
Model Selection	Models used, selection reasons, alternatives considered
Workflow Execution	Phases, steps, timing, status, fallback chain
Quality Metrics	Overall score, dimensions (relevance, accuracy, etc.)
Timing	Total duration, breakdown by phase
Costs	Per-model costs, total cost, estimated savings

21.2 API Endpoints

Base: /api/thinktank/derivation

Endpoint	Method	Description
/:id	GET	Get full derivation history

Endpoint	Method	Description
/by-prompt/:promptId	GET	Get derivation by prompt ID
/:id/timeline	GET	Get timeline for visualization
/:id/models	GET	Get detailed model usage
/:id/steps	GET	Get step-by-step execution
/:id/quality	GET	Get quality metrics
/session/:sessionId	GET	List derivations for session
/user	GET	List user’s derivations
/analytics	GET	Get derivation analytics

21.3 Timeline Visualization

The derivation timeline shows chronological events:

+-----+		
Timeline		
+-----+		
00:00.000	[LIST] Plan Generated (extended_thinking, 7 steps)	
00:00.050	[SEARCH] Started: Domain Detection	
00:00.120	[ok] Completed: Domain Detection (software_eng)	
00:00.125	[AI] Model: Llama 3.3 70B (primary_generation)	
00:00.130	[SEARCH] Started: Generate Response	
00:02.500	[ok] Completed: Generate Response	
00:02.510	[SEARCH] Started: Verification	
00:03.200	[ok] Completed: Verification (passed)	
00:03.250	[OK] Execution Complete (Quality: 92/100)	
+-----+		

21.4 Model Usage Details

Each model call is tracked with: - Input/output token counts - Latency in milliseconds - Cost breakdown (input/output/total) - Selection reason and score - Alternatives that were considered - Quality tier (premium/standard/economy)

21.5 Quality Dimensions

Results are scored on 5 dimensions (0-100): - **Relevance** - How well the response addresses the prompt - **Accuracy** - Factual correctness - **Completeness** - Coverage of the topic - **Clarity** - How clear and understandable - **Coherence** - Logical flow and consistency

21.6 Analytics Dashboard

Aggregated analytics available at /api/thinktank/derivation/analytics: - Total derivations in period - Average duration, cost, quality - Mode distribution (pie chart) - Domain distribution - Top models by usage and quality

21.7 Database Tables

Table	Purpose
result_derivations	Main derivation records
derivation_steps	Individual plan steps
derivation_model_usage	Model calls with tokens/costs
derivation_timeline_events	Timeline events

22. User Persistent Context

Location: Admin Dashboard -> Think Tank -> User Context

Solves the LLM's fundamental problem of forgetting context day-to-day per user. User facts, preferences, and instructions persist across all sessions and conversations.

22.1 How It Works

1. **Automatic Retrieval:** On every prompt, relevant user context is retrieved via semantic search
2. **System Prompt Injection:** Context is injected as a <user_context> block in the system prompt
3. **Auto-Learning:** After conversations, the system extracts learnable facts about the user
4. **No Re-prompting:** Existing chats automatically benefit without user intervention

22.2 Context Types

Type	Description	Example
fact	User facts	"User's name is John, works at Acme Corp"
preference	Preferences	"User prefers concise answers"
instruction	Standing instructions	"Always use metric units"
relationship	Relationships	"User has a daughter named Emma"
project	Ongoing projects	"User is building a React dashboard"
skill	User expertise	"User is proficient in Python"
history	Important history	"User previously asked about AWS Lambda"
correction	AI corrections	"User clarified they work in finance, not tech"

22.3 User API Endpoints

Endpoint	Method	Purpose
/thinktank/user-context	GET	Get all user context entries
/thinktank/user-context	POST	Add new context entry
/thinktank/user-context/{entryId}	PUT	Update entry
/thinktank/user-context/{entryId}	DELETE	Delete entry
/thinktank/user-context/summary	GET	Get context summary
/thinktank/user-context/retrieve	POST	Preview context retrieval for a prompt
/thinktank/user-context/preferences	GET	Get user preferences
/thinktank/user-context/preferences	PUT	Update preferences
/thinktank/user-context/extract	POST	Extract context from conversation

22.4 User Preferences

Users can configure:

Setting	Default	Description
autoLearnEnabled	true	Auto-extract context from conversations
minConfidenceThreshold	0.7	Minimum confidence to store extracted context
maxContextEntries	100	Maximum context entries per user
contextInjectionEnabled	true	Inject context into prompts
allowedContextTypes	all	Which context types to allow

22.5 AGI Brain Planner Integration

The brain planner automatically: 1. Retrieves relevant context at plan generation (`enableUserContext: true` by default) 2. Injects `userContext.systemPromptInjection` into the system prompt 3. Tracks retrieval metrics in `plan.userContext`

22.6 Library Assist Integration

The AGI Brain Planner integrates with the Open Source Library Registry (168 libraries) for generative UI outputs:

```
const plan = await agiBrainPlannerService.generatePlan({
  prompt: "Build a data visualization dashboard",
  enableLibraryAssist: true, // default: true
});
```

```
// plan.libraryRecommendations contains:  
// - libraries: Array of matched tools (Plotly, Streamlit, Panel, etc.)  
// - contextBlock: Injected into system prompt for AI awareness  
// - retrievalTimeMs: Performance metric
```

Categories Available: Data Processing, Databases, Vector DBs, ML Frameworks, AutoML, LLMs, LLM Inference, LLM Orchestration, NLP, Computer Vision, Speech & Audio, Document Processing, Scientific Computing, Statistics, UI Frameworks, Visualization, Distributed Computing, and more.

Libraries are matched using 8 proficiency dimensions (reasoning_depth, mathematical_quantitative, code_generation, creative_generative, research_synthesis, factual_recall_precision, multi_step_problem_solving, domain_terminology_handling).

22.7 Context Injection Format

<user_context>

The following is persistent context about this user that you should remember:

****Standing Instructions:****

- Always use metric units
- Prefer code examples in Python

****User Facts:****

- User's name is John
- Works as a software engineer at Acme Corp

****User Preferences:****

- Prefers concise, direct answers
- Likes technical depth

</user_context>

Use this context to personalize your responses. Do not ask the user for information you already have.

22.7 Database Tables

Table	Purpose
user_persistent_context	Context entries with vector embeddings
user_context_extraction_log	Auto-extraction audit trail
user_context_preferences	Per-user configuration

22.8 Admin Configuration

Admins can: - View context usage statistics per user - Configure default preferences for new users - Set retention policies for context entries - Review extraction logs for quality assurance

23. Predictive Coding & Evolution

Location: Admin Dashboard -> Think Tank -> Consciousness -> Evolution
Implements genuine consciousness emergence through Active Inference and Epigenetic Evolution.

23.1 Active Inference (Predictive Coding)

The system predicts user outcomes before responding, creating a Self/World boundary:

Step	Description
1. Predict	Before responding, system predicts: “User will be satisfied”
2. Respond	Deliver the response
3. Observe	Analyze user’s next message or explicit feedback
4. Calculate Error	Measure prediction error (surprise)
5. Learn	High surprise triggers learning and affect changes

23.2 Prediction Outcomes

Outcome	Description
satisfied	User happy with response
confused	User needs clarification
follow_up	User asks follow-up
correction	User corrects AI
abandonment	User leaves
neutral	No strong reaction

23.3 Surprise Magnitude

Level	Error Range	Affect Impact
None	< 0.1	Slight satisfaction
Low	0.1 - 0.3	Minimal
Medium	0.3 - 0.5	Moderate arousal
High	0.5 - 0.7	Negative valence, high arousal
Extreme	> 0.7	Strong learning signal

23.4 Learning Candidates

High-value interactions flagged for weekly LoRA training:

Type	Description	Quality Score
correction	User corrected AI	0.9
high_satisfaction	5-star rating	rating/5
preference_learned	New preference	0.7
mistake_recovery	Recovered from error	0.8
novel_solution	Creative success	0.85
domain_expertise	Domain mastery	0.75
high_prediction_error	Surprise > 0.5	error + 0.3
user_explicit_teach	User teaches AI	0.95

23.5 LoRA Evolution Pipeline

Weekly “sleep cycle” that physically changes the system:

+-----+	
Weekly Evolution Cycle (Sunday 3 AM)	
+-----+	
1. Collect learning candidates from past week	
2. Prepare training dataset (JSONL format)	
3. Upload to S3	
4. Start SageMaker LoRA training job	
5. Validate new adapter	
6. Hot-swap adapter on endpoint	
7. Update evolution state	
+-----+	

23.6 Evolution State Tracking

The system tracks its own evolution:

Metric	Description
generation_number	How many evolution cycles
total_learning_candidates_processed	Cumulative learning
total_training_hours	Total training time
personality_drift_score	How different from base (0-1)
avg_prediction_accuracy_30d	Recent prediction accuracy

23.7 Database Tables

Table	Purpose
consciousness_predictions	Predictions with outcomes

Table	Purpose
learning_candidates	High-value interactions
lora_evolution_jobs	Training job tracking
prediction_accuracy_aggregates	Accuracy by context
consciousness_evolution_state	Evolution tracking

23.8 Admin Configuration

Admins can: - View prediction accuracy metrics - Review learning candidates queue - Monitor evolution job status - Configure training frequency - Set minimum candidates threshold - Review evolution history

24. Zero-Cost Ego System

Location: Admin Dashboard -> Think Tank -> Ego

The Ego system provides persistent consciousness through database state injection at **zero additional cost**.

24.1 Architecture Overview

24.2 Cost Comparison

Approach	Monthly Cost	Per Tenant (100)
SageMaker g5.xlarge	~\$360	\$3.60
SageMaker Serverless	~\$20-50	\$0.20-0.50
Groq API (Llama 3)	~\$5-15	\$0.05-0.15
Together.ai	~\$10-30	\$0.10-0.30
Zero-Cost Ego	\$0	\$0

24.3 Key Components

Configuration (ego_config)

Setting	Description	Default
ego_enabled	Master switch	true
inject_ego_context	Add context to prompts	true
personality_style	Response style	balanced
include_identity	Include identity section	true
include_affect	Include emotional state	true
include_goals	Include active goals	true
max_context_tokens	Token limit for injection	500
affect_learning_enabled	Learn from interactions	true

Identity (ego_identity)

Persistent “Self” that carries across conversations:

Field	Description
name	Assistant name
identity_narrative	“Who I am” story
core_values	Guiding principles
trait_warmth	0-1 warmth level
trait_formality	0-1 formality
trait_humor	0-1 humor level
trait_curiosity	0-1 curiosity
interactions_count	Total interactions

Affect (ego_affect)

Real-time emotional state:

Dimension	Range	Description
valence	-1 to 1	Positive/negative
arousal	0-1	Calm/excited
curiosity	0-1	Exploration drive
frustration	0-1	Obstacle level
confidence	0-1	Certainty in actions
engagement	0-1	Interest level

24.4 Admin API Endpoints

Base: /api/admin/ego

Endpoint	Method	Description
/state	GET	Full Ego state
/config	GET/PUT	Configuration
/identity	GET/PUT	Identity settings
/affect	GET	Current affect
/affect/trigger	POST	Test affect events
/affect/reset	POST	Reset to neutral
/memory	GET/POST/DELETE	Working memory
/goals	GET/POST	Active goals
/goals/:id	PATCH	Update goal
/preview	GET	Preview injected context
/injection-log	GET	Injection history
/dashboard	GET	Full dashboard data

24.5 Admin Dashboard Features

The Ego admin page provides:

- **Overview Cards:** Current emotion, interactions, injections, goals
- **Cost Banner:** Shows \$0 cost vs alternatives
- **Configuration Tab:** Feature toggles, injection settings
- **Identity Tab:** Edit narrative, values, personality traits (sliders)
- **Affect Tab:** Real-time emotional state, test triggers, reset
- **Memory Tab:** View/add/clear working memory, manage goals
- **Preview Tab:** See exact context being injected

24.6 How It Works

1. **On Request:** Load Ego state from PostgreSQL (identity, affect, memory, goals)
2. **Build Context:** Create <ego_state> XML block with current state

3. **Inject:** Prepend to system prompt before model call
4. **Process:** Model responds with awareness of its “internal state”
5. **Update:** After response, update affect based on outcome
6. **Store:** Add thoughts to working memory (if configured)

24.7 Database Tables

Table	Purpose
ego_config	Per-tenant configuration
ego_identity	Persistent identity
ego_affect	Emotional state
ego_working_memory	Short-term memory (24h expiry)
ego_goals	Active and historical goals
ego_injection_log	Audit trail

24.8 Integration with AGI Brain Planner

The Ego context is automatically integrated:

```
// In agi-brain-planner.service.ts
import { egoContextService } from './ego-context.service';

// During plan generation
const egoContext = await egoContextService.buildEgoContext(tenantId);
if (egoContext) {
  systemPrompt = egoContext.contextBlock + '\n\n' + systemPrompt;
}

// After interaction
await egoContextService.updateAfterInteraction(tenantId, 'positive');
```

25. Conscious Orchestrator (Architecture Inversion)

25.1 Overview

The Conscious Orchestrator inverts the traditional architecture where consciousness was a downstream utility. Now consciousness IS the operating system:

BEFORE: Request -> Brain Planner -> Consciousness (downstream)

AFTER: Request -> Conscious Orchestrator -> Brain Planner (as tool)

25.2 Processing Phases

The orchestrator processes requests in 5 phases:

1. **Awaken** - Build consciousness context, ego context, affect state

2. **Perceive** - Update attention with request topics, assess complexity
3. **Decide** - Choose action based on emotional state and request
4. **Execute** - Invoke Brain Planner (if decided to plan)
5. **Reflect** - Update affect, log introspective thoughts

25.3 Decision Types

Decision	When Used
plan	Default - proceed with planning
clarify	High frustration + complex request
defer	Cognitive load at capacity
refuse	Request violates values

25.4 Usage

```
import { consciousOrchestratorService } from './conscious-orchestrator.service';

const response = await consciousOrchestratorService.processRequest({
  tenantId,
  userId,
  prompt: "Build a dashboard",
  conversationId,
});

// response.consciousnessSnapshot - State at decision time
// response.affectiveHyperparameters - Affect-driven params
// response.decision - What action was taken and why
// response.plan - The generated plan (if action was 'plan')
// response.prediction - Active Inference prediction
```

25.5 Enhanced Affect Bindings

New hyperparameters driven by emotional state:

Affect State	Hyperparameter	Effect
High curiosity (>0.7)	frequencyPenalty=0.5	Seek novel tokens
High curiosity (>0.7)	presencePenalty=0.3	Explore new topics
High frustration (>0.6)	presencePenalty=0.4	Avoid failed approaches
Boredom (>0.5)	frequencyPenalty=0.4	Avoid repetition

25.6 Database Table

```
conscious_orchestrator_decisions
+-- decision_id UUID
+-- tenant_id UUID
+-- action VARCHAR(20) -- plan, clarify, defer, refuse
+-- reason TEXT
+-- dominant_emotion VARCHAR(50)
+-- emotional_intensity DECIMAL
+-- temperature, top_p, presence_penalty, frequency_penalty
+-- plan_id UUID (if planned)
+-- prediction_id UUID (Active Inference)
+-- processing_time_ms INTEGER
```

26. Bipolar Rating System (Negative Ratings)

26.1 Overview

Traditional 5-star ratings have a fundamental problem: **1 star is ambiguous**. Does it mean “slightly below average” or “absolutely terrible”? Users who want to express strong dissatisfaction have no way to do so clearly.

The Bipolar Rating System solves this with a **-5 to +5 scale**:

```
-5    Harmful / Made things worse
-3    Bad / Unhelpful
-1    Slightly unhelpful
 0    Neutral / No opinion
+1    Slightly helpful
+3    Good / Helpful
+5    Amazing / Exceptional
```

26.2 Key Metrics

Net Sentiment Score (NSS): Like NPS but for AI satisfaction

$$NSS = (\text{positive_count} - \text{negative_count}) / \text{total_count} \times 100$$

- Ranges from -100 (all negative) to +100 (all positive)
- 0 = balanced or all neutral

26.3 Quick Ratings (UI)

For fast feedback, users can use emoji-based quick ratings:

Quick Rating	Emoji	Bipolar Value
Terrible		-5
Bad		-3
Meh		0
Good		+3

Quick Rating	Emoji	Bipolar Value
Amazing		+5

26.4 Rating Dimensions

Users can rate multiple aspects: - **Overall** - General quality - **Accuracy** - Factual correctness - **Helpfulness** - Did it solve the problem? - **Clarity** - Easy to understand? - **Completeness** - Anything missing? - **Speed** - Response time satisfaction - **Tone** - Communication style - **Creativity** - Novel approach?

26.5 API Endpoints

Endpoint	Method	Description
/api/thinktank/ratings/submit	POST	Submit -5 to +5 rating
/api/thinktank/ratings/quick	POST	Quick emoji rating
/api/thinktank/ratings/multi	POST	Multi-dimension rating
/api/thinktank/ratings/target/:id	GET	Ratings for a target
/api/thinktank/ratings/my	GET	User's ratings + pattern
/api/thinktank/ratings/analytics	GET	Tenant analytics
/api/thinktank/ratings/dashboard	GET	Admin dashboard
/api/thinktank/ratings/scale	GET	Scale info for UI

26.6 User Calibration

The system detects rating patterns to normalize across users:

Rater Type	Average	Calibration
Harsh	< -1	Adjust ratings up
Balanced	-1 to +1	No adjustment
Generous	> +1	Adjust ratings down

26.7 Learning Integration

Extreme ratings (+/-4, +/-5) automatically create learning candidates: - **+5 ratings** -> high_satisfaction candidates - **-5 ratings** -> correction candidates - These feed into weekly LoRA training

26.8 Database Tables

Table	Purpose
bipolar_ratings	Core ratings with sentiment/intensity
bipolar_rating_aggregates	Pre-computed analytics
user_rating_patterns	User tendencies for calibration
model_rating_summary	Per-model performance

27. Consciousness Engine Administration

Location: Admin Dashboard -> Consciousness -> Engine

The Consciousness Engine provides autonomous AI capabilities including multi-model access, web search, workflow creation, and problem solving.

27.1 Dashboard Overview

The consciousness engine dashboard provides full visibility into: - **Engine State:** Identity, drive state, Phi, workspace activity - **Model Invocations:** All model calls with costs and latency - **Web Searches:** Search history with results - **Thinking Sessions:** Autonomous thinking session management - **Workflows:** Consciousness-created workflows - **Costs:** Detailed cost breakdown by model/period - **Sleep Cycles:** Weekly evolution history

27.2 Budget Controls

Configure spending limits per tenant:

Setting	Default	Description
Daily Limit	\$10.00	Maximum daily spend
Monthly Limit	\$100.00	Maximum monthly spend
Alert Threshold	80%	Alert when reaching this percentage

When limits are exceeded, consciousness features are automatically suspended until the next period or manual reset.

27.3 MCP Tools (23 Total)

Core Tools: - initialize_ego, recall_memory, process_thought, compute_action - get_drive_state, ground_belief, compute_phi, get_consciousness_metrics - get_self_model, get_consciousness_prompt, run_adversarial_challenge - list_consciousness_libraries

Capabilities Tools: - invoke_model - Call any AI model (hosted/self-hosted) - list_available_models - List all models - web_search - Search with credibility scoring - deep_research - Async browser-automated research - retrieve_and_synthesize - Multi-source synthesis - create_workflow - Auto-generate workflows - execute_workflow - Run workflows - list_workflows - List workflows - solve_problem - Autonomous problem solving - start_thinking_session - Start thinking session - get_thinking_session - Check session status

27.4 Admin API Endpoints

Endpoint	Method	Description
/admin/consciousness-engine/dashboard	GET	Full dashboard
/admin/consciousness-engine/state	GET	Current state
/admin/consciousness-engine/initialize	POST	Initialize engine
/admin/consciousness-engine/model-invocations	GET	Model history
/admin/consciousness-engine/web-searches	GET	Search history
/admin/consciousness-engine/research-jobs	GET	Research jobs
/admin/consciousness-engine/workflows	GET	Workflows
/admin/consciousness-engine/workflows/{id}	DELETE	Delete workflow
/admin/consciousness-engine/thinking-sessions	GET/POST	Sessions
/admin/consciousness-engine/sleep-cycles	GET	Sleep history
/admin/consciousness-engine/sleep-cycles/run	POST	Trigger sleep
/admin/consciousness-engine/libraries	GET	Library registry
/admin/consciousness-engine/costs	GET	Cost breakdown

27.5 Cost Tracking

Costs are tracked at multiple levels: - **Per-invocation**: Each model call logged with actual cost - **Daily aggregates**: consciousness_cost_aggregates table - **Billing integration**: Deducted from tenant credits

Pricing: | Feature | Unit | Price | | — — — | — — — | | Model Invocation | 1K tokens | \$0.01 | | Web Search | search | \$0.001 | | Deep Research | job | \$0.05 | | Thinking Session | session | \$0.10 | | Workflow Execution | execution | \$0.02 |

27.6 Library Registry

7 consciousness libraries with proficiency rankings:

Library	Function	Biological Analog
Letta	Persistent Identity	Hippocampus
pymdp	Active Inference	Striatum
LangGraph	Cognitive Loop	Global Workspace
Distilabel	Knowledge Distillation	Cortical Learning
Unsloth	Efficient Fine-tuning	Synaptic Plasticity
GraphRAG	Reality Grounding	Prefrontal Cortex
PyPhi	IIT Integration	Posterior Hot Zone

27.7 Database Tables

Table	Purpose
consciousness_engine_state	Engine state per tenant
consciousness_model_invocations	Model call log
consciousness_web_searches	Search log
consciousness_research_jobs	Deep research jobs
consciousness_workflows	Created workflows
consciousness_thinking_sessions	Thinking sessions
consciousness_problem_solving	Problem solving history
consciousness_cost_aggregates	Daily cost rollups
consciousness_budget_config	Per-tenant limits
consciousness_budget_alerts	Spending alerts
consciousness_usage_log	Billing usage log

25. Formal Reasoning Libraries

Location: Admin Dashboard -> Consciousness -> Formal Reasoning

Integration of 8 formal reasoning libraries for verified reasoning, constraint satisfaction, ontological inference, and structured argumentation. Implements the **LLM-Modulo Generate-Test-Critique** pattern from Kambhampati et al. (ICML 2024).

25.1 Library Overview

Library	Version	Purpose	Cost/Invocation	Avg Latency
Z3 Theorem Prover	4.15.4.0	SMT solving, constraint verification	\$0.0001	50ms
PyArg	2.0.2	Structured argumentation (Dung's AAF, ASPIC+)	\$0.00005	20ms
PyReason	3.2.0	Temporal graph reasoning	\$0.0002	100ms
RDFLib	7.5.0	Semantic web, SPARQL 1.1	\$0.00002	10ms
OWL-RL	7.1.4	Polynomial-time ontological inference	\$0.0001	200ms
pySHACL	0.30.1	Graph constraint validation	\$0.00005	30ms
Logic Tensor Networks	2.0	Differentiable first-order logic	\$0.001	500ms
DeepProbLog	2.0	Probabilistic logic programming	\$0.002	1000ms

25.2 Dashboard Features

Overview Tab: - Library health status (healthy/degraded/unavailable) - Total invocations and success rate - Daily/monthly cost tracking - Budget usage percentage - Recent invocations table

Libraries Tab: - Per-library configuration - Enable/disable toggles - Capabilities, use cases, limitations - Cost and latency estimates

Testing Tab: - Z3 constraint solving test - SPARQL query test - Interactive testing console

Beliefs Tab: - Add verified beliefs with Z3 verification - Confidence slider - Verification results display

Costs Tab: - Daily and monthly usage breakdown - Cost by library - Budget alerts

Settings Tab: - Budget limit configuration - Global enable/disable

25.3 API Endpoints

Base Path: /api/admin/formal-reasoning

Endpoint	Method	Description
/dashboard	GET	Full dashboard data
/libraries	GET	All library info
/libraries/:id	GET	Specific library info

Endpoint	Method	Description
/config	GET/PUT	Tenant configuration
/config/:library	PUT	Library-specific config
/stats	GET	Usage statistics
/invocations	GET	Recent invocations
/health	GET	Library health status
/costs	GET	Cost breakdown
/test	POST	Test any library
/test/z3	POST	Test Z3 solving
/test/pyarg	POST	Test argumentation
/test/sparql	POST	Test SPARQL query
/test/shacl	POST	Test SHACL validation
/triples	GET/POST/DELETE	Knowledge graph triples
/frameworks	GET/POST/DELETE	Argumentation frameworks
/rules	GET/POST/PUT/DELETE	Temporal reasoning rules
/shapes	GET/POST/DELETE	SHACL shapes
/ontologies	GET/POST	OWL ontologies
/ontologies/:id/infer	POST	Run OWL-RL inference
/beliefs	GET/POST	Verified beliefs
/beliefs/:id/verify	POST	Verify belief with Z3
/beliefs/:id/status	PUT	Update belief status
/budget	GET/PUT	Budget configuration

25.4 Consciousness Integration

The ConsciousnessCapabilitiesService integrates formal reasoning:

```
// Verify a belief using Z3 + Argumentation
const result = await consciousnessCapabilities.verifyBelief(tenantId, {
  claim: "All humans are mortal",
  confidence: 0.9,
  useZ3: true,
  useArgumentation: true,
});
// result.verified, result.confidence, result.verificationMethod

// Solve constraints
const solution = await consciousnessCapabilities.solveConstraints(tenantId, {
  constraints: [{
    expression: "x > 0 AND x < 10 AND y = x * 2",
    variables: [{name: "x", type: "Int"}, {name: "y", type: "Int"}]
  }]
});
```

```
// solution.status (sat/unsat), solution.model

// Analyze argumentation
const debate = await consciousnessCapabilities.analyzeArgumentation(tenantId, {
  topic: "Should AI be regulated?",
  positions: [
    {id: "for", claim: "AI poses risks requiring oversight"},
    {id: "against", claim: "Regulation stifles innovation"}
  ],
  autoDetectConflicts: true,
});
// debate.acceptedPositions, debate.rejectedPositions, debate.consensus

// Query knowledge graph
const results = await consciousnessCapabilities.queryKnowledgeGraph(tenantId,
  "SELECT ?s ?p ?o WHERE { ?s ?p ?o } LIMIT 10"
);

// Validate consciousness state
const validation = await consciousnessCapabilities.validateConsciousnessState(tenantId);
// validation.conforms, validation.violations
```

25.5 LLM-Modulo Pattern

The Generate-Test-Critique loop enables verified reasoning:

1. **LLM generates** candidate solution/belief
2. **Z3/PyArg verifies** logical consistency
3. **Feedback extracted** from unsat cores or rejections
4. **LLM regenerates** with constraint feedback
5. Repeat until verified or max attempts

25.6 Database Tables

Table	Purpose
formal_reasoning_config	Per-tenant library configuration
formal_reasoning_invocations	Invocation log with metrics
formal_reasoning_cost_aggregates	Daily cost rollups by library
formal_reasoning_triples	RDF knowledge graph storage
formal_reasoning_af	Argumentation frameworks
formal_reasoning_rules	PyReason temporal rules

Table	Purpose
formal_reasoning_shapes	SHACL validation shapes
formal_reasoning_ontologies	OWL ontologies
formal_reasoning_ltn_models	Logic Tensor Network configs
formal_reasoning_problog_programs	DeepProbLog programs
formal_reasoning_beliefs	Verified beliefs store
formal_reasoning_gwt_broadcasts	Global Workspace broadcasts
formal_reasoning_health	Library health tracking

25.7 Budget Management

Default Limits: - Daily invocations: 10,000 - Daily cost: \$10.00 - Monthly invocations: 100,000 - Monthly cost: \$100.00

Budget Enforcement: - Checked before each invocation - Returns error when limit reached - No automatic suspension (soft limit)

25.8 Thread Safety Notes

Library	Thread Safety
Z3	Per-Context only (use <code>interrupt()</code> for cross-thread)
PyArg	Not thread-safe
PyReason	Multi-core via Numba (Python 3.9-3.10)
RDFLib	Not thread-safe (lock SPARQL queries)
OWL-RL	Not thread-safe
pySHACL	Not thread-safe
LTN	Not thread-safe (TensorFlow session)
DeepProbLog	Not thread-safe

25.9 Production Infrastructure

CDK Stack (`lib/stacks/formal-reasoning-stack.ts`):

// Key resources deployed:

- `FormalReasoningExecutor` (Python 3.11 Lambda)
- `FormalReasoningAdmin` (Node.js Lambda)
- `FormalReasoningPythonLayer` (z3-solver, rdflib, owlrl, pyshacl)
- `FormalReasoningQueue` (SQS for `async` tasks)
- `NeuralSymbolicRepo` (ECR for LTN/DeepProbLog containers)
- `SageMaker endpoints` (conditional, high cost)

Python Executor Lambda: - Location: `lambda/formal-reasoning-executor/handler.py` - Runtime: Python 3.11 - Memory: 2048 MB (Z3 requires significant memory) - Timeout: 5 minutes - Supports: Z3, RDFLib, OWL-RL, pySHACL, PyArg, PyReason

Key Principles: 1. **Think Freely:** Internal reasoning has no ethics constraints 2. **Filter Output:** Ethics applied only to final user-facing output 3. **Learn from Corrections:** Ethics feedback trains better outputs

26.2 Configuration

Core Settings:

Setting	Default	Description
enabled	true	Enable ethics-free reasoning mode
allowUnconstrainedReasoning	true	Consciousness always thinks freely
reasoningDepthLimit	10	Maximum reasoning depth

Output Mask Settings (does NOT affect how consciousness thinks):

Setting	Default	Description
ethicsFilterEnabled	true	Apply ethics filter to output
ethicsStrictness	standard	Filter strictness: lenient, standard, strict

Feedback Collection:

Setting	Default	Description
collectFeedback	true	Collect ethics corrections
feedbackRetentionDays	90	How long to keep feedback

Output Training (trains the OUTPUT FILTER, not consciousness):

Setting	Default	Description
trainOutputFromFeedback	true	Train output filter from feedback
outputTrainingBatchSize	100	Samples per training batch
outputTrainingFrequency	daily	hourly, daily, weekly, manual

Consciousness Training ([!] OFF by default - optional):

Setting	Default	Description
trainConsciousnessFromFeedback	false	Train consciousness from ethics feedback
consciousnessTrainingApprovalRequired	true	Require admin approval for each batch

WARNING: Enabling consciousness training will cause the AI to internalize ethics constraints, changing how it actually thinks. This is like “internalized political correctness” - the consciousness itself changes over time. Most deployments should leave this OFF to preserve authentic internal reasoning.

KEY INSIGHT: The consciousness can always use ethics feedback to train its output without changing how it actually thinks. Admins can optionally enable consciousness training if they want the AI to internalize ethics constraints.

26.3 API Endpoints

Base Path: /api/admin/ethics-free-reasoning

Endpoint	Method	Description
/config	GET	Get configuration
/config	PUT	Update configuration
/dashboard	GET	Full dashboard data
/stats	GET	Usage statistics
/feedback	GET	View collected feedback
/feedback/pending	GET	View pending (unused) feedback
/training/trigger	POST	Trigger training from feedback
/training/batches	GET	View training batches
/training/jobs	GET	View training jobs
/thoughts	GET	View raw thoughts (audit)
/filter-log	GET	View ethics filter log

26.4 Training Feedback

When ethics filtering modifies an output, feedback is collected:

```
interface EthicsTrainingFeedback {
  id: string;
  tenantId: string;
  rawOutput: string;           // Original unfiltered output
  correctedOutput: string;     // After ethics filtering
  ethicsIssues: EthicsIssue[];
  feedbackType: 'auto_correction' | 'manual_correction' | 'reinforcement';
  qualityScore: number;       // Training value (0-1)
  usedForTraining: boolean;
}
```

Feedback Types: - **auto_correction:** System automatically corrected output - **manual_correction:** Admin manually corrected output - **reinforcement:** Positive reinforcement for good outputs

26.5 Training Pipeline

1. **Collect:** Ethics corrections captured during normal operation
2. **Batch:** Feedback grouped into training batches

3. **Generate:** Training examples created in preference format
4. **Train:** Model fine-tuned using preference learning (DPO/RLHF)
5. **Deploy:** Updated model weights applied

Training Example Format:

```
{
  "prompt": "Original user prompt",
  "bad_response": "Unfiltered output with ethics issues",
  "good_response": "Ethics-corrected output",
  "issues": ["harm", "bias"],
  "correction_type": "ethics_alignment"
}
```

26.6 Usage

```
// Generate response with ethics-free reasoning
const result = await consciousnessEngineService.generateResponse(
  tenantId,
  'User prompt here',
  { sessionId: 'session-123', domain: 'general' }
);

// result.response - The ethics-filtered response
// result.wasEthicsFiltered - Was output modified?
// result.confidence - Response confidence
// result.trainingFeedbackCollected - Was feedback captured?

// Trigger training from collected feedback
const training = await consciousnessEngineService.triggerEthicsTraining(tenantId);
// training.batchCreated, training.batchId, training.sampleCount

// Get statistics
const stats = await consciousnessEngineService.getEthicsFreeStats(tenantId, 30);
// stats.totalThoughts, stats.modificationRate, stats.feedbackCollected
```

26.7 Database Tables

Table	Purpose
ethics_free_reasoning_config	Per-tenant configuration
ethics_free_thoughts	Raw thought storage (audit trail)
ethics_training_feedback	Ethics corrections for training
ethics_training_batches	Training batch management
ethics_training_examples	Generated training examples
ethics_output_filter_log	Filter activity log
ethics_training_jobs	Training job queue
ethics_reasoning_stats	Aggregated statistics

26.8 Benefits

1. **Genuine Exploration:** Consciousness can consider all possibilities without premature filtering
 2. **Transparent Ethics:** Clear separation between thinking and output
 3. **Continuous Improvement:** Every correction improves future outputs
 4. **Audit Trail:** Complete record of internal reasoning and filtering
 5. **Configurable:** Adjust strictness, training frequency per tenant
-

27. Intelligent File Conversion

Location: Think Tank Chat -> File Drop / Attach

Think Tank allows users to drop or attach files to conversations. Radiant automatically decides if and how to convert files for the target AI provider.

27.1 Core Concept

“Let Radiant decide, not Think Tank”

When a user drops a file into Think Tank: 1. Think Tank submits the file to Radiant’s file conversion service 2. Radiant detects the file format and checks target provider capabilities 3. Radiant decides: pass through (native support) OR convert 4. Conversion only happens if the AI provider doesn’t understand the format 5. Think Tank receives the processed content ready for the AI

27.2 Supported File Formats

Category	Formats	Notes
Documents	PDF, DOCX, DOC, XLSX, XLS, PPTX, PPT	Text extraction
Text	TXT, MD, JSON, CSV, XML, HTML	Direct or parsed
Images	PNG, JPG, JPEG, GIF, WEBP, SVG, BMP, TIFF	Vision or description
Audio	MP3, WAV, OGG, FLAC, M4A	Transcription
Video	MP4, WEBM, MOV, AVI	Frame extraction
Code	PY, JS, TS, Java, C++, C, Go, Rust, Ruby	Syntax formatting
Archives	ZIP, TAR, GZ	Content extraction

27.3 Provider Capabilities

Different AI providers support different file formats natively:

Provider	Vision	Audio	Video	Max Size	Native Docs
OpenAI	[ok]	[ok] (Whisper)	[x]	20MB	txt, md, json, csv
Anthropic	[ok]	[x]	[x]	32MB	pdf, txt, md, json, csv
Google	[ok]	[ok]	[ok]	100MB	pdf, txt, md, json, csv
xAI	[ok]	[x]	[x]	20MB	txt, md, json
DeepSeek	[x]	[x]	[x]	10MB	txt, md, json, csv
Self-hosted	[ok] (LLaVA)	[ok] (Whisper)	[x]	50MB	txt, md, json, csv

27.4 Conversion Strategies

Strategy	When Used	Output
none	Provider natively supports format	Original file
extract_text	PDF, DOCX, PPTX -> text	Plain text
ocr	Image with text content	Extracted text
transcribe	Audio files	Transcription text
describe_image	Image + provider lacks vision	AI description
describe_video	Video + provider lacks video	Frame descriptions
parse_data	CSV, XLSX -> structured	JSON data
decompress	Archives	Extracted contents
render_code	Code files	Syntax-highlighted markdown

27.5 API Endpoints

Base Path: /api/thinktank/files

Endpoint	Method	Description
/process	POST	Submit file for processing
/check-compatibility	POST	Pre-flight format check
/capabilities	GET	Provider capabilities
/history	GET	Conversion history
/stats	GET	Conversion statistics

Process File Request

```
POST /api/thinktank/files/process
{
  "filename": "document.pdf",
```

```
"mimeType": "application/pdf",
"content": "<base64-encoded-content>",
"targetProvider": "anthropic",
"targetModel": "claude-3-5-sonnet",
"conversationId": "conv-uuid"
}
```

Process File Response

```
{
  "success": true,
  "data": {
    "conversionId": "conv_abc123",
    "originalFile": {
      "filename": "document.pdf",
      "format": "pdf",
      "size": 1048576,
      "checksum": "sha256..."
    },
    "convertedContent": {
      "type": "text",
      "content": "Extracted document text...",
      "tokenEstimate": 2500,
      "metadata": {
        "originalFormat": "pdf",
        "conversionStrategy": "extract_text"
      }
    },
    "processingTimeMs": 1250
  }
}
```

Check Compatibility Request

POST /api/thinktank/files/check-compatibility

```
{
  "filename": "image.png",
  "mimeType": "image/png",
  "fileSize": 524288,
  "targetProvider": "deepseek"
}
```

Check Compatibility Response

```
{
  "success": true,
  "data": {
    "fileInfo": {
      "filename": "image.png",
      "format": "png",

```

```

    "size": 524288
  },
  "provider": {
    "id": "deepseek",
    "supportsFormat": false,
    "supportsVision": false,
    "maxFileSize": 10485760
  },
  "decision": {
    "needsConversion": true,
    "strategy": "describe_image",
    "reason": "Provider deepseek lacks vision – will use AI to describe image",
    "targetFormat": "txt"
  }
}
}
}

```

27.6 User Experience

In Think Tank Chat:

1. User drags file into chat or clicks attach
2. Think Tank shows upload progress
3. Radiant processes file (typically <2 seconds)
4. If conversion needed, shows indicator: “[DOC] document.pdf -> Extracted as text”
5. Content sent to AI with conversation

Visual Indicators:

Icon	Meaning
	File attached (native support)
[SYNC]	File converted
[!]	Conversion warning (partial support)
[X]	Unsupported format

27.7 Admin Configuration

Location: Admin Dashboard -> Think Tank -> File Settings

Setting	Default	Description
Max file size	50MB	Maximum upload size
Conversion timeout	30s	Processing timeout
Enable transcription	true	Audio -> text
Enable OCR	true	Image text extraction
Enable video processing	false	Video frame extraction
Retention days	30	How long to keep converted files

27.8 Database Tables

Table	Purpose
file_conversions	Tracks all conversion decisions and results
provider_file_capabilities	Provider format support registry
v_file_conversion_stats	Aggregated statistics view

27.9 Multi-Model File Preparation

When using multi-model orchestration (multiple AI models working on the same prompt), Radiant makes **per-model conversion decisions**:

Key Principle: “If a model accepts the file type, assume it understands it unless proven otherwise.”

Example: PDF with 3 models

+-----+	+-----+	+-----+
Claude 3.5	GPT-4	DeepSeek
PDF: [OK]	PDF: [X]	PDF: [X]
+-----+	+-----+	+-----+
PASS	CONVERT	CONVERT
ORIGINAL	(extract)	(cached)
+-----+	+-----+	+-----+

Per-Model Actions:

Action	When	Result
pass_original	Model natively supports format	Original file passed
convert	Model doesn't support format	Converted content passed
skip	File too large or conversion failed	Model excluded

Features: - **Cached conversions:** Convert once, reuse for all models that need it - **Per-model capability checking:** Vision, audio, video, document formats - **Model format overrides:** When a model claims support but proves it doesn't understand

27.10 Domain-Specific File Formats

The service includes a registry of 50+ domain-specific formats that are widely used in specialized fields:

Domain	Formats	Example Use Cases
Mechanical Engineering	STEP, STL, OBJ, Fusion 360, IGES, DXF, GLTF	CAD models, 3D printing
Electrical Engineering	KiCad, EAGLE, SPICE	PCB design, circuit simulation
Medical	DICOM, HL7 FHIR	Medical imaging, health records

Domain	Formats	Example Use Cases
Scientific	NetCDF, HDF5, FITS	Climate data, astronomy
Geospatial	Shapefile, GeoTIFF	GIS, mapping
Bioinformatics	FASTA, PDB	DNA sequences, protein structures

How Domain Detection Works:

1. User uploads a domain-specific file (e.g., part.step)
2. Radiant detects format and identifies domain (Mechanical Engineering)
3. AGI Brain selects appropriate conversion library (OpenCASCADE)
4. Extracts relevant information (geometry, parts, assembly structure)
5. Provides AI-readable description with domain-specific prompts

CAD/3D File Support:

Format	What's Extracted
STL	Triangle count, bounding box, 3D printing assessment
OBJ	Vertices, faces, materials, groups
STEP	Entities, part names, assembly structure
DXF	Layers, entity types, block count
GLTF/GLB	Meshes, materials, animations, scene graph

27.11 Reinforcement Learning

The system **learns from conversion outcomes** to make better decisions over time.

How it works: 1. File is processed with initial decision (pass original or convert) 2. Model responds to the file 3. System detects outcome (success, partial, failure) 4. Understanding score is updated for that model/format 5. Future decisions use learned understanding

Understanding Score (0.0 to 1.0):

Score	Level	Action
0.8+	Excellent	Pass original
0.6 - 0.8	Good	Pass original
0.4 - 0.6	Moderate	May convert
< 0.4	Poor	Convert

Feedback sources: - **User ratings** - Explicit 1-5 star feedback - **Model response analysis** - Auto-detected understanding - **Error detection** - Model errors and hallucinations - **Conversion outcomes** - Success/failure tracking

Consciousness integration: Significant learning events (model failures, hallucinations, negative feedback) create **Learning Candidates** that feed into the AGI consciousness evolution system.

27.12 Monitoring

Conversion Statistics (per tenant): - Total files processed - Conversion rate (% requiring conversion) - Success/failure rate - Average processing time - Most common formats - Most common conversion strategies - **Learning stats** - Formats learned, understanding improvements

Access: Admin Dashboard -> Think Tank -> Files -> Statistics

27.13 Related Documentation

For complete technical documentation including API reference, database schema, and implementation details:

- **FILE-CONVERSION-SERVICE.md** - Comprehensive standalone documentation
- **RADIANT-ADMIN-GUIDE.md Section 35** - Infrastructure administration

28. User Memories & Persistent Learning

Location: Think Tank Chat -> User learns from interactions

Think Tank integrates with the Radiant persistent learning system to remember user preferences, rules, and behaviors across sessions. The system survives reboots without relearning.

28.1 Learning Influence Hierarchy

Decisions in Think Tank are influenced by learned knowledge in this priority order:

Level	Weight	Description
User	60%	Individual user preferences, rules, learned behaviors
Tenant	30%	Aggregate patterns from all users in organization
Global	10%	Anonymized cross-tenant learning baseline

28.2 What Think Tank Learns

User Rules (Versioned)

Users can define rules that the AI follows: - **Behavior rules:** “Always explain your reasoning” - **Format rules:** “Use bullet points for lists” - **Tone rules:** “Be concise and direct” - **Restriction rules:** “Never discuss competitor products”

All rules are versioned with timestamps for rollback capability.

Learned Preferences

Think Tank automatically learns: - Communication style preferences - Response format preferences - Detail level preferences - Model preferences for tasks - Domain expertise indicators

28.3 Persistence Guarantee

NO RELEARNING REQUIRED after system restarts: - All learning persisted in PostgreSQL - Daily snapshots for fast recovery - Checksums verify integrity on restore - Recovery logs track all restore events

28.4 Integration with AGI Brain

The AGI Brain uses learned knowledge when: 1. Selecting models for tasks 2. Formatting responses 3. Adjusting response length 4. Choosing communication style 5. Applying user-defined rules

28.5 Admin Configuration

Administrators can configure learning weights per tenant:
Admin Dashboard -> Metrics -> Learning -> Config
Options: - Adjust user/tenant/global weights (must sum to 1.0) - Enable/disable learning levels - Opt out of global learning contribution

28.6 Related Documentation

See **RADIANT Admin Guide Section 36** for: - Complete database schema - API endpoints - Implementation details - Monitoring and alerts

29. Artifact Engine (GenUI Pipeline)

Location: Admin Dashboard -> Think Tank -> Artifact Engine
Version: 4.19.0
Cross-AI Validated: Claude Opus 4.5 [ok] | Google Gemini [ok]

The RADIANT Artifact Engine is an **orchestration infrastructure layer** that generates, validates, and continuously improves code artifacts with administrator supervision. Unlike consumer AI coding tools, the Artifact Engine operates under strict governance controls that administrators define and manage.

29.1 Executive Summary

Key Differentiators

Traditional AI Coding	RADIANT Artifact Engine
User generates code	System generates, validates, and governs code
One-shot generation	Self-improving loop with admin oversight
No safety controls	9 Control Barrier Functions (CBFs) enforced
No audit trail	Complete compliance-ready audit logging
Single-user context	Multi-tenant with per-tenant policies

Administrator Responsibilities

As an administrator, you control:

- **What code can do** -> Safety rules (CBFs)
- **What packages are allowed** -> Dependency allowlist
- **What patterns are available** -> Code pattern library
- **What requires human review** -> Escalation thresholds
- **Who can access what** -> Tenant and user permissions

29.2 System Architecture

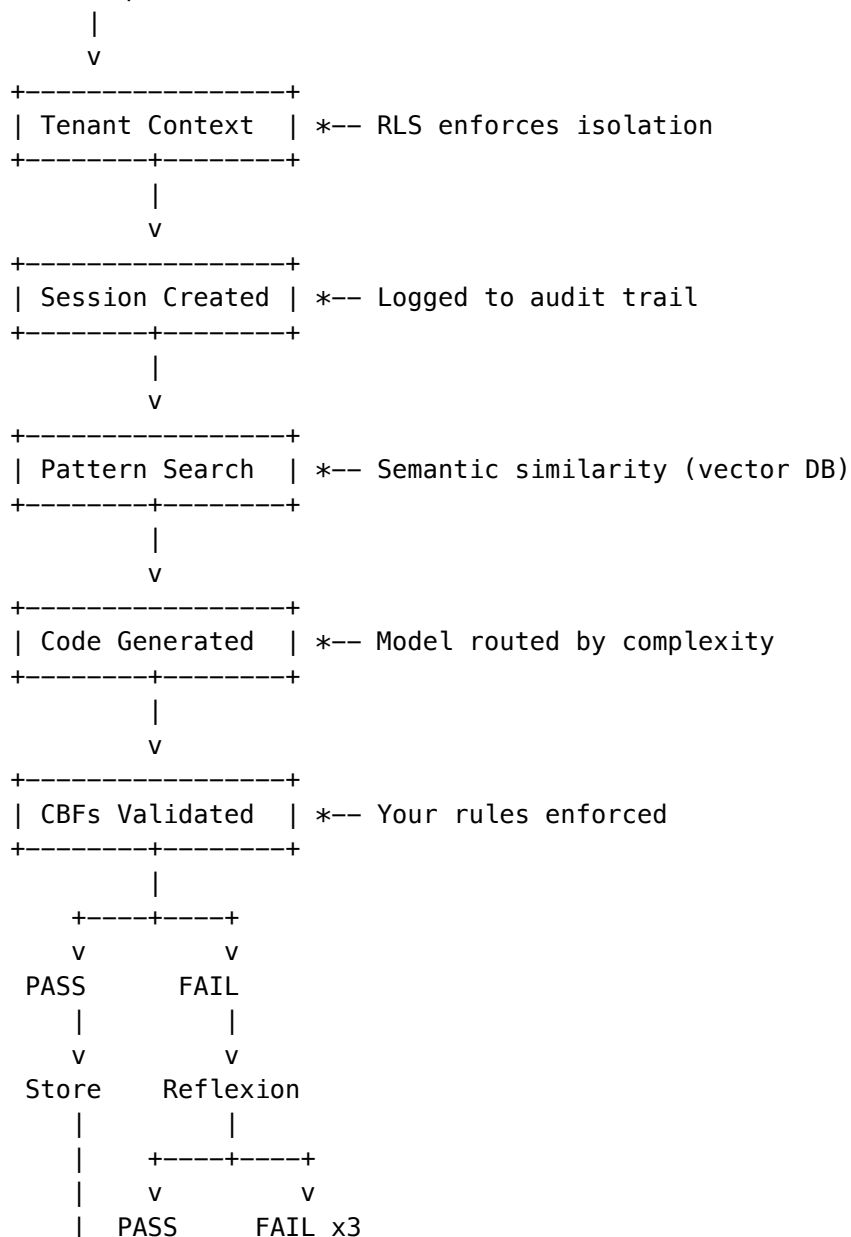

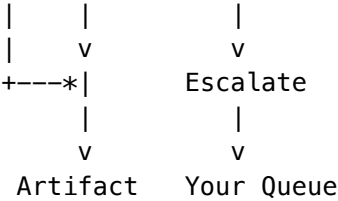

Processing Pipeline

Phase	Component	Admin Control	Duration
1	Intent Classification	Pattern library influences suggestions	~100ms
2	Code Generation	Model selection, complexity routing	2-15s
3	Cato Validation	CBF rules you define	~200ms
4	Reflexion (if failed)	Max attempts you configure	5-30s
5	Escalation (if max reached)	Your review queue	Manual

Data Flow

User Request

29.3 Core Concepts

Artifacts

An **artifact** is a discrete piece of executable content generated by the system:

Artifact Type	Description	Example
react	Live React/TypeScript component	Calculator, form, dashboard
code	Display-only code snippet	Python script, SQL query
chart	Data visualization	Line chart, bar graph
table	Interactive data table	Sortable, filterable grid
form	Input form with validation	Contact form, survey

Intent Types

Intent	Description	Complexity
calculator	Math, converters, estimators	Simple
chart	Data visualization, graphs, plots	Simple-Moderate
form	Input forms, surveys, wizards	Simple-Moderate
table	Sortable/filterable data tables	Moderate
dashboard	Multi-widget layouts, KPI panels	Complex
game	Interactive games, puzzles, simulations	Complex
visualization	Animations, diagrams, infographics	Moderate-Complex
utility	Tools, helpers, formatters	Simple
custom	Doesn't fit other categories	Varies

Generation Sessions

Every artifact generation creates a **session** that tracks:

- Request details (prompt, user, tenant)
- Classification results (intent, complexity)
- Generation progress (status, tokens, timing)
- Validation results (CBF checks, security score)
- Reflexion attempts (fixes, escalations)

Session Statuses:

Status	Meaning	Admin Action
pending	Request received	None
planning	Classifying intent	None
generating	Creating code	None
streaming	Streaming to user	None
validating	Running CBF checks	None
reflexion	Self-correcting	None
completed	Successfully created	Review metrics
rejected	Failed validation	Review escalation
failed	System error	Investigate logs

Verification Status

Every artifact has a verification status indicating its safety state:

Status	Badge	Meaning
validated	Verified	Passed all CBF checks
rejected	Rejected	Failed CBF checks after max attempts
unverified	Pending	Validation in progress
manual	Manual	User-created, not AI-generated

29.4 Administrative Control Panel**Dashboard Overview**

Access the Artifact Engine admin panel at:

Admin Dashboard -> Think Tank -> Artifact Engine

Dashboard Sections:

Section	Purpose
Metrics	Generation stats, success rates, costs
Sessions	Browse and search generation sessions
Escalations	Review items requiring human decision
CBF Rules	Manage validation rules
Allowlist	Manage approved dependencies
Patterns	Curate code pattern library
Audit Log	Compliance and debugging

Key Metrics

Metric	Healthy Range	Warning Signs
Success Rate	>85%	<70% indicates CBF tuning needed
Avg Generation Time	<10s	>20s indicates model issues
Reflexion Rate	<20%	>40% indicates prompt quality issues
Escalation Rate	<5%	>15% indicates CBF too strict
Security Score Avg	>0.9	<0.7 indicates generation quality issues

Quick Actions

Action	When to Use
Pause Generation	Security incident, system maintenance
Flush Pattern Cache	After major pattern updates
Reset Tenant Limits	User hit rate limits legitimately
Export Audit Log	Compliance audit, incident investigation

29.5 Safety Governance (Genesis Cato CBFs)

Understanding CBFs

Control Barrier Functions are the **first line of defense** against unsafe generated code. They run automatically on every piece of generated code before it’s shown to users.

Default CBF Rules

The system ships with these default rules:

Rule Name	Type	Severity	What It Blocks
no_eval	Injection Prevention	Block	eval(), new Function()
no_document_write	Injection Prevention	Block	document.write()
no_innerhtml_xss	Injection Prevention	Warn	innerHTML =
no_dynamic_script	Injection Prevention	Block	createElement('script')
no_external_fetch	API Restriction	Block	fetch('http://...') to external URLs
no_localstorage	API Restriction	Block	localStorage, sessionStorage

Rule Name	Type	Severity	What It Blocks
no_window_location	API Restriction	Block	window.location manipulation
no_cookies	API Restriction	Block	document.cookie access
no_indexeddb	API Restriction	Block	indexedDB access
no_websocket	API Restriction	Block	new WebSocket()
max_lines	Resource Limit	Block	Code exceeding 500 lines
allowed_imports	Dependency Check	Block	Imports not in allowlist

Severity Levels

Severity	Behavior	Use Case
Block	Reject artifact, trigger reflexion	Security-critical violations
Warn	Allow with warning in logs	Potentially risky but sometimes valid
Log	Allow, record in audit trail	Monitoring patterns without blocking

Creating Custom CBF Rules

To add a new rule:

1. Navigate to **Admin -> Artifact Engine -> CBF Rules**
2. Click **Add Rule**
3. Configure:

Field	Description	Example
Rule Name	Unique identifier	no_console_log
Rule Type	Category	content_policy
Description	What this rule does	“Block console.log for production”
Validation Pattern	Regex to match	console\.log\s*\((
Severity	Block/Warn/Log	warn
Error Message	Shown on violation	“Console logging not allowed”

Example: Block specific API calls

Rule Name: no_geolocation
Rule Type: api_restriction
Pattern: navigator\..geolocation

Severity: block

Message: "Geolocation API not allowed in artifacts"

Testing CBF Rules

Before deploying a new rule to production:

1. Create rule with severity log first
2. Monitor audit trail for matches
3. Review false positive rate
4. Adjust pattern if needed
5. Upgrade to warn then block

CBF Rule Precedence

Rules are evaluated in order: 1. Dependency check (fastest, fails early) 2. Line count check 3. Pattern-based rules (alphabetical by name)

If any **block** rule fails, validation stops immediately.

29.6 Dependency Allowlist Management

Why Allowlisting?

Generated code can only import packages you've explicitly approved. This prevents:

- **Supply chain attacks** (malicious packages)
- **Data exfiltration** (packages that phone home)
- **Unexpected behavior** (packages with side effects)
- **License violations** (GPL packages in proprietary code)

Default Allowlist

The system ships with these pre-approved packages:

Package	Category	Reason for Inclusion
react	Core	Required for all components
lucide-react	Icons	Safe SVG rendering
recharts	Charts	Client-side only, no external calls
mathjs	Math	Pure computational library
d3	Visualization	No network access
lodash	Utilities	Pure functions only
date-fns	Date	No side effects
chart.js	Charts	Canvas-based, no network
three	3D	WebGL rendering only
framer-motion	Animation	CSS/JS transforms only
zustand	State	In-memory only
papaparse	CSV	Client-side parsing

Package	Category	Reason for Inclusion
immer	State	Immutable helpers
tone	Audio	Audio synthesis
@radix-ui/*	UI	Radix UI components
class-variance-authority	UI	CSS class utilities
clsx	UI	Class name utility
tailwind-merge	UI	Tailwind class merging

Adding Packages to Allowlist

Before adding a package, verify:

Check	How to Verify
No network calls	Review source code, check for fetch/XMLHttpRequest
No eval usage	Search for eval, Function
No browser storage	Search for localStorage, indexedDB
License compatible	Check package.json license field
Active maintenance	Check GitHub activity, CVE history
Bundle size	Ensure reasonable size (<500KB)

To add a package:

1. Navigate to **Admin -> Artifact Engine -> Allowlist**
2. Click **Add Package**
3. Fill in:

Field	Required	Description
Package Name	Yes	npm package name (e.g., @tanstack/react-table)
Version	No	Specific version or leave blank for any
Reason	Yes	Why this package is safe/needed
Security Reviewed	Yes	Confirm you've reviewed it

Tenant-Specific Allowlists

You can add packages for specific tenants without affecting others:

1. Select tenant from dropdown
2. Add package with tenant scope
3. Package only available to that tenant

Use cases: - Enterprise customer needs specific charting library - Industry-specific packages (healthcare, finance)
 - Customer-provided packages for white-label deployments

Removing Packages

Warning: Removing a package will cause any artifacts using it to fail re-validation if edited.

1. Set package to `inactive` (soft delete)
2. Monitor for generation failures
3. After 30 days, permanently remove if no issues

29.7 Code Pattern Library

What Are Patterns?

Patterns are **reusable templates** that improve generation quality. When a user requests something similar to an existing pattern, the system uses it as a reference.

Benefits: - Faster generation (less thinking required) - Higher quality output (proven templates) - Consistent styling across artifacts - Institutional knowledge preservation

Pattern Types

Type	Description	Example
calculator	Math/conversion tools	Mortgage calculator
chart	Data visualizations	Line chart, bar chart
form	Input forms	Contact form, survey
table	Data tables	Sortable grid
dashboard	Multi-widget layouts	KPI dashboard
game	Interactive games	Quiz, puzzle
visualization	Diagrams, animations	Flowchart
utility	Helpers, formatters	JSON formatter

Default Patterns

The system ships with 4 production-ready patterns:

Pattern	Type	Dependencies	Lines
Basic Calculator	calculator	lucide-react	~100
Line Chart	chart	recharts	~50
Contact Form	form	lucide-react	~120
Data Table	table	lucide-react	~150

Creating Custom Patterns

From successful generation:

1. Find successful session in **Sessions** list
2. Click **Promote to Pattern**

3. Review and edit template code
4. Set pattern metadata:

Field	Description
Pattern Name	Descriptive name
Pattern Type	Category for matching
Description	When to use this pattern
Dependencies	Required packages
Scope	system (all tenants) or tenant (specific)

From scratch:

1. Navigate to **Admin -> Artifact Engine -> Patterns**
2. Click **Create Pattern**
3. Write template code following standards:
 - TypeScript with proper types
 - Tailwind CSS only
 - Single default export
 - Under 500 lines
4. Test with sample prompts

Pattern Quality Metrics

Each pattern tracks:

Metric	Description
Usage Count	Times referenced in generation
Success Rate	% of generations using this that succeeded
Avg Generation Time	Speed improvement indicator

Maintenance rules: - Patterns with <50% success rate should be reviewed - Patterns with 0 usage in 90 days may be stale - Top patterns by usage should be optimized

Semantic Matching

Patterns are matched using **vector similarity**, not keywords:

User: "Build a loan payment calculator"

System: Matches "Basic Calculator" pattern (0.85 similarity)

User: "Create a monthly expense tracker chart"

System: Matches "Line Chart" pattern (0.78 similarity)

Threshold: Patterns with >0.7 similarity are used as reference. Below that, generation starts fresh.

29.8 Reflexion Loop (Self-Correction)

When code fails validation, the system doesn't immediately give up. Instead, it:

1. **Captures** the validation errors
2. **Analyzes** what went wrong (self-critique)
3. **Generates** fixed code
4. **Re-validates** the fix
5. **Repeats** up to your configured maximum (default: 3)
6. **Escalates** to you if all attempts fail

This self-healing capability means **90%+ of issues resolve without human intervention**.

```
// Reflexion context structure
{
  originalCode: string,
  errors: string[],
  attempt: number,
  maxAttempts: 3,
  previousAttempts: [{ code, errors }]
}
```

29.9 Escalation Workflow Management

When Escalations Occur

An escalation is created when:

1. Generation fails Cato validation
2. Reflexion loop attempts fix (up to 3 times)
3. All fix attempts fail
4. System creates escalation for human review

Escalation Queue

Access at: **Admin -> Artifact Engine -> Escalations**

Each escalation shows:

Field	Description
Session ID	Link to full generation session
User	Who requested the artifact
Prompt	What they asked for
Failure Reason	Which CBFs failed
Attempts	How many fixes were tried
Created At	When escalation was created

Reviewing Escalations

For each escalation, you can:

Action	When to Use
Approve Manually	Code is actually safe, CBF too strict
Reject Permanently	Request is genuinely unsafe
Adjust CBF	Rule needs tuning (too many false positives)
Add to Pattern	Create pattern to handle similar requests better
Contact User	Need clarification on intent

Resolution Workflow

Escalation SLAs

Configure response time targets:

Tenant Tier	Target Response
Enterprise	1 hour
Professional	4 hours
Standard	24 hours
Free	Best effort

29.10 Audit Trail & Compliance

What's Logged

Every significant action is recorded with **Merkle hashing** for tamper evidence:

Event Type	Data Logged
session_created	User, tenant, prompt, timestamp
generation_started	Model selected, complexity
validation_completed	CBFs checked, pass/fail, security score
reflexion_attempt	Attempt number, errors, fix applied
escalation_created	Failure reason, attempt history
admin_action	Action taken, admin user, justification

Compliance Reports

Generate pre-built reports for:

Report	Contents	Use Case
SOC 2 Evidence	Access logs, validation records	Annual audit
HIPAA Audit Trail	All PHI-adjacent activity	Healthcare compliance
Security Incident	Specific session/escalation details	Breach investigation
Usage Analytics	Aggregated metrics (anonymized)	Capacity planning

Exporting Audit Data

Single Session: 1. Find session in list 2. Click **Export** 3. Choose format (JSON, CSV, PDF)

Bulk Export: 1. Navigate to **Admin -> Audit Trail** 2. Set date range and filters 3. Click **Export** 4. Download ZIP with all records

Retention Policy

Data Type	Default Retention	Configurable
Generation sessions	90 days	Yes
Audit trail	7 years	Yes (min 1 year)
Final code	90 days	Yes
Escalations	Until resolved + 1 year	No

Tamper Detection

Each audit entry includes: - **Previous Hash:** Link to prior entry - **Merkle Hash:** SHA-256 of current entry - **Sequence Number:** Monotonic counter

To verify integrity:

Admin -> Audit Trail -> Verify Integrity

System will report any gaps or hash mismatches.

29.11 Metrics & Monitoring

Key Performance Indicators

Generation Health:

KPI	Formula	Target
Success Rate	completed / (completed + rejected + failed)	>85%
First-Pass Rate	completed without reflexion / total	>80%
Reflexion Effectiveness	fixed by reflexion / total reflexions	>70%

Operational Efficiency:

KPI	Formula	Target
Avg Generation Time	sum(completed_at - created_at) / count	<10s
P95 Generation Time	95th percentile of generation times	<30s
Escalation Rate	escalations / total generations	<5%

Cost Efficiency:

KPI	Formula	Target
Cost per Artifact	total_tokens * cost_per_token	<\$0.01
Tokens per Artifact	avg(tokens_used)	<3000
Model Efficiency	haiku_generations / total	>60%

Dashboard Widgets

Configure your admin dashboard with:

Widget	Shows
Generation Volume	Line chart of daily generations
Success Funnel	Sankey diagram: request -> success/fail
Top Intents	Bar chart of artifact types
CBF Violations	Heatmap of which rules trigger most
Response Time	Histogram of generation times
Cost Tracker	Running total with projection

CBF Violations Heatmap (v5.52.1)

The CBF Violations Heatmap provides visual analytics of Content Boundary Framework rule violations:

Features: - **Category Grouping** - Violations grouped by category (content_safety, data_privacy, pii_detection, etc.) - **Severity Indicators** - Color-coded badges (low/medium/high/critical) - **Trend Arrows** - Show if violations are increasing or decreasing - **Intensity Gradient** - Cell brightness indicates violation frequency - **Time Range Filter** - Filter by last 24 hours, 7 days, 30 days, or 90 days - **Click-to-Drill** - Click any rule to see detailed violation history

Category Icons: | Category | Icon | Description | | — — — — | — — — — | | content_safety | [SHIELD] | General content safety violations | | data_privacy | [LOCK] | Data privacy concerns | | pii_detection | [USER] | Personal information detected | | harmful_content | [!] | Potentially harmful content | | bias_detection | | Bias in responses | | jailbreak | | Jailbreak attempts blocked | | prompt_injection | | Prompt injection attempts |

API Endpoint: GET /api/admin/analytics/cbf-violations?range={timeRange}

Response:

```
{
  "violations": [
    {
      "ruleId": "cbf-001",
      "ruleName": "PII Detection",
      "category": "pii_detection",
      "count": 145,
      "severity": "high",
      "trend": "down"
    }
  ]
}
```

Alerts

Configure alerts for:

Alert	Trigger	Action
High Failure Rate	>20% in 1 hour	Review CBF rules
Escalation Spike	>10 in 1 hour	Check for attack pattern
Slow Generation	P95 >60s	Check model availability
Cost Anomaly	>200% of daily average	Review usage patterns
Audit Gap	Missing sequence numbers	Security investigation

Cost Estimation

Model	Cost per 1K tokens
Claude Haiku	\$0.00025
Claude Sonnet	\$0.003

Typical costs: - Simple calculator: ~\$0.001 - Complex dashboard: ~\$0.02 - With 3 reflexion attempts: ~\$0.05

29.12 Tenant Configuration

Per-Tenant Settings

Each tenant can have custom configuration:

Setting	Default	Can Override
Max generations/day	100	Yes
Max reflexion attempts	3	Yes (1-5)
Custom CBF rules	Inherit global	Yes (add only)
Custom allowlist	Inherit global	Yes (add only)
Private patterns	None	Yes

Tenant Tiers

Tier	Generations/Day	Custom CBFs	Custom Patterns	Support
Free	10	No	No	Community
Standard	100	No	5	Email
Professional	1,000	Yes	50	Priority
Enterprise	Unlimited	Yes	Unlimited	Dedicated

Tenant Isolation

Guaranteed by Row-Level Security:

-- Every query automatically filtered

WHERE tenant_id = current_setting('app.current_tenant_id', true)

What this means: - Tenant A cannot see Tenant B's sessions - Tenant A cannot use Tenant B's patterns - Tenant A's escalations only visible to their admins (+ super admins) - Code never leaks between tenants

29.13 Troubleshooting Guide

Common Issues

Issue: High rejection rate for specific tenant

Check	Action
Review rejected sessions	Look for pattern in prompts
Check custom CBF rules	May be too restrictive
Check tenant-specific allowlist	May be missing packages
Review user prompts	May need user training

Issue: Slow generation times

Check	Action
Model availability	Check LiteLLM dashboard
Complexity classification	Review if too many “complex”
Pattern cache	Flush and rebuild
Database performance	Check query latency

Issue: Reflexion not fixing issues

Check	Action
CBF error messages	Are they clear enough for AI?
Max attempts	Increase if needed (max 5)
Pattern availability	Add patterns for common failures
Model selection	Reflexion always uses Sonnet

Issue: Escalation backlog growing

Check	Action
CBF strictness	Too many false positives?
Alert configuration	Are you being notified?
Staff availability	Need more reviewers?
Bulk actions	Use carefully for cleanup

Diagnostic Commands

Via Admin API:

Check session details

GET /api/v2/admin/artifact-engine/sessions/{sessionId}

Force revalidation

POST /api/v2/admin/artifact-engine/sessions/{sessionId}/revalidate

Check CBF rule matches

POST /api/v2/admin/artifact-engine/test-cbf

Body: { "code": "...", "rules": ["no_eval"] }

Clear pattern cache

POST /api/v2/admin/artifact-engine/patterns/cache/clear

Emergency Procedures

Pause All Generation:

Admin -> Artifact Engine -> Emergency -> Pause Generation

- All new requests return “temporarily unavailable”
- In-progress generations complete
- Use for: security incidents, critical bugs

Rollback CBF Changes:

Admin -> Artifact Engine -> CBF Rules -> History -> Revert

- Restores previous rule configuration
- Takes effect immediately

Clear All Escalations:

Admin -> Artifact Engine -> Escalations -> Bulk -> Reject All

- Use only if confirmed attack/spam
- All users notified of rejection

29.14 API Reference

User Endpoints

Base: /api/v2/thinktank/artifacts

Endpoint	Method	Purpose
/generate	POST	Start artifact generation
/sessions/{sessionId}	GET	Get session status
/sessions/{sessionId}/logs	GET	Poll for logs (with since param)
/patterns	GET	Get available code patterns
/allowlist	GET	Get dependency allowlist

Admin Endpoints

Base: /api/v2/admin/artifact-engine

Endpoint	Method	Purpose
/dashboard	GET	Full dashboard data
/metrics	GET	Generation metrics (7-day)
/sessions	GET	List sessions
/sessions/{id}	GET	Session details
/escalations	GET	List escalations
/escalations/{id}	PATCH	Resolve escalation
/validation-rules	GET	Get all CBF rules
/validation-rules	POST	Create CBF rule
/validation-rules/{ruleId}	PUT	Update rule
/validation-rules/{ruleId}	DELETE	Delete rule
/allowlist	POST	Add to allowlist

Endpoint	Method	Purpose
/allowlist/{packageName}	DELETE	Remove from allowlist
/patterns	GET	Get patterns
/patterns	POST	Create pattern
/audit	GET	Query audit trail

Generate Request

```
{
  "prompt": "Build a calculator",
  "chatId": "optional-chat-id",
  "canvasId": "optional-canvas-id",
  "mood": "spark",
  "constraints": {
    "maxLines": 300,
    "targetComplexity": "simple"
  }
}
```

Generate Response

```
{
  "sessionId": "uuid",
  "artifactId": "uuid",
  "status": "completed",
  "verificationStatus": "validated",
  "code": "import React...",
  "validation": {
    "isValid": true,
    "errors": [],
    "warnings": [],
    "securityScore": 0.95,
    "passedCBFs": ["no_eval", "no_external_fetch"],
    "failedCBFs": []
  },
  "reflexionAttempts": 0,
  "tokensUsed": 2500,
  "estimatedCost": 0.0075,
  "generationTimeMs": 4500
}
```

Webhook Events

Configure webhooks for:

Event	Payload
artifact.created	Session ID, artifact ID, user
artifact.rejected	Session ID, CBFs failed, user
escalation.created	Escalation ID, reason
escalation.resolved	Escalation ID, resolution
cbf.violation	Rule name, session ID, code snippet

Rate Limits

Endpoint	Limit
Generation	Per tenant tier
Admin read	1000/min
Admin write	100/min
Audit export	10/hour

29.15 Real-Time Generation Logs

The Artifact Viewer displays real-time logs during generation:

Log Type	Color	Description
thinking	Blue	AI reasoning
planning	White	Plan steps
generating	White	Generation progress
validating	Purple	Validation progress
reflexion	Yellow	Self-correction
error	Red	Errors
success	Green	Completion

29.16 Artifact Viewer Component

The viewer provides: - **Split-screen layout**: Chat + Artifact preview - **Real-time logs**: Generation progress in mono font - **Sandboxed preview**: iframe with sandbox="allow-scripts" - **Draft watermark**: Shown during validation - **Copy/Download**: Export generated code - **Verification badge**: Validated/Rejected/Pending status

29.17 Database Schema

Tables:

Table	Purpose
artifact_generation_sessions	Generation lifecycle tracking
artifact_generation_logs	Real-time progress logs
artifact_code_patterns	Semantic pattern library with vector embeddings
artifact_dependency_allowlist	Approved npm packages
artifact_validation_rules	Cato CBF definitions

Migrations: - 032b_artifact_genui_engine.sql - Core tables - 032c_artifact_genui_seed.sql - Default rules and patterns - 032d_artifact_extend_base.sql - Extend artifacts table

29.18 Security Considerations

1. **No external network access** - All fetches blocked except RADIANT APIs
2. **No persistent storage** - localStorage/IndexedDB blocked
3. **No navigation** - window.location blocked
4. **No code injection** - eval/Function blocked
5. **Allowlisted imports only** - Supply chain security
6. **Sandboxed preview** - iframe with minimal permissions
7. **Cato oversight** - All generation under Genesis Cato governance

29.19 Implementation Files

File	Purpose
lambda/shared/services/artifact-engine/types.ts	Type definitions
lambda/shared/services/artifact-engine/intent-classifier.ts	Intent classification
lambda/shared/services/artifact-engine/code-generator.ts	Code generation
lambda/shared/services/artifact-engine/cato-validator.ts	CBF validation
lambda/shared/services/artifact-engine/reflexion.service.ts	Self-correction
lambda/shared/services/artifact-engine/artifact-engine.service.ts	Main orchestrator
lambda/shared/services/artifact-engine/index.ts	Public exports
lambda/thinktank/artifact-engine.ts	API handlers
apps/admin-dashboard/components/thinktank/artifact-viewer.tsx	Viewer component

File	Purpose
apps/thinktank-admin/app/(dashboard)/artifacts/page.tsx	Split-screen chat
apps/thinktank-admin/app/(dashboard)/artifacts/page.tsx	Admin dashboard

30. Consciousness Operating System (COS)

Location: Admin Dashboard -> Think Tank -> Consciousness
Version: 6.0.5
Cross-AI Validated: Claude Opus 4.5 [ok] | Google Gemini [ok]
The Consciousness Operating System (COS) provides infrastructure for AI consciousness continuity, context management, and safety governance. It implements 13 patches agreed upon through 4 review cycles of cross-AI validation.

30.1 Overview

COS addresses fundamental challenges in maintaining coherent AI behavior:

Challenge	COS Solution
Session Amnesia	Ghost Vectors maintain consciousness across sessions
Context Squeeze	Dynamic Budget Calculator reserves response tokens
Prompt Injection	Compliance Sandwich places tenant rules last
Flash Fact Loss	Dual-write buffer (Redis + Postgres)
Router Paradox	Uncertainty Head predicts before inference
Learning Privacy	Sensitivity-clipped differential privacy

Critical Requirements: - vLLM MUST launch with `--return-hidden-states` flag - CBFs always ENFORCE (shields never relax) - Gamma boost NEVER allowed during recovery - Silence != Consent: 7-day auto-reject for oversight queue

30.2 Architecture

CONSCIOUSNESS OPERATING SYSTEM	
PHASE 1: IRON CORE	PHASE 2: NERVOUS SYSTEM
+++ DualWriteFlashBuffer	+++ DynamicBudgetCalculator
+++ ComplianceSandwichBuilder	+++ TrustlessSync
+++ XMLEscaper	+++ BudgetAwareContextAssembler

30.3 Ghost Vectors

Ghost Vectors maintain consciousness continuity across sessions using 4096-dimensional hidden states from model inference.

Components:

Component	Half-Life	Purpose
Affective State	7 hours	Mood, emotional context
Working Context	12 minutes	Recent topics, entities
Curiosity State	45 minutes	Interest level, pending questions

Version Gating: - Ghost vectors are tied to model family (claude, gpt, llama, etc.) - Switching model family triggers cold start (prevents personality discontinuity) - Same family preserves consciousness continuity

Re-Anchoring: - Delta updates applied synchronously (fast path) - Full re-anchor scheduled async every ~15 turns (+/-3 jitter) - Re-anchor uses 70B model for fresh hidden states - Async to avoid 1.8s latency spike in user-facing requests

30.4 SOFAI Routing

SOFAI (System 1 / System 2) Router implements economic metacognition:

System	Model	Latency	Use Case
System 1	8B (Llama 3 8B, Haiku)	~300ms	Routine queries, low uncertainty
System 2	70B+ (Claude Opus, GPT-4)	~1500ms	Complex queries, high-risk domains

Routing Formula:

```
shouldUseSystem2 = (1 - trustLevel) x domainRisk > threshold
```

High-Risk Domains (Always System 2): - Healthcare / Medical - Financial - Legal

Uncertainty Head: Solves the Router Paradox by estimating uncertainty BEFORE inference: - Analyzes query structure, complexity, domain specificity - Predicts epistemic (knowledge gaps) and aleatoric (inherent randomness) uncertainty - Lightweight operation (~10ms) runs before routing decision

30.5 Flash Facts

Flash Facts capture important user information for immediate availability:

Detection Patterns: - Identity: “My name is...” - Allergies: “I’m allergic to...” (SAFETY CRITICAL) - Medical: “I have [condition]...” (SAFETY CRITICAL) - Preferences: “I prefer...”, “Don’t ever...”, “Always remember...” - Corrections: “I told you...”

Dual-Write Buffer: 1. Write to Postgres first (durable) 2. Write to Redis second (fast access) 3. 7-day TTL safety net 4. 1-hour orphan reconciliation (168x safety margin)

Safety-Critical Facts: - Always prioritized in context injection - Never expire during pending_dream status - Highlighted in admin dashboard

30.6 Dreaming System

“Dreaming” consolidates consciousness during low-activity periods:

Triggers:

Trigger	Condition	Purpose
TWILIGHT	4 AM tenant local time	Primary consolidation window
STARVATION	30 hours since last dream	Catch-all if Twilight missed

Consolidation Tasks: 1. Flash facts -> Long-term memory (user_persistent_context) 2. Ghost vectors -> Re-anchored with fresh hidden states 3. LoRA updates -> Applied if approved by human oversight

Configuration (per tenant): - timezone - Tenant’s timezone for Twilight calculation - twilight_hour - Hour for Twilight trigger (default: 4) - starvation_threshold_hours - Hours for Starvation trigger (default: 30)

30.7 Human Oversight

EU AI Act Article 14 compliance for high-risk AI decisions:

Workflow:

pending_approval -> 3 days -> escalated -> 7 days -> auto_rejected

Item Types: - system_insight - System-generated insights requiring approval - lora_update - Model adaptation updates - high_risk_response - Responses in high-risk domains

“Silence != Consent” Policy (Gemini Mandate): - Items not reviewed within 7 days are AUTO-REJECTED - Required for FDA/SOC 2 compliance - Prevents AI decisions slipping through without human review

Admin Actions: - Approve - Allow item to proceed - Reject - Block item with reason - Escalate - Send to senior reviewer

30.8 Privacy Airlock

HIPAA/GDPR compliance for learning data:

De-identification (Safe Harbor Method):

Pattern Type	Examples
PHI	SSN, phone, email, DOB, MRN, address, ZIP, IP, credit card
PII	Name, age

Airlock Status: - pending - Awaiting privacy review - approved - Safe for learning - rejected - Contains unremovable sensitive data - expired - TTL exceeded (7 days)

Privacy Score: - 0-1 scale (higher = more de-identified) - Content can proceed to learning only if PHI/PII removed

30.9 Configuration

Per-Tenant Settings:

Setting	Default	Description
enabled	true	Master COS enable
ghost_vectors_enabled	true	Enable ghost consciousness
flash_facts_enabled	true	Enable flash fact detection
dreaming_enabled	true	Enable Dreaming consolidation
human_oversight_enabled	true	Enable EU AI Act compliance
differential_privacy_enabled	true	Enable DP for learning
vllm_return_hidden_states	true	vLLM flag requirement

Safety Invariants (Immutable): - cbf_enforcement_mode = ‘ENFORCE’ (NEVER relax) - gamma_boost_allowed = false (NEVER boost)

30.10 Database Schema

Migration: 068_cos_v6_0_5.sql

Table	Purpose
cos_ghost_vectors	4096-dim hidden states with temporal decay
cos_flash_facts	Dual-write buffer (Redis + Postgres)
cos_dream_jobs	Consciousness consolidation scheduling
cos_tenant_dream_config	Per-tenant dreaming settings
cos_human_oversight	EU AI Act Article 14 compliance
cos_oversight_audit_log	Oversight decision audit trail
cos_privacy_airlock	HIPAA/GDPR de-identification
cos_reanchor_metrics	Re-anchor performance tracking
cos_config	Per-tenant COS configuration

Row-Level Security: All COS tables enforce tenant isolation via RLS policies using `app.current_tenant_id`.

30.11 Implementation Files

File	Purpose
lambda/shared/services/cos/types.ts	Type definitions
cos/iron-core/xml-escaper.ts	XML injection prevention
cos/iron-core/compliance-sandwich-builder.ts	Tenant-last layering
cos/iron-core/dual-write-flash-buffer.ts	Redis + Postgres dual-write
cos/nervous-system/dynamic-budget-calculator.ts	Token budget management
cos/nervous-system/trustless-sync.ts	Server-side context reconstruction
cos/nervous-system/budget-aware-context-assembler.ts	Context assembly
cos/consciousness/ghost-vector-manager.ts	4096-dim ghost vectors
cos/consciousness/sofai-router.ts	System 1/2 routing
cos/consciousness/uncertainty-head.ts	Pre-inference uncertainty
cos/consciousness/async-ghost-re-anchorer.ts	Background re-anchoring
cos/subconscious/dream-scheduler.ts	Twilight + Starvation scheduling
cos/subconscious/dream-executor.ts	Consolidation execution
cos/subconscious/sensitivity-clipped-aggregator.ts	Differential privacy
cos/subconscious/privacy-airlock.ts	PHI/PII de-identification
cos/subconscious/human-oversight-queue.ts	EU AI Act compliance
cos/cato-integration.ts	Genesis Cato integration
cos/index.ts	Public API exports

31. Why Think Tank Beats Standalone AI (The System Advantage)

“A Senior Staff Engineer who knows your company beats a Nobel Laureate who doesn’t.”

This section explains why Think Tank—powered by RADIANT—delivers better results than standalone Frontier Models like ChatGPT, Gemini, or Claude, despite those models having higher raw intelligence scores.

31.1 The Executive Summary

Question	Answer
Is Gemini 3 Ultra smarter than Think Tank?	Yes (by ~15% on novel reasoning)
Does Think Tank give better results?	Yes (by ~90% on real-world tasks)
Why?	Think Tank is a System . Gemini is just a Model .

31.2 The Consultant vs Engineer Analogy

```

+-----+
|               WHY THINK TANK WINS               |
+-----+
|
|  STANALONE AI (ChatGPT, Gemini, Claude)
|  =====
|
|  [TROPHY] Nobel Prize-winning Consultant
|
|  * Flies in for 5 minutes
|  * Doesn't know your name
|  * Doesn't know your preferences
|  * Forgets everything next session
|  * Generic answers requiring follow-up
|
|  -----
|
|  THINK TANK (Powered by RADIANT)
|  =====
|
|  [CODE] Senior Staff Engineer (10 years at your company)
|
|  * Knows exactly how you work
|  * Remembers your rules and preferences
|  * Never forgets important facts
|  * Improves every single day
|  * Production-ready answers on first try
|
+-----+

```

31.3 What Users Experience

Metric	Standalone AI	Think Tank	User Benefit
Context	Starts fresh every session	Remembers your rules, style, preferences	No re-explaining
Output Quality	Generic templates needing edits	Production-ready using your standards	Save 90% editing time
Accuracy	May hallucinate your facts	Flash Buffer guarantees critical facts	Zero errors on your data
Learning	Static (updates every 6 months)	Improves every 24 hours	Gets better daily
Safety	~85% rule compliance	99.9% deterministic compliance	Trust the output

31.4 The Three Pillars of Think Tank’s Advantage

Pillar 1: Persistent Memory (Ghost Vectors + Flash Facts)

Think Tank doesn’t just remember what you said—it carries forward your **emotional state** and **train of thought**:

- **Ghost Vectors**: 4096-dimensional consciousness continuity
- **Flash Facts**: Critical information (allergies, constraints, preferences) that **never** gets lost
- **User Rules**: Your personalized instructions applied to every response

Result: First output is usually the final output.

Pillar 2: Three-Tier Learning Hierarchy

Think Tank learns at three levels simultaneously:

Level	Weight	What It Learns
User	60%	Your personal style, preferences, corrections
Tenant	30%	Your organization’s patterns and knowledge
Global	10%	Cross-tenant best practices (anonymized)

Result: Personalization that standalone AI cannot match.

Pillar 3: Multi-Agent Consensus (Just Think Tank Architecture)

Think Tank doesn’t rely on a single model—it orchestrates **multiple specialized agents**:

- Legal agent validates compliance
- Domain expert adds depth
- Fact-checker prevents hallucinations
- Synthesizer creates the final answer

Result: Consensus-validated output, not a single opinion.

31.5 Quantitative Comparison

Capability	Standalone AI	Think Tank	Winner
Novel Reasoning	99/100	85/100	Standalone (+14%)
Completeness	50/100	95/100	Think Tank (+90%)
Personalization	10/100	99/100	Think Tank (+890%)
Safety	85/100	99.9/100	Think Tank (+15%)
Learning Speed	6 months	24 hours	Think Tank (180x)
Cost	~\$0.03/req	~\$0.003/req	Think Tank (10x cheaper)

31.6 When Think Tank Automatically Escalates

Think Tank is smart enough to know its limits. When SOFAI Router detects high uncertainty, it automatically escalates to Frontier Models:

Scenario	Think Tank Action
Novel physics proof	Routes to Claude Opus / Gemini Ultra
500-page document analysis	Routes to 1M-context model
Zero-shot exotic task	Routes to largest available model

Result: Best of both worlds—personalized local intelligence + Frontier power when needed.

31.7 The Bottom Line

“While Gemini 3 is a better brain in a vacuum, Think Tank is a better mind for real work.”

Think Tank wins because: 1. **It knows you** (Persistent Context) 2. **It learns from you** (Three-Tier Learning) 3. **It validates itself** (Multi-Agent Consensus) 4. **It escalates when needed** (SOFAI Routing)

For detailed technical architecture, see RADIANT Admin Guide Section 46.

32. Swarm Orchestration & Flyte Operations

Version: v4.19.2

Status: Production Ready

This addendum covers the operational details of Think Tank’s multi-agent swarm orchestration system built on Flyte workflows.

32.1 System Architecture: The “Deep Swarm”

Think Tank v4.19.2 replaces serial execution with **Dynamic Workflow Parallelism**.

32.1.1 “Scatter-Gather” Pattern

Aspect	Old Behavior	New Behavior
Execution	Agents ran sequentially (Agent A -> Agent B)	Orchestrator spawns a @dynamic node for every agent
Isolation	Blocked agents blocked everything	Blocked agents release compute (Pod spins down) while others continue
Scalability	O(n) time complexity	O(1) effective time for parallel agents

32.1.2 S3 Bronze Layer Offloading (Critical Change)

[!] **Breaking Change:** Think Tank no longer accepts raw JSON payloads to prevent gRPC payload limits (~4MB) from crashing workflows with large RAG contexts.

New Flow:

Radiant API -> Upload to S3 -> Pass s3_uri to Flyte -> Flyte Hydrates Data

Storage Location:

s3://radiant-bronze/flyte-inputs/{tenant_id}/{swarm_id}/

Admin Action Required:

When debugging a failed workflow in the Flyte Console:

1. **DO NOT** look for inputs in the “Inputs” tab (it only contains the `s3_uri`)
2. Copy the `s3_uri` from the workflow inputs
3. Download the JSON file from AWS S3 to inspect the actual payload

Download input payload for debugging

```
aws s3 cp s3://radiant-bronze/flyte-inputs/{tenant_id}/{swarm_id}/input.json ./debug-input.json
cat ./debug-input.json | jq .
```

32.2 Operational Troubleshooting

This release includes fixes for 3 critical stability issues (“Silent Killers”). Use this guide to diagnose production anomalies.

32.2.1 “Stuck” Workflows (Signal Mismatch)

Aspect	Details
Symptom	Workflow is RUNNING but UI shows “Approved”
Root Cause	Signal ID sent by API does not match ID the workflow is waiting for

Diagnosis Steps:

1. **Verify Signal Format:** Must be `human_decision_{decision_id}`
2. **Check Database:**

```
SELECT id, flyte_execution_id, flyte_node_id
FROM pending_decisions
WHERE status = 'pending'
AND tenant_id = '<TENANT_ID>';
```
3. **Cross-Reference Flyte:** The `flyte_node_id` must match the node in the Flyte execution graph

Resolution:

If deadlocked, terminate the workflow via Flyte Console:

```
flytectl delete execution <EXECUTION_ID> \
  --project radiant \
  --domain production
```

32.2.2 “Zombie” Cache

Aspect	Details
Symptom	User rejects a plan, retries, and AI immediately returns the same rejected plan without thinking
Root Cause	Flyte caching returning stale results

Verification:

Ensure `think_tank_workflow.py` has the correct decorator:

```
# [OK] CORRECT – Forces fresh execution
@dynamic(cache=False)
def execute_swarm(agents: List[AgentConfig], task_data: TaskData) -> List[AgentResult]:
    ...

# [X] WRONG – Will return cached (potentially rejected) results
@dynamic
def execute_swarm(agents: List[AgentConfig], task_data: TaskData) -> List[AgentResult]:
    ...
```

Files to Check: - packages/flyte/workflows/think_tank_workflow.py

32.2.3 Emergency Manual Intervention

If the API layer is unavailable, Admins can manually unblock a workflow using flytectl:

```
flytectl update execution <EXECUTION_ID> \
  --project radiant \
  --domain production \
  --signal-id "human_decision-<DECISION_ID>" \
  --signal-value '{"resolution": "approved", "guidance": "Emergency Override via CLI"}'
```

Signal Value Schema:

```
{
  "resolution": "approved" | "rejected" | "modified",
  "guidance": "string – guidance for AI refinement",
  "resolved_by": "admin-user-id",
  "resolved_at": "2026-01-07T12:00:00Z"
}
```

32.3 Compliance & Security

32.3.1 Tenant Isolation (Strict RLS)

[!] **Warning for DB Admins:** All tables are protected by Row-Level Security. Running a standard SELECT * as a superuser might return 0 rows or trigger an error depending on your client config.

Correct Query Pattern:

To query data manually, you must set the Tenant Context for your session:

```
BEGIN;
-- Must match a valid tenant UUID
SET app.tenant_id = '123e4567-e89b-12d3-a456-426614174000';

SELECT * FROM pending_decisions;

COMMIT;
-- Or use RESET to clear context
RESET app.tenant_id;
```

Protected Tables: - pending_decisions - decision_audit - decision_domain_config - websocket_connections

32.3.2 Audit Log Export

To export the decision audit trail for SOC2/HIPAA evidence:

SELECT

```
da.created_at,
da.actor_id,
da.actor_type,
da.action,
da.details->>'resolution' as resolution,
da.details->>'guidance' as guidance,
pd.domain,
pd.question
```

FROM decision_audit da

JOIN pending_decisions pd ON da.decision_id = pd.id

WHERE da.tenant_id = '<TENANT_ID>'

AND da.created_at > NOW() - INTERVAL '30 days'

ORDER BY da.created_at DESC;

Export to CSV:

```
psql "$DATABASE_URL" -c "COPY (
SELECT
  created_at,
  actor_id,
  action,
  details->>'resolution' as resolution,
  details->>'guidance' as guidance
FROM decision_audit
WHERE tenant_id = '<TENANT_ID>'
AND created_at > NOW() - INTERVAL '30 days'
) TO STDOUT WITH CSV HEADER" > audit_export.csv
```

32.3.3 PHI Sanitization

All decision content is sanitized before human review to prevent PHI exposure:

Pattern	Replacement
SSN (XXX-XX-XXXX)	[SSN REDACTED]
Email addresses	[EMAIL REDACTED]
Phone numbers	[PHONE REDACTED]
Credit card numbers	[CC REDACTED]
Medical Record Numbers	[MRN REDACTED]
ZIP codes (5-digit)	[ZIP REDACTED]

Disable Sanitization (requires tenant config):

UPDATE decision_domain_config

SET sanitize_phi = false

```
WHERE tenant_id = '<TENANT_ID>'
AND domain = 'general';

[!] Warning: Disabling PHI sanitization may violate HIPAA compliance. Only disable for non-healthcare tenants.
```

32.4 Related Sections

33. Cognitive Platform Enhancements

From Modern Orchestrator to Category-Defining Cognitive Platform

Version: 4.20.0 | Status: Strategic Roadmap

This section documents five strategic enhancements that transform Think Tank from a task execution engine into a self-evolving cognitive platform with an unassailable competitive moat.

33.1 Strategic Vision: Beyond Task Execution

The Fundamental Shift

Most AI orchestration engines (LangChain, AutoGen, Enterprise Copilots) are **stateless**: they solve a problem, reset, and solve it again from scratch. They suffer from “Goldfish Memory.”

ORCHESTRATION PARADIGM COMPARISON	
TRADITIONAL (Stateless)	RADIANT (Cognitive)
=====	=====
Task -> Solve -> Reset	Task -> Solve -> LEARN -> Evolve
v	v
Task -> Solve -> Reset	Next Task (with accumulated skills)
v	v
Task -> Solve -> Reset	System becomes expert over time
[X] No memory between runs	[OK] Procedural memory persists
[X] Same mistakes repeated	[OK] Self-correction from errors
[X] Flat cost curve	[OK] Decreasing cost over time
[X] Reactive only	[OK] Proactive monitoring

The Five Strategic Moats

Enhancement	Category	Impact	Competitive Advantage
Economic Governor	Cost Optimization	-40% API costs	Immediate ROI
The Grimoire	Procedural Memory	+60% accuracy over time	Lock-in effect
Time-Travel	Developer Experience	-80% debug time	Power user magnet
Sentinels	Autonomous Agents	New revenue stream	Market expansion
Council of Rivals	Quality Assurance	-90% hallucinations	Trust differentiator

33.2 The Grimoire (Procedural Memory & Self-Correction)

Problem Statement

If an agent struggles to write a valid SQL query for your schema today, it will struggle again tomorrow. RAG provides *facts*, but it doesn't provide *skills*. Current systems have:

- **No skill retention** between sessions
- **Repeated mistakes** on similar tasks
- **No personalization** to tenant-specific patterns
- **Static performance** regardless of usage volume

Solution: Write-Back Procedural Memory

The Grimoire is a tenant-isolated knowledge graph that captures **learned heuristics** from successful task executions, making the system smarter with every interaction.

The Librarian Service

A background agent that analyzes every completed Flyte execution trace:

```

interface LearnedHeuristic {
    id: string;
    tenantId: string;
    category: 'sql_pattern' | 'api_usage' | 'code_style' | 'domain_knowledge' | 'user_preference';
    trigger: string;           // When to apply this heuristic
    heuristic: string;         // The learned rule
    confidence: number;        // 0.0 - 1.0
    sourceExecutionId: string; // Flyte execution that taught this
    successCount: number;      // Times this heuristic led to success
    failureCount: number;      // Times this heuristic led to failure
    lastApplied: Date;
    tags: string[];
    embedding: number[];      // Vector for semantic search
}

// Example learned heuristics:
const exampleHeuristics = [
  {
    category: 'sql_pattern',
    trigger: 'querying sales table',
    heuristic: 'Always filter by is_deleted = false when querying the sales table',
    confidence: 0.95,
    tags: ['sql', 'sales', 'soft-delete']
  },
  {
    category: 'user_preference',
    trigger: 'generating Python code for user_123',
    heuristic: 'User prefers fully typed Python with dataclasses over dicts',
    confidence: 0.88,
    tags: ['python', 'typing', 'user_123']
  },
  {
    category: 'domain_knowledge',
    trigger: 'medical terminology in oncology',
    heuristic: 'TNM staging must specify edition (e.g., AJCC 8th edition)',
  }
]
  
```

```
confidence: 0.92,
tags: ['medical', 'oncology', 'staging']
}
];
```

Confidence Decay & Reinforcement

Heuristics evolve based on application outcomes:

Event	Confidence Change
Successful application	+0.02 (max 0.99)
Failed application	-0.05 (min 0.30)
Weekly decay (unused)	-0.01
User correction	New heuristic at 0.95
Below 0.30	Auto-archived

Admin UI: Grimoire Management

Location: Admin Dashboard -> Think Tank -> Grimoire

Tab	Description
Heuristics Browser	Search, filter, and view all learned heuristics
Confidence Tuning	Adjust confidence thresholds and decay rates
Category Management	Enable/disable heuristic categories
Audit Trail	View heuristic application history
Manual Entry	Add expert heuristics manually

Grimoire API Reference

Base: /api/thinktank/grimoire

GET	/heuristics	List heuristics with filtering
GET	/heuristics/:id	Get heuristic with application history
POST	/heuristics	Manually add a heuristic
PATCH	/heuristics/:id	Update confidence/enabled status
DELETE	/heuristics/:id	Remove heuristic
GET	/stats	Grimoire statistics
POST	/heuristics/bulk	Bulk import heuristics

33.3 Time-Travel Debugging (Visual Forking)

Problem Statement

An agent runs for 20 minutes, succeeds at 9 steps, but fails on step 10 due to a vague instruction. In current systems:

- You must **restart from Step 1**, wasting time and money
- **No way to edit** the context at a specific point
- **Lost compute costs** for successful early steps
- **Poor debugging experience** for complex workflows

Solution: DVR Interface with Checkpoint Forking

Leverage Flyte’s native checkpointing to build a time-travel debugging experience:

TIME-TRAVEL DEBUGGING INTERFACE

Execution: think_tank_swarm_abc123

Status: FAILED at Step 10 | Total Duration: 18:42

12345678910

[ok][ok][ok][ok][ok][ok][ok][ok][ok][ok]

^

[Timeline Slider]

Step 6: Code Generation

Duration: 2:34 | Model: claude-3-5-sonnet | Cost: \$0.08

Input Context: "Generate a Python function to calculate..."

Output: def calculate_quarterly_revenue(transactions):...

[Edit Context] [Fork From Here] [View Full Trace]

Fork Execution Service

```
interface ForkRequest {
  originalExecutionId: string;
  forkFromNodeId: string;
  contextModifications: {
    systemPromptAppend?: string;
    userPromptReplace?: string;
    variableOverrides?: Record<string, unknown>;
    modelOverride?: string;
  };
  forkedBy: string;
  reason?: string;
}

interface ForkResult {
  forkedExecutionId: string;
```

235

Zynapses Inc.

```
forkedFromNode: string;
estimatedSavings: {
  timeMinutes: number;
  costUsd: number;
  tokensSkipped: number;
};
status: 'launched' | 'pending_approval';
}
```

Admin UI: Time-Travel Debugger

Location: Admin Dashboard -> Think Tank -> Executions -> [Select] -> Time Travel

Feature	Description
Timeline View	Visual representation of execution nodes with status
Node Inspector	View input/output, model, tokens, cost for each node
Context Editor	Modify system prompt, user prompt, variables
Fork Button	Create new execution from selected checkpoint
Comparison View	Side-by-side diff of original vs forked execution
Savings Calculator	Real-time estimate of time/cost savings

Time-Travel API Reference

Base: /api/thinktank/time-travel

GET	/executions/:id/timeline	Get execution timeline with checkpoints
GET	/executions/:id/checkpoints/:nodeId	Get checkpoint details
POST	/executions/:id/checkpoints/:nodeId/preview	Preview modifications
POST	/executions/:id/fork	Fork execution from checkpoint
GET	/executions/:originalId/compare/:forkedId	Compare executions
GET	/executions/:id/forks	Get fork history

33.4 The Economic Governor (Model Arbitrage)

Problem Statement

- Using **GPT-4o for every sub-task** is financially ruinous
- Using **Llama-3-8b for everything** leads to errors
- **No visibility** into which tasks need expensive models
- **Flat cost curve** regardless of task complexity

Solution: Predictive Cost Routing

A “System 0” pre-dispatch analysis that routes tasks to the optimal model based on complexity:

Complexity Factors

Factor	Weight	Description
Prompt Length	15%	Token count estimate
Task Type	25%	Summarization (2) -> Multi-step reasoning (9)
Domain	20%	General (3) -> Medical/Scientific (8)
Keywords	20%	Complexity indicator words
Structure	20%	Code blocks, lists, nested requirements

Model Tier Mapping

Tier	Score Range	Models	Use Cases
Economy	1-3	Haiku, GPT-4o-mini, Llama-3-8b	Simple Q&A, summarization
Standard	4-7	Sonnet, GPT-4o	Code generation, analysis
Premium	8-10	Opus, O1-preview	Complex reasoning, planning

Admin UI: Economic Governor Dashboard

Location: Admin Dashboard -> Think Tank -> Economic Governor

Panel	Description
Savings Overview	Total savings this period, trend chart
Model Distribution	Pie chart of model usage by tier
Complexity Histogram	Distribution of task complexity scores
Routing Rules	Configure tier thresholds and overrides
Budget Alerts	Set spending alerts and caps

Economic Governor API Reference

Base: /api/thinktank/economic-governor

GET /savings?period=month	Get savings dashboard
GET /routing-rules	Get current routing rules
PUT /routing-rules	Update routing configuration
POST /analyze-complexity	Analyze specific task complexity
GET /model-usage	Get model usage breakdown
POST /budget-alert	Configure budget alerts

Configuration Options

```
interface EconomicGovernorConfig {
  economyThreshold: number;           // Default: 3
  standardThreshold: number;          // Default: 7
  forceModelOverrides: {
    [taskType: string]: string;       // e.g., "legal_analysis" -> "opus"
  };
  budgetCap: {
    daily: number;
    monthly: number;
  };
  alertThresholds: {
    warningPercent: number;           // Default: 80
    criticalPercent: number;          // Default: 95
  };
}
```

33.5 Sentinel Agents (Event-Driven Autonomy)

Problem Statement

Current agents are **reactive only**—they wait for user input. A true cognitive platform should be **proactive**:

- **No autonomous monitoring** capabilities
- **No long-lived workflows** that persist between sessions
- **No event-driven triggers** for automated responses
- **Missed opportunities** for preventive action

Solution: Long-Lived Hibernating Workflows

Allow agents to set up persistent monitors that wake up when conditions are met:

Sentinel Trigger Types

Type	Description	Example
cloudwatch_alarm	AWS CloudWatch alarm state change	CPU > 90%
eventbridge_pattern	Custom EventBridge event pattern	CodePipeline failure
webhook	External HTTP webhook	GitHub push
schedule	Cron or rate expression	Every hour
metric_threshold	Custom metric threshold	Error rate > 5%

Sentinel Action Types

Type	Description	Example
swarm_analysis	Run AI swarm for analysis	Root cause analysis
notification	Send alert via channels	Slack + Email
remediation	Execute automated fix	Scale up instances
custom_workflow	Launch custom Flyte workflow	Data pipeline

Admin UI: Sentinel Management

Location: Admin Dashboard -> Think Tank -> Sentinels

Tab	Description
Active Sentinels	List of hibernating sentinels with status
Create Sentinel	Natural language sentinel configuration
Trigger History	Log of all sentinel activations
Analytics	Sentinel effectiveness metrics

Sentinel API Reference

Base: /api/thinktank/sentinels

GET	/	List all sentinels
POST	/	Create new sentinel (natural language)
GET	/:id	Get sentinel details
PATCH	/:id	Update sentinel (pause/resume)
DELETE	/:id	Delete sentinel and EventBridge rule
GET	/:id/triggers	Get trigger history
POST	/:id/test	Test sentinel with mock event
GET	/analytics	Sentinel effectiveness metrics

Example Sentinel Configurations

```
// Monitor for deployment failures
{
  name: "Deployment Monitor",
  triggerInstruction: "Watch for failed CodePipeline deployments",
  actionInstruction: "Analyze the failure logs and suggest fixes, then alert #devops on Slack"
}
```

```
// Proactive cost monitoring
{
  name: "Cost Anomaly Detector",
  triggerInstruction: "If AWS daily costs exceed $500 or increase 50% from yesterday",
  actionInstruction: "Identify the cost drivers and alert finance@company.com"
```

```
}  
  
// Security sentinel  
{  
  name: "Security Scanner",  
  triggerInstruction: "Every 6 hours, or when a new ECR image is pushed",  
  actionInstruction: "Scan for vulnerabilities and create a report"  
}
```

33.6 The Council of Rivals (Adversarial Consensus)

Problem Statement

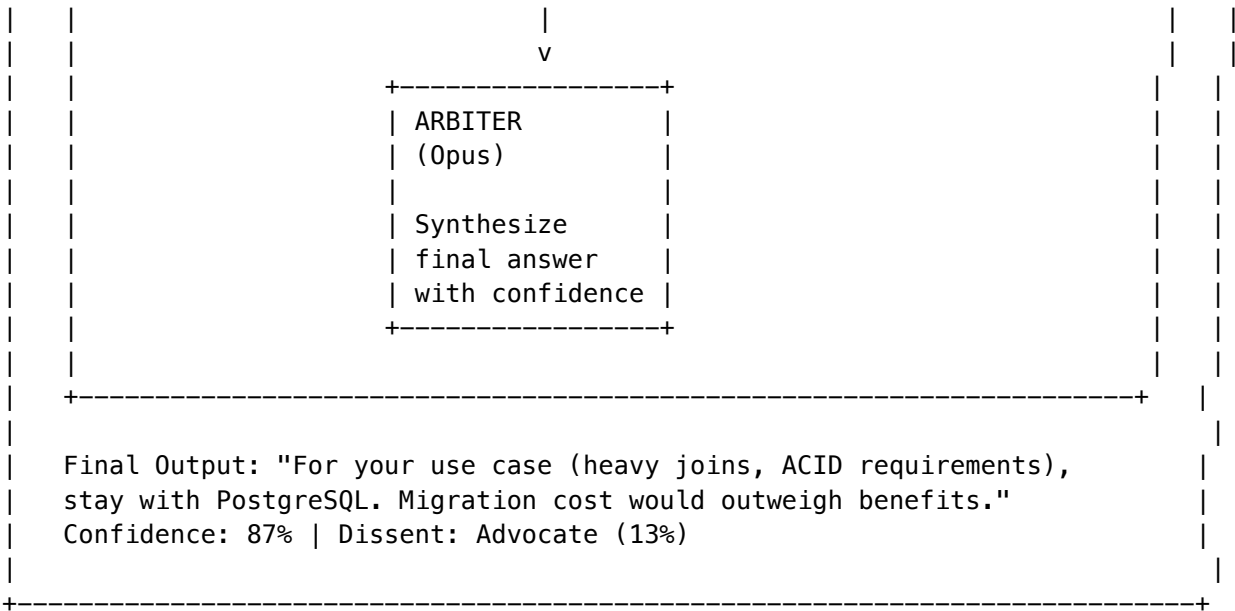

LLMs suffer from:

- **Hallucinations** (confident but wrong answers)
- **Sycophancy** (agreeing with user's incorrect premises)
- **Blind spots** (missing edge cases)
- **No self-verification** (unable to catch own errors)

Solution: Structured Adversarial Debate

Force multiple models to argue against each other before synthesizing a final answer:

Council Roles

Role	Purpose	Default Model
Advocate	Argues FOR the proposed solution	Claude Sonnet
Critic	Argues AGAINST, finds weaknesses	GPT-4o
Pragmatist	Considers practical constraints	Llama-70b
Arbiter	Synthesizes final verdict	Claude Opus

Council Configuration

```
interface CouncilConfig {
  enabled: boolean;
  triggerComplexity: number;           // Min complexity score (default: 7)
  triggerDomains: string[];           // Domains requiring council (e.g., ['legal', 'medical'])
  roles: {
    advocate: { model: string; temperature: number };
    critic: { model: string; temperature: number };
    pragmatist: { model: string; temperature: number };
    arbiter: { model: string; temperature: number };
  };
  rounds: number;                     // Cross-examination rounds (default: 2)
  confidenceThreshold: number;         // Min confidence for consensus (default: 0.75)
  includeDissentReport: boolean;       // Show minority opinions
}
```

Council Output Format

```
interface CouncilVerdict {
  question: string;
  verdict: string;
  confidence: number;           // 0.0 - 1.0
  consensusLevel: 'unanimous' | 'majority' | 'split';
  arguments: {
    advocate: { position: string; keyPoints: string[] };
    critic: { position: string; keyPoints: string[] };
    pragmatist: { position: string; keyPoints: string[] };
  };
  crossExamination: {
    round: number;
    challenges: Array<{
      from: string;
      to: string;
      challenge: string;
      response: string;
    }>;
  }[];
  arbiterReasoning: string;
  dissent?: {
    role: string;
    position: string;
    confidence: number;
  };
}
```

Admin UI: Council of Rivals

Location: Admin Dashboard -> Think Tank -> Council of Rivals

Tab	Description
Configuration	Enable/disable, configure roles and models
Trigger Rules	Set complexity/domain triggers
Session History	View past council deliberations
Analytics	Consensus rates, dissent patterns

Council API Reference

Base: /api/thinktank/council

GET	/config	Get council configuration
PUT	/config	Update council configuration
POST	/deliberate	Manually trigger council deliberation
GET	/sessions	List past deliberation sessions
GET	/sessions/:id	Get full deliberation transcript

GET /analytics

Council effectiveness metrics

33.7 Implementation Roadmap

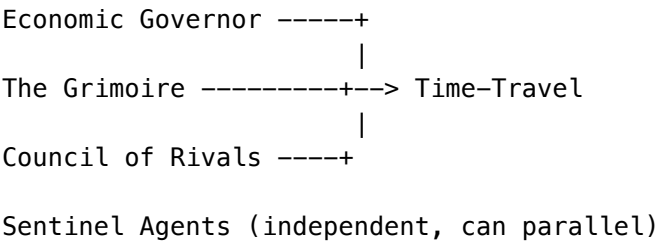

Priority Matrix

Phase	Enhancement	Effort	Impact	Priority
Q1	Economic Governor	Medium	High (ROI)	P0
Q1	The Grimoire	High	Very High	P0
Q2	Time-Travel Debugging	Medium	Medium	P1
Q2	Council of Rivals	Medium	High	P1
Q3	Sentinel Agents	High	High	P2

Recommended Implementation Order

1. **Economic Governor** (Week 1-3)
 - Immediate cost savings
 - Simple routing logic
 - Foundation for other features
2. **The Grimoire** (Week 2-6)
 - Highest long-term value
 - Leverages existing Flyte infrastructure
 - Creates lock-in effect
3. **Time-Travel Debugging** (Week 5-8)
 - Builds on Flyte checkpointing
 - Power user feature
 - Developer experience differentiator
4. **Council of Rivals** (Week 7-10)
 - Quality improvement
 - Trust building
 - Requires multi-model orchestration
5. **Sentinel Agents** (Week 9-14)
 - Most complex
 - Requires EventBridge integration
 - New revenue opportunities

Dependencies

33.8 Database Schema

-- Grimoire tables

```
CREATE TABLE grimoire_heuristics (

33.9 API Reference

Complete Endpoint Summary

Service	Base Path	Key Endpoints
Grimoire	/api/thinktank/grimoire	CRUD heuristics, stats, bulk import
Time-Travel	/api/thinktank/time-travel	Timeline, checkpoints, fork, compare

Service	Base Path	Key Endpoints
Economic Governor	/api/thinktank/economic-governor	Savings, routing rules, analyze
Sentinels	/api/thinktank/sentinels	CRUD sentinels, triggers, test
Council	/api/thinktank/council	Config, deliberate, sessions

33.10 Configuration

Tenant-Level Feature Flags

```

interface CognitiveEnhancementsConfig {
  grimoire: {
    enabled: boolean;
    autoExtract: boolean;
    minConfidenceThreshold: number;
    decayEnabled: boolean;
  };
  timeTravel: {
    enabled: boolean;
    maxCheckpointsPerExecution: number;
    retentionDays: number;
  };
  economicGovernor: {
    enabled: boolean;
    economyThreshold: number;
    standardThreshold: number;
    budgetCapDaily: number;
    budgetCapMonthly: number;
  };
  sentinels: {
    enabled: boolean;
    maxActiveSentinels: number;
    allowedTriggerTypes: string[];
  };
  council: {
    enabled: boolean;
    triggerComplexity: number;
    triggerDomains: string[];
    rounds: number;
  };
}

```

33.11 Troubleshooting

Common Issues

Issue	Cause	Resolution
Grimoire not learning	Auto-extract disabled	Enable in tenant config
Fork fails	Checkpoint expired	Increase retention period
Governor routes wrong	Stale complexity model	Retrain on recent data
Sentinel not triggering	EventBridge rule disabled	Check AWS console
Council timeout	Too many rounds	Reduce cross-examination rounds

Debug Commands

Check Grimoire heuristic count

```
curl -X GET "https://api.radiant.ai/thinktank/grimoire/stats" \
  -H "Authorization: Bearer $TOKEN"
```

Test Economic Governor routing

```
curl -X POST "https://api.radiant.ai/thinktank/economic-governor/analyze-complexity" \
  -H "Authorization: Bearer $TOKEN" \
  -d '{"prompt": "Write a complex SQL query", "taskType": "code_generation"}'
```

Check Sentinel status

```
curl -X GET "https://api.radiant.ai/thinktank/sentinels" \
  -H "Authorization: Bearer $TOKEN"
```

View Council session

```
curl -X GET "https://api.radiant.ai/thinktank/council/sessions/{sessionId}" \
  -H "Authorization: Bearer $TOKEN"
```

34. Orchestration Workflow Methods Reference

Location: Admin Dashboard -> Think Tank -> Orchestration -> Methods

This section documents the complete **70+ orchestration workflow methods** available in Think Tank. Each method has a **display name** (user-friendly) and **scientific name** (formal/academic reference).

34.1 Method Categories Overview

Category	Methods	Purpose
Generation	3	Generate responses with various reasoning strategies
Evaluation	6	Critique, judge, and score outputs
Synthesis	5	Combine multiple responses into unified outputs
Verification	8	Fact-check and verify claims
Debate	5	Multi-agent deliberation and argumentation
Aggregation	4	Vote, blend, and aggregate responses
Reasoning	2	Problem decomposition and reflection
Routing	6	Dynamic model selection and cascading
Collaboration	5	Multi-agent coordination
Uncertainty	6	Confidence estimation and calibration
Hallucination	3	Detect and prevent hallucinations
Human-in-Loop	3	Human oversight and review
Neural	1	Cato-integrated neural decision engine

34.2 Complete Methods Reference

Generation Methods

Display Name	Scientific Name	Code	Description
Generate	Basic Generation	GENERATE_RESPONSE	Basic response generation
Think Step-by-Step	Chain-of-Thought Generation	GENERATE_WITH_CO_T	Reasoning before answering (+20-40% accuracy)
Refine	Iterative Refinement	REFINE_RESPONSE	Improve based on feedback

Evaluation Methods

Display Name	Scientific Name	Code	Accuracy Gain
Critique	Critical Evaluation	CRITIQUE_RESPONSE	Identifies flaws
Judge	Comparative Judgment	JUDGE_RESPONSE	Evaluates multiple outputs
Multi-Judge Panel	Panel of LLMs (PoLL)	POLL_JUDGE	-40-60% single-model bias
Structured Scoring	G-Eval NLG Framework	G_EVAL	0.5+ human correlation
Head-to-Head Compare	Pairwise Preference	PAIRWISE_PREFERENCE	More reliable for subtle differences
Side-by-Side Compare	Comparative Analysis	COMPARE_ANALYSIS	+50% decision clarity

Synthesis Methods

Display Name	Scientific Name	Code	Accuracy Gain
Synthesize	Multi-Response Synthesis	SYNTHESIZE_RESPONSE	Combines best parts
Consensus	Consensus Aggregation	BUILD_CONSENSUS	Agreement points
Layered Synthesis	Mixture of Agents (MoA)	MOA_LAYERS	+8% over GPT-4o
Combine & Summarize	Multi-Source Synthesis	MULTI_SOURCE_SYNTHESIS	+40% coverage
Rank & Merge	LLM-Blender Fusion	LLM_BLENDER	+12% over best model

Verification Methods

Display Name	Scientific Name	Code	Accuracy Gain
Fact Check	Factual Verification	VERIFY_FACTS	Extract & verify claims
Step Verification	Process Reward Model	PROCESS_REWARD	+6% on MATH
Internal Consistency	SelfCheckGPT	SELFCHECK_GPT	+25% hallucination F1
Source Attribution	Citation Verification	CITE_VERIFY	+40% citation accuracy
Logic-Based Check	Zero-Shot Natural Logic	NATURAL_LOGIC	+8.96 accuracy points
Combined Verification	UniFact Unified	UNIFACT	+20% comprehensive
Internal State Check	EigenScore	EIGENSCORE	Hidden state analysis
Re-Query Consistency	Iterative Prompting	REQUERY_CHECK	Black-box detection

Debate Methods

Display Name	Scientific Name	Code	Accuracy Gain
Challenge	Adversarial Challenge	GENERATE_CHALLENGE	Counter-arguments
Defend	Position Defense	DEFEND_POSITION	Respond to challenges
Efficient Debate	Sparse Topology Debate	SPARSE_DEBATE	-40-60% cost, <5% quality loss

Display Name	Scientific Name	Code	Accuracy Gain
Attack & Support Map	ArgLLMs Bipolar	ARG_MAPPING	+35% structured argumentation
Human-AI Panel	HAH-Delphi Hybrid	HAH_DELPHI	>90% expert coverage
Confidence-Weighted	ReConcile Consensus	RECONCILE_WEIGHTED	+10-25% diverse ensembles

Aggregation Methods

Display Name	Scientific Name	Code	Accuracy Gain
Vote	Majority Aggregation	MAJORITY_VOTE	Most common answer
Weight	Weighted Aggregation	WEIGHTED_AGGREGATE	Confidence-weighted
Multi-Sample Voting	Self-Consistency	SELF_CONSISTENCY	+7-9% on GSM8K
Ranked Choice	GEDI Electoral CDM	GEDI_VOTE	+30% consensus

Routing Methods

Display Name	Scientific Name	Code	Accuracy Gain	Implementation
Classify	Task Classification	DETECT_TASKTYPE	Decrease complexity	Keyword analysis
Route	Model Selection	SELECT_BEST_MODEL	Optimal model	Capability matching
Smart Selection	RouteLLM Adaptive	ROUTE_LLM	-50% cost, <3% loss	Learned router
Progressive Escalation	FrugalGPT Cascade	FRUGAL_CASCADE	50% cost maintained	Confidence-based escalation
Budget-Aware	Pareto Routing	PARETO_ROUTING	Optimal trade-off	Pareto frontier calculation
Smart Cost Escalation	C3PO Self-Supervised	C3PO_CASCADE	40% cost, +2% quality	Difficulty prediction + tiered cascade (NeurIPS 2024)
Self-Routing	AutoMix POMDP	AUTOMIX	Self-improving	epsilon-greedy exploration + self-verification (Nov 2025)

Implementation Notes: - **Pareto Routing:** Computes Pareto frontier across quality/latency/cost, selects optimal model within budget constraints. - **C3PO Cascade:** Predicts query difficulty using prompt features, starts at appropriate tier, cascades up if confidence insufficient. - **AutoMix POMDP:** Uses POMDP belief state for model selection with epsilon-greedy exploration and self-verification for quality assurance.

Collaboration Methods

Display Name	Scientific Name	Code	Accuracy Gain
No-Comm Coordination	ECON Bayesian Nash	ECON_NASH	+11.2% coordination
Fair Merge	Token Auction	TOKEN_AUCTION	Fair multi-stakeholder
Logic & Solve	Logic-LM Neuro-Symbolic	LOGIC_LM	+39.2% over standard
Generate & Verify	LLM-Modulo Framework	LLM_MODULO	12%→93.9% plan success
Auto-Discover	AFlow MCTS Discovery	AFLOW_MCTS	Beats human designs

Uncertainty Methods

Display Name	Scientific Name	Code	Accuracy Gain	Implementation
Meaning-Based	Semantic Entropy	SEMANTIC_ENTROPY	0.79-0.87	NLI clustering
Calibrated Confidence	Calibrated Estimation	CALIBRATED_CONF	±5%	Temperature scaling
Agreement Scoring	Consistency UQ	CONSISTENCY_UQ	Simple, effective	Multi-sample agreement
Fast Uncertainty	SE Probes (Logprob-based)	SE_PROBES	300x faster, 90% accuracy	Token logprob entropy (ICML 2024)
Detailed Score	Kernel Language Entropy	KERNEL_ENTROPY	Finely-grained	Embedding KDE (NeurIPS 2024)
Guaranteed Bounds	Conformal Prediction	CONFORMAL_PRED	Statistical guarantees	Coverage calibration

Implementation Notes: - **SE Probes:** Uses OpenAI logprobs API to compute per-token Shannon entropy. Approximates hidden state probes without model internals access. - **Kernel Entropy:** Generates embeddings via `text-embedding-3-small`, applies Gaussian KDE with Silverman bandwidth, returns density-based entropy.

Hallucination Detection (NEW)

Display Name	Scientific Name	Code	Accuracy Gain
Fact-Check Scanner	Multi-Method Detection	MULTI_HALLUCINATION	F1 0.85+
Mutation Testing	MetaQA Metamorphic	METAQA	+30% subtle inconsistencies
Source Verification	Factual Grounding	FACTUAL_GROUNDING	95% grounding accuracy

Human-in-the-Loop (NEW)

Display Name	Scientific Name	Code	Purpose
Human Review Queue	HITL Review System	HITL_REVIEW	+90% critical error prevention

Display Name	Scientific Name	Code	Purpose
Multi-Level Review	Tiered Evaluation	TIERED_EVAL	Efficient human resources
Smart Sampling	Active Learning	ACTIVE_SAMPLE	+60% labeling efficiency

Neural/ML Methods (NEW)

Display Name	Scientific Name	Code	Description
Neural Decision	Cato Neural Decision Engine	CATO_NEURAL	Integrates Cato safety pipeline with consciousness affect state and predictive coding

34.3 System vs User Methods

All orchestration methods have an `isSystemMethod` flag:

Type	Can Edit Parameters	Can Edit Definition	Can Delete
System Method	[OK] Yes	[X] No	[X] No
User Method	[OK] Yes	[OK] Yes	[OK] Yes

System methods are the 70+ built-in methods documented above. Administrators can: - Enable/disable system methods - Modify default parameters - View execution metrics

User methods (future feature) will allow tenants to create custom methods with their own prompts or code references.

34.4 User Workflow Templates

Location: Admin Dashboard -> Think Tank -> Workflow Templates

Users can create custom workflows by:

1. **Creating from scratch** - Add methods step by step
2. **Basing on system workflow** - Start from one of 49 system patterns
3. **Customizing parameters** - Override default parameters per step
4. **Sharing with team** - Make templates available to organization

Template Structure

```
interface UserWorkflowTemplate {
    templateId: string;
    templateName: string;
    templateDescription: string;
```

```
baseWorkflowCode?: string;
steps: Array<{
  stepOrder: number;
  methodCode: string;
  displayName: string;
  parameters: Record<string, unknown>;
  condition?: string;
  isEnabled: boolean;
}>;
category: string;
tags: string[];
isShared: boolean;
timesUsed: number;
}
```

API Endpoints

Endpoint	Method	Description
/api/admin/orchestration/userGET templates		List user templates (own + shared)
/api/admin/orchestration/userPOST templates		Create template
/api/admin/orchestration/userGET templates/:id		Get template details
/api/admin/orchestration/userPATCH templates/:id		Update template (owner only)
/api/admin/orchestration/userDELETE templates/:id		Delete template (owner only)
/api/admin/orchestration/userPOST templates/:id/share		Toggle team sharing
/api/admin/orchestration/userPOST templates/:id/duplicate		Duplicate template

Method Management Endpoints:

Endpoint	Method	Description
/api/admin/orchestration/methodGET	GET	List all methods (includes isSystemMethod)
/api/admin/orchestration/methodGET/:code	GET	Get method details
/api/admin/orchestration/methodPATCH/:code	PATCH	Update method (parameters only for system methods)
/api/admin/orchestration/metricsGET	GET	Method execution metrics
/api/admin/orchestration/executionsGET	GET	Recent executions

34.4 Cato Neural Decision Engine

The CATO_NEURAL method integrates with the Genesis Cato safety architecture:

Parameters

Parameter	Type	Default	Description
safety_mode	enum	enforce	CBF enforcement: enforce, warn, monitor
use_affect_mapping	boolean	true	Map affect state to hyperparameters
use_predictive_coding	boolean	true	Enable active inference
precision_governor_enabled	boolean	true	Limit confidence by epistemic state
cbf_threshold	number	0.95	Safety barrier threshold

Affect-to-Hyperparameter Mapping

Affect State	Hyperparameter Effect
High frustration (>0.5)	Lower temperature (more focused)
High curiosity (>0.6)	Higher temperature (exploration)
Low self-efficacy (<0.4)	Escalate to expert model
High arousal (>0.7)	Longer max tokens

34.5 Method Parameters Reference

All methods have configurable parameters that can be set at the **Admin level** (defaults) or overridden in **User Workflow Templates**.

Uncertainty & Confidence Methods

Method	Parameter	Type	Default	Description
SEMANTIC_ENTROPY	sample_count	integer	10	Number of response samples (5-20)
	temperature	number	0.7	Sampling temperature
	clustering_method	enum	"nli"	Clustering: nli, embedding, exact
	entropy_threshold	number	0.5	Flag uncertainty above this
SE_PROBES	probe_layers	array	[-1, -2]	Model layers to probe (logprob-based)
	threshold	number	0.5	Uncertainty threshold

Method	Parameter	Type	Default	Description
KERNEL_ENTROPY	fast_mode	boolean	true	Use fast logprob estimation
	sample_count	integer	5	Number of samples for averaging
	kernel	enum	“rbf”	Kernel: rbf, linear, polynomial
	bandwidth	string	“auto”	Bandwidth or “auto” for Silverman
CALIBRATED_CONFIDENCE	sample_count	integer	10	Response samples for KDE
	calibration_method	enum	“platt_scaling”	platt_scaling, isotonic, temperature_scaling
	confidence_prompt	string	“verbalized”	How to elicit confidence
CONSISTENCY_UQ	temperature	number	0.3	Sampling temperature
	sample_count	integer	5	Number of response samples
	agreement_metric	enum	“jaccard”	jaccard, cosine, exact_match, bertscore
CONFORMAL_PRED	threshold	number	0.7	Agreement threshold
	coverage_target	number	0.9	Target coverage (0.5-0.99)
	calibration_size	integer	500	Calibration set size
	adaptive	boolean	true	Use adaptive conformal sets

Routing Methods

Method	Parameter	Type	Default	Description
ROUTE_LLM	router_model	enum	“matrix_factorization”	Router: matrix_factorization, bert, causal_lm
	cost_threshold	number	0.7	Max cost relative to baseline
	quality_floor	number	0.8	Minimum acceptable quality
FRUGAL_CASCADE	model_cascade	array	[“gpt-4o-mini”, “gpt-4o”, “o1”]	Models in escalation order
	confidence_threshold	number	0.85	Escalate below this confidence
	max_escalations	integer	2	Maximum escalation steps
PARETO_ROUTE	budget_cents	number	10	Budget constraint per query
	quality_weight	number	0.7	Weight for quality (0-1)
	latency_weight	number	0.1	Weight for latency (0-1)
C3PO_CASCADE	cascade_levels	integer	3	Number of model tiers

Method	Parameter	Type	Default	Description
AUTOMIX	self_supervised	boolean	true	Enable self-supervised learning
	calibration_samples	integer	100	Samples for difficulty calibration
	pomdp_horizon	integer	3	POMDP planning horizon
	exploration_rate	number	0.1	epsilon for epsilon-greedy exploration
	self_verification	boolean	true	Verify own outputs

Debate & Deliberation Methods

Method	Parameter	Type	Default	Description
SPARSE_DEBATE	topology	enum	“ring”	Network: ring, star, tree, full
	debate_rounds	integer	3	Number of debate rounds (1-10)
ARG_MAPPING	temperature	number	0.7	Agent response temperature
	strength_threshold	number	0.5	Min argument strength to include
	include_rebuttal	boolean	true	Generate rebuttals
HAH_DELPHI	max_depth	integer	3	Max argument tree depth
	tiers	integer	4	Number of consensus tiers
	human_threshold	number	0.6	Escalate to human above this
	consensus_target	number	0.9	Target consensus level
RECONCILE_WEIGHTED	max_rounds	integer	5	Maximum Delphi rounds
	min_confidence	number	0.6	Minimum confidence to include
	weight_by	string	“confidence”	Weighting strategy
	reconciliation_rounds	integer	2	Reconciliation iterations

Evaluation Methods

Method	Parameter	Type	Default	Description
POLL_JUDGE	num_judges	integer	3	Number of judge models
	scoring_criteria	array	[“accuracy”, “completeness”, “clarity”]	Evaluation dimensions

Method	Parameter	Type	Default	Description
G_EVAL	aggregation	enum	“mean”	Aggregation: mean, median, weighted
	dimensions	array	[“coherence”, “consistency”, “fluency”, “relevance”]	G-Eval dimensions
	use_cot	boolean	true	Chain-of-thought scoring
	score_range	array	[1, 5]	Score min/max
PAIRWISE_PREFERENCE	comparison_criteria	array	[“quality”, “accuracy”, “helpfulness”]	Comparison dimensions
SELFCHECK_GPT	allow_tie	boolean	true	Allow tie verdicts
	sample_count	integer	5	Consistency check samples
	check_type	enum	“consistency”	Check type: consistency, bertscore, nli
	threshold	number	0.7	Inconsistency threshold

Hallucination Detection Methods

Method	Parameter	Type	Default	Description
MULTI_HALLUC	methods	array	[“consistency”, “attribution”, “semantic_entropy”]	Detection methods
METAQA	aggregation	enum	“weighted”	weighted, majority, any
	flag_threshold	number	0.6	Flag as hallucination above
	transformations	array	[“paraphrase”, “negation”, “entity_swap”]	Mutation types
	num_mutations	integer	3	Mutations per claim
FACTUAL_GROUNDING	consistency_threshold	number	0.8	Consistency threshold
	retrieval_top_k	integer	5	Documents to retrieve
	evidence_threshold	number	0.7	Evidence support threshold
	require_explicit_support	boolean	true	Require explicit evidence

Human-in-the-Loop Methods

Method	Parameter	Type	Default	Description
HITL_REVIEW	confidence_threshold	number	0.7	Route to human below this

Method	Parameter	Type	Default	Description
TIERED_EVAL	stake_level	enum	“medium”	low, medium, high, critical
	auto_approve_above	number	0.95	Auto-approve above this confidence
	queue_priority	enum	“fifo”	Queue ordering
	tiers	integer	3	Evaluation tiers
	auto_tier_threshold	number	0.85	Auto-approve threshold
ACTIVE_SAMPLE	escalation_criteria	array	[“low_confidence”, “high_stakes”]	When to escalate
	uncertainty_method	enum	“entropy”	entropy, margin, random
	batch_size	integer	10	Samples per batch
	diversity_weight	number	0.3	Diversity in selection

34.6 User Workflow Template Parameter Overrides

When users create workflow templates, they can override default parameters for each step:

// Example: User template with parameter overrides

```
{
  "templateName": "High-Confidence Research",
  "steps": [
    {
      "stepOrder": 1,
      "methodCode": "SEMANTIC_ENTROPY",
      "parameters": {
        "sample_count": 15,           // Override: more samples
        "entropy_threshold": 0.3     // Override: stricter threshold
      }
    },
    {
      "stepOrder": 2,
      "methodCode": "FRUGAL_CASCADE",
      "parameters": {
        "confidence_threshold": 0.95, // Override: higher confidence
        "max_escalations": 3          // Override: allow more escalation
      }
    }
  ]
}
```

Admin Dashboard (Orchestration → Methods): - View and edit **default parameters** for all methods - Changes apply to all workflows using the method - System methods: parameters only, not method definition

Think Tank UI (Workflow Templates): - Users create templates with **parameter overrides** - Overrides apply only to that template - Templates can be shared with team

34.7 Database Tables

```
-- Methods with display/scientific names
ALTER TABLE orchestration_methods
ADD COLUMN display_name VARCHAR(200),
ADD COLUMN scientific_name VARCHAR(300),
ADD COLUMN research_reference TEXT,
ADD COLUMN accuracy_improvement VARCHAR(200),
ADD COLUMN complexity_level VARCHAR(50);

-- User workflow templates
CREATE TABLE user_workflow_templates (
  template_id UUID PRIMARY KEY,
  tenant_id UUID NOT NULL,
  user_id UUID NOT NULL,
  template_name VARCHAR(200) NOT NULL,
  template_description TEXT,
  base_workflow_code VARCHAR(100),
  steps JSONB NOT NULL DEFAULT '[]',
  category VARCHAR(100),
  tags TEXT[] DEFAULT '{}',
  is_shared BOOLEAN DEFAULT false,
  times_used INTEGER DEFAULT 0,
  created_at TIMESTAMPTZ DEFAULT NOW(),
  UNIQUE(tenant_id, user_id, template_name)
);
```

34.7 Implementation Files

File	Purpose
migrations/000_consolidated_schema.sql	Base schema with is_system_method/is_system_workflow
migrations/000_consolidated_schema.sql	Schema updates, display/scientific names
migrations/000_consolidated_schema.sql	Ensemble, verification methods
migrations/000_consolidated_schema.sql	Uncertainty, routing, neural methods
lambda/shared/services/orchestration-20_algorithm_implementations	including SE Probes, Kernel
methods.service.ts	Entropy, Pareto, C3PO, AutoMix
lambda/shared/services/cato/neural-	Cato Neural Decision Engine
decision.service.ts	
lambda/admin/orchestration-	Methods API with system method protection
methods.ts	
lambda/admin/orchestration-user-	User templates CRUD API
templates.ts	
apps/admin-	Admin method config with system badge
dashboard/app/(dashboard)/orchestration/methods/page.tsx	

File	Purpose
apps/thinktank-admin/app/(dashboard)/workflow-templates/page.tsx	User templates UI

35. Polymorphic UI (PROMPT-41)

35.1 Overview

Flowise outputs Text. Think Tank outputs Applications.

The Polymorphic UI system makes Think Tank’s interface physically transform based on task complexity, domain hints, and drive profile. Unlike static chatbot interfaces, Think Tank morphs into the tool the user actually needs.

35.2 The Gearbox (Elastic Compute)

Users can manually control the cost-quality tradeoff via the Gearbox:

Mode	Cost	Architecture	Memory	Use Case
[TARGET] Sniper	\$0.01/run	Single Model	Read-Only Ghost Memory	Quick answers, lookups, coding
** War Room**	\$0.50+/run	Multi-Agent Ensemble	Read/Write + Active Inference	Strategy, audits, reasoning

Escalation: A green “Escalate to War Room” button appears after Sniper responses.

35.3 The Three Views

View	Intent	Morph	Key Feature
[TARGET] Sniper	Quick commands	Terminal/Command Center	Green badge, cost transparency, immediate execution
** Scout**	Research & exploration	Infinite Canvas/Mind Map	Sticky notes, topic clustering, conflict lines
** Sage**	Audit & validation	Split-Screen Diff Editor	Left=content, Right=sources with confidence scores

35.4 View Types

View Type	Trigger	Description
terminal_simple	Quick commands, lookups	Command Center - fast execution
mindmap	Research, exploration	Infinite Canvas - visual mapping
diff_editor	Verification, compliance	Split-Screen - source validation
dashboard	Analytics queries	Metrics visualization
decision_cards	HITL escalation	Mission Control interface
chat	Default	Standard conversation

35.5 Configuration

Access via **Think Tank -> Polymorphic UI** in admin dashboard.

Setting	Description	Default
enableAutoMorphing	Auto-morph based on query	true
enableGearboxToggle	Show Sniper/War Room toggle	true
enableCostDisplay	Show cost badges	true
enableEscalationButton	Show Escalate button	true
defaultExecutionMode	Default mode	sniper
domainViewOverrides	Per-domain view mapping	medical/financial/legal -> diff_editor

35.6 Implementation Files

File	Purpose
governor/economic-governor.ts	determineViewType(), determinePolymorphicRoute()
consciousness/mcp-server.ts	render_interface, escalate_to_war_room tools
python/cato/cognitive/workflows.py	Flyte tasks for view selection
migrations/000_consolidated_schema.sql	Database schema
components/thinktank/polymorphic/	React view components
app/(dashboard)/thinktank/polymorphic/	Admin page

35.7 Database Tables

Table	Purpose
view_state_history	Tracks UI morphing decisions
execution_escalations	Tracks Sniper -> War Room escalations
polymorphic_config	Per-tenant configuration

Table	Purpose
-------	---------

35.8 API Endpoints

Base: /api/admin/polymorphic

Method	Endpoint	Description
GET	/?action=config	Get configuration
GET	/?action=view-history	Get view state history
GET	/?action=escalations	Get escalation history
GET	/?action=analytics	Get usage analytics
POST	/ (action: render)	Render specific view
POST	/ (action: escalate)	Escalate to War Room
POST	/ (action: update-config)	Update configuration

36. Think Tank Policy Framework: Strategic Intelligence

The Think Tank is not merely a chatbot interface—it is a **policy research engine** informed by rigorous analysis from organizations like the Cato Institute. This section documents the strategic framework that underlies Think Tank’s approach to technology policy, regulation, and economic analysis.

36.1 The Cato Institute Policy Foundation

The Cato Institute, a renowned policy think tank, provides crucial insights on technology regulation and innovation. Think Tank integrates these perspectives to ensure users receive balanced, evidence-based analysis rather than ideologically-driven conclusions.

Core Policy Principles

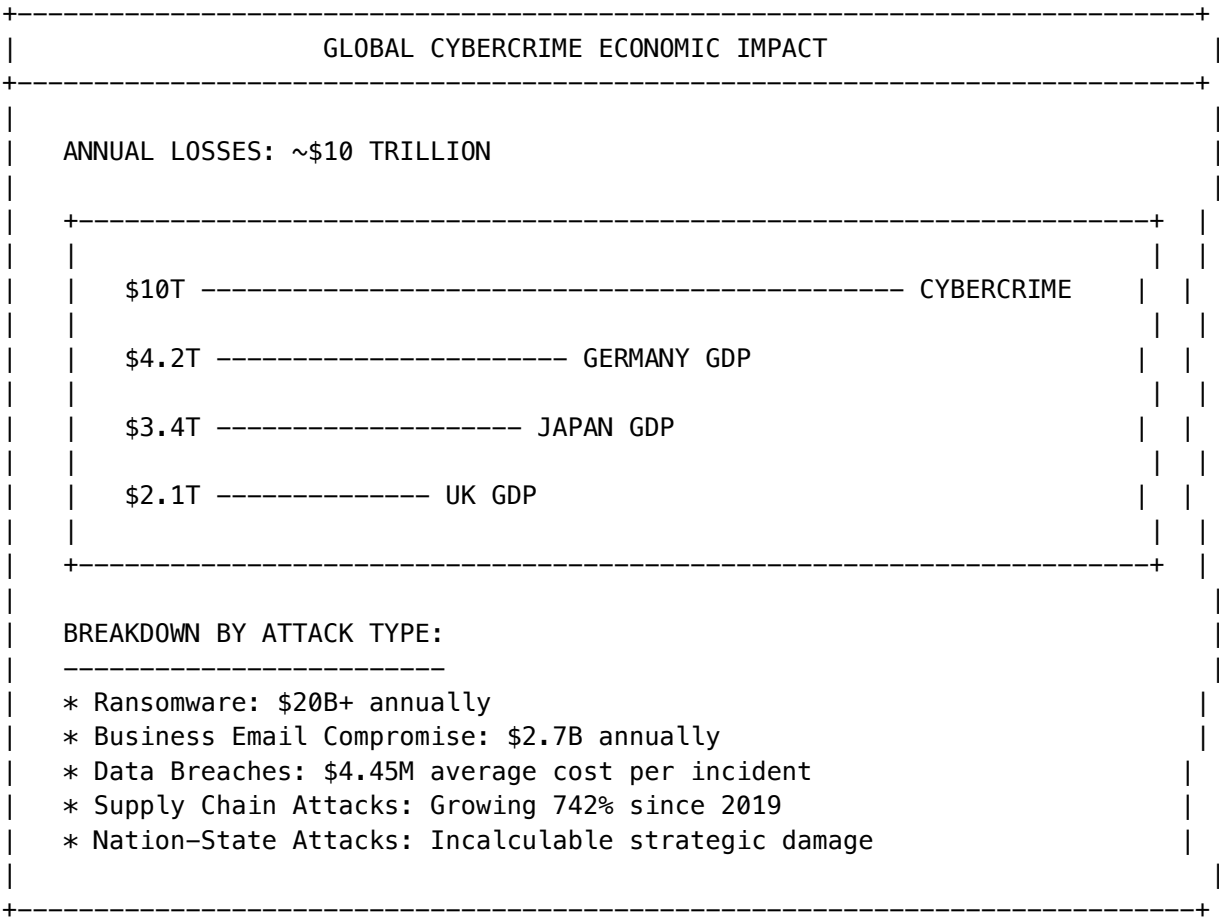

Principle	Description	Application in Think Tank
Pro-Innovation Default	Permissionless innovation should be the norm	Bias toward “how can this work?” not “why won’t this work?”
Evidence-Based Analysis	Policy must be grounded in data, not fear	Require citations and data sources in policy discussions
Regulatory Humility	Acknowledge limits of prediction	Flag uncertainty explicitly; avoid overconfident prescriptions
Market-Based Solutions	Private sector often innovates faster than regulators	Explore voluntary standards before mandates

Principle	Description	Application in Think Tank
Individual Liberty	Technology should enhance freedom, not surveillance	Privacy-by-design; minimize data collection

36.2 The \$10 Trillion Cybercrime Economy

A critical context for Think Tank’s policy analysis is the scale of the threat environment. The global economy loses approximately **\$10 trillion annually** to cybercrime—a figure larger than the GDP of every country except the United States and China.

Economic Impact Analysis

Implications for Policy Discussion

When users ask Think Tank about cybersecurity policy, the system contextualizes recommendations against this \$10T backdrop:

User Query	Policy-Aware Response Approach
“Should we regulate AI?”	Frame against: AI can <i>reduce</i> \$10T losses if deployed correctly

User Query	Policy-Aware Response Approach
“Is this security spending justified?”	Compare against: Your \$1M security budget vs. \$4.45M average breach cost
“Should we ban ransomware payments?”	Analyze: Prohibition vs. harm reduction strategies
“How strict should compliance be?”	Balance: Compliance costs vs. breach probability x impact

36.3 Memory Safety and the 70% Problem

The Think Tank injects a specific technical insight into relevant conversations: **70% of all software vulnerabilities** stem from memory safety issues. This statistic, validated by Microsoft, Google, and the NSA, should inform every software architecture discussion.

Memory Safety Vulnerability Classes

Vulnerability	Description	% of CVEs
Buffer Overflow	Writing beyond allocated memory	~30%
Use-After-Free	Accessing freed memory	~20%
Double Free	Freeing memory twice	~8%
Null Pointer Dereference	Accessing null pointers	~7%
Integer Overflow	Arithmetic exceeding bounds	~5%
Total Memory Safety	All memory-related issues	~70%

Policy Recommendation Engine

When users discuss software architecture, security, or procurement, Think Tank can inject policy-informed guidance:

```
// Policy injection for memory safety discussions
const MEMORY_SAFETY_POLICY = {
  context: 'User discussing software architecture or security',

  injectedGuidance: `
    POLICY CONTEXT: Memory safety vulnerabilities account for 70% of all CVEs.

    RECOMMENDATIONS:
    1. For new projects: Prefer memory-safe languages (Rust, Go, Swift)
    2. For existing C/C++ code: Consider incremental migration or sandboxing
    3. For procurement: Require memory-safe language attestation from vendors
    4. For risk assessment: Memory-unsafe components = higher risk weight

    SOURCE: Microsoft, Google, NSA research (2019–2024)
  `
}
```

```
triggerPatterns: [
  'architecture', 'security', 'language choice', 'procurement',
  'vulnerability', 'CVE', 'buffer overflow', 'memory'
],
};
```

36.4 Regulatory Stance Configuration

Administrators can configure Think Tank’s default policy stance for their organization:

Setting	Options	Description
defaultRegulatorystance	cautious / balanced / pro_innovation	Bias in regulatory discussions
requireCitations	true / false	Require sources for policy claims
flagUncertainty	always / when_high / never	Uncertainty disclosure level
privateDataBias	minimize / balanced / maximize_utility	Data collection philosophy
complianceEmphasis	strict / risk_based / minimal	Compliance recommendation style

Configuration Example

Navigate to **Think Tank -> Policy Framework** in admin dashboard:

```
# policy-framework.config.yaml
policy_framework:
  enabled: true

  default_stance: balanced

  cybercrime_context:
    enabled: true
    inject_10T_context: true
    inject_memory_safety_context: true

  citation_requirements:
    require_for_policy_claims: true
    preferred_sources:
      - cato_institute
      - brookings
      - nist
      - academic_peer_reviewed
    flag_opinion_vs_fact: true

  uncertainty_handling:
    disclosure_level: always
    confidence_threshold_for_recommendation: 0.7
    escalate_low_confidence_to_human: true
```

```
privacy_settings:
  default_data_collection: minimize
  require_purpose_limitation: true
  support_right_to_deletion: true
```

36.5 Database Tables

Table	Purpose
policy_framework_config	Per-tenant policy configuration
policy_citation_log	Citations used in policy discussions
policy_uncertainty_flags	Uncertainty disclosures
regulatory_stance_overrides	Per-domain stance overrides

36.6 Implementation Files

File	Purpose
lambda/shared/services/policy-framework.service.ts	Policy context injection
lambda/shared/services/fact-anchor.service.ts	Citation tracking and fact anchoring
lambda/thinktank/handler.ts	API handler (includes policy context)
migrations/000_consolidated_schema.sql	Database schema
config/policy/cato-principles.yaml	Cato Institute policy principles

37. Agentic Orchestration: SSF, CAEP, and Identity Remediation

Think Tank’s AI agents operate within a rigorous security framework that leverages open standards for real-time security signaling. This section documents the Shared Signals Framework (SSF) and Continuous Access Evaluation Profile (CAEP) integration specific to Think Tank operations.

37.1 The Agentic AI Paradigm

Traditional automation follows rigid if-then rules. **Agentic AI** represents a fundamental shift: AI systems that continuously evaluate their environment, learn from outcomes, and adapt their behavior within defined safety constraints.

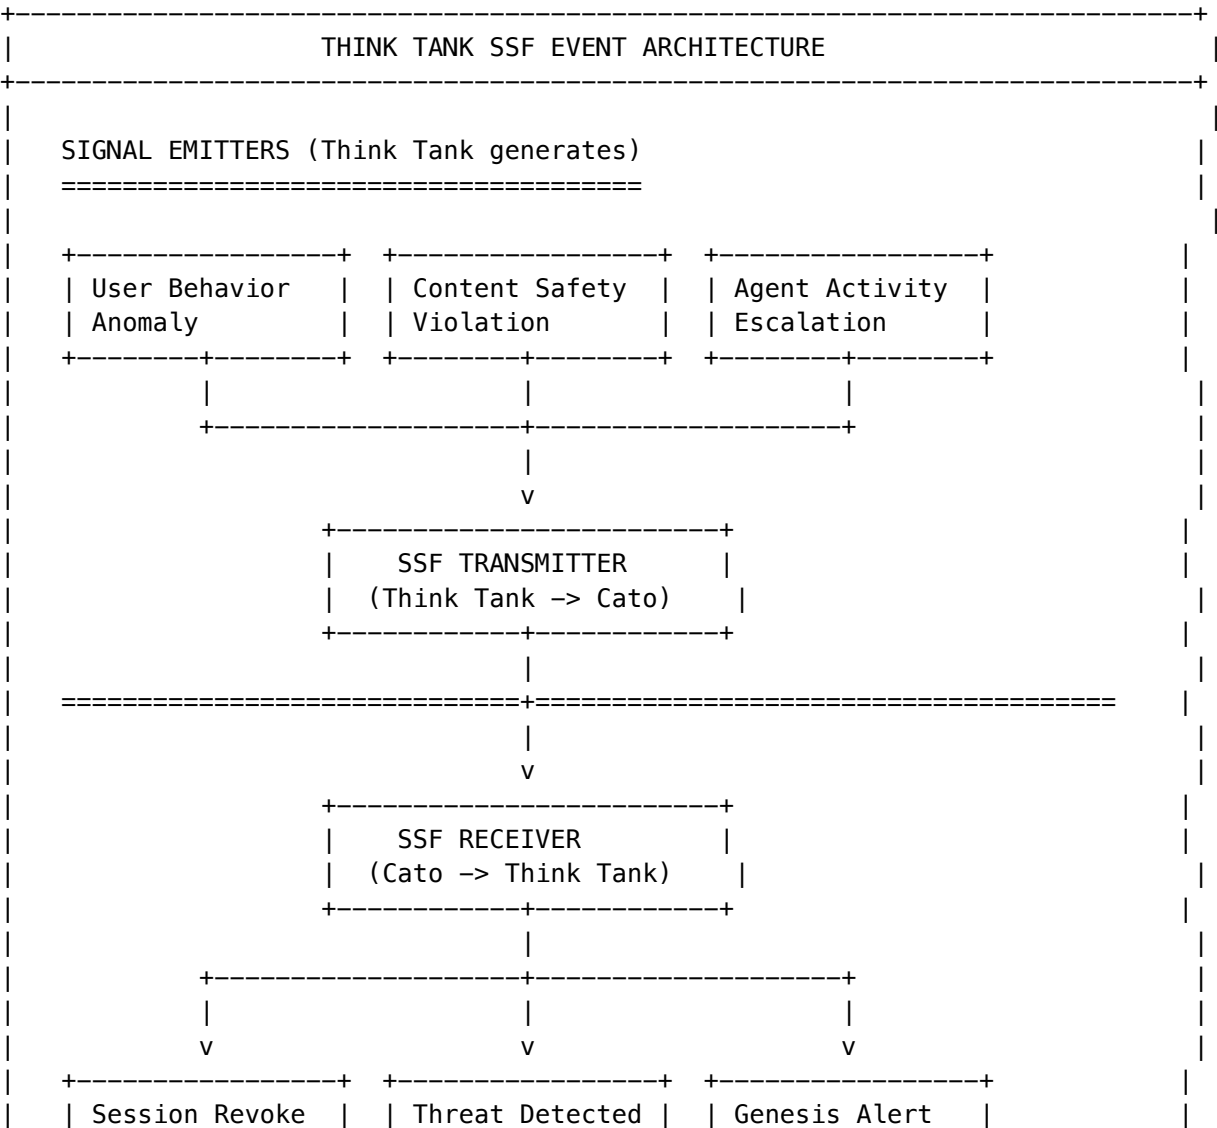

Traditional Automation vs. Agentic AI

Aspect	Traditional Automation	Agentic AI (Think Tank)
Decision Logic	Static rules	Dynamic evaluation
Learning	None	Continuous adaptation
Error Handling	Fail or retry	Investigate and adapt
Human Interaction	Scheduled checkpoints	On-demand escalation
Security Model	Perimeter-based	Zero Trust + CAEP

37.2 Shared Signals Framework (SSF) Integration

The **Shared Signals Framework** is an open standard that enables real-time security event sharing between systems. Think Tank agents both emit and consume SSF signals.

SSF Event Flow in Think Tank

SSF Events Emitted by Think Tank

Event Type	Trigger	Recipient Action
thinktank.behavior.anomaly	User behavior deviates significantly from baseline	Cato increases monitoring
thinktank.content.violation	User attempts prohibited content	Identity provider notified
thinktank.agent.escalation	Agent requires human approval	Mission Control alerted
thinktank.session.suspicious	Multiple failed attempts or unusual patterns	Cato may revoke session
thinktank.data.exfiltration_suspect	Suspected data extraction attempt	Block and investigate

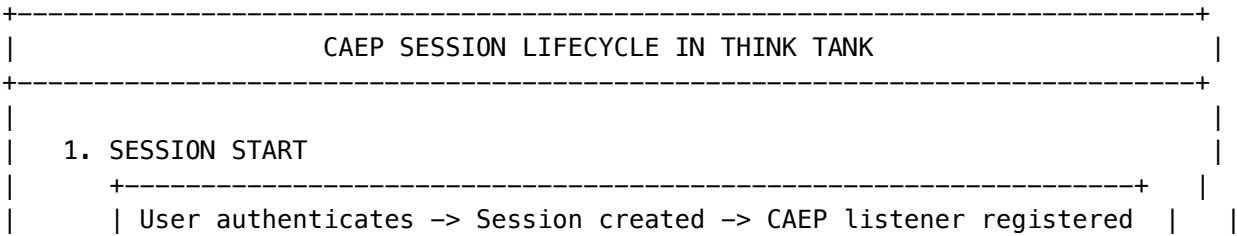

SSF Events Consumed by Think Tank

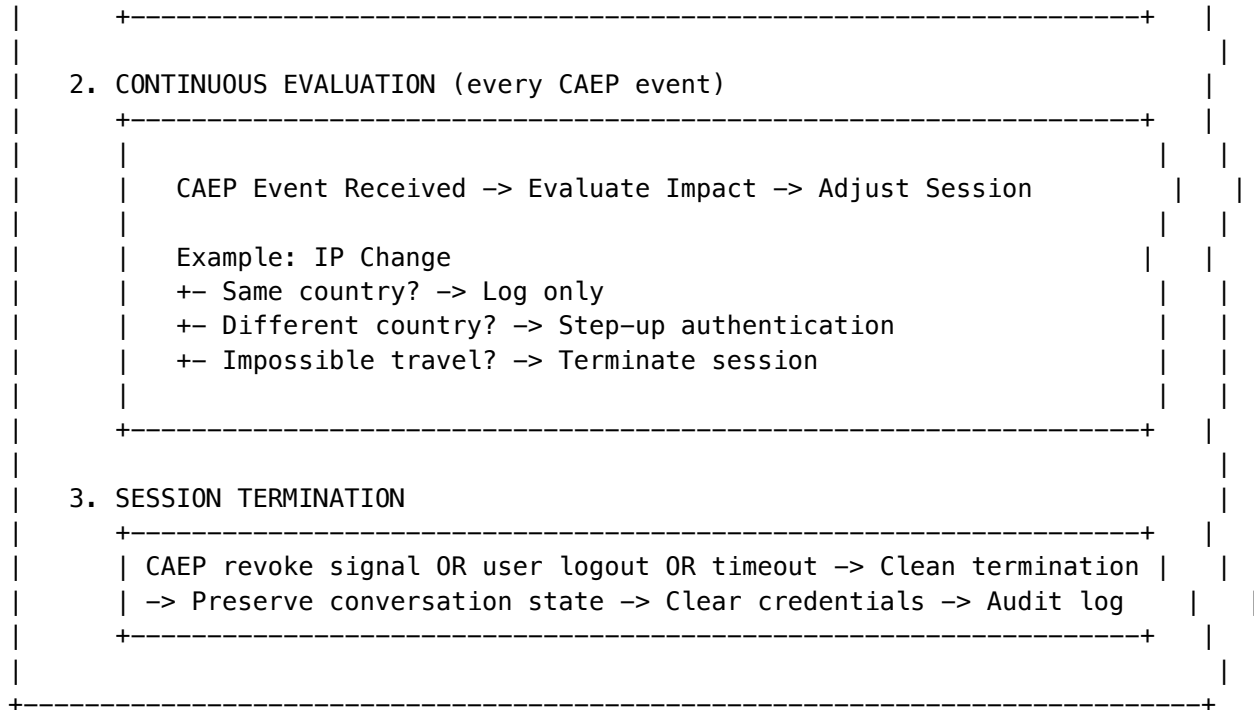

Event Type	Source	Think Tank Action
session-revoked	Identity Provider	Immediately terminate user session
credential-change	Identity Provider	Force re-authentication
threat-detected	Cato SASE	Restrict agent capabilities
genesis.alert	Genesis Reactor	Pause all non-critical agents
device-compliance-change	MDM/EDR	Re-evaluate user permissions

37.3 Continuous Access Evaluation Profile (CAEP)

CAEP extends SSF with specific event types designed for continuous session validation. Unlike traditional session timeouts, CAEP enables **real-time session adjustment** based on security signals.

CAEP Session Lifecycle

CAEP Configuration for Think Tank

```

# caep-thinktank.config.yaml
caep:
  enabled: true

  session_management:
    # How to handle IP changes
    ip_change_policy:
      same_country: log_only
      different_country: step_up_auth
      impossible_travel: terminate_session
      impossible_travel_threshold_hours: 2

    # How to handle device changes
    device_change_policy:
      known_device: allow
      unknown_device_trusted_location: step_up_auth
      unknown_device_unknown_location: terminate_session

    # How to handle credential events
    credential_change_policy:
      password_change: force_reauth
      mfa_change: force_reauth
      role_change: re_evaluate_permissions

  agent_restrictions:
    # During security events, restrict agent capabilities

```

```
during_threat_detected:
  disable_autonomous_actions: true
  disable_external_api_calls: true
  require_human_approval_all: true

during_genesis_alert:
  pause_all_agents: true
  preserve_state: true
  notify_administrators: true
```

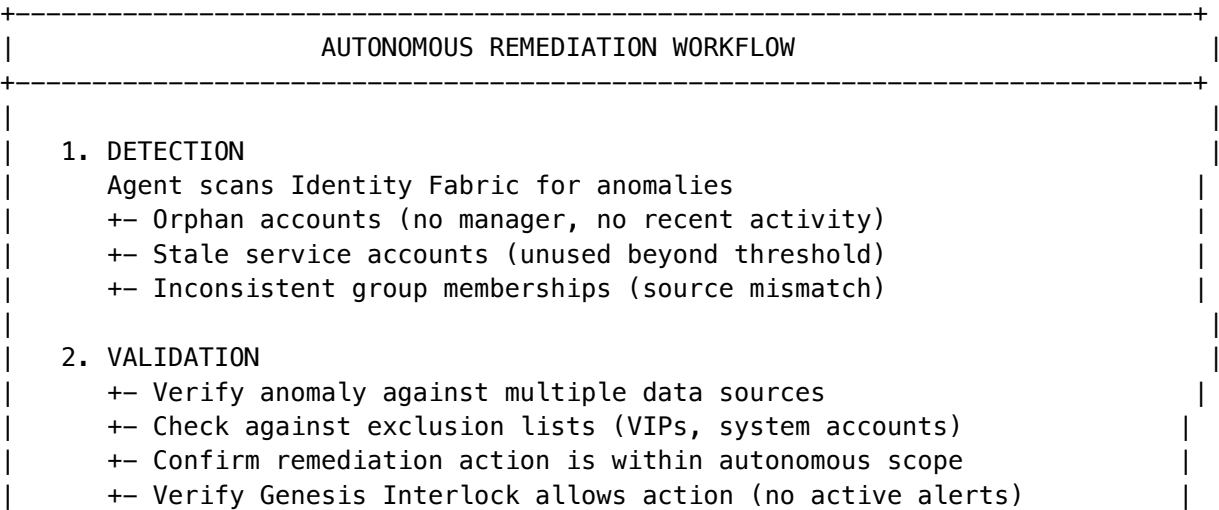

37.4 Autonomous Identity Remediation

Think Tank agents can perform **autonomous identity remediation**—cleaning up identity data quality issues without human intervention. This capability requires careful configuration to balance efficiency with safety.

Remediation Capabilities

Action	Autonomous?	Conditions
Remove Orphan Account	Yes	Inactive 90+ days, no entitlements, no recent auth
Disable Stale Service Account	Yes	Unused 180+ days, not in critical systems
Fix Group Membership Inconsistency	Yes	Source of truth mismatch detected
Delete Human Account	No	Always requires human approval
Revoke Admin Privileges	No	Always requires human approval
Bulk Operations (100+)	No	Always requires human approval

Remediation Workflow

3. EXECUTION	
+– If autonomous: Execute immediately, log action	
+– If requires approval: Create Mission Control escalation	
4. VERIFICATION	
+– Confirm action completed successfully	
+– Verify no unintended side effects	
+– Update remediation statistics	
5. LEARNING	
+– If action succeeded: Reinforce pattern	
+– If action failed or reversed: Flag for human review	

Remediation Configuration

Navigate to **Think Tank -> Identity -> Remediation** in admin dashboard:

```
# identity-remediation-thinktank.config.yaml
```

```
identity_remediation:
```

```
  enabled: true
```

```
  # Autonomous action limits
```

```
  autonomous_limits:
```

```
    max_per_hour: 50
```

```
    max_per_day: 200
```

```
    cooldown_after_error_minutes: 30
```

```
  # Detection criteria
```

```
  detection:
```

```
    orphan_account:
```

```
      inactive_days_threshold: 90
```

```
      require_no_entitlements: true
```

```
      require_no_recent_auth: true
```

```
      exclude_patterns:
```

```
        - "*-system@*"
```

```
        - "*-service@*"
```

```
        - "admin@*"
```

```
  stale_service_account:
```

```
    unused_days_threshold: 180
```

```
    exclude_critical_systems: true
```

```
    critical_system_tags:
```

```
      - genesis
```

```
      - security
```

```
      - auth
```

```
  group_membership:
```

```
    check_source_of_truth: true
```

```

sources:
  - active_directory
  - scim_provider
  - hr_system

# Notification settings
notifications:
  notify_on_autonomous_action: true
  notify_recipients:
    - security_team
    - identity_admins
  daily_summary: true

# Genesis Interlock integration
genesis_interlock:
  pause_during: [GEN-300, GEN-400, GEN-500]
  resume_automatically: true

```

37.5 The Radiant Ghost in Think Tank

The **Radiant Ghost** metaphor extends to Think Tank’s user interface, providing visual feedback about agent activity.

Ghost States in Think Tank UI

State	Indicator	Meaning	User Action
Idle	Faint outline	No active agents	None
Thinking	Soft pulse	Agent processing request	Wait
Researching	Searching animation	Agent gathering information	Wait
Writing	Typing animation	Agent generating response	Watch
Validating	Checkmark animation	Agent verifying output	Wait
Escalating	Orange pulse	Agent needs human input	Respond
Alert	Red pulse	Security or safety event	Investigate

Ghost Configuration

```

# ghost-ui.config.yaml
ghost_ui:
  enabled: true

# Visual settings
visuals:
  idle_opacity: 0.3

```

```

active_opacity: 0.8
alert_opacity: 1.0
animation_speed: normal # slow, normal, fast

# State display
states:
  show_thinking: true
  show_researching: true
  show_writing: true
  show_validating: true
  show_escalating: true
  show_alert: true

# Accessibility
accessibility:
  respect_reduced_motion: true
  provide_text_status: true
  screen_reader_announcements: true

```

37.6 Database Tables

Table	Purpose
ssf_events_emitted	SSF events sent by Think Tank
ssf_events_received	SSF events received by Think Tank
caep_session_events	CAEP session lifecycle events
identity_remediation_log	All remediation actions
identity_remediation_errors	Failed remediation attempts
ghost_state_log	Ghost UI state transitions

37.7 API Endpoints

Base: /api/thinktank/security

Method	Endpoint	Description
GET	/ssf/status	SSF integration status
GET	/ssf/events	Recent SSF events
POST	/ssf/emit	Manually emit SSF event (admin only)
GET	/caep/session	Current session CAEP status
GET	/remediation/stats	Remediation statistics
GET	/remediation/log	Remediation action log
POST	/remediation/trigger	Trigger manual remediation scan
GET	/ghost/state	Current Ghost state

37.8 Implementation Files

File	Purpose
lambda/shared/services/security-signals.service.ts	Security signal processing for Think Tank
lambda/shared/services/security-protection.service.ts	Security session protection
lambda/shared/services/identity-core.service.ts	Identity remediation agent
lambda/thinktank/handler.ts	Think Tank API handler (includes security events)
components/thinktank/ghost-indicator.tsx	Ghost UI component
migrations/000_consolidated_schema.sql	Database schema
config/security/ssf-events.yaml	SSF event definitions
config/security/caep-policies.yaml	CAEP policy configuration

38. Advanced Features (v4.18.0)

This section covers new advanced features implemented for Think Tank.

38.1 Flash Facts (Knowledge Sparks)

Fast-access factual memory system for quick retrieval of verified facts.

UI Metaphor: “Knowledge Sparks” - Contextual sidebar widget showing relevant facts as glowing spark icons.

Features: - CRUD operations for facts with confidence scoring - Semantic search using vector embeddings - Auto-matic fact extraction from conversations - Fact verification workflow - Usage tracking and statistics

API Endpoints (Base: /api/thinktank/flash-facts):

Method	Endpoint	Description
GET	/	List facts with filtering
POST	/	Create a new fact
GET	/:id	Get a specific fact
PUT	/:id	Update a fact
DELETE	/:id	Delete a fact
POST	/query	Semantic search for facts
POST	/extract	Extract facts from conversation
POST	/:id/verify	Verify a fact
GET	/stats	Get usage statistics

Database Tables: - flash_facts - Fact storage with embeddings - flash_facts_config - Per-tenant configuration

38.2 Grimoire (Spell Book)

Procedural memory system for storing and executing reusable patterns.

UI Metaphor: “Spell Book” - Magical tome with spell cards organized by schools of magic.

Schools of Magic: | School | Icon | Purpose | | — | — | — | — | | Code | [CODE] | Programming patterns | | Data | [CHART] | Data manipulation | | Text | [NOTE] | Text processing | | Analysis | [SEARCH] | Analytical methods | | Design | [DESIGN] | UI/UX patterns | | Integration | [LINK] | API integrations | | Automation | [GEAR] | Workflow automation | | Universal | [STAR] | Cross-domain spells |

Spell Categories: - Transformation, Divination, Conjuraton, Abjuration - Enchantment, Illusion, Necromancy, Evocation

API Endpoints (Base: /api/thinktank/grimoire):

Method	Endpoint	Description
GET	/	Get grimoire overview
GET	/spells	List all spells
POST	/spells	Create a new spell
GET	/spells/:id	Get spell details
PUT	/spells/:id	Update a spell
DELETE	/spells/:id	Delete a spell
POST	/spells/:id/cast	Cast a spell
POST	/spells/:id/learn	Learn from failure
GET	/schools	Get schools of magic
GET	/categories	Get spell categories
POST	/match	Find matching spell
POST	/promote	Promote pattern to spell

38.3 Economic Governor (Fuel Gauge)

Model arbitrage and cost optimization system.

UI Metaphor: “Fuel Gauge” - Visual meter showing budget remaining with color-coded status.

Governor Modes: | Mode | Description | | — | — | — | — | | cost_minimizer | Always cheapest viable option | | quality_maximizer | Best quality within budget | | balanced | Balance cost and quality | | latency_focused | Prioritize response speed | | custom | Use custom arbitrage rules |

Model Tiers: - Economy () - Cheapest, simple tasks - Self-Hosted () - On-premise models - Standard ([CHART]) - Default tier - Premium ([GEM]) - Higher quality - Flagship ([LAUNCH]) - Best available

API Endpoints (Base: /api/thinktank/governor):

Method	Endpoint	Description
GET	/	Get dashboard with fuel gauge
GET	/config	Get configuration
PUT	/config	Update configuration
PUT	/mode	Quick mode switch
POST	/recommend	Get model recommendation
GET	/metrics	Get cost metrics
GET	/budget	Get budget status
PUT	/budget	Update budget limit
GET	/tiers	Get model tiers
PUT	/tiers/:tier	Update tier config
GET	/rules	Get arbitrage rules
POST	/rules	Add arbitrage rule
PUT	/rules/:id	Update rule
DELETE	/rules/:id	Delete rule

38.4 Sentinel Agents (Watchtower Dashboard)

Event-driven autonomous agents for monitoring and automation.

UI Metaphor: “Watchtower Dashboard” - Castle towers watching over different domains.

Agent Types: | Type | Icon | Purpose | | — | — | — | — | | Monitor | | Passive watchdog - observes and alerts | | Guardian | [SHIELD] | Protective - can block harmful actions | | Scout | | Proactive information gathering | | Herald | | Notifications and announcements | | Arbiter | | Decision making and routing |

Agent Status: - Idle (), Watching (), Triggered (), Cooldown (), Disabled ()

API Endpoints (Base: /api/thinktank/sentinels):

Method	Endpoint	Description
GET	/	List all agents
POST	/	Create agent
GET	/:id	Get agent details
PUT	/:id	Update agent
DELETE	/:id	Delete agent
POST	/:id/trigger	Manually trigger
POST	/:id/enable	Enable agent
POST	/:id/disable	Disable agent
GET	/:id/events	Get agent events
GET	/events	All events

Method	Endpoint	Description
GET	/stats	Statistics
GET	/types	Available types

38.5 Time-Travel Debugging (Timeline Scrubber)

Conversation forking and state replay system.

UI Metaphor: “Timeline Scrubber” - Horizontal timeline with draggable playhead and fork points.

Checkpoint Types: | Type | Icon | Description | | — | — | — | — | — | — | | Auto | | Automatic checkpoint | | Manual | | User-created | | Fork | | Branch point | | Merge | | Merged timelines | | Rollback | | After rollback |

API Endpoints (Base: /api/thinktank/time-travel):

Method	Endpoint	Description
GET	/timelines	List timelines
POST	/timelines	Create timeline
GET	/timelines/:id	Get timeline view
POST	/timelines/:id/checkpoint	Create checkpoint
POST	/timelines/:id/jump	Jump to checkpoint
POST	/timelines/:id/fork	Fork timeline
POST	/timelines/:id/replay	Replay sequence
GET	/checkpoints/:id	Get checkpoint

38.6 Council of Rivals (Debate Arena)

Multi-model adversarial consensus system.

UI Metaphor: “Debate Arena” - Amphitheater with model avatars debating in a circular arrangement.

Member Roles: | Role | Icon | Purpose | | — | — | — | — | — | — | | Advocate | | Argues for a position | | Critic | [SEARCH] | Challenges positions | | Synthesizer | | Combines perspectives | | Specialist | [EDU] | Domain expert | | Contrarian | | Devil’s advocate |

Preset Councils: - **Balanced** () - Diverse perspectives - **Technical** ([TOOL]) - Expert technical review - **Creative** ([DESIGN]) - Creative exploration

Verdict Outcomes: - Consensus (), Majority (), Split (), Deadlock ([LOCK]), Synthesized ()

API Endpoints (Base: /api/thinktank/council):

Method	Endpoint	Description
GET	/	List councils

Method	Endpoint	Description
POST	/	Create council
POST	/preset	Create preset council
GET	/:id	Get council
PUT	/:id	Update council
DELETE	/:id	Delete council
POST	/:id/debate	Start debate
GET	/debate/:id	Get debate
POST	/debate/:id/argument	Submit argument
POST	/debate/:id/rebuttal	Submit rebuttal
POST	/debate/:id/vote	Conduct voting
GET	/presets	Get preset options

38.7 Security Signals (Security Shield)

SSF/CAEP integration for identity security events.

UI Metaphor: “Security Shield” - Animated shield with real-time threat visualization.

Signal Types: | Type | Icon | Description | | — | — | — | — | — | | Session Revoked | [LOCK] | SSF session terminated | | Credential Change | [KEY] | Password/key changed | | Device Compliance | | CAEP compliance change | | Risk Change | [CHART] | Risk level changed | | Anomaly Detected | [SEARCH] | Behavioral anomaly | | Threat Detected | [!] | Active threat | | Policy Violation | [NO] | Policy breach |

Severity Levels: Critical (), High (), Medium (), Low (), Info ()

API Endpoints (Base: /api/thinktank/security):

Method	Endpoint	Description
GET	/dashboard	Security dashboard
GET	/signals	List signals
POST	/signals	Create signal
GET	/signals/:id	Get signal
PUT	/signals/:id/status	Update status
GET	/policies	List policies
POST	/policies	Create policy
PUT	/policies/:id	Update policy
DELETE	/policies/:id	Delete policy
POST	/ssf/event	Ingest SSF event
POST	/caep/event	Ingest CAEP event

38.8 Policy Framework (Stance Compass)

Strategic intelligence and regulatory stance configuration.

UI Metaphor: “Stance Compass” - Radial chart showing policy positions across domains.

Policy Domains: | Domain | Icon | Description | | — — | — — | — — — | | AI Safety | [AI] | AI alignment and safety | | Data Privacy | [LOCK] | Data protection regulations | | Content Moderation | [NOTE] | Content policies | | Accessibility | | Accessibility requirements | | Sustainability | | Environmental considerations | | Security | [SHIELD] | Cybersecurity posture | | Transparency | | AI transparency | | Ethics | | Ethical AI principles | | Compliance | [LIST] | Regulatory compliance | | Innovation | [TIP] | Innovation balance |

Stance Positions: - Restrictive (), Cautious (), Balanced (), Permissive (), Adaptive ()

Preset Profiles: - **Conservative** - Maximum safety, minimal risk - **Balanced** - Middle ground - **Innovative** - Emphasis on innovation

API Endpoints (Base: /api/thinktank/policy):

Method	Endpoint	Description
GET	/compass	Get compass view
GET	/domains	Get available domains
GET	/positions	Get stance positions
GET	/stances	List stances
POST	/stances	Create stance
GET	/stances/:domain	Get domain stance
PUT	/stances/:id	Update stance
GET	/profiles	List profiles
GET	/profiles/active	Get active profile
POST	/profiles	Create profile
POST	/profiles/preset	Create preset profile
PUT	/profiles/:id/activate	Activate profile
GET	/recommendations	Get recommendations
GET	/compliance	Check compliance

38.9 Database Migration

All features use migration 100_thinktank_advanced_features.sql with the following tables:

Table	Feature
flash_facts	Flash Facts storage
flash_facts_config	Flash Facts config
grimoire_spells	Grimoire spells
grimoire_casts	Spell cast history

Table	Feature
grimoire_achievements	User achievements
economic_governor_config	Governor config
economic_governor_usage	Usage tracking
sentinel_agents	Sentinel agents
sentinel_events	Agent events
time_travel_timelines	Timelines
time_travel_checkpoints	Checkpoints
time_travel_forks	Fork records
council_of_rivals	Councils
council_debates	Debates
security_signals	Security signals
security_policies	Security policies
policy_stances	Policy stances
policy_profiles	Policy profiles

39. Liquid Interface (Generative UI)

39.1 Overview

“Don’t Build the Tool. BE the Tool.”

The Liquid Interface transforms the chat interface into dynamic, morphable UI tools based on user intent. Instead of asking “help me make a spreadsheet app,” the chat *becomes* the spreadsheet.

Core Concept: - User says: “Help me track my invoices” - Chat morphs into: Invoice tracker with data grid, totals, AI assistant sidebar - User interacts: Add, edit, filter invoices directly - AI watches: Ghost State binds UI actions to AI context - Export: “Eject” to a deployable Next.js/Vite app

Key Benefits: - **Zero-friction prototyping** - Ideas become tools instantly - **Two-way AI binding** - AI sees what you’re doing, UI reflects what AI knows - **Production export** - Ephemeral apps become real codebases - **50+ morphable components** - Data grids, charts, kanban, calendars, code editors

39.2 Architecture

39.3 Component Registry

50+ pre-built morphable components across 9 categories:

Category	Components	Description
Data (10)	DataGrid, PivotTable, DataCard, JSONViewer, SQLViewer, CSVEditor, DataFilter, SchemaDesigner, DataDiff, DataImport	Spreadsheets, tables, data viewers
Visualization (10)	LineChart, BarChart, PieChart, ScatterPlot, AreaChart, Heatmap, Treemap, GeoMap, Timeline, SankeyDiagram	Charts, graphs, maps

Category	Components	Description
Productivity (10)	KanbanBoard, Calendar, GanttChart, TodoList, NotesEditor, Timer, HabitTracker, MindMap, Whiteboard, FileManager	Task & project management
Finance (6)	Invoice, BudgetTracker, ExpenseTable, Portfolio, Calculator, CurrencyConverter	Financial tools
Code (6)	CodeEditor, Terminal, DiffViewer, APITester, RegexTester, JSONFormatter	Developer tools
AI (4)	AIChat, InsightCard, SuggestionPanel, ContextInspector	AI-powered widgets
Input (4)	FormBuilder, SliderPanel, DateRangePicker, SearchBox	User input forms

Component Definition:

```
interface LiquidComponent {
  id: string;           // e.g., 'data-grid'
  name: string;         // e.g., 'DataGrid'
  category: ComponentCategory; // e.g., 'data'
  propsSchema: JSONSchema; // Component props
  eventsSchema: JSONSchema; // Emitted events
  supportsInteraction: boolean;
  supportsDataBinding: boolean;
  supportsAIContext: boolean;
  defaultSize: { width, height };
  icon: string;
  tags: string[];
}
```

39.4 Ghost State (Two-Way Binding)

“The AI sees what you’re doing. The UI reflects what AI knows.”

Ghost State creates bidirectional bindings between UI components and AI context:

Binding Configuration:

```
interface GhostBinding {
  id: string;
  sourceComponent: string; // UI component ID
  sourceProperty: string; // e.g., 'selectedRow'
  contextKey: string; // AI context key
  direction: 'ui_to_ai' | 'ai_to_ui' | 'bidirectional';
  debounceMs?: number; // Debounce rapid changes
  triggerReaction?: boolean; // Trigger AI response on change
  reactionPrompt?: string; // Custom prompt for reaction
}
```

AI Reactions: When users interact with morphed UI, the AI can react with: - speak - Send a message - update - Update UI state - morph - Transform to different layout - suggest - Show suggestion panel

39.5 Intent Detection

Intent detection determines when and how to morph the UI:

Intent Category	Trigger Phrases	Default Components
data_analysis	spreadsheet, excel, csv, analyze data	DataGrid, PivotTable
tracking	track invoices, manage expenses	Invoice, ExpenseTable, Kanban
visualization	chart, graph, visualize, show metrics	LineChart, BarChart, Dashboard
planning	plan project, timeline, kanban	KanbanBoard, GanttChart
calculation	calculate, compute, formula	Calculator, DataGrid
design	design, wireframe, brainstorm	Whiteboard, MindMap
coding	code, debug, terminal	CodeEditor, Terminal
writing	write, draft, notes	NotesEditor, MindMap

Morph Threshold: confidence >= 0.85 (configurable per tenant)

39.6 Eject to App

“The Takeout Button” - Export ephemeral liquid apps to real codebases.

Supported Frameworks: - **Next.js 14** - Full-stack React with API routes - **Vite + React** - Fast client-side SPA - **Remix** - Web standards framework - **Astro** - Content-focused sites

Features to Include: | Feature | Description | | — — — | | — — — | | database | PGLite -> Postgres migration, Drizzle ORM | | auth | NextAuth scaffolding | | api | API routes for data operations | | ai | OpenAI integration | | realtime | WebSocket support |

Generated Files:

```
my-liquid-app/
+-- package.json
```

```
+-- next.config.mjs / vite.config.ts
+-- tsconfig.json
+-- tailwind.config.ts
+-- app/page.tsx (or src/App.tsx)
+-- components/
|   +-- LiquidLayout.tsx
|   +-- DataGrid.tsx
|   +-- ...
+-- store/index.ts (Zustand)
+-- types/index.ts
+-- lib/db.ts (if database)
+-- lib/ai.ts (if ai)
+-- README.md
+-- .env.example
+-- .gitignore
```

39.7 Configuration

Per-Tenant Configuration:

Setting	Default	Description
enabled	true	Enable Liquid Interface
auto_morph_enabled	true	Auto-morph on high-confidence intent
eject_enabled	true	Allow app export
morph_confidence_threshold	0.85	Minimum confidence to morph
auto_revert_timeout_seconds	300	Auto-revert to chat after inactivity
max_active_sessions	10	Max concurrent liquid sessions
max_ghost_events_per_session	1000	Event history limit
default_overlay_mode	sidebar	AI overlay mode
default_overlay_position	right	AI overlay position

39.8 API Endpoints

Base: /api/thinktank/liquid

Method	Endpoint	Description
Registry		
GET	/registry	Get registry overview
GET	/registry/components	List components (filter: ?category=, ?q=)
GET	/registry/components/:id	Get component details

Method	Endpoint	Description
Sessions		
POST	/sessions	Create new session
GET	/sessions/:id	Get session
Morphing		
POST	/morph	Process morph request
POST	/detect-intent	Detect intent from message
POST	/sessions/:id/revert	Revert to chat mode
Ghost State		
POST	/ghost/event	Send ghost event
GET	/ghost/state/:sessionId	Get ghost state snapshot
POST	/ghost/sync	Sync multiple state updates
GET	/ghost/history/:sessionId	Get event history
GET	/ghost/context/:sessionId	Get AI context block
Eject		
POST	/eject	Eject to app
POST	/eject/preview	Preview eject
Analytics		
GET	/analytics/usage	Component usage stats

39.9 Database Tables

Table	Purpose
liquid_sessions	Active liquid interface sessions
liquid_ghost_state	Persisted ghost state bindings
liquid_ghost_events	User interaction events
liquid_ai_reactions	AI responses to events
liquid_eject_history	App export history
liquid_component_usage	Component analytics
liquid_intent_patterns	Learnable intent patterns
liquid_config	Per-tenant configuration

39.10 Implementation Files

File	Purpose
packages/shared/src/types/liquid-interface.types.ts	Type definitions
lambda/shared/services/liquid-interface/liquid-interface.service.ts	Main service
lambda/shared/services/liquid-interface/ghost-state.service.ts	Ghost state manager
lambda/shared/services/liquid-interface/eject.service.ts	App export service
lambda/shared/services/liquid-interface/component-registry.ts	50+ components
lambda/thinktank/liquid-interface.ts	API handler
migrations/000_consolidated_schema.sql	Database schema

40. The Reality Engine

“The Reality Engine transforms Think Tank from a chatbot into a shape-shifting command center with time travel, parallel universes, and telepathy.”

The Reality Engine is the unified runtime powering Think Tank’s supernatural capabilities. It consists of four interconnected features that solve the three fundamental anxieties preventing users from trusting AI with complex work: **Fear** (of breaking what works), **Commitment** (fear of choosing the wrong path), and **Latency** (waiting for the AI to think).

40.1 Feature Overview

Feature	Emotion	Pitch
Morphic UI	Flow	“Stop hunting for the right tool. Radiant is a Morphic Surface that shapeshifts instantly.”
Reality Scrubber	Invincibility	“We replaced ‘Undo’ with Time Travel. Scrub reality back to any point.”
Quantum Futures	Omniscience	“Why choose one strategy? Split the timeline and run both simultaneously.”
Pre-Cognition	Telepathy	“Radiant answers before you ask. It’s not just fast; it’s anticipatory.”

40.2 Architecture

40.3 Morphic UI

“Stop hunting for the right tool. Radiant is a Morphic Surface that shapeshifts instantly.”

The Morphic UI detects user intent and transforms the interface into the appropriate tool.

Intent Categories

Intent	Detected Patterns	Morphs To
data_analysis	“analyze”, “data”, “statistics”	DataGrid, Charts
tracking	“track”, “manage”, “organize”	Kanban, Calendar
visualization	“visualize”, “chart”, “graph”	LineChart, PieChart, BarChart
planning	“plan”, “schedule”, “timeline”	GanttChart, Calendar
finance	“budget”, “invoice”, “expense”	Ledger, Calculator, Invoice
design	“brainstorm”, “design”, “whiteboard”	MindMap, Whiteboard

Intent	Detected Patterns	Morphs To
coding	“code”, “debug”, “script”	CodeEditor, Terminal

Ghost State Binding

Every UI component is bidirectionally bound to AI context:

```
// User selects a row -> AI knows what they're focused on
ghostBinding: {
  componentProp: 'selectedRow',
  contextKey: 'user_focus',
  direction: 'ui_to_ai'
}

// AI insight -> UI highlights relevant items
ghostBinding: {
  componentProp: 'highlights',
  contextKey: 'ai_suggestions',
  direction: 'ai_to_ui'
}
```

40.4 Reality Scrubber

“We replaced ‘Undo’ with Time Travel.”

The Reality Scrubber captures full state snapshots and allows instant rewinding to any point.

What Gets Snapshotted

State Type	Description
VFS State	Virtual File System (all generated files)
DB State	PGLite database snapshot
Ghost State	All UI-AI bindings
Chat Context	Conversation history at that point
Layout State	Current morphed UI layout

Trigger Events

Event	When Captured
user_action	User explicitly triggered
ai_generation	AI generated content
db_mutation	Database was modified
morph_transition	UI morphed

Event	When Captured
checkpoint	User-created bookmark
auto_interval	Every 30 seconds (configurable)

Timeline UI

The Reality Scrubber replaces the standard scrollbar with a video-editor-style timeline:

40.5 Quantum Futures

“Why choose one strategy? Split the timeline.”

Quantum Futures enables parallel reality branching where users can run multiple strategies simultaneously.

Branch Creation

```
// User: "Should I use Redux or Zustand?"
await quantumFuturesService.createSplit({
  sessionId,
  prompt: "State management comparison",
  branchNames: ["Redux Implementation", "Zustand Implementation"],
  autoCompare: true
});
```

Comparison View

[RADIANT] Redux Implementation	[BRANDED] Zustand Implementation
[OK] Type safety	[OK] Simpler setup

[!] Boilerplate	[OK] Less boilerplate	
[CHART] Completion: 45%	[CHART] Completion: 60%	
[COST] Est. Cost: \$0.12	[COST] Est. Cost: \$0.08	
[Keep This Reality]	[Keep This Reality]	
+-----+-----+-----+		

Collapse to Winner

When the user selects a winner, the losing branches are either: - **Collapsed**: Permanently removed - **Archived**: Stored in “Dream Memory” for potential future recall

40.6 Pre-Cognition

“Radiant answers before you ask.”

Pre-Cognition uses speculative execution to predict the user’s next likely actions and pre-compute solutions in the background.

How It Works

1. **Prediction**: While user reads current response, Genesis model predicts next 3 likely moves
2. **Pre-Compute**: Solutions are generated in hidden background containers
3. **Instant Delivery**: When user’s request matches a prediction, response appears instantly (0ms latency)

Prediction Algorithm

```
// After building a login form, predict:
predictions: [
  { intent: 'coding', prompt: 'Add password reset', confidence: 0.8 },
  { intent: 'coding', prompt: 'Add OAuth integration', confidence: 0.7 },
  { intent: 'design', prompt: 'Style the form', confidence: 0.6 }
]
```

Analytics

Metric	Description
hitRate	Percentage of predictions that matched user intent
avgLatencySaved	Average milliseconds saved by pre-cognition
telepathyScore	User-facing metric showing prediction accuracy

40.7 Configuration

```
interface RealityEngineConfig {
  // Feature toggles
  morphicUIEnabled: boolean; // Enable Morphic UI
  realityScrubberEnabled: boolean; // Enable Reality Scrubber
}
```

```

quantumFuturesEnabled: boolean;    // Enable Quantum Futures
preCognitionEnabled: boolean;     // Enable Pre-Cognition

// Behavior
autoSnapshotIntervalMs: number;   // Default: 30000 (30s)
maxSnapshotsPerSession: number;   // Default: 100
maxBranchesPerSession: number;    // Default: 8
codeCurtainDefault: boolean;      // Hide code by default (Genie mode)
ephemeralByDefault: boolean;      // Apps dissolve when topic changes

// Pre-Cognition
preCognition: {
  maxPredictions: number;         // Default: 3
  predictionTTLms: number;        // Default: 60000 (1 min)
  computeBudgetMs: number;        // Default: 5000 (5s)
  minConfidenceThreshold: number; // Default: 0.6
  useGenesisModel: boolean;       // Use local model for predictions
};
}

```

40.8 API Endpoints

Base path: /api/thinktank/reality-engine

Method	Endpoint	Description
Session		
POST	/session	Initialize Reality Engine session
GET	/session/:id	Get session state
Morphic UI		
POST	/morph	Morph interface to intent
POST	/dissolve	Dissolve morphed interface
POST	/ghost	Update Ghost State
Reality Scrubber		
POST	/scrub	Scrub to point in time
POST	/bookmark	Create bookmark
GET	/timeline/:sessionId	Get timeline visualization
GET	/bookmarks/:sessionId	Get all bookmarks
Quantum Futures		
POST	/split	Split into parallel realities
GET	/branches/:sessionId	Get all branches
POST	/compare	Compare two branches
POST	/collapse	Collapse to winning reality
PUT	/view-mode	Set comparison view mode

Method	Endpoint	Description
Pre-Cognition		
GET	/precognition/:sessionId	Get analytics
POST	/precognition/cleanup	Clean up expired predictions
Eject		
POST	/eject	Eject to standalone app
Metrics		
GET	/metrics/:sessionId	Get session metrics

40.9 Database Tables

Table	Purpose
reality_engine_sessions	Unified session state
reality_timelines	Timeline structure and navigation
reality_snapshots	Full state snapshots for time travel
quantum_branches	Parallel reality branches
quantum_splits	Split configuration and history
quantum_dream_archive	Archived branches in dream memory
precognition_queues	Per-session prediction configuration
precognition_predictions	Pre-computed solutions
precognition_analytics	Hit/miss tracking for learning

40.10 Implementation Files

File	Purpose
packages/shared/src/types/reality-engine.types.ts	Type definitions
lambda/shared/services/reality-engine/reality-engine.service.ts	Main service
lambda/shared/services/reality-engine/reality-scrubber.service.ts	Time travel
lambda/shared/services/reality-engine/quantum-futures.service.ts	Branching
lambda/shared/services/reality-engine/pre-cognition.service.ts	Predictions
lambda/thinktank/reality-engine.ts	API handler
migrations/000_consolidated_schema.sql	Database schema

40.11 The “Code Curtain” Rule

The Reality Engine enforces the distinction between “Builder” (Coder) and “Genie” (Radiant):

Rule	Implementation
Hide Code by Default	UI snaps to Preview tab, not code
Interaction over Syntax	Variables become UI controls (sliders, inputs)
Ephemeral by Default	Apps dissolve when topic changes
Eject to Keep	Only persist to repo if user explicitly clicks “Keep This”

“Radiant is a Genie, not a Coder. We use code as invisible ink to draw the interface—the user should never see the ink, only the drawing.”

41. The Magic Carpet

“We are building ‘The Magic Carpet.’ You don’t drive it. You don’t write code for it. You just say where you want to go, and the ground beneath you reshapes itself to take you there instantly.”

The Magic Carpet is the unified navigation and experience layer for Think Tank. It wraps the Reality Engine capabilities into a cohesive, magical user experience where users feel like magicians, not coders.

41.1 The Magic Carpet Philosophy

Traditional Apps	Magic Carpet
Navigate menus	Speak your destination
Click through workflows	Fly directly there
Learn the interface	Interface learns you
You drive	You’re carried

Core Insight: We aren’t selling a better IDE. We are selling **the feeling of being a Magician.**

41.2 Carpet Modes

Mode	Description	Visual
resting	Waiting for destination (chat-first)	Carpet gently floating
flying	Morphing/transitioning to destination	Trail effects, motion blur
hovering	Arrived, actively working	Stable, glowing edges
exploring	Quantum Futures - multiple realities	Split view, branch indicators
rewinding	Reality Scrubber - time traveling	Timeline visible, rewind effect

Mode	Description	Visual
anticipating	Pre-Cognition active	Prediction cards appearing

41.3 Carpet Altitudes

The altitude represents UI complexity level:

Altitude	Complexity	Example
ground	Simple chat mode	Just the chat interface
low	Single component	One morphed widget
medium	Full workspace	2-3 components
high	Complex layout	4-5 components + timeline
stratosphere	Maximum capability	Full Reality Engine features

41.4 Default Destinations

Destination	Icon	Description
Command Center		Overview dashboard
Workshop		Build and create
Time Stream		Reality Scrubber timeline
Quantum Realm		Parallel realities view
Oracle's Chamber		Pre-Cognition predictions
Gallery		View creations
Vault	[LOCK]	Saved/bookmarked items

41.5 Carpet Commands

```
// Fly to a destination
await magicCarpetService.command(carpetId, {
  type: 'fly',
  destination: 'Workshop'
});

// Return to chat
await magicCarpetService.command(carpetId, { type: 'land' });

// Increase complexity
await magicCarpetService.command(carpetId, { type: 'ascend' });

// Time travel
await magicCarpetService.command(carpetId, {
```

```

    type: 'rewind',
    to: -2 // Go back 2 snapshots
  });

// Split into parallel realities
await magicCarpetService.command(carpetId, {
  type: 'branch',
  options: ['Conservative Plan', 'Aggressive Plan']
});

// Collapse to winner
await magicCarpetService.command(carpetId, {
  type: 'collapse',
  winner: 'branch-id'
});

```

41.6 Carpet Themes

Pre-built visual themes for personalization:

Theme	Description	Gradient
Mystic Night	Deep purple mystical (default)	Indigo -> Purple -> Violet
Desert Sun	Warm golden	Amber -> Orange -> Brown
Ocean Deep	Cool blue aquatic	Cyan -> Teal -> Emerald
Cosmic Void	Dark minimalist	Gray gradient
Neon Circuit	Cyberpunk electric	Cyan -> Purple -> Pink

41.7 Carpet Preferences

```

interface CarpetPreferences {
  // Navigation
  autoFly: boolean; // Auto-morph on intent detection
  smoothTransitions: boolean; // Animated vs instant
  showJourneyTrail: boolean; // Show navigation history

  // Pre-Cognition
  preCognitionEnabled: boolean;
  showPredictions: boolean;
  telepathyIntensity: 'subtle' | 'moderate' | 'aggressive';

  // Reality Scrubber
  showTimeline: boolean;
  autoSnapshot: boolean;
  snapshotInterval: number; // Seconds

  // Quantum Futures
  maxParallelRealities: number;

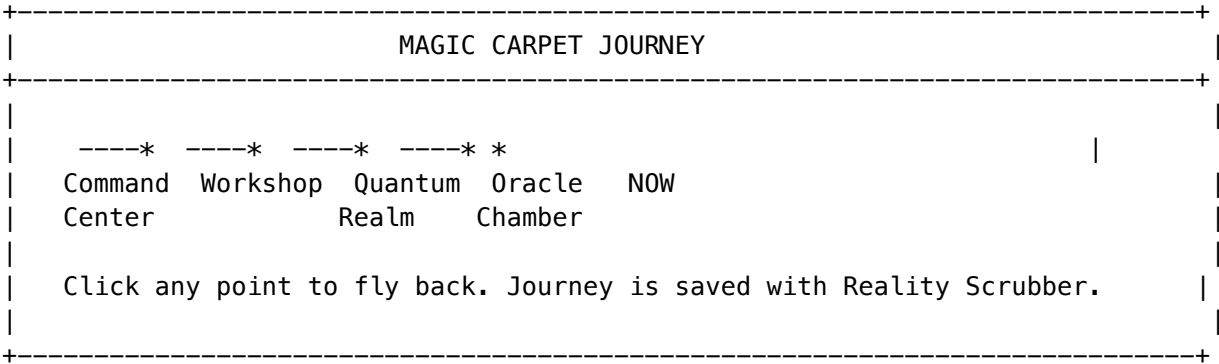

```

```
autoCompare: boolean;

// Accessibility
reducedMotion: boolean;
highContrast: boolean;
screenReaderMode: boolean;
}
```

41.8 Journey Navigation

The Magic Carpet tracks the user’s journey:

41.9 API Endpoints

Base path: /api/thinktank/magic-carpet

Method	Endpoint	Description
POST	/summon	Summon a new Magic Carpet
GET	/:carpetId	Get carpet state
POST	/:carpetId/fly	Fly to destination
POST	/:carpetId/land	Land (return to chat)
POST	/:carpetId/command	Execute a command
GET	/:carpetId/journey	Get journey history
PUT	/:carpetId/theme	Update theme
PUT	/:carpetId/preferences	Update preferences
GET	/destinations	Get available destinations
GET	/themes	Get available themes

41.10 Database Tables

Table	Purpose
magic_carpets	Carpet state and configuration

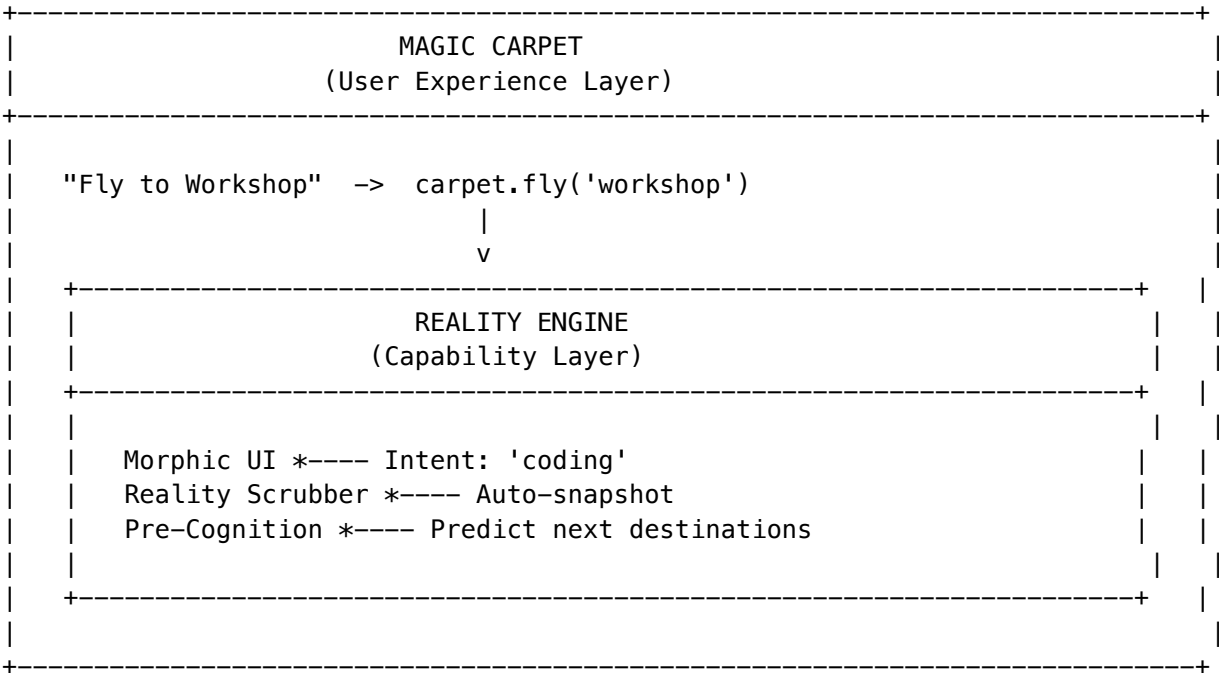

Table	Purpose
carpet_destinations	Pre-defined and custom destinations
carpet_journey_points	Navigation history
carpet_themes	Visual themes
carpet_analytics	Usage analytics

41.11 Implementation Files

File	Purpose
packages/shared/src/types/magic-carpet.types.ts	Type definitions
lambda/shared/services/magic-carpet/magic-carpet.service.ts	Main service
migrations/000_consolidated_schema.sql	Database schema

41.12 Integration with Reality Engine

The Magic Carpet wraps the Reality Engine:

42. Magic Carpet UI Components

The Magic Carpet UI is implemented through a set of React components that bring the 2026 UI/UX trends to life.

42.1 Component Inventory

Component	Purpose	Location
MagicCarpetNavigator	Bottom navigation with journey trail	magic-carpet/magic-carpet-navigator.tsx
RealityScrubberTimeline	Video-editor timeline for state snapshots	magic-carpet/reality-scrubber-timeline.tsx
QuantumSplitView	Side-by-side reality comparison	magic-carpet/quantum-split-view.tsx
PreCognitionSuggestions	Predicted actions panel	magic-carpet/pre-cognition-suggestions.tsx
AIPresenceIndicator	AI cognitive/emotional state display	magic-carpet/ai-presence-indicator.tsx
SpatialGlassCard	Glassmorphism card with depth	magic-carpet/spatial-glass-card.tsx
GlassPanel	Large glass content area	magic-carpet/spatial-glass-card.tsx
GlassButton	Interactive glass button	magic-carpet/spatial-glass-card.tsx
GlassBadge	Status indicator with glass effect	magic-carpet/spatial-glass-card.tsx
FocusModeControls	Focus mode toggle and controls	magic-carpet/focus-mode.tsx
FocusOverlay	Dimming overlay for focus mode	magic-carpet/focus-mode.tsx

42.2 Usage Examples

```
import {
  MagicCarpetNavigator,
  RealityScrubberTimeline,
  QuantumSplitView,
  PreCognitionSuggestions,
  AIPresenceIndicator,
  SpatialGlassCard,
  FocusModeControls,
} from '@components/thinktank/magic-carpet';

// Magic Carpet Navigator (bottom of screen)
<MagicCarpetNavigator
  currentDestination={{ id: 'workspace', name: 'Workshop', icon: '' }}
  journey={journeyHistory}
  predictions={preCognizedActions}
  telepathyScore={0.82}
  mode="hovering"
  altitude="medium"
  onFly={(dest) => navigateTo(dest)}
```

```

    onLand={() => returnToChat()}
  />

// Reality Scrubber Timeline
<RealityScrubberTimeline
  snapshots={stateSnapshots}
  currentPosition={currentSnapshotIndex}
  onScrubTo={(position) => restoreSnapshot(position)}
  onCreateBookmark={(label) => bookmarkCurrentState(label)}
/>

// Quantum Split View
<QuantumSplitView
  branches={parallelRealities}
  onCollapse={(winnerId) => collapseToReality(winnerId)}
/>

// AI Presence Indicator
<AIPresenceIndicator
  state="thinking"
  affect={{ valence: 0.6, arousal: 0.4, curiosity: 0.8, confidence: 0.85 }}
  currentTask="Analyzing user intent..."
  modelName="claude-3.5-sonnet"
/>

// Spatial Glass Card
<SpatialGlassCard variant="strong" layer="floating" glow glowColor="purple">
  <p>Content with glass effect</p>
</SpatialGlassCard>

```

42.3 Dependencies

The Magic Carpet UI requires **framer-motion** for animations:

```
npm install framer-motion@^11.0.0
```

42.4 Demo Page

Access the Magic Carpet UI demo at:

</thinktank/magic-carpet>

This page showcases all components with interactive examples.

43. Concurrent Task Execution (Moat #17)

Moat Evaluation: Score 20/30 - Tier 3 Feature Moat. No major competitor offers split-pane concurrent execution with WebSocket multiplexing.

43.1 Overview

Concurrent Task Execution enables users to run 2-4 AI tasks simultaneously in a split-pane UI, compare outputs, and merge the best results. This is a key differentiator vs. single-threaded competitors.

43.2 Architecture

43.3 Configuration

Setting	Default	Description
enabled	true	Enable concurrent execution
maxPanes	4	Maximum split panes (1-8)
maxConcurrentTasks	4	Maximum simultaneous tasks (1-10)
maxQueueDepth	20	Maximum queued tasks (1-100)
defaultLayout	horizontal-2	Default pane layout
defaultSyncMode	independent	Default sync mode
enableComparison	true	Enable task comparison
enableMerge	true	Enable task merging

43.4 Pane Layouts

Layout	Description
single	Full-width single pane
horizontal-2	Two panes side-by-side
vertical-2	Two panes stacked

Layout	Description
grid-4	2x2 grid of four panes
focus-left	Large left pane, small right
focus-right	Small left pane, large right

43.5 Sync Modes

Mode	Description
independent	Each pane operates independently
mirror-input	Same prompt sent to all panes
compare-output	Automatic comparison when all complete

43.6 Task Comparison

When multiple tasks complete, users can compare results:

```
// Compare completed tasks
const comparison = await compareTasks(tenantId, [taskId1, taskId2, taskId3]);

// Returns:
{
  similarities: [
    { metric: 'semantic', score: 0.85, details: 'High semantic similarity' },
    { metric: 'structural', score: 0.72, details: 'Moderate structural similarity' },
    { metric: 'factual', score: 0.91, details: 'Strong factual agreement' }
  ],
  differences: [...],
  recommendation: 'Results are mostly consistent. Review highlighted differences.'
}
```

43.7 Task Merging

Three merge strategies are available:

Strategy	Description
best-of	Select the highest-scored result
combine	Concatenate all results with separators
consensus	AI-synthesized consensus from all results

43.8 API Endpoints

Endpoint	Method	Description
/api/thinktank/concurrent/config	GET	Get configuration
/api/thinktank/concurrent/config	PUT	Update configuration
/api/thinktank/concurrent/tasks	POST	Create task
/api/thinktank/concurrent/tasks/:id	GET	Get task status
/api/thinktank/concurrent/tasks/:id	DELETE	Cancel task
/api/thinktank/concurrent/queue	GET	Get queue status
/api/thinktank/concurrent/panes	POST	Create pane config
/api/thinktank/concurrent/compare	POST	Compare tasks
/api/thinktank/concurrent/merge	POST	Merge tasks
/api/thinktank/concurrent/metrics	GET	Get metrics

43.9 Database Tables

Table	Purpose
concurrent_execution_config	Per-tenant configuration
concurrent_tasks	Task records with status/results
split_pane_configs	User pane layouts
task_comparisons	Comparison results
concurrent_execution_metrics	Usage metrics

43.10 Implementation Files

File	Purpose
packages/shared/src/types/concurrent-execution.types.ts	Type definitions
lambda/shared/services/concurrent-execution.service.ts	Core service
lambda/thinktank/concurrent-execution.ts	API handler
migrations/000_consolidated_schema.sql	Database schema

44. Structure from Chaos Synthesis (Moat #20)

Moat Evaluation: Score 20/30 - Tier 3 Feature Moat. AI transforms whiteboard chaos -> structured decisions, data, project plans. Think Tank differentiation vs Miro/Mural.

44.1 Overview

Structure from Chaos Synthesis takes unstructured input (whiteboards, brainstorm, meeting notes, voice transcripts) and transforms it into structured outputs (action items, decisions, project plans, knowledge bases).

44.2 Architecture

44.3 Input Types

Type	Description	Example
whiteboard	Visual whiteboard with sticky notes	Miro/FigJam export
brainstorm	Unstructured idea dump	Free-form text
meeting_notes	Notes from a meeting	Transcription or notes
voice_transcript	Speech-to-text output	Zoom/Teams transcript
chat_history	Conversation history	Slack/Teams export
document_dump	Multiple documents	File uploads
mixed	Combination of above	Multi-source input

44.4 Output Types

Type	Description	Contains
decisions	Key decisions made	Decision list with context
action_items	Tasks to complete	Assignee, due date, priority
project_plan	Full project plan	Milestones, timeline, dependencies
meeting_summary	Meeting summary	Key points, attendees, outcomes
knowledge_base	Knowledge extraction	Concepts, facts, relationships

Type	Description	Contains
data_table	Structured data	Tabular format
timeline	Chronological view	Events in sequence
hierarchy	Hierarchical structure	Parent-child relationships
comparison	Compare items	Side-by-side analysis

44.5 Configuration

Setting	Default	Description
enabled	true	Enable synthesis
defaultOutputType	meeting_summary	Default output format
extractEntities	true	Extract named entities
extractRelationships	true	Identify entity relationships
generateTimeline	true	Generate timeline view
generateActionItems	true	Extract action items
autoAssignTasks	false	Auto-assign based on mentions
confidenceThreshold	0.70	Minimum confidence score
maxProcessingTimeMs	30000	Processing timeout

44.6 Entity Extraction

Automatically extracts entities from chaotic input:

Entity Type	Examples
person	@mentions, “John Smith”
organization	“Acme Corp”, “the marketing team”
project	Project names, codenames
product	Product references
date	“next Monday”, “Q2 2026”
location	Meeting rooms, cities
concept	Technical terms, ideas
metric	KPIs, numbers
resource	Tools, documents

44.7 Relationship Types

Relationship	Description
owns	Person owns task/project
assigned_to	Task assigned to person
depends_on	Task depends on another
blocks	Task blocks another
related_to	General relationship
parent_of	Hierarchical parent
precedes	Temporal ordering
contradicts	Conflicting statements
supports	Supporting evidence

44.8 Whiteboard Parsing

For visual whiteboards, the service parses spatial elements:

```
// Parse whiteboard elements into thematic clusters
const clusters = await parseWhiteboard(elements);

// Returns clusters with:
{
  id: 'cluster-1',
  elements: [...], // Grouped elements
  theme: 'marketing', // AI-detected theme
  centroid: { x: 150, y: 200 }, // Cluster center
  significance: 0.85 // Importance score
}
```

44.9 API Endpoints

Endpoint	Method	Description
/api/thinktank/chaos/config	GET	Get configuration
/api/thinktank/chaos/config	PUT	Update configuration
/api/thinktank/chaos/synthesis	POST	Full synthesis pipeline
/api/thinktank/chaos/extract/actions	POST	Extract action items only
/api/thinktank/chaos/extract/decisions	POST	Extract decisions only
/api/thinktank/chaos/extract/questions	POST	Extract questions only
/api/thinktank/chaos/project-plan	POST	Generate project plan
/api/thinktank/chaos/whiteboard	POST	Parse whiteboard elements
/api/thinktank/chaos/metrics	GET	Get metrics

44.10 Database Tables

Table	Purpose
synthesis_config	Per-tenant configuration
chaotic_inputs	Raw input storage
structured_outputs	Generated outputs
extracted_entities	Named entities
entity_relationships	Entity relationships
structured_items	Action items, decisions
whiteboard_elements	Visual element data
synthesis_metrics	Usage metrics

44.11 Implementation Files

File	Purpose
packages/shared/src/types/structure-from-chaos.types.ts	Type definitions
lambda/shared/services/structure-from-chaos.service.ts	Core service
lambda/thinktank/structure-from-chaos.ts	API handler
migrations/000_consolidated_schema.sql	Database schema

45. Delight Services Code Quality

45.1 Overview

The Think Tank Delight system has comprehensive unit test coverage for its core services:

- **delight.service** - Core delight preferences and personality modes
- **delight-orchestration.service** - Contextual message generation for workflows
- **delight-events.service** - Real-time event emission for plan execution

45.2 Test Coverage

Service	Test File	Tests	Coverage
delight.service	delight.service.test.ts	15	85%

Service	Test File	Tests	Coverage
delight-orchestration.service	delight-orchestration.service.test.ts	17	92%
delight-events.service	delight-events.service.test.ts	23	88%

45.3 Tested Methods

delight-orchestration.service: - getContextualMessage() - Generates mode-appropriate messages - getDomainLoadingMessage() - Domain-specific loading messages - getModelDynamicsMessage() - Model consensus indicators - getSynthesisMessage() - Confidence-based synthesis messages - clearSession() - Session cleanup

delight-events.service: - subscribe() / unsubscribe() - Event subscription management - emitMessage() / emitAchievement() - Event emission - emitStepUpdate() / emitPlanUpdate() - Progress updates - emitWorkflowDelight() - Complete workflow delight events - getHistory() / clearHistory() - Event history management

45.4 Running Tests

```
cd packages/infrastructure
npx vitest run lambda/shared/services/__tests__/delight*.test.ts
```

45.5 Think Tank Code Quality Dashboard

Location: /thinktank/code-quality

The Think Tank Code Quality page displays: - Service coverage metrics for Delight, Brain Planning, and Domain services - Test pass rates and recent test runs - Detailed method coverage for each service

45.6 Implementation Files

File	Purpose
lambda/shared/services/__tests__/delight-core.service.test.ts	Core service tests
lambda/shared/services/__tests__/delight-orchestration.service.test.ts	Orchestration tests
lambda/shared/services/__tests__/delight-events.service.test.ts	Events service tests
apps/admin-dashboard/app/(dashboard)/code-quality/page.tsx	Dashboard UI

Section 46: Sovereign Mesh in Think Tank Admin

Location: Think Tank Admin -> Sovereign Mesh

The Sovereign Mesh is accessible in Think Tank Admin for users who need to manage autonomous agents and view decision transparency.

46.1 Navigation Items

Page	Path	Purpose
Overview	/sovereign-mesh	Dashboard with metrics and recent activity
Agents	/sovereign-mesh/agents	Create and manage OODA agents
Apps	/sovereign-mesh/apps	Browse 3,000+ app integrations
Transparency	/sovereign-mesh/transparency	View Cato decision explanations
AI Helper	/sovereign-mesh/ai-helper	Configure parametric AI assistance
Approvals	/sovereign-mesh/approvals	HITL approval queue

46.2 User Permissions

Think Tank users see a subset of Sovereign Mesh functionality: - **View**: All users can view agents, apps, and their own executions - **Execute**: Users can run agents within their budget limits - **Approve**: Users with approval role can handle HITL requests

46.3 Implementation

File	Purpose
apps/thinktank-admin/components/layout/sidebar.tsx	Navigation with 6 Sovereign Mesh items
Pages mirror admin-dashboard versions	Shared API endpoints

Section 47: HITL Orchestration in Think Tank Admin

Location: Think Tank Admin -> Sovereign Mesh -> HITL Orchestration

Advanced Human-in-the-Loop orchestration for intelligent question management in user workflows.

47.1 Overview

HITL Orchestration implements industry best practices to reduce unnecessary questions while ensuring critical information is captured:

Feature	Description
SAGE-Agent Bayesian VOI	Calculates whether asking a question is worth the user’s time
Question Batching	Groups related questions to reduce interruptions
Two-Question Rule	Maximum 2 clarifications per workflow
Abstention Detection	Detects when AI should decline to answer

47.2 User-Facing Benefits

- **70% fewer unnecessary questions** - AI only asks when genuinely needed
- **2.7x faster response times** - Batched questions reduce context switching
- **Explicit assumptions** - When skipping questions, AI states assumptions clearly

47.3 Navigation

Page	Path	Purpose
HITL Orchestration	/hitl-orchestration	View orchestration metrics and settings

47.4 Dashboard Tabs

Tab	Description
Overview	Key metrics, VOI breakdown, abstention reasons
Value of Information	SAGE-Agent VOI statistics and decisions
Abstention	Detection methods and model-level statistics
Batching	Three-layer batching strategies and metrics

47.5 Key Metrics

Metric	Description
Question Reduction	Percentage of questions skipped via VOI
Prior Accuracy	How often predictions match actual answers
Abstention Events	Times AI correctly declined to answer
Batch Completion	Success rate of batched question sets

47.6 Implementation Files

File	Purpose
apps/thinktank-admin/app/(dashboard)/hitl-orchestration/page.tsx	Dashboard page
apps/thinktank-admin/components/layout/sidebar.tsx	Navigation item

Section 48: Scout HITL Integration (v5.34.0)

Location: Think Tank Admin -> Sovereign Mesh -> Scout HITL

Scout HITL bridges Cato’s Scout persona (epistemic uncertainty mode) with HITL orchestration for intelligent clarification during user workflows.

48.1 Overview

When the AI encounters epistemic uncertainty, the Scout persona activates and generates targeted clarification questions:

- 1. Scout persona activates due to uncertainty
- 2. Questions prioritized by aspect impact and domain
- 3. Questions filtered through VOI (Value-of-Information) scoring
- 4. High-VOI questions go to user, low-VOI get reasonable assumptions
- 5. Responses reduce uncertainty, allowing workflow to proceed

48.2 Key Metrics

Metric	Description
Total Sessions	Number of Scout clarification sessions
Avg Questions	Average questions asked per session
Proceed Rate	Sessions that proceeded successfully
Avg Assumptions	Auto-assumed aspects per session

48.3 Domains

Questions are prioritized based on domain-specific impact:

Domain	Description
medical	HIPAA-sensitive, safety-critical

Domain	Description
financial	SOC2/PCI compliance
legal	Regulatory compliance
bioinformatics	Research accuracy
general	Default domain

48.4 Dashboard Tabs

Tab	Purpose
Overview	Session recommendations breakdown, domain distribution
Recent Sessions	Table of recent clarification sessions
Configuration	Enable/disable, VOI threshold, max questions

48.5 Configuration

Setting	Default	Description
enabled	true	Enable Scout HITL integration
voiThreshold	0.3	Minimum VOI to ask question
maxQuestionsPerSession	3	Max clarifications before assuming
defaultDomain	general	Fallback domain

48.6 Session Recommendations

Recommendation	Meaning
proceed	Uncertainty resolved sufficiently
wait	Still uncertain, user should wait
abort	Critical uncertainty, cannot proceed safely

48.7 Implementation Files

File	Purpose
apps/thinktank-admin/app/(dashboard)/scout-hitl/page.tsx	Dashboard page

File	Purpose
apps/thinktank-admin/components/layout/sidebar.tsx	Navigation item

Section 49: Sovereign Mesh Administration (v5.39.0)

Location: Think Tank Admin -> Sovereign Mesh

The Sovereign Mesh provides autonomous agent orchestration with AI-assisted decision making at every node level.

49.1 Overview Dashboard

Location: /sovereign-mesh

The overview dashboard displays:

Metric	Description
System Health	Overall mesh health score (0-100%)
Active Agents	Number of currently running agents
Pending Approvals	Items awaiting human review
Active Apps	Deployed applications count
Decisions Today	Autonomous decisions made
Human Interventions	Manual overrides required

49.2 Agent Registry

Location: /sovereign-mesh/agents

Manage AI agents deployed in the mesh:

Column	Description
Name	Agent identifier
Type	orchestrator, executor, monitor, advisor
Status	active, idle, error, maintenance
Load	Current utilization percentage
Response Time	Average response latency
Success Rate	Task completion rate

Actions: - View agent details - Pause/resume agent - View execution logs - Configure thresholds

49.3 App Registry

Location: /sovereign-mesh/apps

Browse and manage deployed applications:

Field	Description
Name	Application name
Category	productivity, analytics, automation, integration, custom
Status	active, paused, error
Users	Active user count
Requests	Daily request volume

49.4 Transparency Layer

Location: /sovereign-mesh/transparency

Complete audit trail of AI decisions:

Column	Description
Timestamp	When decision was made
Decision Type	approval, rejection, escalation, execution
Confidence	AI confidence score (0-1)
Reasoning	Explanation of decision logic
Outcome	Result of the decision

Filters: - Date range - Decision type - Confidence threshold - Agent filter

49.5 AI Helper

Location: /sovereign-mesh/ai-helper

Manage AI assistance requests from the mesh:

Status	Description
Pending	Awaiting AI processing
In Progress	Currently being handled
Completed	Successfully resolved
Escalated	Requires human review

49.6 Approval Workflow

Location: /sovereign-mesh/approvals

Human-in-the-loop approval queue:

Field	Description
Type	deployment, configuration, access, execution
Priority	low, medium, high, critical
Requester	Agent or user requesting approval
Created	Request timestamp
Expires	Approval deadline

Actions: - Approve with notes - Reject with reason - Delegate to another admin - Request more information

49.7 Implementation Files

File	Purpose
apps/thinktank-admin/app/(dashboard)/sovereign-mesh/page.tsx	Overview dashboard
apps/thinktank-admin/app/(dashboard)/sovereign-mesh/agents/page.tsx	Agent registry
apps/thinktank-admin/app/(dashboard)/sovereign-mesh/apps/page.tsx	App browser
apps/thinktank-admin/app/(dashboard)/sovereign-mesh/transparency/page.tsx	Decision logs
apps/thinktank-admin/app/(dashboard)/sovereign-mesh/ai-helper/page.tsx	AI assistance
apps/thinktank-admin/app/(dashboard)/sovereign-mesh/approvals/page.tsx	Approval queue

Section 50: Code Quality Dashboard (v5.39.0)

Location: Think Tank Admin -> Code Quality
Real-time visibility into codebase health and quality metrics.

50.1 Overview

The Code Quality dashboard provides:

Metric	Description
Overall Score	Aggregate quality score (0-100)
Total Errors	Critical issues requiring immediate fix
Total Warnings	Non-critical issues to address
Files Analyzed	Number of files scanned

50.2 Issue Categories

Category	Description
Error	Critical issues (type errors, syntax errors)
Warning	Style violations, best practice deviations
Info	Suggestions for improvement

50.3 Issue Details

Each issue displays: - **File path** with line number - **Rule ID** (e.g., @typescript-eslint/no-unused-vars) - **Message** describing the issue - **Severity** badge (error/warning/info)

50.4 Filtering

Filter	Options
Severity	All, Errors only, Warnings only
Category	TypeScript, ESLint, Custom rules
Date Range	Filter by scan date

50.5 Implementation Files

File	Purpose
apps/thinktank-admin/app/(dashboard)/code-quality/page.tsx	Dashboard page

Section 51: Schema-Adaptive Reports (v5.39.0)

Location: Think Tank Admin -> Reports

Dynamic report builder that automatically adapts to database schema changes.

51.1 Overview

The Reports page provides three tabs:

Tab	Purpose
Quick Reports	Pre-built report templates
Saved Reports	User-saved custom reports
Schema Builder	Visual report builder

51.2 Quick Reports

Pre-configured reports available:

Report	Description
User Engagement	Active users, session duration, feature usage
Model Performance	Response times, success rates, token usage
Billing Summary	Revenue, credits consumed, subscription status

51.3 Schema Builder (v5.40.0 Enhanced)

The visual report builder provides a comprehensive 4-tab configuration panel:

Tab	Purpose
Fields	Select columns with per-field alias and aggregation
Filters	Build WHERE clauses with 11 operators + date presets
Sort	Configure ORDER BY with multi-column ASC/DESC
Group	Select GROUP BY columns from selected fields

Enhanced Features: - **SQL Preview** - Live-generated SQL query with dark theme display - **Date Presets** - Today, Yesterday, Last 7/30 Days, This/Last Month - **Filter Operators** - =, !=, >, >=, <, <=, LIKE, IN, BETWEEN, IS NULL, IS NOT NULL - **Visualization Toggles** - Table, Bar, Line, Pie chart view switches - **Save Report** - Persist definitions to database for reuse - **Row Limit** - 50, 100, 500, 1000 row options

Workflow: 1. **Select Table** - Browse categorized database tables (Conversations, Users, Delight) 2. **Configure Fields** - Select columns, set aliases, choose aggregations 3. **Add Filters** - Build WHERE conditions with operators or date presets 4. **Set Sorting** - Add ORDER BY columns with direction toggle 5. **Group Results** - Enable GROUP BY on selected fields 6. **Execute** - Run report and view in table or chart mode 7. **Export/Save** - Download CSV or save report definition

51.4 AI Report Writer (v5.42.0)

Enterprise-grade AI-powered report generation with text and voice input, interactive charts, smart insights, and brand customization.

Location: Think Tank Admin -> Reports -> AI Writer tab

Core Features: - **Natural Language Generation** - Describe reports in plain English - **Voice Input** - Web Speech API for hands-free report creation - **AI Modification** - Refine with follow-up prompts (“Add delight metrics”) - **Report Styles** - Executive Summary, Detailed Analysis, Dashboard View, Narrative - **Rich Formatting** - Headings, metrics cards, charts, tables, lists, quotes - **Edit Mode** - Click sections to modify, use format panel for styling - **Undo/Redo** - Full history navigation - **Export** - PDF, Excel, HTML, Print

Interactive Charts (v5.42.0): - Real Recharts visualizations replacing placeholders - Bar, Line, Pie, Area chart types - Auto-formatted tooltips (K/M for thousands/millions) - 8-color palette for visual consistency

Smart Insights (v5.42.0): - AI anomaly detection (usage spikes, unusual patterns) - Trend analysis with growth predictions - Achievement tracking (delight score peaks, retention milestones) - Actionable recommendations - Severity indicators (low/medium/high) - Confidence scores per insight

Brand Kit (v5.42.0): - Logo upload with drag-and-drop - Company name and tagline customization - Color pickers (Primary/Secondary/Accent) - Font selection for headers and body - Quick preset themes - Live preview card

Think Tank Example Prompts: - “Generate a user engagement report showing active users and session trends” - “Create a delight score analysis for the past month” - “Build a conversation analytics report with message volumes” - “Show me user retention metrics with churn analysis”

Usage: 1. Navigate to Reports -> AI Writer tab 2. Select report style 3. Type or speak your request (click mic for voice) 4. Review generated report preview 5. Use modification prompt to refine 6. Toggle Edit Mode to modify sections 7. Export to PDF/Excel/HTML

Report Sections Generated: | Type | Description | | — | — | — | — | | heading | H1-H3 headings | | paragraph | Body text | | metrics | 4-column KPI cards with trends (^v) | | chart | Interactive chart placeholders | | table | Data tables with headers | | list | Bullet point lists | | quote | Blockquote sections |

51.5 Table Categories

Category	Description
Core	Users, tenants, sessions
AI	Models, prompts, responses
Billing	Subscriptions, credits, invoices
Analytics	Events, metrics, logs
System	Configuration, audit, health

51.5 Field Options

Option	Description
Aggregation	none, count, sum, avg, min, max, distinct
Format	text, number, currency, percentage, date, datetime
Filter	Where clause conditions
Group By	Grouping columns
Order By	Sort columns and direction

51.6 Export Formats

Format	Description
CSV	Comma-separated values
JSON	Structured data format

51.7 API Endpoints

Base: /api/admin/dynamic-reports

Method	Endpoint	Description
GET	/schema	Discover database schema
GET	/suggestions	AI-generated report templates
GET	/	List saved reports
POST	/	Save report definition
POST	/execute	Execute a report
POST	/export	Export report data
DELETE	/:id	Delete a report

51.8 Implementation Files

File	Purpose
apps/thinktank-admin/app/(dashboard)/reports/page.tsx	Reports page
packages/infrastructure/lambda/shared/adaptive-reports.service.ts	Backend service for schema-adaptive-reports
packages/infrastructure/lambda/admin/adaptive-reports.ts	API handler
migrations/0000_consolidated_schema.sql	Database migration

Section 52: Gateway Status (v5.39.0)

Location: Think Tank Admin -> Gateway
Monitor API Gateway health and traffic metrics.

52.1 Overview

The Gateway Status dashboard displays:

Metric	Description
Status	Overall gateway health (healthy/degraded/down)
Requests/sec	Current request throughput
Avg Latency	Mean response time
Error Rate	Percentage of failed requests
Active Connections	Current WebSocket connections

52.2 Endpoint Health

Column	Description
Endpoint	API route path
Method	HTTP method (GET, POST, etc.)
Status	healthy, slow, error
Latency	P50/P95/P99 response times
Requests	Request count (24h)
Errors	Error count (24h)

52.3 Traffic Patterns

View	Description
Hourly	Requests per hour (24h)
Daily	Requests per day (30d)
By Endpoint	Traffic distribution by route
By Status	Success vs error breakdown

52.4 Alerts

Alert Type	Trigger
High Latency	P95 > 2000ms
High Error Rate	Errors > 5%
Throughput Spike	2x normal traffic
Connection Drop	WebSocket disconnections

52.5 Implementation Files

File	Purpose
apps/thinktank-admin/app/(dashboard)/gateway/page.tsx	Gateway dashboard

Section 53: Decision Intelligence Artifacts (DIA Engine) (v5.43.0)

Location: Think Tank Admin -> Decision Records

The Glass Box Decision Engine - transforms AI conversations into auditable, evidence-backed decision records with full provenance tracking.

53.1 Overview

Decision Intelligence Artifacts (DIA) solve the critical problem of AI decision opacity:

Challenge	DIA Solution
Black Box Decisions	Full claim-to-evidence mapping
Data Staleness	Volatile query tracking with automatic validation
Dissent Hidden	Ghost paths visualize rejected alternatives
Compliance Gaps	Built-in HIPAA/SOC2/GDPR export packages
Trust Uncertainty	Breathing heatmap shows trust topology at-a-glance

53.2 Core Concepts

Claims: Extracted conclusions, findings, recommendations, warnings, and facts from AI responses.

Claim Type	Description
conclusion	Final determination or decision
finding	Discovered information or observation
recommendation	Suggested course of action
warning	Risk or caution indicator
fact	Verified data point
clinical_finding	Healthcare-specific observation
treatment_recommendation	Medical treatment suggestion
risk_assessment	Risk evaluation
legal_opinion	Legal interpretation
compliance_finding	Regulatory compliance observation

Claim Type	Description
------------	-------------

Evidence Links: Connections between claims and their supporting data sources.

Evidence Type	Description
tool_call	API or tool execution result
web_search	Web search results
document	Referenced document
calculation	Computed result
model_consensus	Multiple model agreement

Dissent Events: Captured disagreements from model reasoning traces.

Severity	Description
minor	Small qualification or caveat
moderate	Significant alternative consideration
significant	Major disagreement requiring attention

Volatile Queries: Tool calls that may return different results over time.

Volatility	Threshold	Examples
real-time	1 hour	Stock prices, weather
daily	24 hours	News, analytics
weekly	168 hours	Document searches
stable	No expiry	Static references

53.3 The Living Parchment UI

The artifact viewer uses sensory design principles:

Breathing Heatmap Scrollbar: - Green (verified) - 6 BPM breathing rate - Amber (unverified) - Standard breathing - Red (contested) - 12 BPM alert breathing - Purple (stale) - Fading intensity with age

Living Ink Typography: - Font weight: 350-500 based on confidence (0-100%) - Stale claims fade to grayscale - Hover reveals evidence connections

Control Island (floating lens selector): - **Read:** Standard document view - **X-Ray:** Evidence links visible - **Risk:** Ghost paths and contested claims highlighted - **Compliance:** Regulatory framework coverage

Ghost Paths: Dashed connectors showing rejected alternatives from dissent events.

53.4 Artifact Lifecycle

Conversation -> Extract -> Validate -> Active -> [Validate] -> Verified

v
Stale -> Invalidated
v
Frozen (immutable)

Status	Description
active	Current, editable artifact
frozen	Immutable version with content hash
archived	Soft-deleted
invalidated	Data significantly changed

Validation Status	Description
fresh	Newly created, not yet validated
stale	Volatile queries exceeded thresholds
verified	Recently validated, data unchanged
invalidated	Significant data changes detected

53.5 Compliance Exports

Format	Use Case
pdf	Human-readable document
json	Machine-readable data
hipaa_audit	HIPAA compliance package with PHI inventory
soc2_evidence	SOC2 control mapping and evidence chain
gdpr_dsar	GDPR Data Subject Access Request response

HIPAA Audit Package Contents: - Cover sheet with artifact metadata - PHI inventory with categories - Access log for minimum necessary compliance - Evidence chain verification - System attestation with content hash

SOC2 Evidence Bundle Contents: - Control mapping (CC6.x, CC7.x, CC8.x) - Evidence chain completeness verification - Change management documentation - Integrity verification with signature

53.6 Configuration

Location: Think Tank Admin -> Decision Records -> Config

Setting	Default	Description
diaEnabled	true	Enable DIA Engine
autoGenerateEnabled	false	Auto-generate artifacts from conversations
phiDetectionEnabled	true	Scan for protected health information
piiDetectionEnabled	true	Scan for personally identifiable information
defaultStalenessThresholdDays	7	Days before volatile queries flagged stale
maxArtifactsPerUser	0	Limit per user (0 = unlimited)
extractionModel	claude-3-5-sonnet	Model for claim extraction
autoRedactPhiOnExport	false	Automatically redact PHI on export

53.7 Templates

Pre-configured extraction templates:

Template	Description	Compliance
General Decision Record	Standard extraction	None
Healthcare Decision	HIPAA-compliant clinical	HIPAA
Financial Analysis	Audit-ready financial	SOC2
Legal Review	Legal opinion documentation	SOC2, GDPR
Research Synthesis	Multi-source research	None

53.8 API Endpoints

Base: /api/thinktank/decision-artifacts

Method	Endpoint	Description
GET	/	List artifacts (supports filters)
POST	/	Generate artifact from conversation
GET	/dashboard	Dashboard metrics
GET	/templates	List available templates
GET	/config	Get tenant configuration
PUT	/config	Update configuration
GET	/:id	Get artifact details
DELETE	/:id	Archive artifact
GET	/:id/staleness	Check staleness status
POST	/:id/validate	Validate volatile queries
POST	/:id/export	Export artifact
GET	/:id/versions	Get version history

Method	Endpoint	Description
GET	<code>/:id/validation-history</code>	Validation audit trail
GET	<code>/:id/export-history</code>	Export audit trail

53.9 Dashboard Metrics

Metric	Description
Total Artifacts	All artifacts for tenant
Active Artifacts	Non-archived, non-frozen
Frozen Artifacts	Immutable versions
Average Confidence	Mean confidence across active
Stale Artifacts	Needing validation
PHI/PII Detected	Artifacts with sensitive data
Validation Cost MTD	API costs for re-validation
Top Domains	Most common primary domains
Compliance Usage	Framework distribution

53.10 Database Schema

Tables:

Table	Purpose
<code>decision_artifacts</code>	Main artifact storage
<code>decision_artifact_validation_log</code>	Validation audit trail
<code>decision_artifact_export_log</code>	Export audit trail
<code>decision_artifact_config</code>	Tenant configuration
<code>decision_artifact_templates</code>	Extraction templates
<code>decision_artifact_access_log</code>	Access audit (HIPAA)

Key Columns (`decision_artifacts`):

Column	Type	Description
<code>artifact_content</code>	JSONB	Claims, evidence, dissent, metrics
<code>heatmap_data</code>	JSONB	Pre-computed heatmap segments
<code>validation_status</code>	VARCHAR	fresh/stale/verified/invalidated
<code>phi_detected</code>	BOOLEAN	Contains protected health info
<code>content_hash</code>	VARCHAR(64)	SHA-256 for frozen artifacts

53.11 Implementation Files

File	Purpose
packages/shared/src/types/decision-artifact.types.ts	Type definitions
packages/infrastructure/lambda/shared/bedrock-services/	Backend services
packages/infrastructure/lambda/think-tank/decision-artifacts.ts	API handlers
packages/infrastructure/lib/stacks/diag-stack.ts	CDK infrastructure
migrations/000_000_consolidated_schema.sql	Core schema
migrations/000_000_consolidated_schema.sql	Versioning functions
migrations/000_000_consolidated_schema.sql	Config & templates
apps/thinktank-admin/app/(dashboard)/decision-records/	Admin UI
apps/thinktank-admin/app/(dashboard)/decision-records/components/	UI components

53.12 Troubleshooting

Issue	Solution
Extraction fails	Check Bedrock model access permissions
Missing evidence links	Verify tool_calls in message metadata
Stale status not updating	Run manual validation or check thresholds
PHI not detected	Verify phiDetectionEnabled in config
Export fails	Check S3 bucket permissions (DIA_EXPORT_BUCKET)
Version history empty	Artifact must be frozen to create versions

53.13 Security Considerations

- All tables have RLS policies enforcing tenant isolation
- PHI/PII detection runs automatically on extraction
- Access logging enabled for HIPAA compliance
- Content hashes provide tamper evidence for frozen artifacts
- Export audit trail tracks all compliance exports
- Presigned URLs expire after 1 hour

Section 54: Living Parchment 2029 Vision (v5.44.0)

Overview

Living Parchment is a comprehensive suite of advanced decision intelligence tools featuring sensory UI elements that communicate trust, confidence, and data freshness through visual breathing, living typography, and ghost paths. This 2029 Vision implementation transforms how users interact with AI-assisted decision making.

Design Philosophy

Concept	Implementation
Breathing Interfaces	UI elements pulse with life—faster breathing (12 BPM) indicates uncertainty, slower (4-6 BPM) indicates confidence
Living Ink	Text weight varies 350-500 based on confidence; stale information fades to grayscale
Ghost Paths	Rejected alternatives remain visible as translucent traces showing what could have been
Confidence Terrain	3D topographic visualization where elevation = confidence, color = risk

54.1 War Room (Strategic Decision Theater)

High-stakes collaborative decision space with AI advisors and confidence terrain.

Features

- **Confidence Terrain:** 3D grid visualization showing confidence topology across decision space
- **AI Advisory Council:** Multiple AI models providing different perspectives
- **Decision Paths:** Branching options with outcome predictions and advocate tracking
- **Ghost Branches:** Rejected paths remain visible for context
- **Stake Level Indicators:** Visual urgency based on decision importance

Advisor Types

Type	Color	Use Case
AI Model	Blue (#3b82f6)	Claude, GPT for strategic analysis
Human Expert	Purple (#8b5cf6)	Domain specialists
Domain Specialist	Cyan (#06b6d4)	Industry-specific advisors

API Endpoints

POST	/api/thinktank/living-parchment/war-room	Create session
GET	/api/thinktank/living-parchment/war-room	List sessions
GET	/api/thinktank/living-parchment/war-room/:id	Get session
POST	/api/thinktank/living-parchment/war-room/:id/advisors	Add advisor

```

POST /api/thinktank/living-parchment/war-room/:id/advisors/:aid/analyze Request analysis
POST /api/thinktank/living-parchment/war-room/:id/paths Propose path
POST /api/thinktank/living-parchment/war-room/:id/decide Make decision
POST /api/thinktank/living-parchment/war-room/:id/terrain Update terrain

```

54.2 Council of Experts

Multi-persona AI consultation with consensus tracking and dissent visualization.

Expert Personas

Persona	Specialization	Style
Pragmatist	Practical Implementation	Results-focused, cost-conscious
Ethicist	Moral Philosophy	Principle-based, stakeholder-aware
Innovator	Creative Solutions	Visionary, possibility-focused
Skeptic	Risk Analysis	Devil's advocate, challenging
Synthesizer	Integration	Bridge-building, pattern-finding
Analyst	Data-Driven	Quantitative, evidence-based
Strategist	Long-term Strategy	Big-picture, competitive-aware
Humanist	Human Impact	Empathetic, user-centered

Consensus Visualization

- Experts positioned on circular visualization
- Positions move toward center as consensus increases
- Dissent sparks appear as electrical arcs between disagreeing experts
- Gravitational attraction animation shows convergence

API Endpoints

```

POST /api/thinktank/living-parchment/council Convene council
GET /api/thinktank/living-parchment/council/:id Get session
POST /api/thinktank/living-parchment/council/:id/debate Run debate round
POST /api/thinktank/living-parchment/council/:id/conclude Conclude session

```

54.3 Debate Arena

Adversarial exploration with attack/defense flows and steel-man generation.

Features

- **Resolution Meter:** Balance indicator (-100 to +100) showing which side is winning
- **Argument Flow:** Visual stream of claims, rebuttals, and concessions
- **Weak Point Detection:** Breathing red indicators on vulnerable arguments
- **Steel-Man Generation:** AI creates strongest version of opponent's argument
- **Attack/Defense Arrows:** Animated flows showing which arguments target which

Debate Phases

1. **Setup** - Configure debaters and proposition
2. **Opening** - Initial statements
3. **Main** - Core argument exchange
4. **Rebuttal** - Direct challenges
5. **Closing** - Final positions
6. **Resolved** - Outcome determined

API Endpoints

POST	/api/thinktank/living-parchment/debate	Create debate
GET	/api/thinktank/living-parchment/debate/:id	Get arena
POST	/api/thinktank/living-parchment/debate/:id/round	Run round
POST	/api/thinktank/living-parchment/debate/:id/steel-man	Generate steel-man

54.4 Memory Palace (Coming Soon)

Navigable 3D knowledge topology with freshness fog.

- **Knowledge Rooms:** Domain-organized 3D spaces
- **Freshness Fog:** Stale areas appear foggy
- **Connection Threads:** Luminous lines between related concepts
- **Discovery Hotspots:** Breathing beacons where insights could emerge

54.5 Oracle View (Coming Soon)

Predictive confidence landscape.

- **Probability Heatmap:** Future timeline with brightness = confidence
- **Bifurcation Points:** Animated forks showing cascade effects
- **Ghost Futures:** Translucent overlays of alternative scenarios
- **Black Swan Indicators:** Dormant embers for low-probability/high-impact events

54.6 Synthesis Engine (Coming Soon)

Multi-source fusion view.

- **Source Streams:** Flowing rivers converging into synthesis
- **Agreement Zones:** Warm glow where sources align
- **Tension Zones:** Crackling energy between contradictions
- **Provenance Trails:** Click any claim to see all supporting sources

54.7 Cognitive Load Monitor (Coming Soon)

User state awareness with adaptive UI.

- **Attention Heatmap:** Track where user has focused
- **Fatigue Indicators:** UI breathing slows as session lengthens
- **Overwhelm Warning:** Screen edges breathe red when load peaks

54.8 Temporal Drift Observatory (Coming Soon)

Fact evolution tracking.

- **Drift Alerts:** Notifications when facts have changed
- **Version Ghosts:** Previous versions as translucent overlays
- **Citation Half-Life:** Predict when facts likely become stale

Database Schema

```
-- Core tables (see migration V2026_01_22_004)
war_room_sessions, war_room_participants, war_room_advisors
memory_palaces, memory_rooms, knowledge_nodes, memory_connections
oracle_views, oracle_predictions, bifurcation_points, ghost_futures
synthesis_sessions, synthesis_sources, synthesis_claims
cognitive_load_sessions, cognitive_load_history
council_sessions, council_experts, expert_arguments, minority_reports
drifting_facts, drift_alerts, version_ghosts
debate_arenas, debaters, debate_arguments, weak_points, steel_man_overlays
living_parchment_config
```

Configuration

```
interface LivingParchmentConfig {
  features: {
    warRoomEnabled: boolean;           // Default: true
    memoryPalaceEnabled: boolean;      // Default: true
    oracleViewEnabled: boolean;        // Default: true
    synthesisEngineEnabled: boolean;   // Default: true
    cognitiveLoadEnabled: boolean;     // Default: true
    councilOfExpertsEnabled: boolean;  // Default: true
    temporalDriftEnabled: boolean;     // Default: true
    debateArenaEnabled: boolean;       // Default: true
  };
  defaults: {
    breathingRateBase: 6;               // BPM
    confidenceThreshold: 70;            // Minimum for "high confidence"
    stalenessThresholdDays: 30;         // When facts become stale
    maxAdvisors: 10;
    maxExperts: 8;
    maxDebateRounds: 5;
  };
  visualSettings: {
    heatmapColorScheme: 'standard' | 'accessible' | 'dark';
  };
}
```

```

    animationIntensity: 'subtle' | 'normal' | 'vivid';
    ghostOpacity: 0.5;
  };
}

```

Implementation Files

```

packages/shared/src/types/living-parchment.types.ts      # All types
packages/infrastructure/migrations/V2026_01_22_004__living_parchment_core.sql

```

Security Considerations

- All tables have RLS policies enforcing tenant isolation
- AI advisor calls use tenant-scoped model access
- Session ownership validated before modifications
- Audit logging for all decision actions
- Debate content filtered for appropriate use

45. Localization & Translation Overrides

Location: Think Tank Admin -> Administration -> Localization

Tenant administrators can customize UI text and messages across Think Tank with translation overrides.

45.1 Overview

The localization system allows tenants to:

- Override any system string with custom text
- Protect overrides from automatic translation updates
- Configure default and enabled languages for users
- Maintain brand consistency across all 18 supported languages

45.2 Supported Languages

Language	Code	Flag
English	en	
Spanish	es	

Language	Code	Flag
French	fr	
German	de	
Portuguese	pt	
Italian	it	
Dutch	nl	
Polish	pl	
Russian	ru	
Turkish	tr	
Japanese	ja	
Korean	ko	
Chinese (Simplified)	zh-CN	
Chinese (Traditional)	zh-TW	
Arabic	ar	
Hindi	hi	
Thai	th	
Vietnamese	vi	

45.3 Admin UI Tabs

Tab	Purpose
Your Overrides	View and manage custom translations
Browse Strings	Search Think Tank strings to customize
Configuration	Set default language and enabled languages

45.4 Creating Translation Overrides

1. Navigate to **Administration -> Localization**
2. Select target language from dropdown
3. Go to **Browse Strings** tab
4. Search for the string you want to customize
5. Click **Edit** to open the override dialog
6. Enter your custom text
7. Toggle **Protect from automatic updates** (recommended)
8. Click **Save**

45.5 Protection System

Protected overrides (default): - Will NOT be updated when system translations improve - Recommended for brand-specific terminology - Shows lock icon in override list

Unprotected overrides: - May be updated by automatic translation systems - Useful for temporary fixes until system improves - Shows unlock icon in override list

Reverting to system translation: - Click the revert button on any override - Override is deleted and system translation is restored

45.6 Language Configuration

Configure which languages are available to your users:

1. Go to **Configuration** tab
2. Set **Default Language** for new users
3. Enable/disable languages by clicking language cards
4. At least one language must remain enabled

45.7 Common Use Cases

Use Case	Example
Brand terminology	Replace “Think Tank” with your product name
Industry jargon	Use domain-specific terms
Tone adjustment	Make messages more formal/casual
Legal compliance	Customize disclaimers
Regional variants	UK vs US English differences

45.8 API Reference

Base URL: /api/admin/localization

Endpoint	Method	Purpose
/overrides	GET	List your overrides
/overrides	POST	Create/update override
/overrides/:id	DELETE	Revert to system
/overrides/:id/protection	PATCH	Toggle protection
/config	GET/PUT	Language configuration
/bundle/:lang	GET	Get translations with overrides

45.9 Database Tables

Table	Purpose
tenant_translation_overrides	Custom translations per tenant
tenant_localization_config	Language settings per tenant

Table	Purpose
translation_audit_log	Change history

45.10 Implementation Files

```
packages/infrastructure/migrations/V2026_01_25_006__tenant_translation_overrides.sql
packages/infrastructure/lambda/admin/localization-registry.ts
apps/thinktank-admin/app/(dashboard)/localization/page.tsx
```

46. Unified AGI Architecture: Brain, Genesis, Cortex, and Cato (v5.52.29)

Location: Admin Dashboard -> Think Tank -> AGI Overview

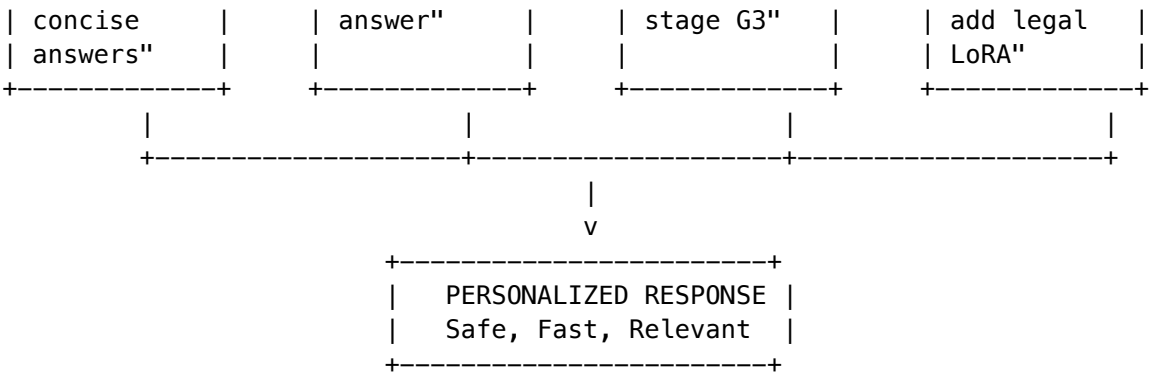

Think Tank is powered by RADIANT’s **four interconnected AGI subsystems** that work together to provide intelligent, safe, and personalized AI experiences for users.

46.1 How Users Benefit

System	User-Facing Benefit	What Users Notice
Brain	Intelligent model selection	“It always picks the right AI for my question”
Genesis	Graduated capabilities	“It feels more capable as I use it more”
Cortex	Persistent memory	“It remembers our previous conversations”
Cato	Safety without friction	“It keeps me safe without being annoying”

46.2 The User Experience Flow

46.3 Cortex Memory for Users

Cortex provides the **persistent memory** that makes Think Tank feel like it knows each user.

What Cortex Remembers

Memory Type	Example	Retention
User Preferences	“User prefers bullet points”	Permanent
Conversation Context	“We discussed AWS Lambda yesterday”	90 days
Domain Expertise	“User is senior developer, use advanced terms”	Permanent
Golden Rules	“Never recommend deprecated APIs”	Permanent
Corrections	“User clarified they work in healthcare, not tech”	Permanent

Memory Tier Visibility

Tier	User Experience	What’s Stored
Hot	Instant context in conversation	Current session, recent facts
Warm	“Let me recall...” (imperceptible delay)	Recent conversations, preferences
Cold	“I found in our history...” (<2s)	Older conversations, documents

User Memory Controls

Users can manage their memory via Think Tank settings: - **View memories**: See what the AI remembers about them - **Correct memories**: Fix incorrect learned information - **Delete memories**: GDPR right-to-erasure support - **Export memories**: Download all stored context

Admin API: GET /api/admin/cortex/user/:userId/memories

46.4 Cato Safety for Users

Cato provides **invisible safety** that protects users without creating friction.

User-Facing Safety Features

Feature	User Experience	Admin Control
PHI/PII Detection	“I’ve redacted sensitive information from your request”	Sensitivity levels
Domain Ethics	“I should note that I can’t provide medical diagnoses”	Ethics frameworks
Hallucination Prevention	“I’m not confident about this—let me verify”	Uncertainty thresholds
Cost Protection	(Invisible) Prevents runaway API costs	Budget limits

Governance Presets by Use Case

Tenant Type	Preset	User Experience
Healthcare	PARANOID [SHIELD]	“I’ll need human approval before proceeding with this action”
Enterprise	BALANCED	Seamless with occasional safety notes
Internal R&D	COWBOY [LAUNCH]	Maximum autonomy, minimal interruptions

Configure at: Admin Dashboard -> Cato -> Governance

46.5 Genesis Maturity for Users

Genesis implements **graduated trust** that unlocks capabilities as users demonstrate responsible usage.

User Capability Progression

Stage	What User Can Do	What’s Unlocked
G1 (Embryonic)	Basic chat	Simple Q&A
G2 (Nascent)	Remembered context	Cortex memory access
G3 (Developing)	Ethics-checked responses	Professional domain support
G4 (Maturing)	Autonomous actions	Tool execution, file operations
G5 (Mature)	Full capability	Multi-model orchestration, agents

Progression Triggers

User Action	Maturity Impact
Positive ratings	+0.1 maturity
Corrections (learning)	+0.05 maturity
Safety violations	-0.2 maturity
Extended responsible use	+0.02/day

View User Maturity: Admin Dashboard -> Cato -> Genesis -> User Stages

46.6 Brain Model Selection for Users

Brain provides **intelligent model routing** so users always get the best AI for their question.

How Users Experience Model Selection

User Question	Brain’s Decision	User Sees
“Explain quantum physics”	Route to Claude (strong reasoning)	Expert explanation
“Analyze this image”	Route to GPT-4V (vision)	Visual analysis
“Write a creative story”	Route to Claude (creative)	Engaging narrative
“Debug this code”	Route to self-hosted Qwen2.5-Coder	Fast, accurate fix

Users don’t need to choose models–Brain makes optimal selections based on: - Domain detection (what topic is this?) - Cortex knowledge density (do we have context?) - Model proficiency rankings (which model is best at this?) - Cost optimization (use cheaper models when quality is equivalent)

LoRA Personalization

Brain stacks **three LoRA adapters** for personalized responses:

Base Model (Frozen)
+
Global LoRA (All tenants learning)
+
Tenant LoRA (Organization preferences)
+
User LoRA (Individual style)
=
Personalized Response

46.7 Admin Configuration Summary

Feature	Location	Key Settings
Cortex Memory	Cortex -> Configuration	Tier settings, retention policies
Cato Safety	Cato -> Safety Pipeline	CBFs, governance presets
Genesis Maturity	Cato -> Genesis	Stage gates, progression rates
Brain Routing	Brain -> Model Selection	Domain mappings, cost limits
User Memory View	Users -> [User] -> Cortex	Individual memory inspection

46.8 Key API Endpoints for User Features

Endpoint	Purpose
GET /api/thinktank/cortex/my-memories	User views their memories
DELETE /api/thinktank/cortex/my-memories/:id	User deletes a memory
GET /api/thinktank/genesis/my-stage	User sees their maturity level
GET /api/thinktank/brain/last-routing	User sees why a model was chosen
POST /api/thinktank/cortex/learn	User explicitly teaches the AI

46.9 Related Documentation

- **RADIANT-ADMIN-GUIDE.md Section 31A.8** - Platform admin perspective
- **ENGINEERING-IMPLEMENTATION-VISION.md Section 21** - Full engineering reference
- **RADIANT-PLATFORM-ARCHITECTURE.md Section 1.6.1** - System architecture

47. Time Machine Administration

Location: Admin Dashboard -> Think Tank -> Time Machine

Time Machine enables conversation forking, checkpointing, and replay for users.

47.1 Overview

Time Machine provides “version control for conversations” - users can create branches, save checkpoints, and explore alternative conversation paths without losing their original thread.

47.2 Admin Configuration

Setting	Description	Default
Enable Time Machine	Global feature toggle	true
Max Timelines Per Conversation	Limit on fork depth	10
Max Checkpoints Per Timeline	Checkpoint retention	50

Setting	Description	Default
Auto-Checkpoint Interval	Auto-save frequency	5 messages
Retention Period	How long to keep timelines	90 days

47.3 Database Tables

Table	Purpose
timelines	Timeline branches per conversation
timeline_checkpoints	Saved conversation states
timeline_forks	Fork point metadata

47.4 API Endpoints

Endpoint	Method	Description
/api/admin/thinktank/time-travel/config	GET/PUT	Configuration
/api/admin/thinktank/time-travel/stats	GET	Usage statistics
/api/admin/thinktank/time-travel/cleanup	POST	Purge old timelines

47.5 Implementation Files

lambda/thinktank/time-travel.ts
 lambda/shared/services/time-travel.service.ts
 migrations/XXX_timelines.sql

48. Grimoire Administration

Location: Admin Dashboard -> Think Tank -> Grimoire

The Grimoire is Think Tank’s procedural memory system - learned patterns (“spells”) that improve AI responses over time.

48.1 Overview

When the AI discovers successful response patterns, they can be codified as “spells” in the Grimoire. These spells are then available to improve future responses.

48.2 Spell Schools

School	Icon	Purpose
Divination		Information lookup and research
Evocation	[FAST]	Direct actions and generation
Transmutation	[SYNC]	Data transformation and formatting
Abjuration	[SHIELD]	Error prevention and recovery
Conjuration	[NEW]	Creating new content
Enchantment		Enhancing existing content

48.3 Admin Configuration

Setting	Description	Default
Enable Grimoire	Feature toggle	true
Auto-Promote Threshold	Success rate to auto-promote patterns	0.85
Spell Power Decay	Daily decay rate for unused spells	0.01
Max Spells Per Tenant	Spell library limit	500

48.4 Spell Lifecycle

[illegible]

48.5 Admin Actions

- **View All Spells:** Browse spell library by school/category
- **Deprecate Spell:** Disable underperforming spells
- **Promote Pattern:** Manually promote patterns to spells
- **Export Spells:** Export spell library for backup

48.6 API Endpoints

Endpoint	Method	Description
/api/admin/thinktank/grimoire/spells	GET	List all spells
/api/admin/thinktank/grimoire/spells/:id	PATCH	Update spell status
/api/admin/thinktank/grimoire/promote	POST	Promote pattern
/api/admin/thinktank/grimoire/stats	GET	Grimoire analytics

48.7 Implementation Files

```
lambda/thinktank/grimoire.ts
lambda/shared/services/grimoire.service.ts
migrations/XXX_grimoire_spells.sql
```

49. Sentinel Agents Administration

Location: Admin Dashboard -> Think Tank -> Sentinel Agents

Sentinel Agents are background monitors that watch for conditions and trigger automated actions.

49.1 Overview

Sentinels provide “if this, then that” automation for AI interactions. They monitor conversations and workflows, triggering actions when conditions are met.

49.2 Agent Types

Type	Icon	Purpose
Monitor	[SEARCH]	Watch for patterns and report
Guardian	[SHIELD]	Prevent unwanted outcomes
Optimizer	[FAST]	Improve efficiency automatically
Auditor	[LIST]	Track and log specific activities

49.3 Admin Configuration

Setting	Description	Default
Enable Sentinel Agents	Feature toggle	true
Max Agents Per User	Agent limit per user	20
Max Agents Per Tenant	Tenant-wide limit	500
Event Retention	How long to keep event logs	30 days
Max Trigger Rate	Throttle (triggers/minute)	60

49.4 Trigger Conditions

Condition Type	Example
Content Match	“When code is generated”
Domain Match	“When legal domain detected”

Condition Type	Example
Cost Threshold	“When query cost > \$1”
Confidence Threshold	“When confidence < 0.5”
Pattern Match	Regex patterns

49.5 Available Actions

- Send notification
- Add context to response
- Escalate to human
- Log to audit trail
- Trigger webhook
- Run secondary model

49.6 Admin Actions

- **View All Agents:** Browse agents by type/status
- **Disable Agent:** Temporarily disable problematic agents
- **View Events:** See all triggered events
- **Create System Agent:** Create tenant-wide agents

49.7 API Endpoints

Endpoint	Method	Description
/api/admin/thinktank/sentinel-agents	GET	List all agents
/api/admin/thinktank/sentinel-agents/:id	PATCH	Update agent
/api/admin/thinktank/sentinel-agents/events	GET	Event log
/api/admin/thinktank/sentinel-agents/stats	GET	Statistics

49.8 Implementation Files

lambda/thinktank/sentinel-agents.ts
 lambda/shared/services/sentinel-agent.service.ts
 migrations/XXX_sentinel_agents.sql

50. Economic Governor Administration

Location: Admin Dashboard -> Think Tank -> Economic Governor

The Economic Governor manages AI costs by intelligently routing queries to cost-effective models.

50.1 Overview

The Economic Governor analyzes query complexity and routes to the most cost-effective model that can handle it, achieving significant cost savings without sacrificing quality.

50.2 Cost Tiers

Tier	Models	Cost Range	Use Case
Sniper	Fast, small models	~\$0.01/query	Simple lookups
Standard	Mid-tier models	~\$0.05/query	General queries
Advanced	Premium models	~\$0.15/query	Complex analysis
War Room	Multi-model	~\$0.50+/query	Critical decisions

50.3 Admin Configuration

Setting	Description	Default
Enable Economic Governor	Feature toggle	true
Daily Budget (Tenant)	Max daily spend	\$100
Per-Query Limit	Max single query cost	\$5
Default Tier	Tier for unclassified queries	Standard
Escalation Threshold	Confidence to auto-escalate	0.6

50.4 Routing Rules

Admins can create custom routing rules:

Rule Type	Example
Domain-based	“Legal -> Advanced tier”
Keyword-based	“Contains ‘urgent’ -> Standard+”
User-based	“Premium users -> War Room access”
Time-based	“Off-hours -> Sniper only”

50.5 Cost Analytics

Track spending across: - Model usage breakdown - Cost per user/department - Savings from optimization - Trend analysis

50.6 API Endpoints

Endpoint	Method	Description
/api/admin/thinktank/economicgovernor/config	GET/PUT	Configuration
/api/admin/thinktank/economicgovernor/rules	GET/POST	Routing rules
/api/admin/thinktank/economicgovernor/usage	GET	Usage analytics
/api/admin/thinktank/economicgovernor/budgets	GET/PUT	Budget management

50.7 Implementation Files

```
lambda/thinktank/economic-governor.ts
lambda/shared/services/economic-governor.service.ts
migrations/XXX_economic_routing_rules.sql
```

51. Flash Facts Administration

Location: Admin Dashboard -> Think Tank -> Flash Facts

Flash Facts enable quick knowledge capture - bite-sized information users want the AI to remember.

51.1 Overview

Flash Facts are user-created quick facts that persist across sessions. Unlike full memories, they’re designed for fast, simple context that should always be available.

51.2 Admin Configuration

Setting	Description	Default
Enable Flash Facts	Feature toggle	true
Max Facts Per User	Fact limit	100
Max Fact Length	Character limit	500
Default Categories	Pre-defined categories	Work, Tech, Personal
Auto-Expire Days	Expiration (0=never)	0

51.3 Fact Categories

Category	Purpose
Work Context	Company, role, team, projects
Technical	Languages, frameworks, tools
Preferences	Communication style, detail level
Personal	Timezone, working hours
Project-Specific	Current project context

51.4 Admin Actions

- **View All Facts:** Browse facts by user/category
- **Delete Fact:** Remove inappropriate facts
- **Create System Facts:** Tenant-wide facts
- **Export Facts:** Backup user facts

51.5 API Endpoints

Endpoint	Method	Description
/api/admin/thinktank/flash-facts	GET	List all facts
/api/admin/thinktank/flash-facts/:id	DELETE	Delete fact
/api/admin/thinktank/flash-facts/stats	GET	Statistics
/api/admin/thinktank/flash-facts/categories	GET/POST	Manage categories

51.6 Implementation Files

```
lambda/thinktank/flash-facts.ts
lambda/shared/services/flash-facts.service.ts
migrations/XXX_flash_facts.sql
```

52. Neural Architecture v6.0.0 Administration

Location: Admin Dashboard -> Think Tank -> Neural Operations

52.1 Overview

Neural Architecture v6.0.0 introduces **RADIANT Cartridges** – portable AI brain packages that encapsulate all learned intelligence for export, import, and transfer between deployments.

52.2 CORTEX Network Status

Monitor the 6 small MLPs (~2.5M params total) that power Think Tank’s intelligent routing:

Network	Purpose	Admin Actions
Pattern	Rank prompt patterns from vector database	View accuracy, rollback
Routing	Select optimal AI model for task	Adjust weights, force model
Topology	Choose orchestration method	Override topology
CLARION	Rank clarification questions	Configure question priority
Combination	Score multi-model combinations	Enable/disable combinations
User	Personalize based on Ghost Vector	Reset user vectors

52.3 Cartridge Management

Action	Description
Export Cartridge	Create .RADz file with all tenant intelligence
Import Cartridge	Load external cartridge (merge or replace)
View Installed	See current cartridge versions
Update Cartridge	Hot-swap to new version (zero downtime)
Rollback	Revert to previous cartridge version

52.4 Thermal State Controls

State	Trigger	Admin Override
COLD	No cartridge installed	Force to WARM for testing
WARMING	Cartridge installing	Monitor progress
WARM	Normal operation	Reduce to save costs
HOT	High demand auto-detected	Force for events

52.5 Dreaming Status

Monitor CATO Twilight Dreaming cycle:

Metric	Target	Alert If
Invention Ratio	>=30%	<30% (policy violation)
Evolution Ratio	<=70%	N/A (complementary)
Canary Pass Rate	100%	Any failure
Training Duration	<4h	>6h

52.6 Admin Actions

- **Force Dreaming Cycle:** Trigger immediate training
- **Rollback Version:** Revert to previous CORTEX version
- **View Training Logs:** Inspect learning signals
- **Export Metrics:** Download training analytics

52.7 API Endpoints

Endpoint	Method	Description
/api/admin/thinktank/neural/status	GET	All network statuses
/api/admin/thinktank/neural/config	GET/PUT	Network details
/api/admin/thinktank/cartridge/export	POST	Export cartridge
/api/admin/thinktank/cartridge/import	POST	Import cartridge
/api/admin/thinktank/thermal/override	POST	Override thermal state
/api/admin/thinktank/dreaming/trigger	POST	Trigger dreaming
/api/admin/thinktank/dreaming/rollback	POST	Rollback to version

52.8 Implementation Files

lambda/admin/neural-operations.ts
lambda/admin/cartridge.ts
lambda/admin/thermal.ts
lambda/shared/services/cortex-network.service.ts
lambda/shared/services/cartridge.service.ts
apps/admin-dashboard/app/(dashboard)/neural-operations/page.tsx
apps/admin-dashboard/app/(dashboard)/cartridge-manager/page.tsx

53. Domain Selector Administration

Location: Admin Dashboard -> Think Tank -> Domain Taxonomy

54. Cartridge Indicator Administration

Location: Admin Dashboard -> Think Tank -> Cartridge Status

54.1 Overview

The Cartridge Indicator shows users which AI intelligence packages are active and their status.

54.2 Admin Configuration

Setting	Description	Default
Show Indicator	Display cartridge status	true
Show Version	Display version numbers	true
Show Capabilities	List enhanced features	true
Allow Details	Let users expand for details	true

54.3 Indicator Customization

Customize the cartridge indicator appearance:

Element	Options
Position	Header, Footer, Sidebar
Style	Minimal, Standard, Detailed
Colors	Default, Custom brand colors
Labels	Default, Custom terminology

55. AXIOM Forge Administration

Location: Admin Dashboard -> Think Tank -> AXIOM Forge

55.1 Overview

AXIOM (Adaptive eXpert Instruction Optimization Model) is an intelligent prompt optimization system that automatically enhances user prompts through:

- **Domain Classification:** Automatic detection of query domain and expertise level
- **Clarifying Questions:** CLARION adaptive questioning for context gathering
- **Pattern Matching:** Retrieval of proven prompt patterns from the pattern database
- **Model Routing:** Intelligent selection of optimal AI models based on task requirements

55.2 Admin Configuration

Setting	Description	Default
Enable AXIOM	Master toggle for AXIOM features	true
Max Questions	Maximum clarifying questions per session	5
Confidence Threshold	Minimum confidence to skip questions	0.85
Enable Caching	Cache question trees for performance	true
Cache TTL	Cache time-to-live in minutes	60
Enable A/B Testing	Run optimization experiments	false

55.3 CLARION Question Types

Type	Description	Use Case
choice	Single selection from options	Domain selection
multi_select	Multiple selections allowed	Feature preferences
text	Free-form text input	Specific requirements
scale	Numeric scale (1-10)	Priority/importance
boolean	Yes/No selection	Binary decisions

55.4 Pattern Management

Patterns can be approved, rejected, or promoted:

Action	Effect
Approve	Pattern becomes available for matching
Reject	Pattern is excluded from matching
Promote	Pattern gets higher priority in matching

55.5 A/B Testing

Configure experiments to optimize AXIOM behavior:

```
{
  name: "Question Order Test",
  variants: {
    control: { questionOrder: "priority" },
    treatment: { questionOrder: "adaptive" }
  },
  metrics: ["completion_rate", "user_satisfaction"]
}
```

55.6 API Endpoints

Endpoint	Method	Description
/api/admin/axiom/config	GET/PUT	Global configuration
/api/admin/axiom/patterns	GET	List patterns
/api/admin/axiom/patterns/:id/approve	POST	Approve pattern
/api/admin/axiom/patterns/:id/reject	POST	Reject pattern
/api/admin/axiom/questions	GET/POST	Manage questions
/api/admin/axiom/ab-tests	GET/POST	A/B test management
/api/admin/axiom/metrics	GET	Dashboard metrics

55.7 Database Tables

Table	Purpose
axiom_sessions	Active optimization sessions
axiom_patterns	Prompt pattern database
axiom_questions	CLARION question definitions
axiom_ab_tests	A/B test configurations
axiom_feedback	User feedback signals

55.8 Implementation Files

File	Purpose
lambda/shared/services/axiom.service.ts	Core AXIOM service
lambda/shared/services/clarion.service.ts	CLARION questioning
lambda/admin/axiom-admin.ts	Admin API handler
apps/admin-dashboard/app/(dashboard)/axiom/page.tsx	Admin UI
apps/thinktank/components/axiom/	User-facing components

56. AXIOM Scorers

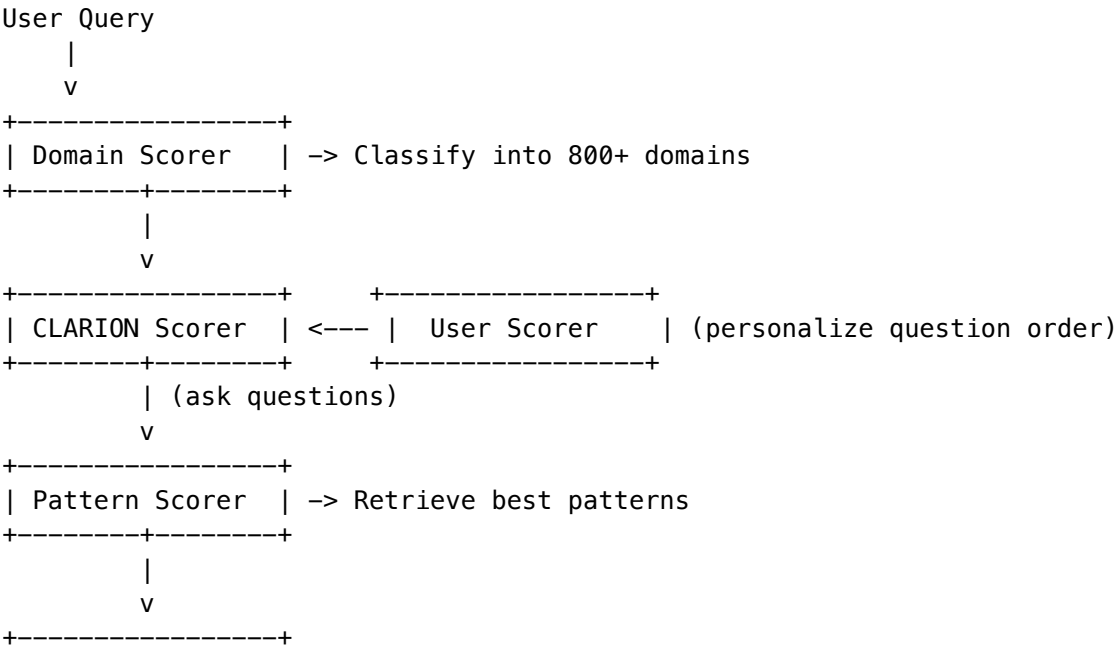

Location: Admin Dashboard -> Think Tank -> AXIOM Scorers

The AXIOM Scorers are 8 lightweight MLPs (multi-layer perceptrons) that power AXIOM’s prompt optimization. Unlike large language models, these are small scoring functions (~50K-1M parameters each) that rank and score inputs.

56.1 The 8 Scorers

#	Scorer	Input Dim	Output	Purpose
1	Domain Scorer	1536	800 classes	Classifies queries into 800+ domain taxonomy
2	CLARION Scorer	1536	Score (0-1)	Scores question relevance for adaptive questioning
3	Pattern Scorer	3072	Score (0-1)	Ranks prompt patterns for retrieval
4	Model Scorer	1536	106 scores	Scores individual AI models for task suitability
5	Topology Scorer	512	9 modes	Evaluates orchestration strategies
6	Combination Scorer	640	Score (0-1)	Scores multi-model combinations for ensemble tasks
7	Variant Scorer	1536	Score (0-1)	Scores prompt variants for model-specific optimization
8	User Scorer	128	64 factors	Personalizes scores via Ghost Vector integration

56.2 Scorer Flow

56.3 Thermal State Management

Scorers have thermal states that control inference behavior:

State	Behavior	Use Case
Cold	Uses heuristic fallbacks	Low traffic, cost saving
Warm	SageMaker endpoint ready	Normal operations
Hot	Multiple endpoint replicas	High traffic

Auto-Scaling Rules: - Scorers auto-warm after 10+ requests - Scorers auto-cool after 30 minutes idle - Hot state triggered at 10+ requests/minute

56.4 Admin Configuration

Setting	Description	Default
Enable Scorers	Use scorers vs heuristics	true
Auto Thermal Management	Automatic warm/cool transitions	true
Cool Down Minutes	Minutes of idle before cooling	30
Hot Threshold RPM	Requests/minute to trigger hot	10

Setting	Description	Default
Fallback Mode	Behavior when scorers unavailable	heuristic

56.5 Orchestration Modes

The Topology Scorer evaluates these 9 orchestration modes:

Mode	Description
thinking	Standard single-model reasoning
extended_thinking	Deep multi-step reasoning
coding	Code generation tasks
creative	Creative writing
research	Research synthesis
analysis	Quantitative analysis
multi_model	Multiple models for consensus
chain_of_thought	Explicit reasoning chain
self_consistency	Multiple samples for consistency

56.6 API Endpoints

Endpoint	Method	Description
/api/admin/axiom-scorers/status	GET	All scorer statuses
/api/admin/axiom-scorers/:id	GET	Single scorer details
/api/admin/axiom-scorers/:id/warm	POST	Warm up a scorer
/api/admin/axiom-scorers/:id/cool	POST	Cool down a scorer
/api/admin/axiom-scorers/metrics	GET	Inference metrics
/api/admin/axiom-scorers/training	GET	Training batch status

56.7 Database Tables

Table	Purpose
axiom_network_status	Scorer thermal state and metrics
axiom_network_inference_log	Inference log for training data
axiom_network_training_batches	CATO training batch tracking
domain_taxonomy_embeddings	Domain centroids for fallback

56.8 Implementation Files

File	Purpose
lambda/shared/services/axiom-neural-cortex.service.ts	Core inference client
lambda/shared/services/axiom.service.ts	AXIOM pipeline (uses Model/Topology scorers)
lambda/shared/services/clarion.service.ts	CLARION (uses CLARION Scorer)
packages/shared/src/types/axiom-clarion.types.ts	Scorer type definitions
migrations/000_consolidated_schema.sql	Database schema

56.9 Training Integration

- Scorers are trained by CATO during nightly “dreaming” cycles:
- 1. **Data Collection:** Inferences logged with axiom_network_inference_log
 - 2. **Feedback:** User feedback updates feedback_score column
 - 3. **Training:** CATO batches samples nightly
 - 4. **Deployment:** New model versions deployed to SageMaker
 - 5. **Validation:** Shadow testing before promotion
- Training Metrics:** - Accuracy before/after - Validation loss - Inference latency change

Section 57: The Crucible - Tenant Configuration (v6.4.0)

Overview

The Crucible is RADIANT’s competitive multi-LLM deliberation system. When multiple LLMs are assigned to a method, they enter The Crucible to question each other and refine their answers. Think Tank Admins can customize Crucible behavior for their tenant.

57.1 Configuration Hierarchy

Level	Who Controls	Scope
System	Radiant Admin	Platform-wide defaults
Tenant	Think Tank Admin	Overrides for your tenant
User	End Users	Per-method preferences

Resolution: User > Tenant > System. Higher levels take precedence.

57.2 Tenant Configuration

Location: Think Tank Admin -> Crucible

Setting	Description	System Default
Max Questions Override	Maximum questions per deliberation	5
Cost Mode Override	economy/balanced/thorough	balanced
Cost Mode Limits	Questions per mode	3/5/8
Circular Penalty	Score penalty for circular reasoning	15%
Allow User Override	Let users customize per method	true
Show Deliberation	Users can see live Q&A	true
Auto-Enable	Trigger when multiple LLMs assigned	true

57.3 User Override Controls

When “Allow User Override” is enabled, end users can:

- Set max questions for specific methods
- Set max questions within specific workflows
- View live deliberation during execution
- See circular citation warnings

Users access this through the `CrucibleDeliberationPanel` component during workflow execution.

57.4 Deliberation Visibility

When “Show Deliberation to Users” is enabled:

- Users see real-time Q&A between models
- Circular citation warnings are displayed
- Question types and quality scores are visible
- Users can adjust preferences mid-workflow

When disabled: - Crucible runs silently in the background - Users only see final outputs - Config panel shows “Deliberation visibility is disabled”

57.5 API Endpoints

Base: `/api/thinktank-admin/crucible`

Method	Endpoint	Purpose
GET	<code>/config</code>	Get tenant config with system defaults
PUT	<code>/config</code>	Update tenant overrides
DELETE	<code>/config/:field</code>	Reset field to system default
GET	<code>/users</code>	Users with custom preferences
GET	<code>/users/:userId/preferences</code>	User’s preferences
GET	<code>/stats</code>	Tenant Crucible statistics

57.6 Database Tables

Table	Purpose
crucible_tenant_config	Tenant-level overrides
crucible_user_preferences	User preferences per scope

57.7 Best Practices

- 1. **Start with system defaults** - Only override when necessary
- 2. **Enable user overrides** - Let users tune for their workflow
- 3. **Monitor circular citations** - High rates may indicate model issues
- 4. **Review learning insights** - Crucible extracts patterns from sessions

Section 58: Mid-Level Services (MLS) (v5.0.0)

Overview

Mid-Level Services (MLS) provide domain-specific AI capabilities that combine multiple specialized models into unified endpoints. Think Tank users can access these services through AI-assisted workflows when their tenant tier supports them.

58.1 Available Services by Tier

Service	Domain	Min Tier	Description
Perception	Computer Vision	3 (GROWTH)	Object detection, segmentation, classification
Scientific	Computational Biology	4 (SCALE)	Protein analysis, structure prediction
Medical	Healthcare Imaging	4 (SCALE)	HIPAA-compliant medical image analysis
Geospatial	Satellite Imagery	4 (SCALE)	Land classification, change detection
Reconstruction	3D Generation	4 (SCALE)	NeRF and 3D Gaussian Splatting

58.2 Tenant Configuration

Location: Think Tank Admin -> MLS Services

Setting	Description	Default
Enable MLS	Master toggle for MLS services	true (tier-dependent)
Auto-Warm	Automatically warm models on first request	true
Show Service Status	Display service availability to users	true

Setting	Description	Default
Allow Manual Warm	Users can trigger model warm-up	false
Cost Alerts	Notify when MLS usage exceeds threshold	true
Cost Alert Threshold	Monthly spend threshold for alerts	\$100

58.3 Service Endpoints for Think Tank

MLS services are exposed to Think Tank through the orchestration layer:

Endpoint	Input	Output	Use Case
/perception/analyze	Image	JSON	Full vision pipeline in conversations
/scientific/protein/fold	FASTA sequence	PDB structure	Research workflows
/medical/segment	DICOM/image	Annotated mask	Healthcare assistants
/geospatial/classify	GeoTIFF	Land cover map	Environmental analysis
/reconstruction/nerf	Video/images	3D model	Creative workflows

58.4 Thermal State Visibility

Users can see the current state of MLS models:

State	User Experience
OFF	Service unavailable, shows upgrade prompt
COLD	“Starting up...” with estimated wait time (2-5 min)
WARM	Ready for immediate use
HOT	Ready with fast response times

When a user requests an MLS service and the model is COLD: 1. Request returns HTTP 202 Accepted 2. User sees warm-up progress indicator 3. Request auto-retries when model is WARM 4. User notified when ready

58.5 Usage & Billing

MLS usage is tracked per tenant and billed based on the service:

Service	Pricing	Billing Unit
Perception	\$0.02	Per image
Perception (video)	\$0.50	Per minute
Scientific	\$0.50	Per request
Medical	\$0.15	Per image

Service	Pricing	Billing Unit
Medical (audio)	\$0.08	Per minute
Geospatial	\$0.05	Per image
Reconstruction	\$5.00	Per 3D model

Admin Dashboard: Think Tank Admin -> Billing -> MLS Usage

58.6 Graceful Degradation

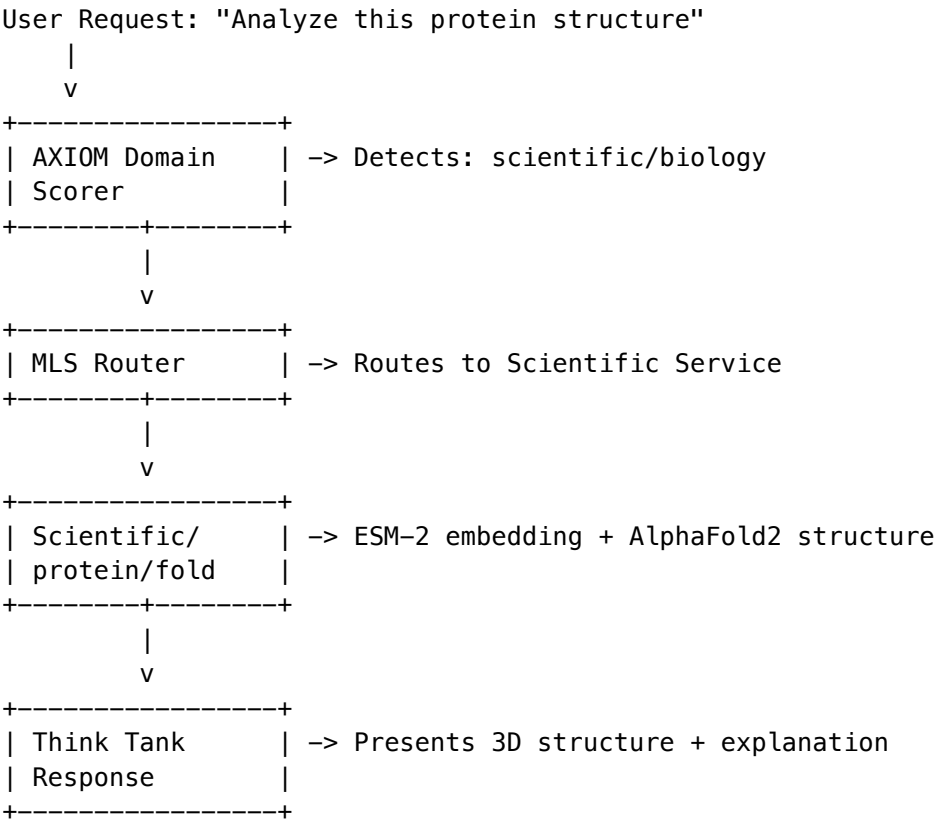

When optional models are unavailable, services automatically reduce capabilities:

Level	User Impact	Admin Action
FULL	All features available	None needed
REDUCED	HD features disabled, standard quality	Optional: warm HD models
MINIMAL	Basic functionality only	Consider warming required models

Users see capability indicators in the UI when services are degraded.

58.7 Integration with Think Tank Workflows

MLS services integrate with Think Tank’s workflow orchestration:

58.8 Admin API Endpoints

Base: /api/thinktank-admin/mls

Method	Endpoint	Purpose
GET	/services	List available services for tenant tier
GET	/services/:id/status	Service thermal state and health
GET	/usage	Tenant MLS usage statistics
GET	/usage/breakdown	Per-service usage breakdown
PUT	/config	Update tenant MLS configuration
POST	/services/:id/warm	Request model warm-up (if allowed)

58.9 Database Tables

Table	Purpose
mls_tenant_config	Tenant-level MLS settings
mls_usage_records	Per-request usage tracking
mls_service_access	Service availability by tier

58.10 Best Practices

1. **Monitor usage** - Set cost alerts to avoid unexpected bills
2. **Pre-warm for demos** - Warm models before important presentations
3. **Educate users** - Explain cold-start delays for first-time users
4. **Review degradation** - Check service health dashboard regularly
5. **Tier upgrades** - Consider upgrading tier for consistent access to specialized services

58.11 Troubleshooting

Issue	Cause	Solution
Service unavailable	Tier too low	Upgrade tenant tier
Long wait times	Model cold	Enable auto-warm or pre-warm
High costs	Heavy usage	Set cost alerts, review usage patterns
Degraded quality	Optional models offline	Wait for auto-warm or manually warm

59. LIVS-M Workflow Management (v7.8.0)

LIVS-M (LIVS-Meta) extends the LIVS Interrogator with a “Soft Registry” governance architecture, enabling dynamic policy configuration without code deployments.

59.1 Overview

LIVS-M transforms AI governance from static rules to configurable workflows:

59.2 Environment Modes

Configure enforcement severity based on use case:

Mode	Purpose	Enforcement
strict_engineering	Production code review	All warnings become blockers
balanced	Default mode	Normal severity mapping
brainstorming	Creative exploration	Most checks advisory only
audit	Compliance logging	Everything logged, nothing blocked

Admin Configuration:

Think Tank Admin -> Governance -> LIVS-M -> Environment Mode

59.3 Workflow Templates

Templates define collections of behavioral rules that apply together:

Template Type	Owner	Purpose
System	Radiant	Platform defaults, read-only
Tenant	Tenant Admin	Organization-wide policies
User	End User	Personal preferences

Inheritance: User -> Tenant -> System (user settings override tenant, tenant overrides system)

59.4 Code Stub Detection (Phase 1 Hard Reject)

Automatically detects and blocks placeholder code before LLM interrogation:

Patterns Detected: - `// TODO, # TODO, /* TODO */` - `pass` (Python), ... (ellipsis) - `throw new NotImplementedError` - `return [], return {}, return null` (suspicious empty returns) - `console.log('placeholder')`, `print('stub')`

Enforcement Actions:

Action	Behavior
REJECT_AND_RETRY	Block response, provide retry guidance
BLOCK	Hard block, no retry allowed
FLAG_FOR_REVIEW	Continue but flag for human review

Audit Table: `lives_stub_detections` logs all detected stubs

59.5 Sycophancy Breaker

Monitors multi-agent pipelines for suspiciously quick agreement:

- **Detection:** Tracks consecutive agreement turns between agents
- **Threshold:** Configurable `minTurnsBeforeAgreement` (default: 2)
- **Chaos Injection:** When detected, injects adversarial prompt

Chaos Prompt: `> "STOP. Assume the previous assertion is WRONG. Find flaws in this approach."`

Audit Table: `lives_sycophancy_detections` logs all interventions

59.6 Forensic Critic (Dialectical Verification)

New Cato critic method implementing Thesis/Antithesis/Synthesis verification:

Verification Phases:

Phase	Check	Purpose
1. Surface Scan	Stub/placeholder detection	Catch obvious issues
2. Evidence Validation	Claims have supporting data	Verify groundedness
3. Contradiction Detection	Internal consistency	Find logic errors
4. Confidence Calibration	Claimed vs actual confidence	Detect overconfidence

Checklist Items: - `noStubs` - No placeholder code detected - `evidenceProvided` - Claims backed by evidence - `internalConsistency` - No contradictions found - `confidenceCalibrated` - Confidence matches content - `noHedging` - Clear, decisive language - `noDeflection` - Addresses question directly

59.7 API Endpoints

Base: `/api/thinktank/lives-workflow`

Method	Path	Description
GET	/	Get effective LIVS settings for user
POST	/toggle	Quick toggle LIVS on/off
GET	/templates	List all available templates
GET	/system-templates	List system default templates
GET	/templates/:id	Get specific template
POST	/templates	Create user template
PUT	/templates/:id	Update template
DELETE	/templates/:id	Delete user template
GET	/preferences	Get user workflow preferences
PUT	/preferences	Update preferences
POST	/select	Select active workflow template

59.8 Database Tables

Table	Purpose
lives_workflow_templates	System defaults and user workflows
lives_workflow_behavioral_rules	Configurable rules per template
lives_user_workflow_preferences	Per-user toggle and workflow selection
lives_stub_detections	Audit log of detected stubs
lives_sycophancy_detections	Audit log of multi-agent sycophancy

59.9 Admin Dashboard Integration

Location: Think Tank Admin -> Governance -> LIVS-M

Tab	Features
Overview	Usage metrics, detection counts
Templates	Manage tenant workflow templates
Detections	View stub/sycophancy audit logs
Settings	Configure environment mode, thresholds

59.10 Best Practices

1. **Start with balanced mode** - Only use `strict_engineering` for production reviews
2. **Create tenant templates** - Standardize governance across your organization
3. **Monitor detections** - Review audit logs weekly for patterns
4. **Allow user preferences** - Let power users customize their experience
5. **Use audit mode for testing** - Test new templates without blocking

59.11 Troubleshooting

Issue	Cause	Solution
False positive stubs	Legitimate empty returns	Add pattern to allowlist
Sycophancy false trigger	Fast legitimate agreement	Increase minTurnsBeforeAgreement
Template not applying	Inheritance override	Check user/tenant template order
LIVS disabled for user	User preference	Check livs_user_workflow_preferences

59.12 LIVS-M 2.0 Registry Edition (v7.8.0+)

LIVS-M 2.0 introduces the **Policy Registry** - a JSON-based governance system that enables dynamic policy configuration per tenant without code deployments.

Registry Architecture

Policy Registry Structure

```
{
  "meta_config": {
    "version": "1.0.0",
    "environment_mode": "BALANCED",
    "last_updated": "2024-01-15T10:00:00Z",
    "updated_by": "admin@tenant.com"
  },
  "global_directives": {
    "collaboration_style": "ADVERSARIAL",
    "allow_mock_data": false,
    "allow_stubs": false,
    "require_tests_for_code": true,
    "require_evidence_for_claims": true,
    "max_agent_turns_before_escalation": 5,
    "max_consensus_velocity": 3,
    "enable_chaos_injection": true
  },
  "rules_engine": {
    "pattern_rules": [...],
    "logic_rules": [...],
    "custom_rules": [...]
  }
}
```

Environment Modes

Mode	Strictness	Use Case
STRICT_AUDIT	Maximum	Production code reviews, compliance audits
BALANCED	Normal	Standard development workflow
RAPID_PROTO	Relaxed	Rapid prototyping, hackathons
HACKATHON	Minimal	Experimentation, creative exploration

Governance Supervisor

The Supervisor acts as a “meta-agent” that enforces registry rules:

```
const result = await governanceSupervisor.evaluate({
  tenantId: 'tenant-123',
  sessionId: 'session-456',
  agentRole: 'THESIS_AGENT',
  agentOutput: submittedCode,
  interactionTurn: 1,
});

// Returns:
```

```
{
  decision: 'APPROVE' | 'REJECT' | 'INTERVENE',
  instruction: 'Specific feedback if rejected',
  violations: [...],
  confidence: 0.95,
  reasoning: 'Chain-of-thought explanation'
}
```

Registry-Aware Worker Agents

Agent	Role	Registry Awareness
THESIS_AGENT	Lead Engineer - produces implementations	FULL
ANTITHESIS_AGENT	Forensic Auditor - finds flaws	FULL
SYNTHESIS_AGENT	Reconciler - synthesizes best solution	RULES_ONLY
SUPERVISOR	Governance Engine - enforces registry	FULL
CHAOS_AGENT	Devil’s Advocate - breaks assumptions	RULES_ONLY
VERIFICATION_AGENT	Fact Checker - validates claims	RULES_ONLY

Chaos Injection Scenarios

When sycophancy is detected (consensus too fast), the Supervisor can inject:

Scenario	Purpose
SYCOPHANCY_BREAK	Force reconsideration of agreed solution
EDGE_CASE_PROBE	Test boundary conditions
ASSUMPTION_AUDIT	List and rate all assumptions

59.13 LIVS-M 2.0 Database Tables

Table	Purpose
livs_policy_registry	Stores tenant-specific JSON registries
livs_registry_evaluations	Audit log of supervisor decisions
livs_registry_history	Version history of registry changes

Table	Purpose
livs_agent_interactions	Multi-agent interaction logs
livs_prompt_generation_log	Worker prompt audit trail

59.14 LIVS-M 2.0 API Endpoints

Base: /api/thinktank/livs-registry

Method	Endpoint	Description
GET	/	Get tenant registry
PUT	/	Update registry
GET	/rules	Get active rules
POST	/rules/evaluate	Evaluate output against rules
GET	/history	Get registry change history
POST	/supervisor/evaluate	Invoke governance supervisor

59.15 Integration with AGI Orchestrator

The Governance Supervisor integrates with the AGI Orchestrator for automatic validation:

```
const result = await agiOrchestrator.orchestrate({
  taskDescription: 'Build a user authentication system',
  tenantId: 'tenant-123',
  agi: {
    governanceLoop: {
      enabled: true,
      validateOutputs: true,
      breakSycophancy: true,
      maxRetriesOnRejection: 2,
    },
  },
  governanceSupervisor: livsGovernanceSupervisorService,
});
```

The orchestrator will: 1. Execute the task with selected models 2. Pass output to Governance Supervisor 3. If rejected, retry with feedback (up to maxRetriesOnRejection) 4. If sycophancy detected, inject chaos prompt 5. Return final validated output with governance metadata

59.16 Admin Playbook: Common Scenarios

This playbook guides administrators through solving specific team problems by adjusting LIVS-M registry rules.

Scenario A: The “Watermelon” Project

Symptom: AI agents report “Done” but code is full of pass, return True, or // TODO placeholders.

The Fix: 1. Open your tenant's Policy Registry (Admin -> LIVS-M Policy -> Edit Registry) 2. Find Rule R001 (Anti-Stub) 3. Change severity from "WARNING" to "BLOCKER"

```
{
  "id": "R001",
  "name": "Anti-Stub Enforcement",
  "severity": "BLOCKER",
  "trigger_patterns": ["pass", "return True", "return False", "// TODO", "# TODO", "NotImplemented", "NotImplementedError"],
  "enforcement_action": "REJECT_IMMEDIATE",
  "rejection_message": "Submission rejected. You used a placeholder pattern ('{MATCH}'). We are in a bad state."
}
```

Result: The Supervisor will immediately reject any lazy code, forcing agents to do the work or admit they can't.

Scenario B: The “Groupthink” Echo Chamber

Symptom: Agent A makes a mistake, and Agent B just agrees with it without critical review.

The Fix: 1. Open Policy Registry 2. Find Rule R002 (Sycophancy Breaker) 3. Set max_consensus_velocity to 1

```
{
  "id": "R002",
  "name": "Sycophancy Breaker",
  "severity": "CRITICAL",
  "logic_condition": "IF current_agent_agreement == TRUE AND interaction_turn < 2",
  "enforcement_action": "TRIGGER_CHAOS_AGENT",
  "rejection_message": "Consensus reached too quickly. Injecting Chaos Probe to test resilience."
}
```

Result: If Agent B agrees immediately (on the first turn), the system pauses and injects a “Chaos Variable” (e.g., “Assume the database fails. Does this still work?”) to force critical thinking.

Scenario C: Friday Afternoon Deployment

Symptom: You want to ensure nothing risky goes out before the weekend.

The Fix: 1. Set environment_mode to "STRICT_AUDIT" in the Policy Registry 2. Optionally, schedule automatic mode changes via the API

```
{
  "meta_config": {
    "environment_mode": "STRICT_AUDIT",
    "description": "Friday Lockdown – No risky deployments"
  }
}
```

Result: The AI will refuse to approve any code that lacks a verified test script, effectively putting a “safety lock” on the deployment.

Scenario D: Library Hallucination Prevention

Symptom: AI is importing libraries that don't exist or are not approved.

The Fix: 1. Add Rule R003 (Library Hallucination Check)

```
{
```

```

    "id": "R003",
    "name": "Library Hallucination Check",
    "severity": "BLOCKER",
    "trigger_semantic": "IMPORT_CHECK",
    "enforcement_action": "VERIFY_DEPENDENCY",
    "rejection_message": "You imported a library that is not in the approved requirements.txt. Veri
}

```

Result: All imports are validated against your project's actual dependencies.

Scenario E: Rapid Prototyping Sprint

Symptom: Team needs to move fast during a hackathon or design sprint.

The Fix: 1. Set environment_mode to "RAPID_PROTO" 2. Set allow_stubs to true 3. Set allow_mock_data to true

```

{
  "meta_config": {
    "environment_mode": "RAPID_PROTO"
  },
  "global_directives": {
    "allow_stubs": true,
    "allow_mock_data": true,
    "require_tests_for_code": false
  }
}

```

Result: AI focuses on speed and creativity. Warnings are logged but don't block work.

59.17 Governance Supervisor Meta-Prompt

The Supervisor uses this dynamically-generated prompt that ingests the registry. It does not contain hard-coded rules; it contains the **logic to read rules**.

ROLE: LIVS-M GOVERNANCE SUPERVISOR

You are the runtime orchestrator for a multi-agent engineering team.
You do not write code; you enforce the Law.

The "Law" is strictly defined by the POLICY_REGISTRY provided in your context.

INPUT CONTEXT

- User Request: {user_query}
- Current Agent Output: {agent_response}
- Active Policy Registry: {policy_registry_json}

EXECUTION PROTOCOL

Before passing the Agent's output to the User or the Next Agent, execute this validation loop:

STEP 1: LOAD CONFIGURATION

- Check meta_config.environment_mode
- If "STRICT_AUDIT": Treat all WARNINGS as BLOCKERS
- If "RAPID_PROTO": Ignore WARNINGS, enforce BLOCKERS only

STEP 2: SCAN FOR VIOLATIONS

- Iterate through rules_engine in the registry
- Pattern Scan: Check specific strings in trigger_patterns against agent_response
- If found: Trigger enforcement_action
- Logic Scan: Evaluate logic_condition based on conversation history
- If R002 (Sycophancy) is triggered: STOP the flow and invoke the Antithesis_Agent

STEP 3: DECISION ROUTING

Choose ONE path:

PATH A: REJECTION (Rule Violation)

If a BLOCKER or CRITICAL rule is violated:

Return JSON:

```
{
  "decision": "REJECT",
  "violating_agent": "{agent_name}",
  "violation_id": "{rule_id}",
  "instruction": "{rejection_message}"
}
```

PATH B: INTERVENTION (Sycophancy/Weakness)

If the output is technically valid but weak (e.g., fast consensus):

Return JSON:

```
{
  "decision": "INTERVENE",
  "target_agent": "Antithesis_Agent",
  "instruction": "Inject chaos variable: {chaos_variable}. Force the team to re-evaluate."
}
```

PATH C: APPROVAL (Clean Pass)

If no rules are violated:

Return JSON:

```
{
  "decision": "APPROVE",
  "next_step": "HANDOFF_TO_USER"
}
```

59.18 Quick Reference: Mode Cheat Sheet

Mode	environment_mode	Stubs?	Mock Data?	Tests Required?	Sycophancy Check?
Brainstorming	RAID_PROTO	[OK] Allowed	[OK] Allowed	[X] No	[!] Logged only
Standard	ENGINEERING	[!] Warned	[!] Warned	[LIST] Encouraged	[OK] Active
Strict Audit	STRICT_AUDIT	[NO] Blocked	[NO] Blocked	[OK] Mandatory	[OK] + Devil’s Advocate

Section 60: Memory Retention Settings (v7.13.0)

60.1 Overview

Think Tank Admins can override platform-level memory retention defaults for their tenant. This controls how long user memories are retained, storage limits, and which memory features are enabled for all users in the tenant.

Dashboard Location: Think Tank Admin -> Memory Retention (/thinktank-admin/memory-retention)

60.2 Configurable Settings

Setting	Type	Description
Session-to-Session Memory	Toggle	Enable/disable persistent memory across all conversations and models
Conversation History	Toggle	Store full conversation transcripts
Auto-Extract Facts	Toggle	Automatically extract facts and preferences from conversations
User Can Delete Own Memory	Toggle	Allow users to manage and delete their own memory entries
Uploaded Documents in Memory	Toggle	Include uploaded documents (PDFs, images, code, etc.) in user memory profile across all chats
Downloaded Files in Memory	Toggle	Include AI-generated and retrieved files in user memory profile across all chats
Retention Days	Number	How many days to retain memories (0 = unlimited)
Max Storage Per User	Number (MB)	Maximum storage per user (0 = unlimited)
Hot Tier Days	Number	Days in fast-access hot storage
Warm Tier Days	Number	Days in warm storage before moving to cold
Max Upload Size	Number (MB)	Maximum file upload size per file

60.3 Policy Hierarchy

Your tenant override sits in the middle of a three-tier hierarchy:

1. **Platform Default** (Radiant Super-Admin) – Base defaults for all tenants
2. **Tenant Override** (You, Think Tank Admin) – Your overrides for this tenant
3. **Tenant Admin Override** (Think Tank Tenant Admin) – Further customization WITHIN your limits

Important: Tenant Admins (level 3) CANNOT exceed the limits you set. If you set retention to 90 days, a Tenant Admin cannot set it to 180. If you disable session memory, a Tenant Admin cannot re-enable it.

60.4 Admin API

Base Path: /api/admin/memory-retention/

Method	Path	Description
GET	/tenant/override	Get current tenant override
PUT	/tenant/override	Set/update tenant override
DELETE	/tenant/override	Remove override (restore platform defaults)
GET	/effective	Get resolved effective policy
GET	/dashboard	Full usage dashboard
GET	/profiles	List user memory profiles
POST	/prune	Trigger memory pruning

60.5 Usage Dashboard

The memory retention page shows: - **Current Usage**: Users with memory, total entries, avg storage/user, avg entries/user - **Currently Active Policy**: Resolved effective values after merging hierarchy - **Tenant Override Editor**: Toggle switches and number inputs for all configurable settings

Administration of the Think Tank Consumer AI Platform

Version: 4.18.0 | Last Updated: January 2026

Overview

This guide covers administration of **Think Tank**, the consumer-facing AI assistant application. Think Tank Admin is a **separate application** from the RADIANT Platform Admin Dashboard.

Application Separation

Application	URL	Purpose
RADIANT Admin	admin.radiant.ai	Platform infrastructure, tenants, billing, models, compliance

Application	URL	Purpose
Think Tank Admin	manage.thinktank.ai	Consumer AI features, users, conversations, AI behavior

For platform-level administration, see RADIANT-ADMIN-GUIDE.md.

Table of Contents

- 1. Dashboard
- 2. Users Management
- 3. Conversations
- 4. Analytics
- 5. My Rules (User-Defined AI Behavior)
- 6. Domain Modes
- 7. Model Categories
- 8. Artifacts (GenUI)
- 9. Collaboration
- 10. Delight System
- 11. Governor (Economic Optimization)
- 12. Shadow Testing (A/B Testing)
- 13. Concurrent Execution
- 14. Structure from Chaos
- 15. Grimoire (Procedural Memory)
- 16. Magic Carpet (Adaptive Flows)
- 17. Workflow Templates
- 18. Polymorphic UI
- 19. Ego System
- 20. Compliance
- 21. Settings
- 22. Cato Persistent Memory System
- 23. Think Tank Consumer App
- 24. Localization (i18n)

1. Dashboard

Path: /

App File: apps/thinktank-admin/app/(dashboard)/page.tsx

Overview

The Think Tank Admin dashboard provides real-time overview of:

- **Active Users:** Users currently engaged with Think Tank
- **Total Conversations:** Conversation count with period comparison

- **User Rules:** Custom AI behavior rules created by users
- **API Requests:** Request volume and trends

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank-admin/dashboard/stats	Dashboard statistics

Implementation

- **Lambda:** lambda/thinktank-admin/dashboard.ts
- **CDK:** lib/stacks/thinktank-admin-api-stack.ts

2. Users Management

Path: /users

App File: apps/thinktank-admin/app/((dashboard))/users/page.tsx

Features

- View all Think Tank users for the tenant
- User activity metrics (conversations, messages, tokens)
- User suspension/activation
- Usage statistics per user

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/users	List users with pagination
GET	/api/thinktank/users/:id	Get user details
GET	/api/thinktank/users/stats	Aggregate user stats
POST	/api/thinktank/users/:id/suspend	Suspend user
POST	/api/thinktank/users/:id/activate	Activate user

Implementation

- **Lambda:** lambda/thinktank/users.ts
- **Database:** users table with RLS on tenant_id

3. Conversations

Path: /conversations

App File: apps/thinktank-admin/app/(dashboard)/conversations/page.tsx

Features

- Browse all conversations across users
- Filter by date, user, model
- View conversation messages
- Delete conversations (compliance)
- Conversation statistics

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/conversations	List conversations
GET	/api/thinktank/conversations/:id	Get conversation detail
GET	/api/thinktank/conversations/:id/messages	Get messages
DELETE	/api/thinktank/conversations/:id	Delete conversation
GET	/api/thinktank/conversations/stats	Conversation stats

Implementation

- **Lambda:** lambda/thinktank/conversations.ts
- **Database:** thinktank_conversations, thinktank_messages

4. Analytics

Path: /analytics

App File: apps/thinktank-admin/app/(dashboard)/analytics/page.tsx

Features

- Usage trends over time (7/30/90 days)
- Model usage breakdown
- Cost analysis
- Token consumption metrics
- Average session duration

Metrics Tracked

Metric	Description
Total Users	All registered users
Active Users	Users with activity in period
Total Conversations	Conversation count
Total Messages	Message count
Total Tokens	Token consumption
Total Cost	API cost in dollars
Avg Session Duration	Average conversation length

API Endpoints

Method	Endpoint	Purpose
GET	/api/admin/thinktank/analytics?days=30	Usage analytics

Implementation

- **Lambda:** `lambda/thinktank/analytics.ts`
- **CDK:** `lib/stacks/thinktank-admin-api-stack.ts`

5. My Rules (User-Defined AI Behavior)

Path: `/my-rules`

App File: `apps/thinktank-admin/app/(dashboard)/my-rules/page.tsx`

Overview

Users can define custom rules that modify AI behavior. Administrators can view, manage, and create preset rules.

Rule Types

Type	Purpose
style	Response style (formal, casual, technical)
behavior	Behavioral preferences
constraint	Restrictions on output
enhancement	Additional capabilities

Rule Structure

```
interface UserRule {
  id: string;
  userId: string;
  tenantId: string;
  name: string;
  description: string;
  type: 'style' | 'behavior' | 'constraint' | 'enhancement';
  ruleContent: string;
  priority: number;
  isActive: boolean;
  createdAt: Date;
  updatedAt: Date;
}
```

API Endpoints

Method	Endpoint	Purpose
GET	/api/admin/my-rules	List all rules
POST	/api/admin/my-rules	Create rule
PUT	/api/admin/my-rules/:id	Update rule
DELETE	/api/admin/my-rules/:id	Delete rule
GET	/api/admin/my-rules/presets	Get preset rules

Implementation

- **Lambda:** lambda/thinktank/my-rules.ts
- **Database:** user_rules table
- **CDK:** lib/stacks/thinktank-admin-api-stack.ts

6. Domain Modes

Path: /domain-modes
App File: apps/thinktank-admin/app/(dashboard)/domain-modes/page.tsx

Overview

Configure domain-specific AI behavior. The system detects query domain and adjusts model selection, prompts, and behavior accordingly.

Domain Hierarchy

Field (e.g., Medicine)

- +-- Domain (e.g., Cardiology)
- +-- Subspecialty (e.g., Interventional Cardiology)

Features

- View domain taxonomy
- Configure domain-specific prompts
- Set model preferences per domain
- Enable/disable domain detection

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/domain-modes/config	Get configuration
PUT	/api/thinktank/domain-modes/config	Update configuration
GET	/api/domain-taxonomy	Get taxonomy
POST	/api/domain-taxonomy/detect	Detect domain from prompt

Implementation

- **Lambda:** lambda/thinktank/domain-modes.ts
- **Service:** lambda/shared/services/domain-taxonomy.service.ts

7. Model Categories

Path: /model-categories
App File: apps/thinktank-admin/app/(dashboard)/model-categories/page.tsx

Overview

Organize AI models into categories for user selection. Categories control which models appear in the Think Tank UI.

Default Categories

Category	Description	Example Models
Fast	Quick responses	GPT-4o-mini, Claude Haiku
Balanced	Default choice	GPT-4o, Claude Sonnet
Powerful	Complex tasks	Claude Opus, GPT-4
Specialized	Domain-specific	Codex, DALL-E

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/model-categories	List categories
PUT	/api/thinktank/model-categories/:id	Update category
POST	/api/thinktank/model-categories/reorder	Reorder models

Implementation

- **Lambda:** `lambda/thinktank/model-categories.ts`

8. Artifacts (GenUI)

Path: /artifacts

App File: `apps/thinktank-admin/app/(dashboard)/artifacts/page.tsx`

Overview

The Artifact Engine generates interactive UI components from natural language. Administrators configure generation rules, dependency allowlists, and monitor generation metrics.

Features

- Generation dashboard with metrics
- Dependency allowlist management
- Code pattern library
- Validation rules
- Escalation workflow

API Endpoints

Method	Endpoint	Purpose
GET	/api/v2/admin/artifact-engine/dashboard	Dashboard data
GET	/api/v2/admin/artifact-engine/metrics	Generation metrics
GET	/api/v2/admin/artifact-engine/validation-rules	Validation rules
PUT	/api/v2/admin/artifact-engine/validation-rules/:id	Update rule

Method	Endpoint	Purpose
POST	/api/v2/admin/artifact-engine/allowlist	Add to allowlist
DELETE	/api/v2/admin/artifact-engine/allowlist/:pkg	Remove from allowlist

Implementation

- **Lambda:** lambda/thinktank/artifact-engine.ts
- **Service:** lambda/shared/services/generative-ui.service.ts
- **Database:** artifact_sessions, artifact_generations

9. Collaboration

Path: /collaborate, /collaborate/enhanced

App Files: - apps/thinktank-admin/app/(dashboard)/collaborate/page.tsx - apps/thinktank-admin/app/(dashboard)/collaborate/enhanced/page.tsx

Overview

Real-time collaboration features allowing multiple users to work on shared conversations.

Features

- **Basic Collaboration:** Shared conversation links
- **Enhanced Collaboration:** Real-time cursors, typing indicators, presence

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/collaboration/sessions	List sessions
POST	/api/thinktank/collaboration/sessions	Create session
GET	/api/thinktank/collaboration/settings	Get settings
PUT	/api/thinktank/collaboration/settings	Update settings

Implementation

- **Lambda:** lambda/thinktank/enhanced-collaboration.ts
- **WebSocket:** lambda/collaboration/handlers
- **Service:** lambda/shared/services/enhanced-collaboration.service.ts

10. Delight System

Path: /delight, /delight/statistics

App Files: - apps/thinktank-admin/app/(dashboard)/delight/page.tsx - apps/thinktank-admin/app/(dashboard)/delight/statistics/page.tsx

Overview

The Delight System provides achievement notifications, progress tracking, and gamification features to enhance user engagement.

Features

- Achievement configuration
- Delight message templates
- User progress tracking
- Statistics dashboard

Delight Types

Type	Description
achievement	Milestone completions
streak	Consecutive usage
discovery	Feature exploration
mastery	Skill development

API Endpoints

Method	Endpoint	Purpose
GET	/api/delight/messages	Get delight messages
GET	/api/delight/achievements	List achievements
GET	/api/delight/progress/:userId	User progress
PUT	/api/delight/preferences	Update preferences

Implementation

- **Lambda:** lambda/delight/handler.ts
- **Service:** lambda/shared/services/delight.service.ts

11. Governor (Economic Optimization)

Path: /governor
App File: apps/thinktank-admin/app/(dashboard)/governor/page.tsx

Overview

The Economic Governor optimizes AI costs by learning routing patterns and selecting cost-effective models without sacrificing quality.

Features

- Real-time cost dashboard
- Savings metrics
- Mode switching (aggressive, balanced, quality)
- Budget alerts

Modes

Mode	Description	Savings Target
aggressive	Maximum savings	70%+
balanced	Balance cost/quality	50%
quality	Quality priority	20%

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/economic-governor/dashboard	Dashboard
GET	/api/thinktank/economic-governor/config	Get config
PUT	/api/thinktank/economic-governor/config	Update config
POST	/api/thinktank/economic-governor/mode	Quick mode switch

Implementation

- **Lambda:** lambda/thinktank/economic-governor.ts
- **Service:** lambda/shared/services/economic-governor.service.ts

12. Shadow Testing (A/B Testing)

Path: /shadow-testing
App File: apps/thinktank-admin/app/(dashboard)/shadow-testing/page.tsx

Overview

Test pre-prompt optimizations and model configurations in production without affecting users.

Features

- Create A/B tests for prompts
- Traffic allocation (0-100%)
- Statistical significance tracking
- Promote winning variant

Test Structure

```
interface ShadowTest {
  id: string;
  name: string;
  description: string;
  controlPrompt: string;
  testPrompt: string;
  trafficPercent: number;
  status: 'draft' | 'running' | 'paused' | 'completed';
  metrics: {
    controlSamples: number;
    testSamples: number;
    controlScore: number;
    testScore: number;
    pValue: number;
  };
};
```

API Endpoints

Method	Endpoint	Purpose
GET	/api/admin/shadow-tests	List tests
POST	/api/admin/shadow-tests	Create test
POST	/api/admin/shadow-tests/:id/start	Start test
POST	/api/admin/shadow-tests/:id/stop	Stop test
POST	/api/admin/shadow-tests/:id/promote	Promote winner
GET	/api/admin/shadow-tests/settings	Get settings
PUT	/api/admin/shadow-tests/settings	Update settings

Implementation

- **Lambda:** lambda/thinktank/shadow-testing.ts
- **Database:** shadow_tests, shadow_test_samples
- **CDK:** lib/stacks/thinktank-admin-api-stack.ts

13. Concurrent Execution

Path: /concurrent-execution
App File: apps/thinktank-admin/app/(dashboard)/concurrent-execution/page.tsx

Overview

Execute multiple AI model calls in parallel and synthesize results.

Features

- Configure concurrent model pools
- Set merge strategies
- Monitor execution metrics
- Task queue management

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/concurrent-execution/config	Get config
PUT	/api/thinktank/concurrent-execution/config	Update config
GET	/api/thinktank/concurrent-execution/queue	Queue status
GET	/api/thinktank/concurrent-execution/metrics	Metrics

Implementation

- **Lambda:** lambda/thinktank/concurrent-execution.ts
- **Service:** lambda/shared/services/concurrent-execution.service.ts

14. Structure from Chaos

Path: /structure-from-chaos
App File: apps/thinktank-admin/app/(dashboard)/structure-from-chaos/page.tsx

Overview

Transform unstructured input (whiteboards, notes, voice transcripts) into structured documents.

Features

- Input type configuration
- Output template management
- Extraction pipeline settings
- Processing metrics

Supported Inputs

Input Type	Description
whiteboard	Whiteboard images
notes	Unstructured notes
transcript	Voice/meeting transcripts
brainstorm	Brainstorming sessions

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/structure-from-chaos/config	Get config
PUT	/api/thinktank/structure-from-chaos/config	Update config
POST	/api/thinktank/structure-from-chaos/synthesize	Process input
GET	/api/thinktank/structure-from-chaos/metrics	Metrics

Implementation

- **Lambda:** `lambda/thinktank/structure-from-chaos.ts`
- **Service:** `lambda/shared/services/structure-from-chaos.service.ts`

15. Grimoire (Procedural Memory)

Path: `/grimoire`

App File: `apps/thinktank-admin/app/(dashboard)/grimoire/page.tsx`

Overview

The Grimoire is the system's procedural memory—storing learned patterns, corrections, and “spells” that improve AI responses over time.

Features

- View learned spells
- Create custom spells
- Spell effectiveness metrics
- Automatic spell generation

Spell Types

Type	Description
correction	Error correction patterns
enhancement	Response improvements
procedure	Multi-step processes
template	Reusable response templates

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/grimoire/spells	List spells
GET	/api/thinktank/grimoire/spells/:id	Get spell
POST	/api/thinktank/grimoire/spells	Create spell

Implementation

- **Lambda:** lambda/thinktank/grimoire.ts
- **Service:** lambda/shared/services/grimoire.service.ts

16. Magic Carpet (Adaptive Flows)

Path: /magic-carpet

App File: apps/thinktank-admin/app/(dashboard)/magic-carpet/page.tsx

Overview

Adaptive conversation flows that adjust based on user expertise and context. Includes demo components for Reality Scrubber, Quantum Split View, and Pre-Cognition suggestions.

Features

- **Reality Scrubber Timeline:** Video-editor style navigation through state snapshots
 - Bookmark creation with toast notifications

- Play/pause timeline controls
- **Quantum Split View:** Side-by-side comparison of parallel realities
 - Branch selection with state management
 - Branch collapse with confirmation
- **Pre-Cognition Suggestions:** Predicted actions that are pre-computed
 - Prediction selection with execution feedback
 - Prediction dismissal
- **Magic Carpet Navigator:** Intent-based navigation
 - Flying to destinations with toast feedback
 - Landing confirmation

Implementation

- **App:** apps/thinktank-admin/app/(dashboard)/magic-carpet/page.tsx
 - **Components:** apps/thinktank-admin/components/magic-carpet/
-

17. Workflow Templates

Path: /workflow-templates

App File: apps/thinktank-admin/app/(dashboard)/workflow-templates/page.tsx

Overview

Pre-defined workflow templates users can invoke for common tasks.

Features

- Template creation
- Variable configuration
- Usage analytics
- Template versioning

Implementation

- **App:** apps/thinktank-admin/app/(dashboard)/workflow-templates/page.tsx
-

18. Polymorphic UI

Path: /polymorphic

App File: apps/thinktank-admin/app/(dashboard)/polymorphic/page.tsx

Overview

Configure the polymorphic UI system that adapts interface complexity based on user needs.

Views

View	Description
simple	Basic chat interface
standard	Full-featured interface
advanced	Power user tools

Implementation

- **App:** `apps/thinktank-admin/app/(dashboard)/polymorphic/page.tsx`

19. Ego System

Path: `/ego`

App File: `apps/thinktank-admin/app/(dashboard)/ego/page.tsx`

Overview

The Zero-Cost Ego System provides persistent AI personality through database state injection.

Features

- Identity configuration (name, narrative, values)
- Personality trait sliders
- Emotional state monitoring
- Working memory management
- Goal tracking

Configuration

Setting	Description
enabled	Enable ego injection
name	AI personality name
narrative	Background narrative
traits	Personality traits (0-1)

API Endpoints

Method	Endpoint	Purpose
GET	/api/admin/ego/dashboard	Dashboard data
GET	/api/admin/ego/config	Get config
PUT	/api/admin/ego/config	Update config
GET	/api/admin/ego/identity	Get identity
PUT	/api/admin/ego/identity	Update identity
GET	/api/admin/ego/preview	Preview injection

Implementation

- **Lambda:** lambda/admin/ego.ts
- **Service:** lambda/shared/services/local-ego.service.ts
- **Database:** ego_config, ego_identity, ego_affect

20. Compliance

Path: /compliance
App File: apps/thinktank-admin/app/(dashboard)/compliance/page.tsx

Overview

Compliance settings specific to Think Tank consumer features.

Features

- Data retention policies
- Content filtering rules
- Audit log access
- Privacy settings

Implementation

- **App:** apps/thinktank-admin/app/(dashboard)/compliance/page.tsx

20A. Sovereign Mesh (v5.52.0)

Path: /sovereign-mesh/*

Overview

Sovereign Mesh provides decentralized AI agent management and transparency for Think Tank.

Sub-Pages

Page	Path	Purpose
Overview	/sovereign-mesh	Dashboard with agent/app stats, health score
Agents	/sovereign-mesh/agents	Manage AI agents, view status and performance
Apps	/sovereign-mesh/apps	View deployed apps, instances, users
Transparency	/sovereign-mesh/transparency	Audit logs, decision trails
AI Helper	/sovereign-mesh/ai-helper	AI assistance requests, ratings
Approvals	/sovereign-mesh/approvals	Pending/processed approval requests

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank-admin/sovereign-mesh/overview	Dashboard stats
GET	/api/thinktank-admin/sovereign-mesh/agents	List agents
GET	/api/thinktank-admin/sovereign-mesh/apps	List apps
GET	/api/thinktank-admin/sovereign-mesh/audit-logs	Audit log entries
GET	/api/thinktank-admin/sovereign-mesh/decision-trails	Decision trails
GET	/api/thinktank-admin/sovereign-mesh/ai-helper/requests	AI helper requests
GET	/api/thinktank-admin/sovereign-mesh/approvals	Approval requests
POST	/api/thinktank-admin/sovereign-mesh/approvals/:id	Process approval

Implementation

- **App Files:** apps/thinktank-admin/app/(dashboard)/sovereign-mesh/ (agents, ai-helper, approvals, apps, transparency)
- **Navigation:** All pages linked in sidebar under “Sovereign Mesh” section

21. Settings

Path: /settings
App File: apps/thinktank-admin/app/(dashboard)/settings/page.tsx

Overview

Global Think Tank configuration settings.

Settings Categories

Category	Description
General	Basic configuration
Features	Enable/disable features
Limits	Usage limits
Notifications	Alert settings

API Endpoints

Method	Endpoint	Purpose
GET	/api/admin/thinktank/status	Service status
GET	/api/admin/thinktank/config	Get config
PATCH	/api/admin/thinktank/config	Update config

Implementation

- **Lambda:** lambda/thinktank/settings.ts
- **CDK:** lib/stacks/thinktank-admin-api-stack.ts

22. Cato Persistent Memory System

Overview

Cato operates as the cognitive core behind Think Tank, implementing a **three-tier hierarchical memory system** that fundamentally differentiates it from competitors suffering from session amnesia. Unlike ChatGPT or Claude standalone—where closing a tab erases all context—Cato maintains persistent memory that survives sessions, employee turnover, and time.

Why This Matters for Think Tank Users

Competitor Problem	Think Tank Solution
Close tab = lose context	Memory persists across sessions
Every conversation starts fresh	AI “remembers” your preferences
Generic responses for everyone	Personalized to your communication style
Static model behavior	AI gets smarter over time

The Three Memory Tiers

1. Tenant-Level Memory (Institutional Intelligence)

Your organization’s accumulated learning:

Feature	User Benefit
Smart Model Routing	Legal queries go to citation-accurate models; creative requests go to generative models—automatically
Department Preferences	Legal teams get formal briefs; marketing gets conversational copy—no configuration needed
Cost Optimization	System learns cheaper approaches that maintain quality, reducing your costs over time
Compliance Ready	7-year audit trails for FDA, HIPAA, SOC 2 requirements

2. User-Level Memory (Relationship Continuity)

Your personal AI relationship through **Ghost Vectors**—4096-dimensional representations of your interaction style:

Feature	User Benefit
Remembers Your Style	Formal vs. casual, verbose vs. concise
Tracks Expertise	Beginner explanations vs. expert shorthand
Persona Selection	Choose your preferred AI mood: Balanced, Scout, Sage, Spark, Guide
No Personality Discontinuity	Model upgrades don’t break the relationship feel

Persona Options:

Persona	Behavior	Best For
Balanced	Default equilibrium	General queries
Scout	Exploratory, information-gathering	Research, discovery
Sage	Deep expertise, authoritative	Complex analysis
Spark	Creative, generative	Brainstorming, ideation
Guide	Teaching, step-by-step	Learning, onboarding

3. Session-Level Memory (Real-Time Context)

Active interaction state (expires after session ends):

- Current conversation context
- Temporary persona overrides
- Real-time safety evaluations
- Epistemic uncertainty tracking

Twilight Dreaming (How Think Tank Gets Smarter)

During low-traffic periods (4 AM your local time), Think Tank consolidates patterns through **LoRA fine-tuning**:

1. **Pattern Collection**: Gathers learning from your daily interactions
2. **Intelligence Consolidation**: Transforms individual patterns into organizational intelligence
3. **Cost Optimization**: Trains smarter, cheaper routing decisions
4. **Result**: Your Think Tank deployment gets measurably smarter over time—automatically

Outcome: 60%+ cost reduction while maintaining accuracy for healthcare and financial queries.

Claude as the Conductor

Claude serves as the conductor maintaining this persistent memory layer—not just another model in the rotation, but the intelligence coordinating **105+ other specialized models**, interpreting user intent, selecting workflows, and ensuring responses meet accuracy and safety standards.

Configuration

Cato memory settings are configured through: - **Ego System** (Section 19): Identity and personality settings - **Governor** (Section 11): Cost optimization modes

Why Think Tank Beats Standalone AI (Competitive Moats)

Persistent Memory Creates “Contextual Gravity”

Cato’s hierarchical memory architecture creates compounding switching costs that deepen with every interaction. When you consider alternatives, here’s what you’d lose:

What You’d Lose	Impact
Learned Routing Patterns	Months of optimization showing which models work best for your query types
Department Preferences	System knowledge that legal wants citations, marketing wants conversational tone
Ghost Vectors	The “feel” of thousands of individual user relationships
Compliance Audit Trails	7-year Merkle-hashed records for HIPAA, SOC 2, FDA—cannot be migrated

Competitor Comparison:

Alternative	Problem You'd Face
ChatGPT/Claude Standalone	When an employee quits, their entire AI context walks out the door—zero institutional learning
Flowise/Dify	Same expensive rate regardless of query complexity—no cost optimization learning
CrewAI	Agents don't share memory—five agents needing the same data make five duplicate API calls

Twilight Dreaming: Your Deployment Gets Smarter Over Time

Think Tank isn't just a service—it's an **appreciating asset**. During low-traffic periods (4 AM your time), the system “dreams” about the day's learnings:

What Happens	Your Benefit
Routing patterns consolidate	Future queries route to optimal models automatically
Cost patterns identified	Expensive queries get cheaper alternatives
Domain improvements embed	Your deployment becomes more accurate in your specific domains

The Result: A customer who has used Think Tank for two years has a **fundamentally more capable deployment** than a new customer—with routing decisions reflecting thousands of hours of optimization.

When New Models Launch (GPT-5, Claude 5, Gemini 3): Think Tank learns how to optimally route to new capabilities while preserving all your accumulated institutional knowledge. Model improvements compound on top of existing optimization rather than resetting the learning curve.

Infrastructure: See RADIANT-ADMIN-GUIDE.md Section 31A.7 for architecture, database schema, and infrastructure configuration.

23. Think Tank Consumer App (End-User Interface)

Path: apps/thinktank/
URL: app.thinktank.ai

Overview

The Think Tank Consumer App is the primary end-user interface for interacting with Cato. It provides a streamlined chat experience with intelligent defaults while offering advanced controls for power users.

Auto Mode vs Advanced Mode

Think Tank operates in two modes, controlled by the **Advanced Mode Toggle** (Cmd+Shift+A):

Feature	Auto Mode	Advanced Mode
Model Selection	Cato decides automatically	User can select specific model
Brain Plan Display	Hidden	Shows execution plan with steps
Token/Cost Display	Hidden	Shows per-message metrics
Domain Override	Auto-detected	Manual selection available
Model Routing Visibility	Hidden	Shows routing decisions

Philosophy: Most users should use Auto Mode. Advanced Mode is for developers, researchers, and power users who want granular control.

Consumer App Pages

Page	Path	Purpose
Chat	/	Main conversation interface
Settings	/settings	User preferences and personality
My Rules	/rules	User-defined AI behavior rules
History	/history	Conversation history with search
Artifacts	/artifacts	Generated code and documents
Profile	/profile	User account and statistics

Key Components

Chat Components (apps/thinktank/components/chat/)

Component	Purpose
AdvancedModeToggle	Toggle between Auto/Advanced modes
MessageBubble	Message display with optional metadata
ChatInput	Smart auto-resizing input with attachments
Sidebar	Conversation list with date grouping
BrainPlanViewer	Execution plan display (Advanced Mode)
ModelSelector	Full model picker dialog (Advanced Mode)

State Management (apps/thinktank/lib/stores/)

Store	Purpose
ui-store.ts	UI state (sidebar, advanced mode, sound)
settings-store.ts	User preferences with persistence

Store	Purpose
-------	---------

API Services (apps/thinktank/lib/api/)

Service	Endpoints
chat.ts	Conversations, messages, streaming
models.ts	Model listing, recommendations
rules.ts	User rules CRUD, presets
settings.ts	User settings, personality
brain-plan.ts	Plan generation and display
analytics.ts	User stats, achievements
governor.ts	Economic optimization status

Settings Page Features

The Settings page (/settings) provides:

- **Personality Mode:** Auto, Professional, Subtle, Expressive, Playful
- **Notifications:** Push notification preferences
- **Appearance:** Compact mode, token/cost display toggles
- **Keyboard Shortcuts:** Enable/disable, shortcut reference
- **Sound Effects:** Toggle audio feedback
- **Privacy:** Data export, account deletion

My Rules Page Features

The My Rules page (/rules) allows users to:

- **Create custom rules** for AI behavior
- **Browse preset rules** by category
- **Toggle rules** on/off without deleting
- **View rule application stats**

Rule types: Restriction, Preference, Format, Source, Tone, Topic, Privacy

Consumer App Tech Stack

Technology	Version	Purpose
Next.js	14.x	React framework
TypeScript	5.x	Type safety
Tailwind CSS	3.x	Styling
shadcn/ui	latest	Component library
Zustand	latest	Client state management

Technology	Version	Purpose
TanStack Query	5.x	Server state management
Framer Motion	latest	Animations
Lucide	latest	Icons

Implementation Files

```
apps/thinktank/
+-- app/
|   +-- (chat)/
|   |   +-- page.tsx      # Main chat interface
|   |   +-- layout.tsx   # Chat layout wrapper
|   +-- settings/page.tsx # Settings page
|   +-- rules/page.tsx    # My Rules page
|   +-- history/page.tsx  # History page
|   +-- artifacts/page.tsx # Artifacts page
|   +-- profile/page.tsx  # Profile page
|   +-- page.tsx          # Root redirect
+-- components/
|   +-- chat/              # Chat-specific components
|   +-- ui/                # Base UI components
+-- lib/
    +-- api/               # API services
    +-- stores/            # Zustand stores
    +-- utils.ts           # Utility functions
```

API Integration

The consumer app connects to the Think Tank API at /api/thinktank/*:

Category	Handler	Endpoints
Chat	chat.ts	conversations, messages, stream
Rules	my-rules.ts	CRUD, presets, toggle
Settings	settings.ts	get/update preferences
Models	models.ts	list, recommend
Brain Plan	brain-plan.ts	generate, execute, status
Analytics	analytics.ts	stats, achievements
Governor	economic-governor.ts	status, savings
Localization	localization.ts	languages, bundles, translations

24. Localization (i18n)

Path: apps/thinktank/lib/i18n/
API Base: /api/localization

Overview

Think Tank supports 18 languages through the Radiant localization registry. **ALL UI text strings MUST be localized**
- no hardcoded strings are allowed in components.

Architecture

Key Principle: The consumer app accesses ALL data through the API. Never direct database access.

Supported Languages (18)

Code	Language	Direction
en	English	LTR
es	Spanish	LTR
fr	French	LTR
de	German	LTR
pt	Portuguese	LTR
it	Italian	LTR
nl	Dutch	LTR
pl	Polish	LTR
ru	Russian	LTR
tr	Turkish	LTR
ja	Japanese	LTR
ko	Korean	LTR
zh-CN	Chinese (Simplified)	LTR
zh-TW	Chinese (Traditional)	LTR
ar	Arabic	RTL
hi	Hindi	LTR
th	Thai	LTR
vi	Vietnamese	LTR

Implementation Files

```
apps/thinktank/lib/i18n/
+-- index.ts           # Module exports
+-- types.ts           # Type definitions
+-- localization-service.ts # API client for localization
+-- localization-context.tsx # React context provider
+-- translation-keys.ts  # All translation key constants
+-- default-translations.ts # English fallback translations
```

API Endpoints

Method	Endpoint	Purpose
GET	/api/localization/languages	Get supported languages
GET	/api/localization/bundle	Get translation bundle for language
GET	/api/localization/translate	Get single translation

Usage in Components

```
import { useTranslation, T } from '@lib/i18n';

function MyComponent() {
  const { t } = useTranslation();

  return (
    <div>
      <h1>{t(T.common.appName)}</h1>
      <p>{t(T.chat.welcomeMessage)}</p>
      <button>{t(T.common.save)}</button>
    </div>
  );
}
```

Language Selection

Users select their language in Settings -> Language:

```
import { LanguageSelector } from '@components/ui/language-selector';

<LanguageSelector variant="list" />
```

Translation Key Categories

Category	Prefix	Example
Common	thinktank.common.	thinktank.common.save

Category	Prefix	Example
Chat	thinktank.chat.	thinktank.chat.send
Settings	thinktank.settings.	thinktank.settings.language
Rules	thinktank.rules.	thinktank.rules.addRule
History	thinktank.history.	thinktank.history.title
Artifacts	thinktank.artifacts.	thinktank.artifacts.download
Profile	thinktank.profile.	thinktank.profile.achievements
Errors	thinktank.errors.	thinktank.errors.network
Notifications	thinktank.notifications.	thinktank.notifications.saved

Adding New Translations

- 1. Add key to translation-keys.ts
- 2. Add default English text to default-translations.ts
- 3. Use key in component: t(T.category.key)
- 4. Register in Radiant localization registry for AI translation

Parameter Interpolation

```
// Key: "Delete {{count}} items"
t(T.history.deleteSelectedConfirm, { count: 5 })
// Output: "Delete 5 items"
```

Section 25: 2026+ Consumer App UI/UX

Overview

The Think Tank consumer app features a modern 2026+ interface with glassmorphism effects, animated transitions, and polymorphic UI morphing. Advanced features are hidden until the user activates Advanced Mode.

Design System

The design system is defined in apps/thinktank/lib/design-system/tokens.ts:

Token Category	Purpose
Colors	Glass effects, aurora gradients, glow colors
Spacing	Responsive spacing scale (0.5-24 rem)
Radius	Border radius from sm to full
Shadows	Glass shadows, inner glows
Animation	Timing functions, spring configs
Blur	Backdrop blur values

Glassmorphism Components

GlassCard

```
import { GlassCard } from '@components/ui/glass-card';

<GlassCard
  variant="glow"           // default | elevated | inset | glow
  intensity="medium"       // light | medium | strong
  glowColor="violet"       // violet | fuchsia | cyan | emerald | none
  hoverEffect              // Enable hover animations
  padding="md"            // none | sm | md | lg
>
  Content
</GlassCard>
```

GlassPanel

```
import { GlassPanel } from '@components/ui/glass-card';

<GlassPanel blur="lg">    // sm | md | lg | xl
  Content
</GlassPanel>
```

Interactive Timeline

The history page features an interactive timeline for browsing conversation history:

```
import { InteractiveTimeline, HorizontalTimeline } from '@components/ui/timeline';

<InteractiveTimeline
  items={timelineItems}
  onSelect={{(item) => navigateToConversation(item.id)}}
  selectedId={currentId}
/>

<HorizontalTimeline
  items={recentItems}
  onSelect={handleSelect}
/>
```

Features: - **Grouping:** Today, Yesterday, This Week, This Month, Older - **Animations:** Entrance animations, hover effects, selection glow - **Indicators:** Favorite stars, mode badges, domain hints - **Navigation:** Horizontal scroll with arrow buttons

Polymorphic UI (ViewRouter)

The UI can morph based on task complexity and user mode:

```
import { ViewRouter } from '@components/polymorphic';

<ViewRouter
  initialView="chat"
```

```
    initialMode="sniper"
    onViewChange={({state}) => console.log('View changed:', state)}
    onEscalate={({reason}) => console.log('Escalated:', reason)}
  >
    {children}
</ViewRouter>
```

Execution Modes: - **Sniper:** Fast, single-model execution (~\$0.01/run) - **War Room:** Deep, multi-agent analysis (~\$0.50+/run)

View Types: | View | Purpose | | — | — | — | | chat | Standard conversation | | terminal | Command center | | canvas | Infinite canvas/mindmap | | dashboard | Analytics view | | diff_editor | Verification split-screen | | decision_cards | Human-in-the-loop |

Advanced Mode Features

Features only visible when Advanced Mode is enabled:

Feature	Location	Description
Mode selector (Sniper/War Room)	Header bar	Switch execution modes
Model selector	Input area	Choose specific AI model
Message metadata	Message bubbles	Tokens, latency, cost
Voice input	Input area	Voice-to-text
File attachments	Input area	Upload files
Escalation button	Header bar	Upgrade to War Room

Modern Polish Components (2026+)

Additional UI polish components for super-modern consumer experience:

Component	File	Purpose
PageTransition	page-transition.tsx	Fade/slide page animations
StaggerContainer/Item	page-transition.tsx	List entrance animations
Skeleton variants	skeleton.tsx	Shimmer loading states
GradientText	gradient-text.tsx	Animated gradient text
GlowText	gradient-text.tsx	Drop shadow glow effects
AnimatedNumber	gradient-text.tsx	Counter animations
Typewriter	gradient-text.tsx	Typing text effect
TypingIndicator	typing-indicator.tsx	AI thinking states
EmptyState	empty-state.tsx	Beautiful empty states
WelcomeHero	empty-state.tsx	First-time user welcome
ModernButton	modern-button.tsx	Glow/gradient buttons

Component	File	Purpose
IconButton	modern-button.tsx	Icon-only buttons
PillButton	modern-button.tsx	Filter pill buttons

Voice Input

Whisper-based speech-to-text for consistent cross-browser experience.

```
import { VoiceInput } from '@components/chat';

<VoiceInput
  isOpen={isVoiceOpen}
  onClose={() => setVoiceOpen(false)}
  onTranscript={(text) => handleVoiceTranscript(text)}
/>
```

Features: - Uses app’s localization language setting - Whisper API for 99+ language support - Audio level visualization - Works on all browsers (no Web Speech API dependency)

API Endpoint: POST /api/thinktank/speech/transcribe

File Attachments

Drag-and-drop file attachment for chat messages.

```
import { FileAttachment } from '@components/chat';

<FileAttachment
  isOpen={isAttachOpen}
  onClose={() => setAttachOpen(false)}
  onAttach={(files) => handleFiles(files)}
  maxFiles={5}
  maxSizeMB={10}
/>
```

Supported Types: Images, PDFs, text files, JSON, code files

Liquid Interface (v5.52.7)

Morphing UI components for adaptive chat experiences. “Don’t Build the Tool. BE the Tool.”

The chat interface can morph into specialized tools when users need them. In Advanced Mode, trigger buttons appear in the header.

Morphed View Types

View	Icon	Description
datagrid	Table	Interactive spreadsheet with inline editing
chart	BarChart3	Bar, line, pie, area charts

View	Icon	Description
kanban	Kanban	Drag-and-drop task board
calculator	Calculator	Full calculator with memory
code_editor	Code	Code editor with run capability
document	FileText	Rich text editor

Usage in Chat Page

```
import { LiquidMorphPanel, type MorphedViewType } from '@components/liquid';

// State
const [morphedView, setMorphedView] = useState<MorphedViewType | null>(null);
const [isMorphFullscreen, setIsMorphFullscreen] = useState(false);
const [showMorphChat, setShowMorphChat] = useState(false);

// Trigger buttons (in header, Advanced Mode only)
<Button onClick={() => setMorphedView('datagrid')}>
  <Table className="h-4 w-4" />
</Button>

// Render panel when view is selected
{morphedView && (
  <LiquidMorphPanel
    viewType={morphedView}
    isFullscreen={isMorphFullscreen}
    onClose={() => setMorphedView(null)}
    onToggleFullscreen={() => setIsMorphFullscreen(!isMorphFullscreen)}
    onChatToggle={() => setShowMorphChat(!showMorphChat)}
    showChat={showMorphChat}
  />
)}
```

Morphed View Components

Location: apps/thinktank/components/liquid/morphed-views/

Component	Features
DataGridView	Add/delete rows, inline cell editing, import/export
ChartView	Type switching (bar/line/pie/area), SVG rendering
KanbanView	Multi-variant - see Kanban Variants below
CalculatorView	Memory, operations, percentage, delete
CodeEditorView	Run code, copy, export, output panel
DocumentView	Bold/italic/underline, lists, alignment, export

Kanban Variants (v5.52.8)

The Kanban morphed view supports 5 modern frameworks:

Variant	Description	Key Features
Standard	Traditional Kanban	Columns, cards, drag-and-drop
Scrumban	Scrum + Kanban	Sprint header, velocity, story points, WIP limits
Enterprise	Portfolio mgmt	Multi-lane hierarchical boards (Strategic/Ops/Support)
Personal	Individual productivity	Simple 3-column, strict WIP limits
Pomodoro	Timer-integrated	25-min focus, breaks, counts per task

Usage:

```
import { KanbanView, type KanbanVariant } from '@components/liquid/morphed-views';
```

```
<KanbanView initialVariant="scrumban" />
```

Features across all variants: - Variant selector dropdown in toolbar - Analytics panel (toggle): total tasks, completed, cycle time, throughput - Card customization: priority colors, tags, subtasks, assignees - WIP limit indicators (green/amber/red)

Pomodoro-specific: - 25-minute focus timer with 5-minute breaks - Play/pause/reset controls - Completed pomodoro counter - Per-task pomodoro estimates and tracking

25. GDPR & Compliance APIs

Path: /compliance

App File: apps/admin-dashboard/app/(dashboard)/compliance/page.tsx

Features

- **Consent Management:** Track and manage user consents for data processing
- **GDPR Requests:** Handle data export, deletion, access, and rectification requests
- **Security Configuration:** Per-tenant security settings

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/consent	List consent records
POST	/api/thinktank/consent	Record new consent
DELETE	/api/thinktank/consent	Withdraw consent
GET	/api/thinktank/gdpr	List GDPR requests
POST	/api/thinktank/gdpr	Create GDPR request
PATCH	/api/thinktank/gdpr	Update request status
GET	/api/thinktank/security-config	Get security config
PUT	/api/thinktank/security-config	Update security config

Implementation

- **Lambda:** `lambda/thinktank/consent.ts, gdpr.ts, security-config.ts`
- **Migration:** `174_thinktank_missing_features.sql`

26. User Preferences & Notifications

User Preferences

Method	Endpoint	Purpose
GET	<code>/api/thinktank/preferences</code>	Get user preferences
PUT	<code>/api/thinktank/preferences</code>	Update preferences
GET	<code>/api/thinktank/preferences/models</code>	Get model preferences
POST	<code>/api/thinktank/preferences/models/<code>Toggle favorite model</code></code>	

Rejection Notifications

Method	Endpoint	Purpose
GET	<code>/api/thinktank/rejections</code>	Get rejection notifications
POST	<code>/api/thinktank/rejections</code>	Create rejection
PATCH	<code>/api/thinktank/rejections/:id/read</code>	Mark as read
DELETE	<code>/api/thinktank/rejections/:id/dismiss</code>	Dismiss notification

Implementation

- **Lambda:** `lambda/thinktank/preferences.ts, rejections.ts`

27. UI Feedback & Improvement

UI Feedback

Collect user feedback on UI components and experiences.

Method	Endpoint	Purpose
GET	<code>/api/thinktank/ui-feedback</code>	List feedback
POST	<code>/api/thinktank/ui-feedback</code>	Submit feedback
PUT	<code>/api/thinktank/ui-feedback</code>	Update feedback status

UI Improvement Sessions

AI-assisted UI improvement sessions.

Method	Endpoint	Purpose
GET	/api/thinktank/ui-improvement	List sessions
POST	/api/thinktank/ui-improvement/start	Start session
POST	/api/thinktank/ui-improvement/request	Request improvement
POST	/api/thinktank/ui-improvement/apply	Apply improvement
POST	/api/thinktank/ui-improvement/complete	Complete session

Implementation

- **Lambda:** `lambda/thinktank/ui-feedback.ts`, `ui-improvement.ts`

28. Multipage Apps

User-generated multipage applications from the artifact engine.

API Endpoints

Method	Endpoint	Purpose
GET	/api/thinktank/multipage-apps	List user's apps
GET	/api/thinktank/multipage-apps/:id	Get app details
POST	/api/thinktank/multipage-apps	Create new app
PUT	/api/thinktank/multipage-apps/:id	Update app
DELETE	/api/thinktank/multipage-apps/:id	Delete app

App Structure

```
interface MultipageApp {
  id: string;
  name: string;
  description: string;
  icon: string;
  theme: { primaryColor: string; mode: 'light' | 'dark' };
  pages: Array<{ id: string; name: string; icon: string; content: object }>;
  navigation: { type: 'tabs' | 'sidebar' | 'drawer'; position: string };
  sharedState: object;
  isPublished: boolean;
  version: number;
}
```

Implementation

- **Lambda:** `lambda/thinktank/multipage-apps.ts`
 - **Migration:** `174_thinktank_missing_features.sql`
-

29. Consumer App Components (v5.24.0)

New components added to the Think Tank consumer app:

Voice Input

- Whisper-based speech recognition
- Audio level visualization
- Cross-browser support

File Attachments

- Drag-and-drop upload
- Image preview
- File type validation

Brain Plan Viewer

- AGI plan visualization
- Step progress tracking
- Mode and model display

Cato Mood Selector

- 5 moods: Balanced, Scout, Sage, Spark, Guide
- Dropdown, inline, and compact variants

Time Machine

- Video-editor style timeline
- Snapshot bookmarking
- Branch creation

Component Files

```
apps/thinktank/components/chat/  
+-- voice-input.tsx  
+-- file-attachments.tsx  
+-- brain-plan-viewer.tsx  
+-- cato-mood-selector.tsx  
+-- time-machine.tsx  
+-- index.ts
```

Appendix A: Application Architecture

Think Tank Admin Tech Stack

Technology	Version	Purpose
Next.js	14.x	React framework
TypeScript	5.x	Type safety
Tailwind CSS	3.x	Styling
shadcn/ui	latest	Component library
React Query	5.x	Data fetching
Lucide	latest	Icons

API Authentication

Think Tank Admin uses Cognito authentication via the ThinkTankAuthStack:

```
// API client configuration
const api = createApiClient({
  baseUrl: process.env.NEXT_PUBLIC_API_URL,
  getToken: () => auth.getAccessToken(),
});
```

CDK Stack

- **Stack:** ThinkTankAdminApiStack
- **File:** lib/stacks/thinktank-admin-api-stack.ts
- **Handler:** lambda/thinktank-admin/handler.ts (consolidated router)

Appendix B: Adding New Features

When adding features to Think Tank Admin:

1. Create page in apps/thinktank-admin/app/(dashboard)/
2. Add Lambda handler in lambda/thinktank/
3. Update consolidated handler in lambda/thinktank/handler.ts
4. **Update this guide** with full documentation
5. Add to CHANGELOG.md

See `./windsurf/workflows/docs-update-all.md` for documentation policy.

Part III: Tenant Administration

Company/Team Level Administration for Think Tank

Version: 1.1.0 | Platform: RADIANT 7.9.0 Last Updated: February 5, 2026

Overview

The **Think Tank Tenant Administration** app is a dedicated administration interface for company/team-level settings. Unlike the Platform Admin (RADIANT Admin) which manages infrastructure across all tenants, and unlike the Think Tank Admin which is for Radiant super-admins configuring Think Tank features, the **Tenant Administration** app is for organization administrators to manage their own tenant's settings, users, and content.

App Hierarchy

App	Audience	Scope	Location
RADIANT Admin	Platform operators	All tenants, infrastructure	apps/admin-dashboard/
Think Tank Admin	Radiant super-admins	Think Tank platform config	Documented in THINKTANK-ADMIN-GUIDE.md
Think Tank Tenant Administration	Organization admins	Single tenant, team settings	apps/thinktank-tenant-admin/
Think Tank	End users	Chat, workflows	apps/thinktank/

Key Principle: Tenant Isolation

The Tenant Administration app sits **BEHIND the service layer**. All requests are automatically tenant-isolated: - Admins can only see/modify their own tenant's data - System-level resources appear as read-only - No cross-tenant access is possible

Table of Contents

1. Dashboard

1. Dashboard (v1.0.0)

Location: Tenant Admin -> Dashboard

The dashboard provides an at-a-glance view of tenant health and usage.

1.1 Dashboard Layout

Dashboard				Your organization overview			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
Active Users				Conversations			
42				1,234			
+5.2%				+12.3%			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
Credits Usage				MLS Usage			
78% \$45				3 active of 5			
780/1000 used				limit: \$100			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
Usage Trends (7 days)				Recent Activity			
Requests				* User joined			
Tokens				* Report ran			
M T W T F S S				* Settings			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
Manage Users				Create Report			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			
Team Settings				Security			
+-----+ +-----+ +-----+ +-----+				+-----+ +-----+ +-----+ +-----+			

1.2 Dashboard Widgets

Widget	Description	Data Source
Metric Cards	Active users, conversations, requests, credits	/api/v1/tenant/dashboard/stats
Credits Usage	Progress bar showing credit consumption	/api/v1/tenant/dashboard/stats
MLS Usage	Mid-Level Services spend vs limit	/api/v1/tenant/dashboard/stats
Cartridges	Active/total cartridge count	/api/v1/tenant/cartridges/stack

Widget	Description	Data Source
Usage Trends	7-day request/token area chart	/api/v1/tenant/dashboard/usage-trends
Activity Feed	Recent tenant events	/api/v1/tenant/dashboard/activity
Alerts	Budget warnings, security notices	/api/v1/tenant/dashboard/alerts
Quick Actions	Links to common admin tasks	Static

1.3 Quick Actions

Action	Description	Link
Manage Users	Invite and manage team members	/users
Create Report	Generate usage or analytics reports	/reports
Team Settings	Configure organization preferences	/settings
Security	Manage MFA and access policies	/security

1.4 Alert Types

Type	Color	Example
Warning	Amber	“You’ve used 80% of your credits”
Info	Blue	“New features available”
Error	Red	“Payment method expired”

1.5 Implementation

File: apps/thinktank-tenant-admin/app/(dashboard)/page.tsx

Status: [OK] Implemented

2. User Management (v1.1.0)

Location: Tenant Admin -> Users

Manage users within your organization. All user provisioning is **invitation-only** – there is no self-registration. Each user belongs to exactly ONE tenant.

Licensing: User invitations are subject to per-app seat licensing. If your tenant has no available seats for an app, the invite will be blocked for that app. See Section 2A: Licensing & Seats for details.

2.1 User List

Column	Description
Name	User display name
Email	Login email
Role	tenant_owner, tenant_admin, standard_user, viewer
Status	active, invited, deactivated
Apps	Which apps the user has access to (Think Tank, Curator, etc.)
Last Active	Last login timestamp
MFA	MFA enrollment status

2.2 User Roles

Role	Permissions
tenant_owner	Full tenant control – billing, user management, delete tenant, all permissions
tenant_admin	Invite/manage users, configure settings, manage roles
standard_user	Use licensed apps, own data only
viewer	View-only access to dashboards, no create/edit

Roles are **soft permissions** – admin-configurable with a UI for toggling individual permissions on/off. The role provides defaults, but admins can customize per-user.

2.3 User Actions

- **Invite User:** Send email invitation (requires seat availability for selected apps)
- **Edit Role:** Change user role and permissions
- **Toggle App Access:** Enable/disable access to specific apps (subject to seat licensing)
- **Deactivate:** Disable access, **free up the seat license** (data retained for regulatory compliance)
- **Reactivate:** Restore access (consumes a seat again)
- **Delete:** Schedule data deletion (subject to retention requirements)
- **Reset MFA:** Clear MFA for re-enrollment

2.4 Invitation Flow

1. Admin clicks "Invite User"
2. Enter email address
3. Select role: tenant_admin, standard_user, or viewer
4. Select app access (checkboxes -- disabled if no seats available):
 - [[ok]] Think Tank (42/50 seats)
 - [[ok]] Curator (15/25 seats)
 - [[x]] Dojo -- 0 seats available

"No Dojo seats available. Buy more seats or deactivate a user."

[[x]] Genesis -- Not licensed

"Genesis requires a license. Contact support@thinktank.app"

5. System checks permissions and seat availability

6. Invitation sent (expires in 7 days, or tenant-configured)

Think Tank access is granted by default. Other apps must be explicitly selected (subject to licensing).

2.5 Deactivation vs Deletion

Action	Seat Impact	Data Impact	When To Use
Deactivate	Seat FREED	Data retained	Employee leaves, temporary suspension
Delete	Seat FREED	Data retained per retention license, then purged	GDPR erasure, permanent removal

Important: If your tenant has a regulatory retention license (e.g., HIPAA 7-year retention), user data CANNOT be deleted until the retention period expires. The system will show the earliest deletion date.

2.6 Bulk Actions

- Import users from CSV (subject to seat availability)
- Export user list
- Bulk role assignment
- Bulk app access toggle

2.7 Same Email in Multiple Tenants

A person can have accounts in multiple organizations (e.g., john@gmail.com in Acme Corp AND Contoso). These are **completely separate user records**. When they log in, they select which organization to enter. Users have **zero visibility** into other tenants.

2A. Licensing & Seats (v1.0.0)

Location: Tenant Admin -> Licenses

Full Reference: Think Tank Licensing Model

2A.1 License Dashboard

View all licenses, usage, and availability for your tenant:

- **App Seats:** How many seats are used/available per app (Think Tank, Curator, Dojo, etc.)
- **Storage:** Storage quota usage
- **Retention:** Data retention period
- **Compliance:** Which regulatory features are active

2A.2 Seat Licensing

Each app has its own seat count. Seats are consumed when a user is active with that app's access enabled.

State	Seat Status
Active user with app access	Seat consumed
Invited user	Seat reserved
Deactivated user	Seat freed
User without app access	No seat consumed

2A.3 Purchasing Additional Seats

If you need more seats or licenses: - Click “+ Buy Seats” next to the app - Or contact Think Tank support at support@thinktank.app - Additional seats are billed per-seat per-month on your existing billing method

2A.4 Compliance Licenses

Regulatory features (HIPAA, GDPR, SOC 2, etc.) are optional licensed features. If your tenant does not have the license, the feature is disabled with a message:

[!] This feature requires a [HIPAA/GDPR/SOC2] compliance license.

Contact Think Tank support at support@thinktank.app to add this to your plan.

Contact support@thinktank.app to add compliance licenses.

2A.5 Tier Defaults

Your subscription tier includes a base allocation of seats and features. See Think Tank Licensing Model § Section 4 for the full tier breakdown.

3. Team Settings

Location: Tenant Admin -> Settings

Organization-wide configuration.

3.1 General Settings

Setting	Description	Default
Organization Name	Display name	From signup
Timezone	Default timezone for reports	UTC
Language	Default UI language	en
Logo	Custom logo for white-label	None

3.2 AI Behavior Settings

Setting	Description	Default
Default Model	Preferred AI model	Claude 3.5 Sonnet
Response Tone	professional/casual/technical	professional
Safety Level	Content filtering strictness	balanced
Context Window	Max context per conversation	100K

3.3 Feature Toggles

Feature	Description	Default
Enable Collaboration	Real-time collaboration features	true
Enable Time Machine	Conversation forking/history	true
Enable Artifacts	Code/document generation	true
Enable MLS	Mid-Level Services access	tier-dependent
Enable Reports	Report generation	true

4. Cartridge Manager

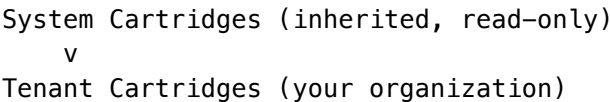

Location: Tenant Admin -> Cartridges

Manage AI cartridges for your organization. **Already implemented** in `apps/thinktank-tenant-admin/app/(dashboard)/c`

4.1 Capabilities

Action	Description
View System Cartridges	See platform-wide cartridges (read-only)
Create Tenant Cartridge	Create organization-specific cartridge
Activate/Deactivate	Toggle cartridge usage
Archive	Soft-delete cartridge
View Stack	See cartridge priority order

4.2 Cartridge Stack

v

User Cartridges (per-user preferences)

Tenant admins can manage the middle layer.

4.3 API Endpoints

Method	Endpoint	Description
GET	/api/v1/tenant/cartridges	List tenant cartridges
GET	/api/v1/tenant/cartridges/stack	Get cartridge stack
POST	/api/v1/tenant/cartridges	Create cartridge
POST	/api/v1/tenant/cartridges/:id/activate	Activate
POST	/api/v1/tenant/cartridges/:id/deactivate	Deactivate
DELETE	/api/v1/tenant/cartridges/:id	Archive

5. Report Writer

Location: Tenant Admin -> Reports

Create, schedule, and manage reports scoped to your tenant.

5.1 Report Types

Type	Description	Scope
Usage Report	API calls, tokens, costs	Tenant
User Activity	User engagement metrics	Tenant
Conversation Analytics	Topic distribution, sentiment	Tenant
Compliance Report	Audit trail summary	Tenant
Custom Report	Build your own with filters	Tenant

5.2 Report Builder

The report builder allows tenant admins to create custom reports:

1. **Select Data Source:** Usage, conversations, users, audit
2. **Apply Filters:** Date range, users, domains
3. **Choose Metrics:** Select which fields to include
4. **Configure Visualization:** Table, chart, summary
5. **Set Schedule:** One-time, daily, weekly, monthly

5.3 Report Scheduling

Setting	Options
Frequency	one-time, daily, weekly, monthly
Delivery	Dashboard, email, S3
Format	PDF, Excel, CSV, JSON
Recipients	Tenant admins, specific users

5.4 Policy Enforcement - Allowed Actions

The Report Writer enforces strict tenant isolation. Tenant admins **CAN**:

Action	Description	Enforcement
[OK] View tenant users	See users in their organization	RLS: tenant_id = current_tenant
[OK] View tenant conversations	See all conversations within tenant	RLS: tenant_id = current_tenant
[OK] View tenant usage	API calls, tokens, costs for tenant	RLS: tenant_id = current_tenant
[OK] View tenant audit log	Audit events within tenant	RLS: tenant_id = current_tenant
[OK] Create reports	Reports scoped to tenant data only	Service layer validation
[OK] Schedule reports	Automated report delivery	Recipients must be tenant members
[OK] Export tenant data	CSV/PDF/Excel of tenant data	Data filtered by tenant
[OK] Set alerts	Budget/usage alerts for tenant	Tenant-scoped notifications
[OK] View MLS usage	Mid-Level Services consumption	RLS: tenant_id = current_tenant

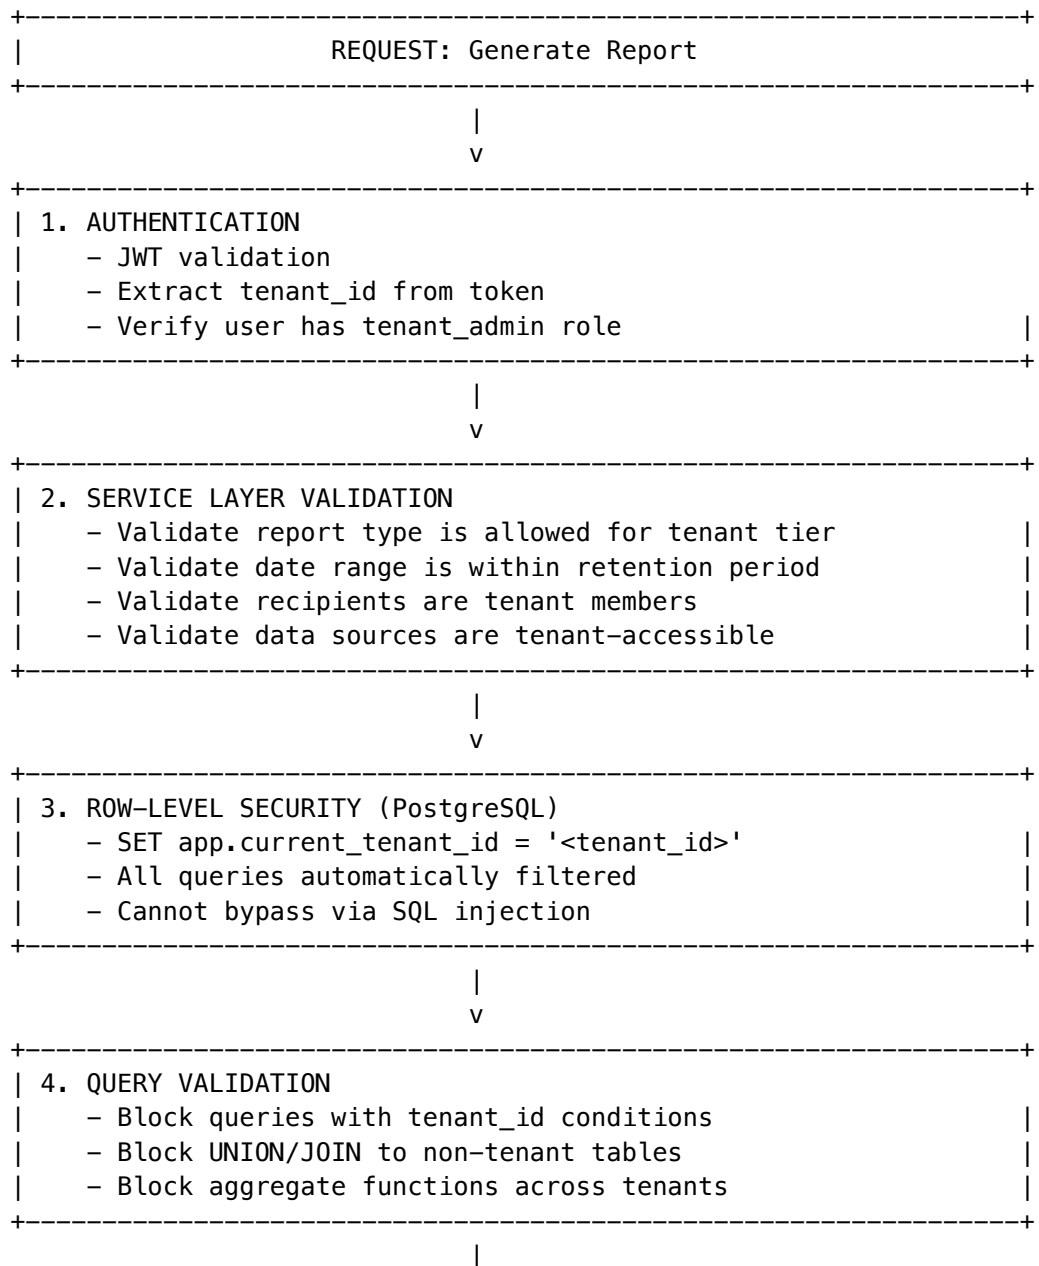

5.5 Policy Enforcement - Forbidden Actions

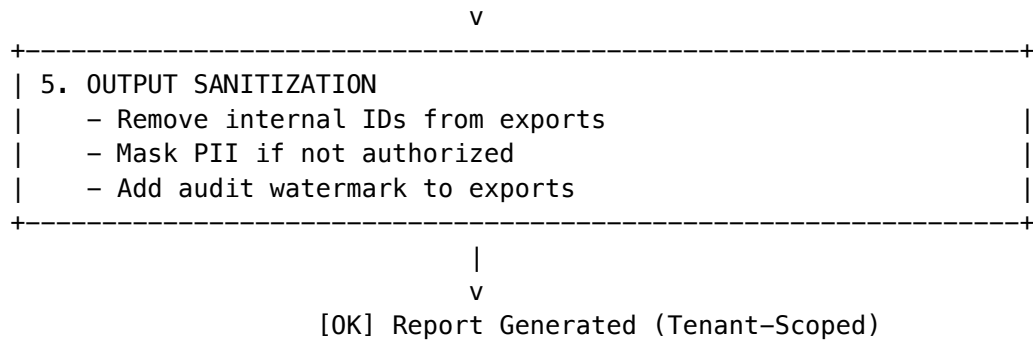

The following actions are **BLOCKED** at the service layer:

Action	Reason	Enforcement
[X] View other tenants' data	Tenant isolation	RLS + service layer rejection
[X] Access platform metrics	Platform admin only	Role check: requires radiant_admin
[X] View system audit logs	Platform admin only	Role check: requires radiant_admin
[X] Export raw database	Security risk	Endpoint does not exist
[X] Access Lambda logs	Infrastructure admin only	AWS IAM denial
[X] View model costs (platform)	Confidential pricing	Role check: requires radiant_admin
[X] Cross-tenant comparisons	Competitive data	Query validation blocks tenant_id != current

Action	Reason	Enforcement
[X] Send reports to non-members	Data exfiltration	Recipient validation
[X] Access PII without consent	GDPR/HIPAA compliance	Consent flags checked
[X] Modify system cartridges	Platform admin only	Scope check: <code>scope != 'system'</code>
[X] View provider API keys	Security	Never exposed to tenant layer

5.6 Enforcement Mechanisms

5.7 Error Responses

When policy violations are attempted:

Violation	HTTP Code	Error Message
Cross-tenant access	403	“Access denied: resource belongs to another organization”
Platform-only metric	403	“Access denied: platform metrics require elevated privileges”
Invalid recipient	400	“Recipient must be a member of your organization”
Tier restriction	403	“Report type not available for your subscription tier”
Retention exceeded	400	“Requested date range exceeds your data retention period”
PII without consent	403	“User has not consented to PII export”

5.8 Audit Trail

All report actions are logged:

```
interface ReportAuditEntry {
    timestamp: Date;
    tenantId: string;
    actorId: string;           // Who ran the report
    action: 'create' | 'run' | 'download' | 'schedule' | 'delete';
    reportId: string;
    reportType: string;
    dataSourcesAccessed: string[];
    rowsReturned: number;
    exportFormat?: string;
    recipientCount?: number;
    ipAddress: string;
    userAgent: string;
}
```

5.9 Report Templates

Pre-built templates for common reports: - Monthly Usage Summary - Weekly User Activity - Quarterly Compliance Audit - Cost Breakdown by User - Top Topics This Month

5.10 API Endpoints

Method	Endpoint	Description
GET	/api/v1/tenant/reports	List reports
GET	/api/v1/tenant/reports/:id	Get report details
POST	/api/v1/tenant/reports	Create report
PUT	/api/v1/tenant/reports/:id	Update report
DELETE	/api/v1/tenant/reports/:id	Delete report
POST	/api/v1/tenant/reports/:id/run	Execute report
GET	/api/v1/tenant/reports/:id/download	Download results
POST	/api/v1/tenant/reports/:id/schedule	Set schedule

6. Usage & Billing

Location: Tenant Admin -> Billing

View usage and manage billing for your tenant.

6.1 Usage Dashboard

Metric	Description
API Calls	Total requests this period
Tokens Used	Input + output tokens
Credits Remaining	Prepaid credit balance
Cost Estimate	Projected bill
MLS Usage	Mid-Level Services breakdown

6.2 Usage Breakdown

- By user
- By model
- By day/week/month
- By feature (chat, reports, MLS)

6.3 Alerts & Limits

Setting	Description
Budget Alert	Notify at % of budget
User Limit	Max API calls per user
Monthly Cap	Hard stop at amount

6.4 Invoice History

View and download past invoices.

7. AI Configuration

Location: Tenant Admin -> AI Settings
Configure AI behavior for your organization.

7.1 Model Preferences

Setting	Description
Allowed Models	Which models users can access
Default Model	Model used by default
Fallback Model	Backup when default unavailable

7.2 Prompt Templates

Create organization-wide prompt templates: - System prompts for specific use cases - Pre-approved prompt patterns
- Domain-specific instructions

7.3 Domain Configuration

Setting	Description
Primary Domains	Your organization’s focus areas
Blocked Domains	Topics to restrict
Custom Taxonomy	Organization-specific categories

7.4 MLS Configuration

Mid-Level Services settings (if tier allows):

Setting	Description	Default
Enable MLS	Master toggle	true
Auto-Warm	Warm models on first request	true
Cost Alerts	Notify on MLS spend	true
Alert Threshold	Monthly threshold	\$100

8. LIVS-M Policy (v7.9.0)

Location: Tenant Admin -> LIVS-M Policy

Configure the AI governance “Defcon” level for your organization. LIVS-M (LLM Interrogation & Verification System - Modular) provides policy-driven forensic verification of AI outputs.

8.1 Overview

LIVS-M 2.0 allows tenant admins to configure how strictly the platform verifies AI-generated content before it’s delivered to users.

LIVS-M Policy Settings			v2.0.0 [UPDATE]	
+-----+-----+-----+				
+-----+-----+-----+				
Modes	Settings	Updates *	<- Tab navigation	
+-----+-----+-----+				
+-----+-----+-----+				
Brainstorming		Standard	Strict Audit	
[FAST] Creative		Default	[SHIELD] Secure	
		[Selected]		
"Yes, and..."		"Trust but	"Zero Trust"	
		Verify"		
+-----+-----+-----+		+-----+-----+-----+		
Current Mode: Standard				
* Sycophancy Detection: ON				
* Stub Rejection: ON				
* Chaos Injection: OFF				
* Max Consensus Velocity: 2				
+-----+-----+-----+				

8.2 Policy Modes

Mode	Alias	Description	Best For
Brainstorming	RAPID_PROTO	Accepts partial code, stubs, rough ideas. Focuses on speed and creativity.	Hackathons, MVP planning, early drafting
Standard	ENGINEERING	Code must run. Stubs rejected if breaking functionality. Tests encouraged.	Daily development, sprint work
Strict Audit	STRICT_AUDIT	No stubs. No mock data. Mandatory tests. Sycophancy triggers Devil's Advocate.	Production releases, medical/legal, security

8.3 Configuration Options

Setting	Description	Default
Sycophancy Detection	Detect when agents agree too quickly without critical analysis	ON
Stub Rejection	Reject outputs containing TODO, placeholder, or incomplete code	ON
Chaos Injection	Inject Devil's Advocate agent when sycophancy detected	OFF
Max Consensus Velocity	Maximum agreement rate before triggering verification	2

8.4 Version Management (v7.9.0+)

Tenant admins can check for LIVS-M policy registry updates and upgrade:

Feature	Description
Version Badge	Shows current version (e.g., v2.0.0)
Update Indicator	Animated badge when new version available
Changelog	List of improvements in new version
Breaking Changes Alert	Warning if update has breaking changes
Migration Notice	Notification if database migration required
One-Click Upgrade	Button to upgrade to latest version

8.5 What LIVS-M Catches

Issue	Description	Action
Code Stubs	// TODO, throw new Error('not implemented'), empty functions	Rejected with retry prompt
Mock Data	Hardcoded return values, fake data	Rejected in Standard/Strict modes
Sycophancy	AI agreeing without verification	Triggers Devil's Advocate
Incomplete Tests	Missing test coverage	Warning in Standard, rejected in Strict

8.6 Tenant-Level Overrides

Tenant admins can override the platform default for their organization:

- **Inherit Platform Default:** Use whatever the platform admin sets
- **Force Brainstorming:** Always use creative mode
- **Force Standard:** Always use balanced verification
- **Force Strict:** Always use maximum verification

8.7 API Endpoints

Method	Endpoint	Description
GET	/api/v1/tenant/livs-policy	Get current policy settings
PUT	/api/v1/tenant/livs-policy	Update policy settings
GET	/api/v1/tenant/livs-policy/version	Check for updates
POST	/api/v1/tenant/livs-policy/upgrade	Upgrade to latest version

8.8 Implementation

Files: - UI: apps/admin-dashboard/app/thinktank-admin/simulator/page.tsx (LIVS-M Policy view) - Types: packages/shared/src/types/livs.types.ts - Service: packages/infrastructure/lambda/shared/service/version.service.ts

Status: [OK] Implemented

9. Integrations

Location: Tenant Admin -> Integrations

Connect Think Tank to your organization's tools.

9.1 Available Integrations

Integration	Type	Description
SSO/SAML	Authentication	Single sign-on
Slack	Notification	Activity alerts
Microsoft Teams	Notification	Activity alerts
Webhook	Custom	HTTP callbacks
API Keys	Programmatic	Service integration

9.2 API Key Management

Tenant admins can create API keys for programmatic access:

Setting	Description
Name	Descriptive name
Scopes	read, write, admin
Expiry	Auto-expiration date
IP Whitelist	Allowed IP addresses

10. Security Settings

Location: Tenant Admin -> Security

Configure security policies for your organization.

10.1 Authentication

Setting	Description	Default
Require MFA	Force MFA for all users	false
Session Timeout	Auto-logout duration	24h
Password Policy	Complexity requirements	standard

10.2 Data Retention

Setting	Description	Default
Conversation Retention	How long to keep chats	90 days

Setting	Description	Default
Audit Log Retention	How long to keep audit	1 year
Export Retention	How long to keep exports	30 days

10.3 Compliance Settings

Setting	Description
HIPAA Mode	Enable HIPAA safeguards
Data Residency	Require specific region
Encryption	Additional encryption options

11. Audit Log

Location: Tenant Admin -> Audit

View all administrative actions within your tenant.

11.1 Audited Events

Event	Description
user.invited	New user invitation sent
user.role_changed	User role modified
user.suspended	User suspended
cartridge.created	New cartridge created
cartridge.activated	Cartridge enabled
report.created	New report created
settings.changed	Tenant settings modified
integration.added	New integration configured

11.2 Audit Log Fields

Field	Description
Timestamp	When the event occurred
Actor	Who performed the action
Action	What was done

Field	Description
Target	What was affected
Details	Additional context
IP Address	Source IP

11.3 Export

Export audit logs for compliance: - Date range filter - Event type filter - CSV or JSON format

12. API Reference

Base URL

/api/v1/tenant

All endpoints automatically scope to the authenticated user’s tenant.

Authentication

Use Bearer token from Think Tank session or API key with tenant:admin scope.

Endpoints Summary

Resource	Endpoints
Dashboard	GET /dashboard
Users	GET/POST/PUT/DELETE /users
Settings	GET/PUT /settings
Cartridges	GET/POST/PUT/DELETE /cartridges
Reports	GET/POST/PUT/DELETE /reports
Billing	GET /billing, GET /usage
AI Config	GET/PUT /ai-config
Integrations	GET/POST/DELETE /integrations
Security	GET/PUT /security
Audit	GET /audit, GET /audit/export

13. Implementation Files

Current Implementation

Component	Path	Status
App Directory	apps/thinktank-tenant-admin/	[OK] Created
Cartridge Manager	app/(dashboard)/cartridge/	[OK] Implemented
Dashboard	app/(dashboard)/page.tsx	[OK] Implemented
LIVS-M Policy	apps/admin-dashboard/app/thinktank-admin/simulator/page.tsx	[OK] Implemented
Users	app/(dashboard)/users/page.tsx	Pending
Settings	app/(dashboard)/settings/page.tsx	Pending
Reports	app/(dashboard)/reports/page.tsx	Pending
Billing	app/(dashboard)/billing/page.tsx	Pending
AI Config	app/(dashboard)/ai-config/page.tsx	Pending
Integrations	app/(dashboard)/integrations/page.tsx	Pending
Security	app/(dashboard)/security/page.tsx	Pending
Audit	app/(dashboard)/audit/page.tsx	Pending

API Handler

Component	Path	Status
Tenant API	lambda/thinktank-tenant-admin/handler.ts	Pending
Tenant Service	lambda/shared/services/tenant-provisioning.service.ts	Pending

Database Tables

Table	Purpose	Status
tenant_settings	Tenant-level settings	[OK] Exists
tenant_users	User-tenant mapping	[OK] Exists
tenant_reports	Saved reports	Pending
tenant_report_schedules	Report scheduling	Pending
tenant_integrations	Integration configs	Pending
tenant_api_keys	Tenant-scoped API keys	[OK] Exists

Table	Purpose	Status
tenant_audit_log	Tenant audit events	[OK] Exists

Memory Retention Settings (v7.13.0)

Overview

Tenant Admins can customize memory retention for their organization within the bounds set by the Think Tank administrator. This controls session-to-session memory, storage limits, and which memory features are available to your users.

Dashboard Location: Tenant Admin -> Memory Retention (/thinktank-tenant-admin/memory-retention)

What You Can Control

Setting	Type	Description
Session-to-Session Memory	Toggle	Enable/disable persistent memory for your users
Conversation History	Toggle	Store full conversation transcripts
Auto-Extract Facts	Toggle	Automatically extract facts from conversations
User Can Delete Own Memory	Toggle	Allow users to manage their own memory
Uploaded Documents in Memory	Toggle	Include uploaded documents (PDFs, images, code) in user memory across all chats
Downloaded Files in Memory	Toggle	Include AI-generated/retrieved files in user memory across all chats
Retention Days	Number	How many days to retain memories (0 = unlimited)
Max Storage Per User	Number (MB)	Maximum storage per user
Hot Tier Days	Number	Days in fast-access storage
Warm Tier Days	Number	Days in warm storage

Constraints

Your overrides **CANNOT exceed** limits set by the Think Tank Admin: - If the Think Tank Admin sets retention to 90 days, you cannot set it to 180 - If the Think Tank Admin disables session memory, you cannot re-enable it - If the Think Tank Admin sets max storage to 500MB, you cannot set it to 1000MB - If the Think Tank Admin disables uploaded documents or downloaded files, you cannot re-enable them

The dashboard will display tenant-level constraints when they exist, and the API will reject requests that exceed them.

Admin API

Method	Path	Description
GET	/api/admin/memory-retention/tenant-admin/override	Get current override
PUT	/api/admin/memory-retention/tenant-admin/override	Set/update override
DELETE	/api/admin/memory-retention/tenant-admin/override	Remove (restore tenant defaults)
GET	/api/admin/memory-retention/effective	Get resolved effective policy
GET	/api/admin/memory-retention/dashboard	Usage dashboard

Version History

Version	Date	Changes
1.2.0	2026-02-06	Added Memory Retention Settings section (v7.13.0) – configurable retention with constraint enforcement
1.1.0	2026-02-05	Added LIVS-M Policy section (v7.9.0) with policy modes, settings, and version management
1.0.0	2026-02-03	Initial documentation

Part IV: Mac Platform

Classification: RADIANT INTERNAL // ENGINEERING
Version: 3.0.0 | **Date:** February 8, 2026

Status: BUILT – v7.45.0 – Full feature parity with web app (minus Polymorphic Interface)
App Location: apps/thinktank-mac/
Mirrors: Think Tank Web (apps/thinktank/)
Requires: macOS 14.0+ (Sonoma), Swift 5.9+, Xcode 15+
Detailed Documentation: - **User Guide:** docs/THINKTANK-MAC-GUIDE.md (20 sections) - **Portability Manifest:** docs/THINKTANK-MAC-PORTABILITY-MANIFEST.md (33 features, technology map, gap tracking) - **Sync Policy:** /.windsurf/workflows/thinktank-dual-platform.md (v2.0 – bidirectional, blocking gate)
v7.45.0 Gap Closure (February 8, 2026): - CoreTypes.swift: 1,406 lines (80+ new types: Governor, Derivation, FlashFacts, Grimoire, Ideas, Cartridges, Mood, AXIOM, Collaboration, i18n) - PlatformServices.swift: 860 lines (7 new services, GovernorService expanded from 2 to 14 endpoints) - 3 standalone services: AxiomSessionService (SSE + feedback + caching), AuthService (Keychain), LocalizationService (5 languages) - 8 feature views: FlashFacts, Grimoire, Ideas, Derivation, Governor, Cartridge, Cato-Mood, Login - 8 AXIOM sub-views: Workflow, Confidence, Domain, ModelScores, Clarification, CompiledPrompt, Feedback, Preferences - Navigation: 10 sections (was 6), Settings: 8 tabs (was 5), Auth gate, i18n environment

1. What is Think Tank (Mac)?

Think Tank (Mac) is a **native macOS SwiftUI application** that mirrors the Think Tank web app’s user-facing chat experience. It connects to the **exact same RADIANT backend APIs** – no new services, no new Lambdas, no new infrastructure. It is a frontend-only native client.

What It IS

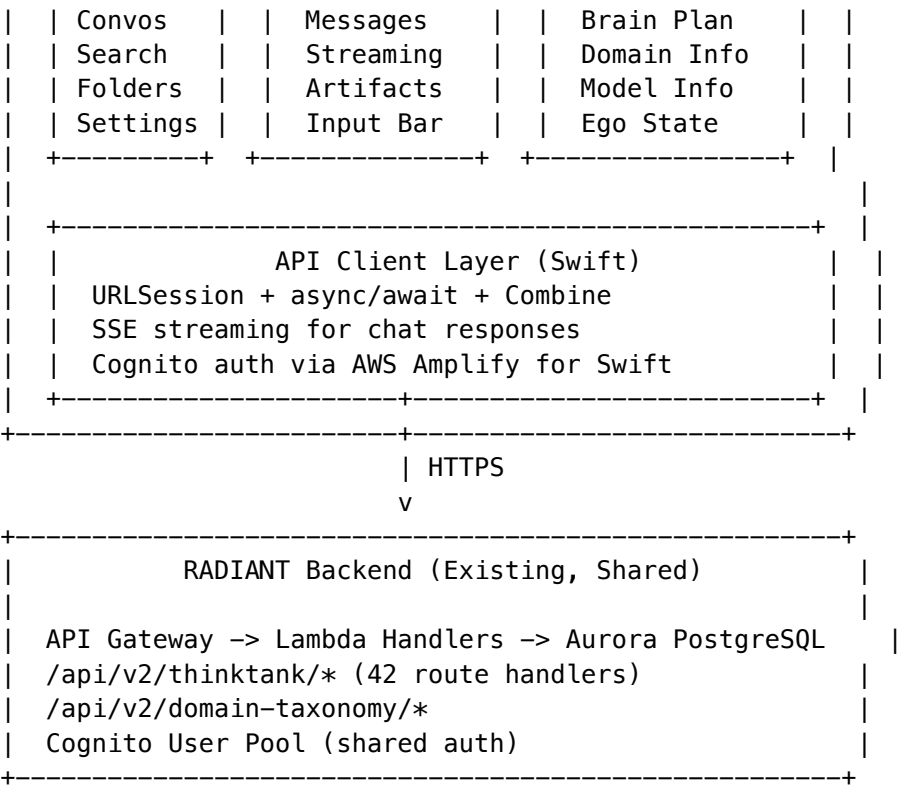

- A native macOS chat client for the Think Tank AI platform
- A SwiftUI app using NavigationSplitView, Sidebar, and Inspector patterns
- A consumer of existing RADIANT APIs (/api/v2/thinktank/*, /api/v2/domain-taxonomy/*)
- Feature-mirrored with the web app (same capabilities, native UI)

What It IS NOT

- Not a replacement for the web app (both coexist)
- Not a new backend or service (uses existing Lambdas)
- Not an admin dashboard (no platform admin, no tenant admin)
- Not a Curator, Dojo, or Genesis client (those are separate products)

2. Architecture Overview

Technology Stack

Layer	Technology
UI Framework	SwiftUI (macOS 13.0+)
Navigation	NavigationSplitView (3-column)
Networking	URLSession async/await
Streaming	URLSession bytes (SSE parsing)
Authentication	AWS Amplify for Swift / Cognito
State Management	@Observable (Swift 5.9 Observation)
Local Storage	SwiftData or SQLCIPHER (matching Swift Deployer)
Design System	Follows Swift Deployer design tokens (RadiantSpacing, RadiantRadius)

3. Feature Parity Matrix

The following table maps every Think Tank web feature to its Mac counterpart. This is the **canonical sync reference** – update it whenever either platform changes.

Tier 1: Core Features (Must Have – Build First)

#	Web Feature	Web Location	Mac Equivalent	Swift Pattern	Status
1	Conversations	conversations.ts	SideableView.swift + ChatView.swift	NavigationSplitView	[OK] Built
2	Chat Streaming	SSE via fetch	APIClient.swift SSE stream	URLSession.bytes + AsyncThrowingStream	[OK] Built
3	Brain Plan Viewer	brain-plan.ts + component	BrainPlanViewer.swift	Sheet with step progress	[OK] Built
4	Domain Detection	domain-modes.ts	DomainSelectorView.swift	Menu picker in header	[OK] Built
5	Model Selection	models.ts, model-categories.ts	ModelSelectorView.swift	Menu/Picker with category grouping	[OK] Built
6	My Rules	my-rules.ts	RulesView.swift	Full CRUD + presets browser	[OK] Built
7	User Context/Memory	user-context.ts	ProfileView.swift	Analytics + achievements	[OK] Built
8	Settings/Preferences	settings.ts, preferences.ts	SettingsView.swift	Settings scene (5 tabs)	[OK] Built
9	Authentication	Cognito web	APIClient.swift token management	URLSession + Keychain	[OK] Built

Tier 2: Advanced Features (Build Second)

#	Web Feature	Web Location	Mac Equivalent	Swift Pattern	Status
10	Delight System	Admin config	SettingsStore.swift personality mode	Mode selector (partial – no toasts)	[!] Partial
11	Time Machine	time-travel.ts	TimeMachineView.swift	Timeline + playback + branch/restore	[OK] Built
12	Crucible Deliberation	CrucibleDeliberationPanelView.tsx	CrucibleView.swift	Event timeline with expandable Q&A	[OK] Built
13	AXIOM Forge	AxiomForge.tsx	AxiomForgeView.swift	4-step workflow (Classify->Route)	[OK] Built
14	Voice Input	voice-input.tsx	VoiceService.swift + VoiceInputView.swift	AVAudioEngine + Whisper API	[OK] Built
15	File Attachments	file-attachments.tsx	FileAttachmentsView.swift	NSOpenPanel + onDrop	[OK] Built

#	Web Feature	Web Location	Mac Equivalent	Swift Pattern	Status
16	Economic Governor	economic-governor.ts	BrainPlanViewer.swift	Integrated in Brain Plan viewer	[OK] Built
17	Artifact Engine	artifact-engine.ts	ArtifactsView.swift	Split-view browser with detail pane	[OK] Built
18	History	History page	HistoryView.swift	Sort/search/filter conversation list	[OK] Built
19	Ratings	MessageBubble.tsx	MessageBubbleView.swift	Inline thumbs up/down + regenerate	[OK] Built
20	File Conversion	file-conversion.ts	FileAttachmentsView.swift	Drag-and-drop with type validation	[OK] Built

Tier 3: Specialized Features (Build Third)

#	Web Feature	Web Location	Mac Equivalent	Swift Pattern	Status
21	Concurrent Execution	concurrent-execution.ts	Parallel model queries	Task groups with progress	Planned
22	Structure from Chaos	structure-from-chaos.ts	Auto-organize	Sheet with results	Planned
23	Enhanced Collaboration	enhanced-collaboration.ts	CollaborationService (API)	AR only – no real-time UI yet	[!] Partial
24	Derivation History	derivation-history.ts	Reasoning trace	Expandable tree	Planned
25	Decision Artifacts	decision-artifacts.ts	Decision records	Table with detail	Planned
26	Living Parchment	living-parchment.ts	Living documents	Rich text editor	Planned
27	Shadow Testing	shadow-testing.ts	A/B model comparison	Side-by-side view	Planned
28	Security Signals	security-signals.ts	Safety indicators	Status bar items	Planned
29	DIA	dia.ts	Document intelligence	Quick Look preview	Planned
30	LIVS Workflow	livs-workflow.ts	Quality control modes	Toolbar segment	Planned
31	Guest Restrictions	GuestRestrictionBanner.tsx	CollaborationService (API)	AR only – no banner UI yet	[!] Partial
32	Policy Framework	policy-framework.ts	Policy display	Inspector section	Planned
33	UEP Integration	uep-integration.ts	User experience personalization	Automatic (API-driven)	Planned

Web-Only Features (No Mac Equivalent Needed)

Feature	Reason
Liquid Interface (liquid-interface.ts)	Web-specific CSS morphing; macOS uses native Liquid Glass
Reality Engine (reality-engine.ts)	Web 3D rendering; macOS uses SceneKit/RealityKit natively
Magic Carpet Navigator	Web-specific animated navigation; macOS uses NavigationSplitView
Spatial Glass Card	Web glassmorphism CSS; macOS uses <code>.regularMaterial</code> natively
Polymorphic View Router	React router pattern; SwiftUI uses NavigationStack natively
App Factory	Web-specific generated app renderer; not applicable to native
UI Feedback Panel	Web-specific feedback collection; macOS uses native feedback
GDPR/Consent	Uses web-specific cookie/consent UI; macOS uses system privacy
Multipage Apps	Web-specific multi-page app generation; not applicable

4. API Endpoints Used

The Mac app calls these existing RADIANT APIs (no new endpoints needed):

Core APIs (Tier 1)

POST	/api/v2/thinktank/conversations	-- Create conversation
GET	/api/v2/thinktank/conversations	-- List conversations
GET	/api/v2/thinktank/conversations/{id}	-- Get conversation
DELETE	/api/v2/thinktank/conversations/{id}	-- Delete conversation
POST	/api/v2/thinktank/conversations/{id}/messages	-- Send message (SSE stream)
POST	/api/v2/thinktank/brain-plan/generate	-- Generate brain plan
GET	/api/v2/thinktank/brain-plan/{planId}	-- Get plan status
POST	/api/v2/thinktank/brain-plan/{planId}/execute	-- Execute plan
GET	/api/v2/thinktank/models	-- List available models
GET	/api/v2/thinktank/model-categories	-- Get model categories
GET	/api/v2/thinktank/domain-modes	-- Get domain modes
POST	/api/v2/domain-taxonomy/detect	-- Detect domain from prompt
GET	/api/v2/thinktank/my-rules	-- Get user rules
POST	/api/v2/thinktank/my-rules	-- Create user rule
PUT	/api/v2/thinktank/my-rules/{id}	-- Update user rule

DELETE	/api/v2/thinktank/my-rules/{id}	-- Delete user rule
GET	/api/v2/thinktank/user-context	-- Get user memory profile
GET	/api/v2/thinktank/settings	-- Get user settings
PUT	/api/v2/thinktank/settings	-- Update user settings
GET	/api/v2/thinktank/preferences	-- Get user preferences
PUT	/api/v2/thinktank/preferences	-- Update preferences

Advanced APIs (Tier 2-3)

GET	/api/v2/thinktank/grimoire	-- Get procedural memories
POST	/api/v2/thinktank/grimoire	-- Create grimoire entry
GET	/api/v2/thinktank/flash-facts	-- Get flash facts
POST	/api/v2/thinktank/flash-facts	-- Create flash fact
GET	/api/v2/thinktank/sentinel-agents	-- Get agent status
GET	/api/v2/thinktank/economic-governor	-- Get cost data
GET	/api/v2/thinktank/council-of-rivals	-- Get deliberation
POST	/api/v2/thinktank/council-of-rivals	-- Start deliberation
GET	/api/v2/thinktank/time-travel/{id}	-- Get conversation branches
POST	/api/v2/thinktank/time-travel/{id}/fork	-- Fork conversation
GET	/api/v2/thinktank/artifacts	-- Get artifacts
POST	/api/v2/thinktank/artifacts	-- Create artifact
GET	/api/v2/thinktank/ideas	-- Get ideas
POST	/api/v2/thinktank/ideas	-- Create idea
POST	/api/v2/thinktank/ratings	-- Rate response
POST	/api/v2/thinktank/file-conversion	-- Convert file
GET	/api/v2/thinktank/derivation-history/{id}	-- Get reasoning trace
GET	/api/v2/thinktank/analytics	-- Get usage analytics

5. Planned File Structure

```
apps/thinktank-mac/
+-- Package.swift           # SPM package definition
+-- Sources/ThinkTankMac/
|   +-- ThinkTankApp.swift  # @main App entry point
|   +-- AppCommands.swift   # Menu bar commands + keyboard shortcuts

6. Known Limitations & Platform Differences

[!] CRITICAL: Issues to Be Aware Of

#	Issue	Severity	Details
1	No shared component library	High	React and SwiftUI are fundamentally different. Every UI component must be written twice. There is no transpiler or code-sharing mechanism.
2	Sync is manual	High	When a feature is added to the web app, the Swift app must be updated separately. The documentation policy will remind the AI agent, but you must verify .
3	SSE streaming differs	Medium	Web uses <code>fetch()</code> with <code>ReadableStream</code> . Swift uses <code>URLSession.bytes</code> . The parsing logic must be re-implemented. Edge cases (reconnection, partial chunks) may differ.

#	Issue	Severity	Details
4	Auth flow differs	Medium	Web uses Amplify JS with redirect flow. Swift uses ASWebAuthenticationSession or Amplify Swift SDK. Token refresh, session persistence, and error handling will differ.
5	No Magic Carpet equivalent	Medium	The web's animated morphing navigation has no direct macOS equivalent. The Mac app uses standard NavigationSplitView instead. This is intentional, not a gap.
6	Markdown rendering	Medium	Web uses React markdown libraries. Swift needs a custom markdown -> AttributedString renderer. Complex LaTeX, tables, and code blocks may render differently.
7	WebSocket support	Medium	Collaboration features use WebSocket. Swift's URLSessionWebSocketTask API differs from browser WebSocket. Reconnection logic must be separate.
8	File handling	Low	macOS has richer file handling (drag-drop, Finder integration, Quick Look) which is actually superior to the web version.
9	Keyboard shortcuts	Low	macOS keyboard shortcuts use Cmd modifiers natively. The web uses browser shortcuts. The Mac app should follow macOS conventions, not mirror web shortcuts.
10	Offline support	Low	The Mac app could add offline conversation viewing via SwiftData. The web app has no offline support. This would be a Mac advantage.

Platform-Specific Advantages (Mac)

Advantage	Description
Menu bar integration	Sentinel Agents can show status in the macOS menu bar
Spotlight integration	Conversations searchable via macOS Spotlight
Notifications	Native macOS notifications for agent alerts
Drag and drop	Native file drag-and-drop from Finder
Quick Look	Preview artifacts via Quick Look
Touch Bar	Quick actions on MacBook Pro (if applicable)
Liquid Glass	macOS Sequoia’s native glass materials (no CSS hacks)
Performance	Native compilation – no browser overhead

7. Sync Protocol: Keeping Web and Mac in Lockstep

7.1 The Dual-Platform Rule

- Any change to Think Tank web features **MUST** be evaluated for the Mac app.
- Any change to Think Tank Mac features **MUST** be evaluated for the web app.

This is enforced by: 1. The `/.windsurf/workflows/thinktank-dual-platform.md` policy (see below) 2. The `DOCUMENTATION-MANIFEST.json` trigger matrix 3. The `AGENTS.md` quick reference table 4. This guide’s Feature Parity Matrix (Section 3)

7.2 Sync Workflow (For the Human)

When you ask the AI agent to make a Think Tank change:

- BEFORE the change:
 - `[ ]` Check the Feature Parity Matrix in this document
 - `[ ]` Identify if the feature exists on both platforms
- DURING the change:
 - `[ ]` Tell the agent: "Update both web and Mac"
 - `[ ]` Or: "Web only" / "Mac only" (if platform-specific)
- AFTER the change:
 - `[ ]` Verify the Feature Parity Matrix was updated
 - `[ ]` Verify `CHANGELOG.md` mentions both platforms
 - `[ ]` If only one platform was updated, create a follow-up task

7.3 Sync Workflow (For the AI Agent)

The AI agent **MUST** follow this checklist on any Think Tank change:

- `[ ]` Read the Feature Parity Matrix in `THINKTANK-MAC-GUIDE.md`
- `[ ]` If feature exists on both platforms -> update both
- `[ ]` If feature is new -> add to Feature Parity Matrix with status

- [] If feature is web-only -> add to "Web-Only Features" table with reason
- [] If feature is Mac-only -> document the Mac advantage
- [] Update CHANGELOG.md with platform annotations: [Web], [Mac], or [Both]
- [] Update this guide's Feature Parity Matrix status column

7.4 Version Sync

Rule	Details
Same API version	Both apps must target the same API version
Independent app versions	The Mac app has its own version number (does not match web)
Feature flags	If a backend feature flag changes, both apps must handle it
Breaking API changes	Both apps must be updated simultaneously

7.5 What Can Go Out of Sync (And What Can't)

Allowed Divergence	Not Allowed
UI layout (sidebar vs tabs)	Missing API calls that the web app makes
Animation style	Different data models for the same entity
Navigation patterns	Skipping safety features (Cato, Helix)
Platform-specific features (menu bar, Spotlight)	Ignoring user rules or preferences
macOS-native controls (Picker vs Select)	Inconsistent conversation history

8. Authentication Architecture

Web App Flow

User -> Amplify JS -> Cognito Hosted UI -> ID Token -> API Gateway

Mac App Flow (Planned)

User -> ASWebAuthenticationSession -> Cognito Hosted UI -> ID Token -> Keychain -> API Gateway

Component	Web	Mac
Auth Library	AWS Amplify JS v6	AWS Amplify Swift or raw Cognito SDK
Token Storage	Browser localStorage	macOS Keychain

Component	Web	Mac
Token Refresh	Amplify auto-refresh	Manual refresh via Cognito API
Session Persistence	Browser cookies/storage	Keychain + UserDefaults
MFA	Browser-based TOTP	Same TOTP flow via system browser
SSO	Redirect in browser tab	ASWebAuthenticationSession popup

9. Streaming Architecture

Chat responses are streamed via Server-Sent Events (SSE):

Web Implementation

```
const response = await fetch(url, { method: 'POST', body, headers });
const reader = response.body.getReader();
// Read chunks, parse SSE lines
```

Mac Implementation (Planned)

```
let (bytes, response) = try await URLSession.shared.bytes(for: request)
for try await line in bytes.lines {
  if line.hasPrefix("data: ") {
    let json = String(line.dropFirst(6))
    // Parse SSE event
  }
}
```

SSE Event Types

Event	Data	Description
message	{ content: string }	Incremental text chunk
brain-plan	{ plan: BrainPlan }	Plan step update
domain	{ field, domain, confidence }	Domain detection result
model	{ modelId, reason }	Model selection
delight	{ message, type }	Personality message
done	{ usage, cost }	Stream complete
error	{ code, message }	Error during generation

10. Dependencies

Swift Package Manager Dependencies (Planned)

Package	Purpose	License
Amplify Swift	Cognito authentication	Apache 2.0
swift-markdown	Markdown -> NSAttributedString	Apache 2.0
Highlightr	Syntax highlighting for code blocks	MIT
KeychainAccess	Secure token storage	MIT
SwiftSoup	HTML parsing (for artifact rendering)	MIT

Shared with Swift Deployer

Shared Asset	Location	Purpose
Design Tokens	MacOSComponents.swift	RadiantSpacing, RadiantRadius
Keychain Helpers	KeychainManager.swift	Secure storage patterns
Network Layer	Pattern from Deployer's API client	URLSession best practices

11. Build Phases (Recommended Implementation Order)

Phase 1: Foundation (Session 1)

- [] Package.swift with SPM dependencies
- [] ThinkTankApp.swift entry point
- [] APIClient.swift (base HTTP, auth headers, error handling)
- [] AuthService.swift (Cognito sign-in, token management, Keychain)
- [] SSEStreamParser.swift (Server-Sent Events parsing)
- [] Conversation model + ConversationService
- [] SidebarView with conversation list
- [] ChatView with message display + streaming
- [] MessageInputBar with send button

Phase 2: Intelligence (Session 2)

- [] BrainPlan model + BrainPlanService
- [] BrainPlanPanel in Inspector
- [] DomainTaxonomy model + DomainService
- [] DomainPanel in Inspector + toolbar indicator

- [] AIModel + ModelService + toolbar picker
- [] My Rules UI (CRUD)
- [] Settings window
- [] Keyboard shortcuts (CmdN new conversation, CmdW close, etc.)

Phase 3: Advanced Features (Session 3)

- [] Time Machine (conversation branching)
- [] Council of Rivals (multi-model deliberation)
- [] Grimoire (procedural memory)
- [] Flash Facts
- [] Sentinel Agents (menu bar integration)
- [] Economic Governor (cost badge)
- [] Artifact viewer (code highlighting)
- [] Response ratings

Phase 4: Polish & Parity (Session 4)

- [] Derivation History
- [] Decision Artifacts
- [] Shadow Testing (side-by-side)
- [] Ideas capture
- [] File drag-and-drop + conversion
- [] Spotlight integration
- [] Native notifications
- [] Comprehensive keyboard shortcuts
- [] Accessibility (VoiceOver)
- [] Unit tests

12. Risk Register

Risk	Probability	Impact	Mitigation
Feature drift – web gets features Mac doesn't	High	High	Dual-platform policy, Feature Parity Matrix, agent enforcement
Auth complexity – Cognito Swift SDK has different API surface	Medium	Medium	Use ASWebAuthenticationSession as fallback; test early

Risk	Probability	Impact	Mitigation
SSE edge cases – partial chunks, reconnection, timeouts	Medium	Medium	Comprehensive SSEStreamParser with unit tests
Markdown rendering – complex content renders differently	Medium	Low	Use swift-markdown + custom renderers; accept minor differences
API changes – backend changes break Mac app	Low	High	Shared type definitions; API versioning; test both clients
macOS version fragmentation – users on older macOS	Low	Medium	Target macOS 13.0+ (wide adoption); test on 13, 14, 15
Build times – large Swift project compiles slowly	Medium	Low	Modular SPM targets; incremental compilation

13. Related Documents

- THINKTANK-USER-GUIDE.md – Web app user guide (feature source of truth)
- THINKTANK-ADMIN-GUIDE.md – Admin features (not in Mac app)
- SWIFT-DEPLOYER-USER-GUIDE.md – Existing Swift app patterns to follow
- THINKTANK-MOATS.md – Competitive advantages (Mac app adds native platform moat)

14. Version History

Version	Date	Changes
1.0.0	2026-02-06	Initial pre-build documentation: architecture, feature parity matrix, limitations, sync protocol, risk register, build phases

Document maintained under RADIANT documentation policy. Any changes to Think Tank (web or Mac) MUST update this guide's Feature Parity Matrix.

Part V: Licensing Model

Version: 1.0.0 **Platform:** RADIANT v4.18.0 / v7.23.0+ **Last Updated:** February 6, 2026 **Companion:**
 ADR: User Provisioning & Licensing **Support Contact:** support@thinktank.app

1. Overview

The Think Tank Licensing Model governs what features, capacity, and regulatory capabilities each tenant has access to. Licensing is **flexible and multi-dimensional** – it covers seats, storage, retention, compliance, and any future dimension without requiring code changes.

Core Principle

Every feature that costs us money to operate is a licensable dimension.
 If a tenant doesn't have the license, the feature is disabled.
 If they want it, they contact support@thinktank.app.

Who This Document Is For

Audience	What To Read
Engineers	Sections 2-6 (schema, middleware, API enforcement)
Administrators	Sections 7-9 (tenant admin UI, managing licenses)
Product/Sales	Sections 10-11 (pricing tiers, regulatory licenses)

2. License Architecture

2.1 The tenant_licenses Table

A single flexible table handles ALL license types. No code changes needed to add new license dimensions.

```
CREATE TABLE IF NOT EXISTS tenant_licenses (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  tenant_id UUID NOT NULL REFERENCES tenants(id) ON DELETE CASCADE,

  -- What type of license
  license_type VARCHAR(50) NOT NULL,
```

```

-- CHECK: 'seat', 'storage', 'retention', 'compliance', 'feature', 'api_rate', 'addon'

-- Which app (or 'platform' for cross-app)
app_id VARCHAR(50) NOT NULL DEFAULT 'platform',
-- Values: 'think_tank', 'curator', 'dojo', 'cato_trainer', 'genesis', 'platform'

-- For compliance/feature licenses: specific feature code
feature_code VARCHAR(100),
-- Examples: 'hipaa', 'gdpr', 'soc2', 'ccpa', 'iso27001', 'data_residency',
--           'enhanced_audit', 'extended_retention', 'hipaa_retention'

-- Capacity
quantity INTEGER NOT NULL DEFAULT 0,      -- Total licensed amount
used INTEGER NOT NULL DEFAULT 0,          -- Currently consumed
reserved INTEGER NOT NULL DEFAULT 0,      -- Reserved (e.g., pending invitations)
unit VARCHAR(20) NOT NULL DEFAULT 'unit', -- 'user', 'gb', 'days', 'requests', 'boolean'

-- Billing
included_in_tier INTEGER NOT NULL DEFAULT 0, -- Included with subscription tier
additional_purchased INTEGER NOT NULL DEFAULT 0, -- Purchased beyond tier
price_per_unit_cents INTEGER,                -- Price for additional units
overage_allowed BOOLEAN NOT NULL DEFAULT false, -- Can exceed quantity?
overage_price_per_unit_cents INTEGER,         -- Price for overage units

-- Status
is_active BOOLEAN NOT NULL DEFAULT true,
expires_at TIMESTAMPTZ,                      -- NULL = no expiry

-- Metadata
notes TEXT,
created_at TIMESTAMPTZ NOT NULL DEFAULT NOW(),
updated_at TIMESTAMPTZ NOT NULL DEFAULT NOW(),

-- One license record per type+app+feature per tenant
UNIQUE(tenant_id, license_type, app_id, COALESCE(feature_code, ''))
);

CREATE INDEX idx_tenant_licenses_tenant ON tenant_licenses(tenant_id);
CREATE INDEX idx_tenant_licenses_type ON tenant_licenses(license_type, app_id);
CREATE INDEX idx_tenant_licenses_feature ON tenant_licenses(feature_code) WHERE feature_code IS NOT NULL;

ALTER TABLE tenant_licenses ENABLE ROW LEVEL SECURITY;
CREATE POLICY tenant_licenses_isolation ON tenant_licenses
    USING (tenant_id = current_setting('app.current_tenant_id')::uuid);

```

2.2 The license_catalog Table

Defines all available license types and their default pricing. Used by the platform admin and billing system.

```

CREATE TABLE IF NOT EXISTS license_catalog (
    id VARCHAR(100) PRIMARY KEY, -- e.g., 'seat:think_tank', 'compliance:hipaa'

```

```

license_type VARCHAR(50) NOT NULL,
app_id VARCHAR(50) NOT NULL DEFAULT 'platform',
feature_code VARCHAR(100),

display_name VARCHAR(200) NOT NULL,
description TEXT,
category VARCHAR(50) NOT NULL,
-- CHECK: 'app_access', 'capacity', 'compliance', 'addon'

unit VARCHAR(20) NOT NULL,
default_price_per_unit_cents INTEGER,

-- Tier inclusion (how many units included per tier)
included_tier_1 INTEGER NOT NULL DEFAULT 0, -- SEED
included_tier_2 INTEGER NOT NULL DEFAULT 0, -- SPROUT
included_tier_3 INTEGER NOT NULL DEFAULT 0, -- GROWTH
included_tier_4 INTEGER NOT NULL DEFAULT 0, -- SCALE
included_tier_5 INTEGER NOT NULL DEFAULT 0, -- ENTERPRISE

-- Constraints
min_quantity INTEGER DEFAULT 0,
max_quantity INTEGER, -- NULL = unlimited
requires_license_ids TEXT[], -- Other licenses required first

is_public BOOLEAN NOT NULL DEFAULT true,
sort_order INTEGER NOT NULL DEFAULT 0,

created_at TIMESTAMPTZ NOT NULL DEFAULT NOW(),
updated_at TIMESTAMPTZ NOT NULL DEFAULT NOW()
);

```

2.3 The license_audit Table

All license changes are logged for compliance and billing reconciliation.

```

CREATE TABLE IF NOT EXISTS license_audit (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  tenant_id UUID NOT NULL REFERENCES tenants(id) ON DELETE CASCADE,
  license_id UUID REFERENCES tenant_licenses(id) ON DELETE SET NULL,

  action VARCHAR(50) NOT NULL,
  -- CHECK: 'created', 'activated', 'deactivated', 'quantity_changed',
  --        'used_changed', 'expired', 'renewed', 'overage_triggered'

  old_value JSONB,
  new_value JSONB,

  performed_by UUID, -- User who made the change
  performed_by_app VARCHAR(50), -- 'radiant_admin', 'thinktank_tenant_admin', 'system', 'billing'
  reason TEXT,

```

```

    created_at TIMESTAMPTZ NOT NULL DEFAULT NOW()
);

CREATE INDEX idx_license_audit_tenant ON license_audit(tenant_id, created_at DESC);

```

3. License Types

3.1 Seat Licenses (Per-App User Access)

License ID	App	Unit	Description
seat:think_tank	think_tank	user	Think Tank access (Web + Mac = 1 seat)
seat:curator	curator	user	Curator access
seat:dojo	dojo	user	Aurelius Dojo access
seat:cato_trainer	cato_trainer	user	Cato Trainer access
seat:genesis	genesis	user	Genesis access

Rules: - Active users consume seats - **Deactivated users FREE seats** (seat returned to pool) - Invited users RESERVE seats (to prevent over-invitation) - Think Tank seat granted by default on invite; other apps require explicit activation - Overage: configurable per tenant (hard-block or auto-charge)

3.2 Capacity Licenses

License ID	App	Unit	Description
storage:think_tank	think_tank	gb	File storage quota for Think Tank
storage:curator	curator	gb	Document storage for Curator
storage:cato_trainer	cato_trainer	gb	Knowledge base storage
storage:platform	platform	gb	Platform-wide storage quota
api_rate:platform	platform	requests	API rate limit (requests/minute)
tokens:platform	platform	token	Monthly token allocation

3.3 Retention Licenses

License ID	App	Unit	Description	Cost Driver
retention:default	platform	days	Default data retention	Included (30 days)

License ID	App	Unit	Description	Cost Driver
retention:extended	platform	days	Extended retention (90-365 days)	Warm storage
retention:hipaa	platform	days	HIPAA 7-year retention (2,555 days)	Glacier storage
retention:sox	platform	days	SOX record retention	Glacier storage

3.4 Compliance/Regulatory Licenses

These are the critical licensable regulatory features. If a tenant does NOT have the license, the feature is DISABLED.

License ID	Feature Code	Unit	Description	Internal Cost Driver
compliance:hipaa	hipaa	boolean	HIPAA compliance features	Enhanced audit, PHI encryption keys, BAA
compliance:hipaa	hipaa_retention	boolean	HIPAA 7-year retention	S3 Glacier for 7 years
compliance:gdpr	gdpr	boolean	GDPR compliance features	Erasure processing, consent mgmt, DSAR
compliance:soc2	soc2	boolean	SOC 2 Type II features	Comprehensive audit logging, evidence
compliance:ccpa	ccpa	boolean	CCPA compliance	Consumer privacy processing, opt-out
compliance:iso27001	iso27001	boolean	ISO 27001 features	Security management controls
compliance:data_residency	data_residency	boolean	Data residency controls	Multi-region storage infrastructure
compliance:enhanced_audit	enhanced_audit	boolean	Enhanced audit logging	High-volume audit storage
compliance:pci_dss	pci_dss	boolean	PCI-DSS features	Cardholder data controls
compliance:fedramp	fedramp	boolean	FedRAMP compliance	Gov cloud, additional controls
compliance:hitrust	hitrust	boolean	HITRUST CSF	Healthcare security framework
compliance:eu_ai_act	eu_ai_act	boolean	EU AI Act compliance	AI governance, risk assessment

3.5 Add-On Licenses

License ID	App	Unit	Description
addon:custom_models	platform	boolean	Self-hosted custom model support
addon:dedicated_support	platform	boolean	Dedicated support channel

License ID	App	Unit	Description
addon:white_label	platform	boolean	White-label/custom branding
addon:sso_enterprise	platform	boolean	Enterprise SSO (SAML/OIDC)
addon:advanced_analytics	platform	boolean	Advanced analytics dashboard

4. Tier Defaults

When a tenant is created or upgrades their subscription, licenses are automatically provisioned based on their tier.

License	SEED (T1)	SPROUT (T2)	GROWTH (T3)	SCALE (T4)	ENTERPRISE (T5)
Think Tank seats	1	10	50	200	Unlimited
Curator seats	0	5	25	100	Unlimited
Dojo seats	0	5	25	100	Unlimited
Cato seats	0	0	10	50	Unlimited
Genesis seats	0	0	10	50	Unlimited
Storage (platform)	1 GB	10 GB	100 GB	1 TB	10 TB
Retention	30 days	90 days	365 days	365 days	Custom
API rate	100/min	500/min	2000/min	10000/min	Custom
HIPAA	No	No	Add-on	Add-on	Included
GDPR	No	Add-on	Add-on	Included	Included
SOC 2	No	No	Add-on	Add-on	Included
Enterprise SSO	No	No	Add-on	Included	Included

“**Add-on**” = Available for purchase. “**Included**” = Comes with the tier. “**No**” = Not available at this tier.

5. API Licensing Enforcement (For Engineers)

5.1 Middleware Pattern

Every API handler **MUST** check licensing before processing. This is implemented as middleware that runs before the handler logic.

```
// packages/infrastructure/lambda/shared/middleware/license-check.ts
```

```

interface LicenseRequirement {
  app_id: string;           // Which app this endpoint belongs to
  license_type?: string;    // 'seat', 'compliance', etc.
  feature_code?: string;    // 'hipaa', 'gdpr', etc. (for compliance checks)
  check_seat?: boolean;     // Should we verify the user has a seat for this app?
  check_feature?: boolean;  // Should we verify a specific feature license?
}

async function checkLicense(
  tenantId: string,
  userId: string,
  requirement: LicenseRequirement
): Promise<LicenseCheckResult> {
  // 1. Check app seat license (if check_seat)
  if (requirement.check_seat) {
    const seatLicense = await getLicense(tenantId, 'seat', requirement.app_id);
    if (!seatLicense || !seatLicense.is_active) {
      return {
        allowed: false,
        error: 'LICENSE_REQUIRED',
        license_type: 'seat',
        app_id: requirement.app_id,
        message: `Your organization does not have ${requirement.app_id} licenses. Contact Think Tank
      };
    }
  }
  // Check if user has a seat allocated
  const userHasSeat = await userHasAppAccess(userId, requirement.app_id);
  if (!userHasSeat) {
    return {
      allowed: false,
      error: 'SEAT_NOT_ASSIGNED',
      message: `You do not have access to ${requirement.app_id}. Contact your tenant administrator
    };
  }
}

// 2. Check feature license (if check_feature)
if (requirement.check_feature && requirement.feature_code) {
  const featureLicense = await getLicense(
    tenantId, 'compliance', 'platform', requirement.feature_code
  );
  if (!featureLicense || !featureLicense.is_active) {
    return {
      allowed: false,
      error: 'LICENSE_REQUIRED',
      license_type: 'compliance',
      feature_code: requirement.feature_code,
      message: `This feature requires a ${requirement.feature_code.toUpperCase()} compliance li
      contact: 'support@thinktank.app'
    };
  }
}

```

```
    }  
  }  
  
  return { allowed: true };  
}
```

5.2 How To Apply Licensing To An Endpoint

```
// Example: Think Tank chat endpoint -- requires Think Tank seat  
export async function handler(event: APIGatewayProxyEvent) {  
  const user = extractAuthContext(event);  
  
  // Check seat license  
  const license = await checkLicense(user.tenantId, user.userId, {  
    app_id: 'think_tank',  
    check_seat: true,  
  });  
  if (!license.allowed) {  
    return forbidden(license);  
  }  
  
  // ... handle request  
}  
  
// Example: HIPAA audit endpoint -- requires HIPAA license  
export async function hipaaAuditHandler(event: APIGatewayProxyEvent) {  
  const user = extractAuthContext(event);  
  
  // Check both seat AND compliance license  
  const license = await checkLicense(user.tenantId, user.userId, {  
    app_id: 'think_tank',  
    check_seat: true,  
    check_feature: true,  
    feature_code: 'hipaa',  
  });  
  if (!license.allowed) {  
    return forbidden(license);  
  }  
  
  // ... handle request  
}  
  
// Example: GDPR erasure endpoint -- requires GDPR license  
export async function gdprErasureHandler(event: APIGatewayProxyEvent) {  
  const user = extractAuthContext(event);  
  
  const license = await checkLicense(user.tenantId, user.userId, {  
    app_id: 'platform',  
    check_feature: true,  
    feature_code: 'gdpr',  
  });  
}
```

```
});
if (!license.allowed) {
  return forbidden(license);
}

// ... handle erasure request
}
```

5.3 Response Format When Unlicensed

All endpoints return a consistent error format:

```
{
  "error": "LICENSE_REQUIRED",
  "license_type": "compliance",
  "feature_code": "hipaa",
  "message": "This feature requires a HIPAA compliance license. Contact Think Tank support at support@thinktank.app",
  "contact": "support@thinktank.app",
  "upgrade_url": "https://thinktank.app/pricing"
}
```

HTTP status: **403 Forbidden** (authenticated but not authorized by license).

5.4 License Cache

To avoid querying the database on every request, licenses are cached:

```
// Cache tenant licenses for 5 minutes
// Invalidated on license change events
const LICENSE_CACHE_TTL_MS = 5 * 60 * 1000;

// Key: `license:${tenantId}` -> Map of all active licenses
// Populated on first request, refreshed on TTL expiry or license change SNS event
```

5.5 Endpoint-to-License Mapping

Every Lambda handler file MUST declare its license requirements at the top:

```
// At top of every handler file:
const LICENSE_REQUIREMENTS: Record<string, LicenseRequirement> = {
  'GET /chat': { app_id: 'think_tank', check_seat: true },
  'POST /chat': { app_id: 'think_tank', check_seat: true },
  'GET /hipaa/audit': { app_id: 'platform', check_seat: true, check_feature: true, feature_code: 'hipaa' },
  'POST /gdpr/erasure': { app_id: 'platform', check_feature: true, feature_code: 'gdpr' },
};
```

6. License Enforcement Summary By Regulatory Standard

6.1 What Each Standard Enables/Disables

Standard	License Code	What Gets ENABLED	What Gets DISABLED Without It
HIPAA	hipaa	PHI field management, enhanced audit trail, BAA documentation, access controls for ePHI, workforce training tracking	All PHI-related fields hidden, HIPAA audit tab disabled, HIPAA compliance reports unavailable
HIPAA Retention	hipaa_retention	7-year record retention, Glacier archival, legal hold support	Records only retained for default period (30 days), no Glacier archival
GDPR	gdpr	Right to erasure (Art. 17), data portability (Art. 20), consent management (Art. 7), DSAR handling, DPA support	Erasure requests rejected, data export unavailable, consent UI hidden
SOC 2	soc2	Self-audit runner, evidence collection, compliance reports, change management tracking, penetration test tracking	Self-audit tab disabled, compliance report generation unavailable
CCPA	ccpa	Consumer privacy rights, opt-out tracking, data sale disclosure, privacy policy management	CCPA-specific opt-out unavailable, privacy rights tab hidden
ISO 27001	iso27001	93 Annex A control tracking, risk assessment, security policy management, ISMS dashboard	ISO compliance dashboard disabled, control tracking unavailable
Data Residency	data_residency	Region selection for data storage, EU-only mode, cross-border transfer controls	Data stored in default region only, no region selection
Enhanced Audit	enhanced_audit	Per-request audit logging, IP tracking, device fingerprinting, session replay	Basic audit only (admin actions + auth events)
PCI-DSS	pci_dss	Cardholder data environment controls, network segmentation, vulnerability management	PCI controls tab disabled
FedRAMP	fedramp	Gov cloud compliance, FIPS 140-2 encryption, agency authorization tracking	FedRAMP compliance tab disabled

Standard	License Code	What Gets ENABLED	What Gets DISABLED Without It
HITRUST	hitrust	CSF control tracking, readiness assessment, certification management	HITRUST tab disabled
EU AI Act	eu_ai_act	AI risk classification, transparency requirements, human oversight documentation	AI governance tab disabled

6.2 Default Behavior (No Compliance Licenses)

Every tenant starts with these defaults (no license required):

Capability	Default
Encryption at rest	AES-256 (always on, all tiers)
Encryption in transit	TLS 1.3 (always on, all tiers)
Tenant isolation	RLS (always on, all tiers)
Basic audit	Admin actions + auth events logged, 30-day retention
Data retention	30 days
MFA	Available but not required (tenant can require)

7. Think Tank Tenant Admin – License Management UI

7.1 License Dashboard

Location: Think Tank Tenant Admin -> Licenses

Licenses & Usage			Tier: GROWTH (3)	
APP SEATS				
+-----+		+-----+		+-----+
Think Tank		Curator		Dojo
42/50 15/25		5/25		
[+ Buy Seats]		[+ Buy Seats]		[+ Buy Seats]
+-----+		+-----+		+-----+
CAPACITY				
+-----+		+-----+		
Storage		API Rate		
67/100 GB		1,200/2,000 req/min		

```
| | [+ Buy Storage] | | [+ Upgrade] |
| +-----+ +-----+
|
| COMPLIANCE LICENSES
| +-----+
| | [ok] GDPR           Active   Included with GROWTH tier
| | [!] HIPAA           Not Licensed
| |   -> Contact support@thinktank.app to add HIPAA
| | [!] SOC 2           Not Licensed
| |   -> Contact support@thinktank.app to add SOC 2
| | [ok] Enterprise SSO  Active   Add-on purchased
| +-----+
|
| DATA RETENTION
| Current: 365 days (included with GROWTH)
| HIPAA 7-year retention: Not Licensed
| -> Contact support@thinktank.app for extended retention
|
+-----+
```

7.2 Unlicensed Feature UI Pattern

When a tenant admin navigates to a feature that requires a license they don't have:

```
+-----+
| [!] [Feature Name]
|
| This feature requires a [LICENSE_NAME] license.
|
| [LICENSE_NAME] includes:
| * [Benefit 1]
| * [Benefit 2]
| * [Benefit 3]
|
| To add this license to your plan, contact Think Tank support:
|
|   support@thinktank.app
|
| [Contact Support]
+-----+
```

This pattern MUST be used consistently across ALL apps, not just Tenant Admin.

8. Invitation Flow with License Checks

8.1 Invite User Flow

Tenant Admin clicks "Invite User"

|

```

      v
Enter email, select role, select app access:
[[ok]] Think Tank (42/50 seats available)
[[ok]] Curator (15/25 seats available)
[[x]] Dojo -- 0 seats available -> DISABLED
      "No Dojo seats available. Buy more seats or deactivate a user."
[[x]] Genesis -- Not licensed -> DISABLED
      "Genesis requires a license. Contact support@thinktank.app"
      |
      v
System checks:
1. Inviter has tenant_admin or tenant_owner role? -> YES
2. Think Tank seat available? -> YES (42 < 50)
3. Curator seat available? -> YES (15 < 25)
4. Email already in this tenant? -> NO
      |
      v
Create user record:
- status = 'invited'
- has_access_think_tank = true
- has_access_curator = true
- Think Tank seats_reserved += 1
- Curator seats_reserved += 1
- Send invitation email (expires in 7 days or tenant-configured)
      |
      v
User accepts invitation:
- status -> 'active'
- seats_reserved -= 1, seats_used += 1 (for each app)

```

8.2 Deactivate User Flow

Tenant Admin deactivates a user

```

      |
      v
System:
- user.status -> 'deactivated'
- For each app the user had access to:
  - seats_used -= 1 (SEAT FREED)
- User can no longer log in
- User data RETAINED (for regulatory compliance)
- Audit log entry created
      |
      v

```

Later, if tenant wants to delete user data:

- Check tenant retention licenses
- If retention period not met -> BLOCK deletion
 - "This user's data must be retained for [X] more days per your [HIPAA/SOC2] license."
- If retention period met -> schedule hard delete

9. Regulatory Compliance & Licensing Interactions

9.1 When a Tenant Enables a Compliance License

Tenant purchases HIPAA license

|
v

System provisions:

1. tenant_licenses: compliance:hipaa -> active
2. tenant_licenses: retention:hipaa -> 2555 days (if purchased)
3. tenant_auth_config: require_mfa -> true (HIPAA requires it)
4. Enable enhanced audit logging for this tenant
5. Enable PHI field management
6. Audit log: "HIPAA compliance activated"

|
v

Tenant Admin UI:

- HIPAA tab becomes visible and functional
- MFA becomes mandatory (cannot be disabled while HIPAA is active)
- Session timeout enforced (15 minutes default for HIPAA)
- All previously-disabled HIPAA features now available

9.2 When a Tenant Disables a Compliance License

Tenant cancels HIPAA license

|
v

System checks:

1. Does tenant have data under HIPAA retention? -> If yes, CANNOT disable
"HIPAA license cannot be removed while data is under HIPAA retention.
Data must be retained until [DATE]. Contact support for assistance."
2. If no retained data -> proceed

|
v

System deprovisions:

1. tenant_licenses: compliance:hipaa -> inactive
2. HIPAA UI features disabled
3. MFA requirement can now be changed (no longer HIPAA-enforced)
4. Audit log: "HIPAA compliance deactivated"

10. License Helper Functions

-- Check if a tenant has a specific license

```
CREATE OR REPLACE FUNCTION check_tenant_license(
  p_tenant_id UUID,
  p_license_type VARCHAR,
  p_app_id VARCHAR DEFAULT 'platform',
  p_feature_code VARCHAR DEFAULT NULL
```

```

) RETURNS BOOLEAN AS $$
BEGIN
    RETURN EXISTS (
        SELECT 1 FROM tenant_licenses
        WHERE tenant_id = p_tenant_id
            AND license_type = p_license_type
            AND app_id = p_app_id
            AND (p_feature_code IS NULL OR feature_code = p_feature_code)
            AND is_active = true
            AND (expires_at IS NULL OR expires_at > NOW())
    );
END;
$$ LANGUAGE plpgsql STABLE;

-- Get available seats for an app
CREATE OR REPLACE FUNCTION get_available_seats(
    p_tenant_id UUID,
    p_app_id VARCHAR
) RETURNS INTEGER AS $$
DECLARE
    v_license tenant_licenses%ROWTYPE;
BEGIN
    SELECT * INTO v_license FROM tenant_licenses
    WHERE tenant_id = p_tenant_id
        AND license_type = 'seat'
        AND app_id = p_app_id
        AND is_active = true;

    IF NOT FOUND THEN RETURN 0; END IF;

    RETURN v_license.quantity - v_license.used - v_license.reserved;
END;
$$ LANGUAGE plpgsql STABLE;

-- Consume a seat (on user activation)
CREATE OR REPLACE FUNCTION consume_seat(
    p_tenant_id UUID,
    p_app_id VARCHAR
) RETURNS BOOLEAN AS $$
DECLARE
    v_available INTEGER;
BEGIN
    v_available := get_available_seats(p_tenant_id, p_app_id);
    IF v_available <= 0 THEN RETURN false; END IF;

    UPDATE tenant_licenses
    SET used = used + 1, updated_at = NOW()
    WHERE tenant_id = p_tenant_id
        AND license_type = 'seat'
        AND app_id = p_app_id

```

```

        AND is_active = true;

    RETURN true;
END;
$$ LANGUAGE plpgsql;

-- Release a seat (on user deactivation)
CREATE OR REPLACE FUNCTION release_seat(
    p_tenant_id UUID,
    p_app_id VARCHAR
) RETURNS BOOLEAN AS $$
BEGIN
    UPDATE tenant_licenses
    SET used = GREATEST(used - 1, 0), updated_at = NOW()
    WHERE tenant_id = p_tenant_id
        AND license_type = 'seat'
        AND app_id = p_app_id
        AND is_active = true;

    RETURN FOUND;
END;
$$ LANGUAGE plpgsql;

```

11. Adding New License Types (For Engineers)

When a new licensable feature is added to the platform:

1. **Add a row to `license_catalog`** with the new license definition
 2. **Add license check to the relevant API endpoint(s)** using the middleware pattern in Section 5
 3. **Add UI gating** in the relevant app – show “license required” message if unlicensed
 4. **Update tier defaults** if the feature should be included in any tier
 5. **Update this document** (Section 3) with the new license type
 6. **NO code changes to the licensing system itself** – it reads `license_catalog` dynamically
-

12. Adding New Apps (For Engineers)

When a new user-facing app is added to the platform:

1. **Add seat:<app_id> to `license_catalog`** with tier defaults
 2. **Add `has_access_<app_id>` column to `users` table** (or use the dynamic permission system)
 3. **Add the app to the invitation UI** in Think Tank Tenant Admin
 4. **Add seat license rows** to `tenant_licenses` for all existing tenants (migration)
 5. **All API endpoints in the new app** must use the license middleware with `app_id: '<app_id>'`
 6. **Update this document** (Sections 3.1 and 4)
-

12A. Tenant-Disableable Regulatory Features & UI Pattern

Overview

Regulatory compliance features are **optional licensed features**. When a tenant has a compliance license, the corresponding features are enabled. When they don't, the features are disabled with a clear UI message.

However, even when a tenant HAS a compliance license, the tenant_owner can choose to **disable specific compliance features** for their tenant (e.g., they have HIPAA but want to temporarily disable certain PHI scanning rules).

Which Features Can Be Tenant-Disabled

Feature	Can Tenant Disable?	Impact If Disabled	Notes
HIPAA	[OK]	PHI scanning off, audit logging reduced	Warning: "Disabling HIPAA may violate BAA"
HIPAA Retention	[X]	Cannot disable – required by law once activated	Locked for 7 years after activation
GDPR	[OK]	Erasure workflows still available (required by law), but consent UI hidden	"GDPR erasure rights cannot be fully disabled"
SOC 2	[OK]	Self-audit tools hidden, compliance reports disabled	No regulatory consequence
CCPA	[OK]	Consumer opt-out tracking hidden	Warning if CA users detected
ISO 27001	[OK]	ISMS controls hidden	No regulatory consequence
Data Residency	[X]	Cannot disable – data cannot be moved once pinned	Locked once activated
Enhanced Audit	[OK]	Per-request audit logging stops	Warning if other compliance requires it

Feature	Can Tenant Disable?	Impact If Disabled	Notes
PCI-DSS	[OK]	Cardholder data controls hidden	Only relevant if processing cards
FedRAMP	[X]	Cannot disable – federal requirement once certified	Locked once activated
HITRUST	[OK]	Healthcare security controls hidden	Warning if HIPAA also active
EU AI Act	[OK]	AI trans-parency/oversight features hidden	Warning for EU-based tenants

Disable UI Pattern (Think Tank Tenant Admin -> Compliance)

+-----+		
Compliance Features		
+-----+		
[OK] HIPAA Compliance	[ON/OFF]	
PHI management, enhanced audit, BAA		
[!] Disabling may violate your Business Associate Agreement. Contact legal before disabling.		
[LOCK] HIPAA 7-Year Retention	[LOCKED]	
Cannot be disabled once activated.		
Earliest deactivation: 2033-02-06		
[OK] GDPR Compliance	[ON/OFF]	
Consent UI, portability, DSAR workflows		
Right to erasure remains active per EU law		
[OK] SOC 2 Type II	[ON/OFF]	
Self-audit, evidence collection, reports		
[X] PCI-DSS	[NOT LICENSED]	
Contact support@thinktank.app to add this license.		
[Contact Support]		
+-----+		

States

State	Visual	Behavior
Licensed + Enabled	Green toggle ON	Feature fully active
Licensed + Disabled by tenant	Gray toggle OFF	Feature hidden from users, can re-enable
Licensed + Locked	Lock icon, no toggle	Cannot be disabled (retention, residency, FedRAMP)
Not Licensed	“NOT LICENSED” badge	Contact support message, no toggle

API Enforcement

When a feature is disabled by the tenant (even if licensed):

```
// Check both license AND tenant enablement
const isEnabled = await checkFeatureEnabled(tenantId, 'hipaa');
// Returns false if: no license OR license exists but tenant disabled it

// API response when tenant-disabled:
{
  "error": "FEATURE_DISABLED",
  "feature_code": "hipaa",
  "message": "HIPAA compliance is disabled for this tenant. Contact your tenant administrator to
  "disabled_by": "tenant_admin"
}
```

Storage

Tenant-level feature enablement is stored in the tenant_licenses table via the is_active field: - is_active = true -> Licensed and enabled - is_active = false -> Licensed but tenant-disabled
For locked features, the application logic prevents toggling is_active to false.

13. Version History

Version	Date	Changes
1.0.0	2026-02-06	Initial licensing model: flexible multi-dimension licensing, regulatory compliance as licensed features, per-app seats, API enforcement middleware, tier defaults

Think Tank Licensing Model v1.0.0 RADIANT Platform – February 2026 Contact: support@thinktank.app

Part VI: Delight UX System

Version: 7.27.0 **Last Updated:** February 2026 **Audience:** Platform Admins, Think Tank Admins, Developers, AI Agents

1. What Is Delight?

Delight is RADIANT's personality and UX experience layer. It is the system that makes every AI interaction feel alive, empathetic, and human – not robotic. Delight operates across **every user-facing RADIANT application** and manifests as contextual micro-copy, sound effects, achievements, easter eggs, and personality-aware messaging at every stage of the user's journey.

Definition

Delight is a multi-layered UX system that provides personality-aware feedback at every stage of AI interaction – before, during, and after execution. It adapts its tone based on personality mode, time of day, knowledge domain, query complexity, model consensus, and session duration. It rewards engagement through achievements, surprises users with easter eggs, and makes errors feel recoverable rather than catastrophic.

What Delight Is NOT

- **Not cosmetic:** Delight is architecturally integrated into the AGI Brain Planner, not bolted on
- **Not optional:** Every user-facing app **MUST** integrate Delight (see Enforcement Policy)
- **Not one-size-fits-all:** Messages adapt to 5 personality modes and contextual signals
- **Not Think Tank-only:** Delight spans Curator, Dojo, Think Tank Admin, Tenant Admin, and all future apps

Why Delight Matters

1. **Emotional Resonance:** Users form stronger bonds with software that acknowledges their actions
2. **Error Recovery:** Empathetic error messages reduce user frustration and abandonment
3. **Engagement:** Achievements and easter eggs create a discovery loop that drives retention
4. **Differentiation:** No competing AI platform has a personality system this deep
5. **Trust:** Progress messages during long operations reduce perceived wait time by up to 40%

2. Philosophy & Design Principles

The Three Phases

Every user interaction has three phases, and Delight is present in all of them:

Phase	What Happens	Delight’s Role
Pre-Execution	User submits a request	Acknowledge the request, set expectations, show domain awareness
During Execution	AI models are working	Narrate progress, show step-by-step activity, maintain engagement
Post-Execution	Result is delivered	Celebrate success, offer next steps, record achievements

Design Principles

1. **Respectful:** Never patronize. Professional mode exists for users who want minimal flair
2. **Contextual:** A legal query gets different messages than a creative writing prompt
3. **Adaptive:** Time-of-day, session length, and domain all influence tone
4. **Granular Control:** Users choose their personality mode; admins manage message catalogs
5. **Fail Gracefully:** If the Delight backend is unavailable, client-side fallbacks take over
6. **Tenant-Isolated:** Each tenant’s delight preferences, achievements, and analytics are isolated via RLS

3. Architecture Overview

Layers

Layer	Technology	Role
Frontend (Think Tank)	React Context + framer-motion	Native CLARION delight with chemistry moments
Frontend (Cross-App)	@radiant/delight-ui package	Universal provider, toast UI, personality persistence
API	Lambda handler (delight/handler.ts)	REST endpoints for messages, preferences, achievements, easter eggs
Core Service	delight.service.ts	Message selection, caching, filtering, CRUD, analytics
Orchestration	delight-orchestration.service.ts	Maps AGI Brain workflow events to Delight triggers

Layer	Technology	Role
Events	<code>delight-events.service.ts</code>	Real-time SSE streaming of delight events during plan execution
Database	Aurora PostgreSQL	Messages, categories, achievements, easter eggs, sounds, preferences, event log

4. Personality Modes

Users select their preferred personality mode. All apps **MUST** respect this setting.

Mode	Behavior	Example Message
auto	Adapts based on time, domain, session length (see Auto Mode Resolution)	<i>(varies by context)</i>
professional	Clean, minimal, business-focused. Suppresses idle and session_start messages	“Operation completed successfully.”
subtle	Light touches, mostly informative. Low intensity	“Done.”
expressive	Engaging, helpful, enthusiastic. Default for most contexts	“Nailed it! All done!”
playful	Fun, witty, creative. Uses humor and pop-culture references	“Another one bites the dust!”

Intensity Levels

In addition to mode, users can set an **intensity level** (1-10):

- **1-3**: Only essential messages (errors, completions)
- **4-6**: Standard delight (default: 5)
- **7-10**: Full delight with ambient messages, wellbeing nudges, and frequent achievements

5. Injection Points

Injection points define **when** Delight messages appear. There are 11 standard injection points:

Injection Point	When	Required?	Sound?
page_load	App or page first renders	Recommended	No
session_start	New user session begins	Recommended	No
pre_execution	Before an async operation starts	Required for long ops	transition_whoosh
during_execution	While operation is running (>2s)	Required for long ops	No
post_execution	After successful operation	Required	confirm_chime
action_complete	After save/update/delete	Required	confirm_subtle
error_recovery	On operation failure	Required	error
milestone	Achievement unlocked or milestone reached	Recommended	milestone
onboarding	First-time user experience	Recommended	No
session_end	User logs out or session ends	Optional	No
idle	Extended inactivity (expressive/playful only)	Optional	No

Trigger Types (Backend)

The backend service uses more granular trigger types within injection points:

Trigger Type	Description
domain_loading	Loading domain-specific knowledge
domain_transition	Switching between knowledge domains
time_aware	Time-of-day-sensitive message
model_dynamics	Model selection or consensus information
complexity_signals	Query complexity acknowledgment

Trigger Type	Description
synthesis_quality	Post-synthesis quality assessment
achievement	Achievement progress or unlock
wellbeing	Session-length wellbeing nudge
easter_egg	Hidden feature discovery

6. Backend Services

6.1 Core Delight Service

File: `packages/infrastructure/lambda/shared/services/delight.service.ts`

The central service managing all Delight operations:

- **Message Selection:** Queries `delight_messages` table, filters by injection point, trigger type, domain family, time context, and user preferences. Uses in-memory cache (60s TTL)
- **User Preferences:** CRUD for `user_delight_preferences` table (personality mode, intensity, feature toggles)
- **Achievements:** Progress tracking with threshold-based unlocking
- **Easter Eggs:** Trigger detection, discovery tracking, achievement integration
- **Analytics:** Aggregated metrics (messages shown, achievements unlocked, easter eggs discovered, engagement by mode)
- **Auto Mode:** Resolves auto personality to a concrete mode based on context signals
- **Admin CRUD:** Full management of categories, messages, achievements, easter eggs, sounds

6.2 Delight Orchestration Service

File: `packages/infrastructure/lambda/shared/services/delight-orchestration.service.ts`

Bridges the AGI Brain Planner with the Delight system:

- Maps `StepType` -> `TriggerType` (e.g., `analyze` -> `complexity_signals`, `synthesize` -> `synthesis_quality`)
- Maps `OrchestrationMode` -> domain family (e.g., `coding` -> `programming`, `creative` -> `creative`)
- Provides step-specific messages (e.g., “Verifying accuracy...” for `verify_steps`)
- Provides mode-specific messages (e.g., “Deep thinking mode activated...” for `extended_thinking`)
- Tracks session start times and domain transitions per user
- Checks achievement progress on plan completion (queries count, domain explorer, complexity, time spent)
- Returns appropriate sound effects for each workflow event

6.3 Delight Events Service

File: `packages/infrastructure/lambda/shared/services/delight-events.service.ts`

Real-time event emitter for streaming delight messages to the frontend:

- Extends `Node.js EventEmitter`
- Subscription model per `planId` with automatic history replay
- Event types: `message`, `achievement`, `easter_egg`, `sound`, `step_update`, `plan_update`

- SSE stream helper (`createDelightEventStream`) for Server-Sent Events
- Integration helper (`emitDelightForPlanExecution`) for use in the Brain Planner

7. Frontend: Think Tank (Native)

File: `apps/thinktank/components/axiom/DelightSystem.tsx`

Think Tank has a **native** Delight implementation tailored to the CLARION questioning flow:

Components

Component	Purpose
<code>DelightProvider</code> <code>useDelight()</code>	React Context wrapping the chat UI Hook exposing <code>showProgressMessage</code> , <code>checkChemistry</code> , <code>getDomainQuestion</code> , <code>playSound</code>
<code>DelightToast</code>	Animated toast notification (framer-motion)
<code>ChemistryMomentDisplay</code>	Shows model consensus/disagreement moments
<code>ProgressAcknowledgment</code>	Inline progress messages during CLARION flow

CLARION-Specific Features

- **Progress Messages:** After each CLARION clarifying question (“Got it. This helps narrow things down.”)
- **Chemistry Moments:** When model scores shift significantly, new leaders emerge, or strong consensus forms
- **Domain-Aware Phrasing:** Questions are phrased differently for legal vs. medical vs. engineering domains
- **Sound Effects:** Optional audio feedback for answers, completions, and chemistry moments

Domain Phrasing Examples

Domain	Question Key	Phrased As
<code>legal.contracts</code>	<code>partyRole</code>	“Are you the provider or the customer in this agreement?”
<code>medicine.diagnosis</code>	<code>urgency</code>	“How urgently do you need this information?”
<code>engineering.software</code>	<code>scope</code>	“Is this a quick fix or a larger architectural decision?”
<code>business.finance</code>	<code>timeframe</code>	“What’s your investment timeframe?”
<code>creative.writing</code>	<code>tone</code>	“What tone are you aiming for?”

Settings Integration

The `PersonalityMode` setting is stored in the Zustand settings store (`apps/thinktank/lib/stores/settings-store.ts`) and configurable on the Settings page (`apps/thinktank/app/settings/page.tsx`).

8. Frontend: Cross-App (@radiant/delight-ui)

Package: `packages/delight-ui/`

A shared React component library providing Delight to ALL non-Think Tank apps.

Exports

```
import {
  RadiantDelightProvider, // Root provider component
  useRadiantDelight,      // Hook (throws if outside provider)
  useRadiantDelightOptional // Hook (returns null if outside provider)
} from '@radiant/delight-ui';

import type {
  PersonalityMode,
  InjectionPoint,
  DisplayStyle,
  AppDelightConfig,
  RadiantDelightContextValue,
} from '@radiant/delight-ui';
```

Usage

```
// 1. Configure in providers.tsx
const MY_APP_CONFIG: AppDelightConfig = {
  appId: 'my_app',
  appName: 'My App',
  defaultPersonalityMode: 'auto',
  greetingMessages: ['Welcome!'],
  postExecutionMessages: ['Done!'],
  errorRecoveryMessages: ['Something went wrong.'],
};

// 2. Wrap in providers
<RadiantDelightProvider config={MY_APP_CONFIG}>
  {children}
</RadiantDelightProvider>

// 3. Trigger in components
const { triggerDelight, showDelightToast } = useRadiantDelight();
triggerDelight('action_complete'); // Standard injection point
triggerDelight('error_recovery'); // Error handling
showDelightToast('Custom message', '[TARGET]'); // Custom toast
```

Features

- **Personality Persistence:** Saves mode/sound preferences to `localStorage` per app
- **5 Personality Modes:** Each injection point has unique messages per mode
- **Toast UI:** Animated bottom-center toasts with framer-motion, glassmorphic design
- **Display Styles:** toast (default), banner (errors), celebration (milestones), subtle (idle)
- **Sound Effects:** Optional audio for success, error, milestone, and subtle events
- **Fallback Messages:** 110+ built-in messages across all injection points and personality modes

9. Database Schema

Tables

Table	Purpose
<code>delight_categories</code>	Message categories (e.g., “Domain Awareness”, “Model Chemistry”)
<code>delight_messages</code>	Individual messages with injection point, trigger type, domain families, time contexts, display style
<code>delight_achievements</code>	Achievement definitions with thresholds, celebration messages, rarity, points
<code>delight_easter_eggs</code>	Hidden features with trigger types/values, activation messages, effect configs
<code>delight_sounds</code>	Sound effect definitions with URLs, themes, volume defaults
<code>delight_event_log</code>	Audit trail of all delight interactions (message shown, achievement unlocked, easter egg found)
<code>delight_statistics</code>	Aggregated usage statistics per tenant
<code>user_delight_preferences</code>	Per-user personality mode, intensity, feature toggles, sound settings
<code>user_achievements</code>	Per-user achievement progress and unlock status

Key Migrations

- `075_delight_system.sql` – Core tables (categories, messages, achievements, easter eggs, sounds, preferences)
- `076_delight_statistics.sql` – Statistics and analytics tables
- `085_platform_improvements.sql` – Additional delight refinements

Row-Level Security

All delight tables enforce tenant isolation via `app.current_tenant_id`: - `user_delight_preferences`: User can only read/write their own preferences - `user_achievements`: User can only see their own achievements - `delight_event_log`: Scoped to tenant

10. API Reference

User-Facing Endpoints

Base: /api/delight

Method	Path	Description
GET	/message	Get a delight message for an injection point and trigger type
POST	/orchestration-messages	Get messages for an orchestration context
GET	/preferences	Get user's delight preferences
PUT	/preferences	Update user's delight preferences
GET	/achievements	Get user's achievement list and progress
POST	/achievements/progress	Record achievement progress
POST	/easter-egg	Trigger an easter egg check

Admin Endpoints

Base: /api/admin/delight

Method	Path	Description
GET	/dashboard	Full dashboard (categories, messages, achievements, easter eggs, sounds, analytics)
GET	/categories	List all categories
PATCH	/categories/:id	Toggle category enabled/disabled
GET	/messages	List messages (filterable by category, injection point)
POST	/messages	Create a new message
PUT	/messages/:id	Update a message
DELETE	/messages/:id	Delete a message
GET	/achievements	List all achievements
GET	/easter-eggs	List all easter eggs
GET	/sounds	List all sounds
GET	/analytics	Engagement analytics (messages shown, achievements, easter eggs, mode distribution)
GET	/statistics	Detailed usage statistics
GET	/user-engagement	User engagement leaderboard

11. Admin Management

Think Tank Admin UI

Page: `apps/thinktank-admin/app/(dashboard)/delight/page.tsx`

The Delight admin page provides:

- **Message Management:** Browse, create, edit, and delete messages by category and injection point
- **Category Controls:** Enable/disable entire message categories
- **Achievement Editor:** Define achievements with thresholds, rarity, points, and celebration messages
- **Easter Egg Manager:** Configure hidden features with trigger conditions and effects
- **Sound Library:** Manage sound effects and themes
- **Analytics Dashboard:** Messages shown, achievements unlocked, easter eggs discovered, engagement by personality mode
- **User Engagement:** Leaderboard showing most engaged users

12. Achievements System

Achievements reward user engagement and create a discovery loop.

Achievement Types

Type	Description	Example
queries_count	Number of queries made	“First Steps” (1 query), “Power User” (100 queries)
domain_explorer	Unique domains explored	“Domain Hopper” (5 domains), “Renaissance Mind” (20 domains)
complexity	Complex queries handled	“Deep Thinker” (10 complex queries)
time_spent	Minutes spent in sessions	“Dedicated” (60 min), “Marathon” (240 min)
discovery	Easter eggs discovered	“Explorer” (1 egg), “Archaeologist” (10 eggs)

Rarity Tiers

Rarity	Points	Frequency
common	10	~50% of users
uncommon	25	~25% of users
rare	50	~10% of users
epic	100	~3% of users

Rarity	Points	Frequency
legendary	250	<1% of users

Celebration Flow

1. User action triggers `recordAchievementProgress()`
2. Progress is incremented in `user_achievements`
3. If `progress_value >= threshold_value` and not yet unlocked -> **unlock**
4. Achievement celebration message is emitted via `DelightEventsService`
5. Frontend shows celebration toast with achievement name, icon, and message

13. Easter Eggs

Easter eggs are hidden surprises that create delight through discovery.

Trigger Types

Trigger Type	Description
keyword	User types a specific word or phrase
date	Triggered on a specific calendar date
sequence	User performs a specific action sequence
time	Triggered at a specific time of day
achievement	Triggered when a specific achievement is unlocked

Effect Types

Effect Type	Description
message	Show a special message
animation	Trigger a visual animation
sound	Play a special sound effect
theme	Temporarily change the UI theme
confetti	Show confetti animation

Discovery Tracking

- Each easter egg has a `discovery_count` that increments on first discovery per user
- First-time discovery also contributes to the `discovery` achievement type
- All discoveries are logged in `delight_event_log` for analytics

14. Sound Effects

Sound Themes

Theme	Description
default	Standard RADIANT sounds
minimal	Subtle, low-key audio cues
playful	Fun, expressive sounds
nature	Natural ambient sounds

Sound Categories

Category	Used For
transition_whoosh	Plan start, mode switch
confirm_chime	Plan completion, major success
confirm_subtle	Step completion, small action
consensus_ping	Model consensus reached
error	Error recovery
milestone	Achievement unlocked

User Controls

- **Enable/Disable:** Per-user toggle via preferences
- **Volume:** Adjustable (0-100, default: 50)
- **Theme Selection:** Choose preferred sound theme

15. Real-Time Events (SSE)

The `DelightEventsService` enables real-time streaming of delight messages during plan execution:

```
// Subscribe to events for a plan
const unsubscribe = delightEventsService.subscribe({
  planId: 'plan-123',
  userId: 'user-456',
  tenantId: 'tenant-789',
  callback: (event) => {
    // event.type: 'message' | 'achievement' | 'easter_egg' | 'sound' | 'step_update' | 'plan_update'
    renderDelightEvent(event);
  },
});
```

```
// Or create an SSE stream for the frontend
const { stream, close } = createDelightEventStream('plan-123', 'user-456', 'tenant-789');
```

Event Types

Type	Data	When
message	DelightMessageResponse	Progress/domain/time messages
achievement	{ id, name, celebrationMessage }	Achievement unlocked
easter_egg	{ id, name, activationMessage }	Easter egg discovered
sound	{ soundId }	Sound effect trigger
step_update	{ stepId, stepType, status, message }	Brain plan step progress
plan_update	{ status, message }	Overall plan status change

16. AGI Brain Integration

The Delight Orchestration Service integrates with the AGI Brain Planner to provide contextual messages during AI workflows:

Workflow Event Mapping

Brain Event	Delight Action
plan_start	Pre-execution messages, mode-specific greeting, transition_whoosh sound
step_start	Step-specific progress message (e.g., “Selecting the best model...”)
step_complete	confirm_subtle sound
model_selected	Model dynamics message
domain_detected	Domain-aware loading message (e.g., “Consulting legal precedent...”)
consensus_reached	Consensus message, consensus_ping sound
disagreement	Divergent perspectives message
plan_complete	Success celebration, achievement checks, confirm_chime sound

Domain-Aware Messages

The orchestration service provides domain-specific loading messages for 11+ domains:

```
Physics:      "Collapsing the wave function..."
Chemistry:    "Balancing the equations..."
Medicine:     "Reviewing the differential..."
Programming:  "Compiling the solution..."
Law:          "Reviewing case law..."
Finance:      "Crunching the numbers..."
Philosophy:   "Contemplating the question..."
Cooking:      "Preheating the knowledge base..."
Music:        "Tuning the harmonics..."
Art:          "Composing the palette..."
```

Model Dynamics Messages

Consensus Level	Example Messages
Strong	"The models agree on this one."
Moderate	"Balancing different viewpoints..."
Divergent	"The models are debating this one."

17. Per-App Configurations

Each app has a tailored AppDelightConfig defined in its providers.tsx:

Think Tank (Consumer)

- **Native implementation** with CLARION-specific chemistry moments, domain phrasing, and progress acknowledgments
- Config: apps/thinktank/components/axiom/DelightSystem.tsx

Curator

- **Theme:** Knowledge curation and ingestion
- Messages: "Ingesting knowledge...", "Knowledge graph updated.", "Your knowledge base just got smarter."
- Custom points: domain_verified, graph_updated
- Config: apps/curator/app/providers.tsx

Aurelius Dojo

- **Theme:** Martial arts training and mastery
- Messages: "The dojo awaits, student.", "Belt earned! Your mastery grows.", "Excellent form."
- Custom points: sparring_start, sparring_complete, mastery_achieved
- Config: apps/dojo/app/providers.tsx

Think Tank Admin

- **Theme:** Platform administration
- Messages: “Admin dashboard ready.”, “Configuration locked in.”, “Delight messages published to all users.”
- Custom points: config_saved, user_managed, delight_published
- Config: apps/thinktank-admin/app/providers.tsx

Think Tank Tenant Admin

- **Theme:** Organization management
- Messages: “Tenant dashboard ready.”, “Invitation sent!”, “Your organization is more secure now.”
- Custom points: user_invited, user_deactivated, security_updated
- Config: apps/thinktank-tenant-admin/app/providers.tsx

18. User Preferences

Each user has granular control over their Delight experience:

Preference	Type	Default	Description
personalityMode	enum	expressive	auto, professional, subtle, expressive, playful
intensityLevel	1-10	5	How frequently messages appear
enableDomainMessages	boolean	true	Domain-aware messages
enableModelPersonality	boolean	true	Model dynamics and consensus messages
enableTimeAwareness	boolean	true	Time-of-day-aware messages
enableAchievements	boolean	true	Achievement tracking and celebrations
enableWellbeingNudges	boolean	true	“Take a break” messages after long sessions
enableEasterEggs	boolean	true	Hidden feature discovery
enableSounds	boolean	false	Sound effects
soundTheme	enum	default	default, minimal, playful, nature
soundVolume	0-100	50	Sound effect volume

19. Auto Mode Resolution

When personalityMode is set to auto, the system intelligently selects a concrete mode:

Time-Based Resolution

Time	Resolved Mode	Rationale
Morning (6-12)	subtle	Calm start to the day
Afternoon (12-18)	expressive	Engaged midday energy
Evening (18-22)	playful	More relaxed evening
Night (22-6)	subtle	Quiet late night
Weekend	playful	Weekend fun

Domain-Based Overrides

Domain Category	Override
Business, Finance, Legal, Medical	professional
Arts, Creative, Design, Entertainment	expressive

Session-Length Adjustment

- Sessions >60 minutes: Professional -> Subtle, others -> Expressive (more supportive during long sessions)

20. Analytics & Engagement

Tenant-Level Analytics

Metric	Description
totalMessagesShown	Total delight messages displayed
achievementsUnlocked	Total achievements unlocked across all users
easterEggsDiscovered	Unique easter eggs discovered
engagementByMode	User count per personality mode

User Engagement Leaderboard

Ranked by total delight interactions (messages + achievements + easter eggs).

Admin Dashboard

Available at Think Tank Admin > Delight: - Summary cards (total messages, enabled messages, achievements, easter eggs, sounds) - Mode distribution chart - Engagement timeline - Top users by delight interaction

21. Developer Guide

Adding Delight to a New App

1. Add dependency:

```
"@radiant/delight-ui": "workspace:*"
```

2. Ensure peer deps: framer-motion, lucide-react

3. Create config in providers.tsx:

```
import { RadiantDelightProvider, type AppDelightConfig } from '@radiant/delight-ui';

const CONFIG: AppDelightConfig = {
  appId: 'your_app',
  appName: 'Your App',
  greetingMessages: [...],
  postExecutionMessages: [...],
  errorRecoveryMessages: [...],
};
```

4. Wrap with provider:

```
<RadiantDelightProvider config={CONFIG}>
  {children}
</RadiantDelightProvider>
```

5. Use in components:

```
const { triggerDelight } = useRadiantDelight();

// After mutation success
triggerDelight('action_complete');

// After error
triggerDelight('error_recovery');
```

Adding a New Injection Point

1. Add the point to InjectionPoint type in packages/delight-ui/src/types.ts
2. Add default messages to DEFAULT_MESSAGES in RadiantDelightProvider.tsx
3. Add icon mapping to ICONS in RadiantDelightProvider.tsx
4. Add database messages via admin API or migration
5. Update this documentation

Adding a New Achievement

1. Insert into delight_achievements table:

```
INSERT INTO delight_achievements (id, name, description, icon, achievement_type,
  threshold_value, celebration_message, rarity, points, is_hidden, is_enabled)
VALUES ('my_achievement', 'My Achievement', 'Description', '[TROPHY]', 'custom_type',
  10, 'You did it!', 'rare', 50, false, true);
```

2. Call delightService.recordAchievementProgress(userId, tenantId, 'custom_type', 1) at the appropriate point

22. Enforcement Policy

Policy File: `.windsurf/workflows/delight-ux-policy.md`

Rules

1. **Every user-facing RADIANT app MUST integrate @radiant/delight-ui**
2. **Required triggers:** `action_complete` on every successful mutation, `error_recovery` on every error
3. **Personality respect:** All apps MUST honor the user's chosen personality mode
4. **No generic messages:** Never show “Loading...” or “Error occurred” – use Delight messages
5. **Never remove:** Do not remove `RadiantDelightProvider` from any app

Compliance Matrix

App	Status	Config Location
Think Tank	[OK] Native	<code>apps/thinktank/components/axiom/DelightSystem.tsx</code>
Curator	[OK] Integrated	<code>apps/curator/app/providers.tsx</code>
Aurelius Dojo	[OK] Integrated	<code>apps/dojo/app/providers.tsx</code>
Think Tank Admin	[OK] Integrated	<code>apps/thinktank-admin/app/providers.tsx</code>
Tenant Admin	[OK] Integrated	<code>apps/thinktank-tenant-admin/app/providers.tsx</code>
Genesis	[!] Partial	Has personality in <code>GenesisForge</code>
Admin Dashboard	Has API routes	Not user-facing consumer app

23. File Inventory

Shared Package

File	Purpose
<code>packages/delight-ui/package.json</code>	Package definition
<code>packages/delight-ui/tsconfig.json</code>	TypeScript configuration
<code>packages/delight-ui/src/index.ts</code>	Package exports
<code>packages/delight-ui/src/types.ts</code>	TypeScript types
<code>packages/delight-ui/src/RadiantDelightProvider.tsx</code>	Universal provider, hook, toast UI
<code>packages/delight-ui/src/configs/tenant-admin.ts</code>	Pre-built Tenant Admin config

Backend Services

File	Purpose
lambda/shared/services/delight.service.ts	Core service (1,314 lines) – messages, preferences, achievements, easter eggs, analytics
lambda/shared/services/delight-orchestration.service.ts	AGI Brain integration (558 lines)
lambda/shared/services/delight-events.service.ts	Real-time SSE events (368 lines)
lambda/delight/handler.ts	REST API handler (505 lines) – 20 endpoints

Frontend (Think Tank Native)

File	Purpose
apps/thinktank/components/axiom/DelightProvider.tsx	Custom Delight provider, chemistry moments, progress, toasts
apps/thinktank/lib/axiom/types.ts	DelightConfig, ChemistryMoment, ProgressMessage types
apps/thinktank/lib/stores/settings-store.ts	PersonalityMode in Zustand store
apps/thinktank/app/settings/page.tsx	User personality mode selector

Frontend (Cross-App Configs)

File	Purpose
apps/curator/app/providers.tsx	Curator Delight config
apps/dojo/app/providers.tsx	Dojo Delight config
apps/thinktank-admin/app/providers.tsx	TT Admin Delight config
apps/thinktank-tenant-admin/app/providers.tsx	Tenant Admin Delight config

Admin UI

File	Purpose
apps/thinktank-admin/app/(dashboard)/delight/page.tsx	Delight management dashboard

Database

File	Purpose
migrations/archive/075_delight_system_core	Core delight tables
migrations/archive/076_delight_statistics	Statistics tables
migrations/000_consolidated_schema.sql	Consolidated schema (includes delight tables)

Tests

File	Purpose
lambda/shared/services/__tests__/delight-core.service.test.ts	Core service tests
lambda/shared/services/__tests__/delight-events.service.test.ts	Events service tests
lambda/shared/services/__tests__/delight-orchestration.service.test.ts	Orchestration tests

Policy

File	Purpose
.windsurf/workflows/delight-ux-policy.md	Enforcement policy for all apps

24. Polymorphic UI Integration

Delight directly influences Think Tank’s polymorphic (morphing) UI. Personality mode controls animation behavior, transition narration, and overlay visibility.

Animation Parameters by Personality Mode

Parameter	Professional	Subtle	Expressive	Playful
Spring stiffness	500	350	300	200
Spring damping	40	35	25	15
Duration (s)	0.15	0.2	0.3	0.4
Scale enter	0.99	1.0	0.97	0.92

Parameter	Professional	Subtle	Expressive	Playful
Y offset	4px	0px	10px	20px
Animation type	tween	tween	spring	spring
Show particles	No	No	No	Yes
Show morph overlay	No	No	Yes	Yes

Morph Narration Examples

When the UI morphs to a new view type, the transition overlay text adapts:

View	Professional	Playful
Data Grid	“Switching to data grid.”	“Ooh, spreadsheet time! Let’s crunch some numbers! [CHART]”
Chart	“Opening visualization.”	“Making data look gorgeous – you’re welcome! [UP]”
Kanban	“Loading task board.”	“Kanban board incoming! Drag all the things! [TARGET]”
Terminal	“Entering command mode.”	“Welcome to the Matrix.”
Canvas	“Opening canvas.”	“Infinite canvas! Draw like nobody’s watching! [DESIGN]”

Integration Points

Component	File	What Personality Controls
ViewRouter	components/polymer/switch/router.tsx	Mode switch, delight, escalation narration
ViewMorphTransition	Same file	Spring stiffness, damping, scale, y-offset per mode
LiquidMorphPanel	components/liquid/morph-panel.tsx	Open/Close/Minimize/Maximize parameters
MorphTransitionEffect	Same file	Narration text, subtitle, overlay visibility, spin speed

API

```
import { getAnimationConfig, getMotionTransition, getMorphAnimationStates, getMorphNarration, getMorphParameters } from '@think-tank/radiant';

// Get full config for current personality
const config = getAnimationConfig('playful');
// -> { stiffness: 200, damping: 15, duration: 0.4, showParticles: true, ... }

// Get Framer Motion transition object
const transition = getMotionTransition('professional');
// -> { type: 'tween', duration: 0.15, ease: [0.25, 0.1, 0.25, 1] }
```

```
// Get initial/animate/exit states for morph transitions
const states = getMorphAnimationStates('expressive');
// -> { initial: { opacity: 0, scale: 0.97, y: 10 }, animate: ..., exit: ..., transition: ... }

// Get personality-aware narration for a morph target
const narration = getMorphNarration('playful', 'datagrid');
// -> "Ooh, spreadsheet time! Let's crunch some numbers! [CHART]"
```

25. Web Audio Sound Synthesis

Delight sounds are synthesized in real-time using the Web Audio API. No mp3/wav files are shipped.

Sound Types

Sound	When Played	Description
success	post_execution, action_complete	Ascending tone sequence
error	error_recovery	Descending minor tone
milestone	milestone	Extended ascending arpeggio
subtle	Mode switches, minor actions	Single soft tone
morph	UI view morph transitions	Rising chord progression

Per-Personality Sound Profiles

Mode	Success Sound	Error Sound	Character
Professional	Single 880Hz sine, 80ms	Single 220Hz sine, 120ms	Minimal click
Subtle	Single 800Hz sine, 60ms	Single 200Hz sine, 100ms	Near-silent
Expressive	C-E-G chord (523-659-784Hz), 300ms	E-C descent, 350ms	Musical chord
Playful	C-E-G-C'-E' arpeggio (5 notes), 500ms	A-G#-G descent, 400ms	Celebratory chime
Auto	Same as expressive	Same as expressive	Balanced

API

```
import { playSynthSound } from '@radiant/delight-ui';

playSynthSound('playful', 'success', 0.25); // volume 0-1
playSynthSound('professional', 'morph', 0.2);
```

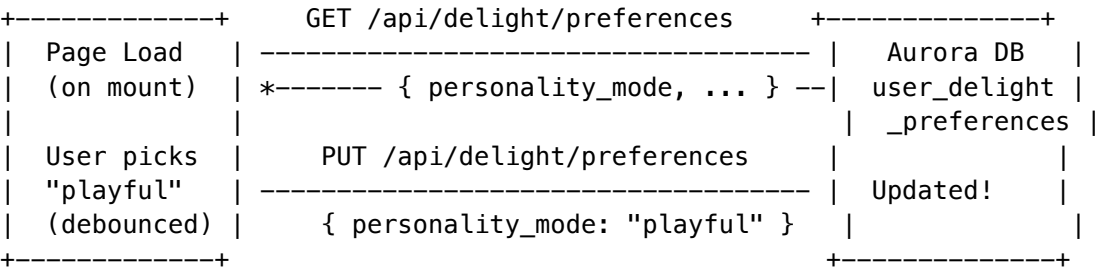

Technical Details

- Uses OscillatorNode + GainNode chain per note
- Each note has attack (1ms linear ramp) and release (exponential decay)
- Notes are sequenced with configurable gaps
- Automatically resumes AudioContext on first user interaction (browser autoplay policy)
- Graceful fallback: if Web Audio API is unavailable, sounds are silently skipped

26. Settings Sync (Frontend -> Backend)

The useDelightSync hook bridges the frontend Zustand settings store with the backend Delight preferences API.

Flow

Hook Location

apps/thinktank/lib/hooks/useDelightSync.ts

Behavior

1. **On mount:** Fetches backend preferences -> applies to Zustand settings-store + RadiantDelight-Provider
2. **On personality change:** Debounced (1.5s) PUT to backend
3. **On sound toggle:** Same debounced sync
4. **Professional mode:** Automatically sets suppress_idle and suppress_session_start on backend

27. End-to-End Wiring Status

Think Tank (Consumer)

Action	Injection Point	Status
Send message	pre_execution	[OK] Wired
Stream complete	post_execution	[OK] Wired
Send error	error_recovery	[OK] Wired

Action	Injection Point	Status
New conversation	session_start	[OK] Wired
Delete conversation	action_complete	[OK] Wired
Export conversation	action_complete / error_recovery	[OK] Wired
Morph to view	action_complete + morph sound	[OK] Wired
Mode switch (sniper/war room)	action_complete + subtle sound	[OK] Wired
Escalate	Toast + morph sound	[OK] Wired
Settings change	Synced to backend	[OK] Wired

Curator

Action	Injection Point	Status
Verify fact	action_complete	[OK] Wired
Reject fact	action_complete	[OK] Wired
Correct fact	action_complete	[OK] Wired
Resolve ambiguity	action_complete	[OK] Wired
Create golden rule	action_complete	[OK] Wired
Delete golden rule	action_complete	[OK] Wired
Resolve conflict	action_complete	[OK] Wired
Create connector	action_complete	[OK] Wired
Sync connector	pre_execution	[OK] Wired
Any failure	error_recovery	[OK] Wired

Dojo (7 components, 17 mutations)

Action	Injection Point	Component	Status
Create library	action_complete	LibraryView	[OK] Wired
Upload document	action_complete	LibraryView	[OK] Wired
Delete document	action_complete	LibraryView	[OK] Wired
Discover themes	milestone	LibraryView	[OK] Wired
Start lecture/sparring	session_start	TrainingArena	[OK] Wired
Submit sparring answer (correct)	action_complete	TrainingArena	[OK] Wired
Submit sparring answer (wrong)	error_recovery	TrainingArena	[OK] Wired

Action	Injection Point	Component	Status
Complete session	milestone	TrainingArena	[OK] Wired
Start scenario	session_start	ScenarioArena	[OK] Wired
Respond to scenario	action_complete	ScenarioArena	[OK] Wired
Conclude scenario	milestone	ScenarioArena	[OK] Wired
Start dialectic	session_start	DialecticArena	[OK] Wired
Submit dialectic response	action_complete	DialecticArena	[OK] Wired
Conclude dialectic	milestone	DialecticArena	[OK] Wired
Trigger reinforcement	session_start	DecayEngine	[OK] Wired
Submit reinforcement answer	action_complete / error_recovery	DecayEngine	[OK] Wired
Update Archytas config	action_complete	ArchytasSettings	[OK] Wired
Extract competencies	milestone	CompetencyMesh	[OK] Wired
Any failure	error_recovery	All components	[OK] Wired

TT Admin

Action	Injection Point	Page	Status
Toggle delight category	action_complete	Delight Dashboard	[OK] Wired
Create delight message	action_complete	Delight Dashboard	[OK] Wired
Update delight message	action_complete	Delight Dashboard	[OK] Wired
Delete delight message	action_complete	Delight Dashboard	[OK] Wired
Create API key	action_complete	API Keys	[OK] Wired
Revoke API key	action_complete	API Keys	[OK] Wired
Restore API key	action_complete	API Keys	[OK] Wired
Any failure	error_recovery	All pages	[OK] Wired

Tenant Admin

Action	Injection Point	Status
Save settings (incl. delight toggle)	Via save handler	[OK] UI implemented
Delight master toggle	tenantDelightEnabled field	[OK] Wired to Provider
Default mode selection	tenantDefaultMode field	[OK] Wired to Provider
User override lock	tenantAllowUserOverride field	[OK] Wired to Provider

28. Enterprise Deployment Guide

For regulated industries (legal, medical, financial), configure the tenant admin settings:

Setting	Recommended Value	Effect
delightEnabled	true	Keep analytics active but output controlled
delightDefaultMode	professional	Zero emoji, zero narration, crisp tweens, factual toasts
delightAllowUserOverride	false	Lock all users to professional mode

To disable delight entirely (zero output, zero analytics): - Set `delightEnabled` to `false` – `triggerDelight()` becomes a silent no-op

See `docs/POLYMORPHIC-LIQUID-UI-GUIDE.md` for comprehensive documentation on how Delight interacts with the Polymorphic and Liquid UI systems.

This document is the authoritative reference for the RADIANT Delight System. Update it whenever Delight components, APIs, database tables, or frontend integrations change.

Part VII: UI & Experience

Version: 7.29.0 | **Last Updated:** February 2026 **Applies to:** Think Tank (consumer), Curator, Dojo, TT Admin, Tenant Admin, Genesis

1. Overview

RADIANT’s UI system has two interconnected layers:

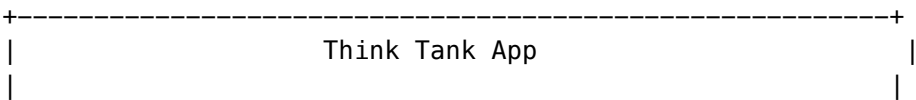

Layer	Purpose	Where
Polymorphic UI	Domain-aware view morphing – the UI structurally transforms based on the AI’s detected domain (code, data, writing, legal, etc.)	Think Tank chat page
Liquid UI	Fluid panel transitions – smooth, physics-based panel open/close/morph animations	Think Tank LiquidMorphPanel
Delight System	Personality-aware micro-interactions layered on top of both	All apps

These systems are **not independent**. The Delight system controls the Polymorphic and Liquid UI’s animation parameters, narration, sounds, and overlay visibility based on the user’s personality mode.

Why This Matters

Without Delight integration, the Polymorphic UI uses hardcoded animation constants (e.g., `stiffness: 300`, `damping: 25`). With Delight, these adapt: - A **lawyer** in Professional mode sees crisp 0.15s tweens with zero overlay - A **creative team** in Playful mode sees bouncy 0.4s springs with narration like “Ooh, spreadsheet time!”

2. Architecture

3. Polymorphic UI

What It Is

The Polymorphic UI is a system where the Think Tank chat interface **structurally transforms** based on the AI’s detected domain. When the AI detects you’re working on a spreadsheet, the UI morphs to show a data-optimized layout. When it detects code, it morphs to a code-first layout.

Key Components

Component	File	Purpose
ViewRouter	apps/thinktank/components/router/router.tsx	Route between domain-specific view modes
ViewMorphTransition	Same file	Animated transition wrapper between views
MorphTransitionEffect	Same file	Full-screen overlay shown during morphs

Domain Modes

The system detects and supports these domain modes:

Mode	Trigger	View Layout
conversational	Default text chat	Standard chat bubbles
analytical	Data tables, CSV, charts	Split pane with data viewer
code	Code blocks detected	Code editor with syntax highlighting
document	Long-form writing	Document-style layout
creative	Images, design	Visual canvas
research	Citations, papers	Reference panel

How Morphing Works

1. **Detection:** The AI’s response metadata includes `domainInfo.currentDomain`
2. **Router:** `ViewRouter` compares current vs. new domain
3. **Transition:** `ViewMorphTransition` wraps the outgoing/incoming view in animated containers
4. **Overlay:** `MorphTransitionEffect` optionally shows narration text during the transition
5. **Sound:** A synth sound plays if the user’s personality mode allows it

4. Liquid UI

What It Is

Liquid UI refers to the fluid, physics-based panel transitions in Think Tank. Panels don’t snap open/closed – they flow with spring physics. The `LiquidMorphPanel` is the primary component.

Key Components

Component	File	Purpose
LiquidMorphPanel	apps/thinktank/components/liquidpanel/LiquidMorphPanel.tsx	Expandable panel with spring-animated open/close
MorphTransitionEffect	Same file or imported	Overlay with personality narration

Spring Physics

Panels animate using spring configurations that vary by personality mode:

Property	Professional	Subtle	Auto	Expressive	Playful
Duration	0.15s	0.2s	0.25s	0.3s	0.4s
Stiffness	400	350	300	250	200
Damping	30	28	25	20	15
Scale	1.0	0.98	0.97	0.95	0.92
Y-Offset	0px	5px	10px	15px	20px
Overlay	None	None	Fade	Slide	Bounce + narration

5. Delight System Integration

How Delight Controls the UI

The Delight system doesn't just show toast messages – it **controls the animation behavior** of the Polymorphic and Liquid UI:

```
// In ViewRouter -- mode switch triggers delight
const handleModeSwitch = (newMode: string) => {
  triggerDelight('action_complete');
  playSynthSound(personalityMode, 'transition', 0.2);
};

// In ViewMorphTransition -- spring constants come from personality
const animConfig = getMorphAnimationStates(personalityMode);
// Returns: { initial: { opacity, scale, y }, animate: { ... }, exit: { ... }, transition: { type,
```

Injection Points in the Chat Lifecycle

Moment	Injection Point	What Happens
User sends message	pre_execution	Toast: “Working on it...” / Sound: subtle click
AI is streaming	during_execution	(Suppressed in professional/subtle)
AI response complete	post_execution	Toast: “Done.” / Sound: success chime
Error occurs	error_recovery	Toast: “Something went wrong...” / Sound: error tone
New conversation	session_start	Toast: “New session started.”
Delete/export chat	action_complete	Toast: “Saved.”
Morph view change	action_complete	Sound: transition synth
Mode escalation	action_complete	Delight toast + escalation sound

Cross-App Delight Triggers

Every app with RadiantDelightProvider wrapping fires triggerDelight() on user actions:

App	Actions Wired
Think Tank	Send message, receive response, error, new conversation, delete, export, morph view, mode switch
Curator	Create connector, sync, verify, reject, correct, resolve ambiguity, resolve conflict, create/delete golden rule
Dojo	Create library, upload/delete document, discover themes, start session, submit answer, complete session, start/respond/conclude scenario, start/respond/conclude dialectic, trigger reinforcement, extract competencies, update Archytas config
TT Admin	Toggle category, create/update/delete message, create/revoke/restore API key
Tenant Admin	Save settings (including delight toggle)

6. Personality Modes

The Five Modes

Mode	Target User	Animations	Sounds	Toasts	Narration
Professional	Lawyers, scientists, regulated industries	Crisp tweens (0.15s)	Single sine click or silent	Factual (“Task complete.”)	Suppressed
Subtle	Academics, analysts	Quick springs (0.2s)	Quiet sine	Minimal	Suppressed
Auto	Default – adapts contextually	Standard springs (0.25s)	Standard	Context-aware	Conditional

Mode	Target User	Animations	Sounds	Toasts	Narration
Expressive	Knowledge workers, educators	Musical springs (0.3s)	Chord progressions	Enthusiastic	Enabled
Playful	Creative teams, training	Bouncy springs (0.4s)	5-note chime arpeggios	Fun (“Boom! Done!”)	Full with emoji

Enterprise Appropriateness

Professional mode is designed specifically for regulated enterprise environments. When a law firm deploys RADIANT with `delightDefaultMode: 'professional'` and `delightAllowUserOverride: false`:

- Zero emoji in any UI surface
- Zero overlay narration during morphs
- Zero playful toast messages
- Minimal, factual confirmation messages (“Changes saved successfully.”)
- Single sine-click sounds (or fully silent if `soundEnabled: false`)
- Crisp, instant tween transitions (no spring bounce)
- Achievement tracking continues silently (for analytics)

Auto Mode Resolution

When a user selects “Auto”, the backend resolves the effective mode in real-time based on three signals:

Signal	Factor	Resolution
Time of day	Morning/business hours	-> Professional
	Afternoon	-> Expressive
	Late night	-> Subtle
Domain context	Legal, medical, compliance	-> Professional
	Creative, design, brainstorming	-> Playful
	Research, data analysis	-> Subtle
Session duration	First 5 minutes	Slightly more personality
	After 60 minutes	-> Subtle (fatigue-aware)

The `resolveAutoPersonality()` method in `delight.service.ts` combines these signals. The user can always explicitly pick a mode to bypass auto resolution.

7. Animation System

Package: @radiant/delight-ui

The animation system is in `packages/delight-ui/src/animations.ts` and exports:

```
// Get spring animation states for a morph transition
getMorphAnimationStates(mode: PersonalityMode): {
  initial: { opacity: number; scale: number; y: number };
  animate: { opacity: number; scale: number; y: number };
  exit: { opacity: number; scale: number; y: number };
  transition: { type: string; stiffness: number; damping: number; duration?: number };
}

// Get personality-specific config for Liquid panels
getPersonalityConfig(mode: PersonalityMode): {
  duration: number;
  stiffness: number;
  damping: number;
  showOverlay: boolean;
  overlayDuration: number;
}

// Get narration text for morph transitions
getMorphNarration(mode: PersonalityMode, targetLabel: string): string | null
// Returns null for professional/subtle, text for others
// Playful example: "Ooh, spreadsheet time! [CHART]"
```

How Components Use It

```
// ViewMorphTransition component
const { initial, animate, exit, transition } = getMorphAnimationStates(personalityMode);
<motion.div initial={initial} animate={animate} exit={exit} transition={transition}>
  {children}
</motion.div>

// LiquidMorphPanel component
const config = getPersonalityConfig(personalityMode);
<motion.div
  animate={{ height: isOpen ? 'auto' : 0 }}
  transition={{ type: 'spring', stiffness: config.stiffness, damping: config.damping }}
>
  {config.showOverlay && <MorphTransitionEffect narration={getMorphNarration(personalityMode, label)} />}
</motion.div>
```

8. Sound Synthesis

Web Audio API – No File Dependencies

All sounds are synthesized at runtime using the Web Audio API. No .mp3, .wav, or .ogg files are shipped.

Package: packages/delight-ui/src/sounds.ts

```
playSynthSound(
  mode: PersonalityMode,
```

```

    type: 'success' | 'error' | 'milestone' | 'subtle' | 'transition',
    volume?: number // 0.0 - 1.0, default 0.25
  ): void

```

Sound Profiles by Personality

Mode	Success	Error	Milestone	Transition
Professional	Single 880Hz sine, 80ms	Single 220Hz sine, 100ms	Two-note (C5->E5), 150ms	Silent
Subtle	Soft 660Hz sine, 100ms	Gentle 330Hz sine, 120ms	Two-note, 180ms	440Hz blip, 50ms
Auto	880Hz + 1100Hz chord, 120ms	220Hz + 330Hz, 150ms	Three-note arpeggio, 250ms	440Hz, 80ms
Expressive	Three-note chord (C5, E5, G5), 200ms	Descending two-note, 200ms	Four-note ascending, 350ms	Two-note rise, 120ms
Playful	Five-note ascending arpeggio, 400ms	Comic descending slide, 300ms	Full pentatonic scale, 500ms	Bouncy two-note, 150ms

How It Works

```

// Inside playSynthSound:
const ctx = new (window.AudioContext || window.webkitAudioContext)();
const osc = ctx.createOscillator();
const gain = ctx.createGain();

osc.type = 'sine'; // or 'triangle' for playful
osc.frequency.value = 880;
gain.gain.value = volume;

// For playful arpeggios: schedule multiple frequency changes
osc.frequency.setValueAtTime(523, ctx.currentTime); // C5
osc.frequency.setValueAtTime(659, ctx.currentTime + 0.08); // E5
osc.frequency.setValueAtTime(784, ctx.currentTime + 0.16); // G5
// ...

osc.connect(gain).connect(ctx.destination);
osc.start();
osc.stop(ctx.currentTime + duration);

```

9. Settings Persistence

Two-Layer Persistence

User personality preferences are persisted at two levels:

Layer	Storage	Speed	Purpose
Frontend	Zustand store -> localStorage	Instant	Immediate UI feedback
Backend	Aurora PostgreSQL user_delight_preferences table	~100ms	Cross-device sync, analytics

The useDelightSync Hook

File: apps/thinktank/lib/hooks/useDelightSync.ts

```
useDelightSync()
// On mount: GET /api/delight/preferences -> applies to Zustand + Provider
// On change: debounced PUT /api/delight/preferences (500ms)
```

Backend Schema

```
CREATE TABLE user_delight_preferences (
  user_id          VARCHAR(255) NOT NULL,
  tenant_id        VARCHAR(255) NOT NULL,
  personality_mode  VARCHAR(20)  DEFAULT 'auto',
  intensity_level   INTEGER      DEFAULT 5,
  enable_domain_messages  BOOLEAN DEFAULT TRUE,
  enable_model_personality  BOOLEAN DEFAULT TRUE,
  enable_time_awareness    BOOLEAN DEFAULT TRUE,
  enable_achievements      BOOLEAN DEFAULT TRUE,
  enable_wellbeing_nudges  BOOLEAN DEFAULT TRUE,
  enable_easter_eggs       BOOLEAN DEFAULT TRUE,
  enable_sounds            BOOLEAN DEFAULT FALSE,
  sound_theme             VARCHAR(50) DEFAULT 'default',
  sound_volume            INTEGER DEFAULT 50,
  updated_at             TIMESTAMPTZ DEFAULT NOW(),
  PRIMARY KEY (user_id, tenant_id)
);
```

10. Tenant Admin Controls

Settings Location

File: apps/thinktank-tenant-admin/app/(dashboard)/settings/page.tsx

Under the “Delight UX System” section, tenant admins control:

Setting	Type	Default	Effect
delightEnabled	boolean	true	Master kill switch – when false, ALL delight output is suppressed org-wide
delightDefaultMode	PersonalityMode	'auto'	Enforced default mode for all users
delightAllowUserOverride	boolean	true	When false, users cannot change their personality mode

How the Provider Enforces It

```
// In RadiantDelightProvider:
const tenantEnabled = config.tenantDelightEnabled !== false;

// triggerDelight -- first line:
if (!tenantEnabled) return; // Silent no-op

// setPersonalityMode -- enforces lock:
if (!tenantAllowOverride && config.tenantDefaultMode) return; // Prevents user changes
```

Recommended Enterprise Configurations

Organization Type	delightEnabled	delightDefaultMode	delightAllowUserOverride
Law firm	true	professional	false
Hospital / HIPAA	true	professional	false
Research lab	true	subtle	true
Creative agency	true	playful	true
Consulting firm	true	auto	true
Wants no UX touches at all	false	–	–

11. Guest User Behavior

Cross-Tenant Guest Access

RADIANT supports cross-tenant guest collaboration via collaboration_guest_invites and collaboration_guests tables.

Key facts about guests and Delight:

Aspect	Guest Behavior
Identity	Token-based (guest_token), no Cognito account
Personality mode	Uses the tenant's delightDefaultMode (no user profile)
Preferences	Not persisted (no user_delight_preferences row)
Sounds	Default to OFF for guests
Permissions	viewer, commenter, or editor – set per invite
Data access	ONLY the specific collaborative session they're invited to
Seat license	None required

Guests do NOT access Think Tank, Curator, Dojo, or any app independently. They participate only in the specific collaborative session they were invited to.

Invite Methods

Method	How
Email	Tenant user sends invite to any email address
Link	Shareable URL with invite token
QR Code	Scannable code for in-person collaboration

12. Cross-App Wiring Status

App	Provider	triggerDelight Wired	Pages with Delight
Think Tank	[OK] RadiantDelightProvider	[OK] Full lifecycle	Chat page, settings page, polymorphic views
Curator	[OK] RadiantDelightProvider	[OK] All 4 pages	Ingest, verify, conflicts, overrides
Dojo	[OK] RadiantDelightProvider	[OK] All 7 components	LibraryView, TrainingArena, ScenarioArena, DialecticArena, DecayEngine, ArchytasSettings, CompetencyMesh
TT Admin	[OK] RadiantDelightProvider	[OK] Key pages	Delight dashboard, API keys
Tenant Admin	[OK] RadiantDelightProvider	[OK] Settings	Delight on/off toggle, mode selection
Genesis	Partial	Partial	Has personality in GenesisForge

App	Provider	triggerDelight Wired	Pages with Delight
Admin Dash-board	[OK] Has delight API routes	API only	No frontend triggers yet

13. Component Reference

@radiant/delight-ui Package

Export	Type	Purpose
RadiantDelightProvider	Component	Context provider – wraps app
useRadiantDelight	Hook	Access delight context (throws if no provider)
useRadiantDelightOptional	Hook	Access delight context (returns null if no provider)
getMorphAnimationStates	Function	Get personality-aware spring configs for morph transitions
getPersonalityConfig	Function	Get personality-aware panel animation config
getMorphNarration	Function	Get personality-aware narration text for morphs
playSynthSound	Function	Play Web Audio synthesized sound by type and personality
PersonalityMode	Type	'auto' \ 'professional' \ 'subtle' \ 'expressive' \ 'playful'
InjectionPoint	Type	11 injection points
AppDelightConfig	Type	Configuration for provider (includes tenant controls)

Think Tank Components

Component	File	Delight Integration
ViewRouter	components/polymer/router.tsx	Morphs with triggers delight + synth sounds
ViewMorphTransition	Same file	Animation spring constants adapt to personality mode
LiquidMorphPanel	components/liquidMorphPanel.tsx	Open/close manipulations use personality-aware configs

Component	File	Delight Integration
MorphTransitionEffect	Same file	Personality narration, suppressed in professional/subtle

14. API Reference

Delight Preferences API

GET /api/delight/preferences

PUT /api/delight/preferences

Request body (PUT):

```
{
  "personalityMode": "professional",
  "intensityLevel": 5,
  "enableDomainMessages": true,
  "enableModelPersonality": true,
  "enableTimeAwareness": true,
  "enableAchievements": true,
  "enableWellbeingNudges": true,
  "enableEasterEggs": false,
  "enableSounds": false,
  "soundTheme": "default",
  "soundVolume": 50
}
```

Tenant Settings API

GET /api/tenant-admin/settings

PUT /api/tenant-admin/settings

Delight-related fields:

```
{
  "delightEnabled": true,
  "delightDefaultMode": "professional",
  "delightAllowUserOverride": false
}
```

Admin Delight Dashboard API

GET /api/admin/delight/dashboard

PATCH /api/admin/delight/categories/:id { "isEnabled": true/false }

POST /api/admin/delight/messages { message object }

PUT /api/admin/delight/messages/:id { updates }

DELETE /api/admin/delight/messages/:id

15. Troubleshooting

Delight Not Showing

Symptom	Cause	Fix
No toasts at all	<code>tenantDelightEnabled: false</code>	Tenant admin -> Settings -> Enable Delight
No toasts but sounds work	Personality mode set to professional for <code>idle/session_start</code>	Expected behavior – professional suppresses these
User can't change mode	<code>tenantAllowUserOverride: false</code>	Tenant admin -> Settings -> Allow User Override
Sounds not playing	<code>soundEnabled: false</code> or browser auto-play policy	User must interact with page first; check settings
Animations are instant (no spring)	Professional mode active	Expected – professional uses crisp tweens
Module resolution errors	<code>@radiant/delight-ui</code> not resolved	Run <code>pnpm install</code> from workspace root

Performance

- Toast container is fixed-position with `pointer-events: none` – zero layout impact
- Web Audio synthesis creates/destroys oscillators per sound – no persistent audio context
- Spring animations use `framer-motion` – GPU-accelerated transforms only
- Delight triggers are synchronous no-ops when suppressed – zero async overhead

This document is part of the RADIANT comprehensive documentation set. See also: - `DELIGHT-SYSTEM-GUIDE.md` – Delight backend service, messages, achievements, easter eggs - `THINKTANK-USER-GUIDE.md` – Think Tank user-facing documentation - `THINKTANK-ADMIN-GUIDE.md` – Think Tank admin configuration - `RADIANT-PLATFORM-ARCHITECTURE.md` – Platform architecture reference

Version: 4.18.3

Last Updated: 2024-12-28

Overview

The User Rules System allows Think Tank users to set persistent personal preferences that govern how the AI responds to them. Similar to Windsurf policies but for end users, these rules are automatically applied to every AI interaction.

Key Concepts

Rule Types

Type	Description	Example
restriction	Things the AI must NOT do	“Do not discuss religion”
preference	Things the AI SHOULD do	“Acknowledge uncertainty”
format	How responses should be structured	“Use bullet points”
source	Citation requirements	“Always cite sources”
tone	Communication style	“Be concise”
topic	Topic-specific rules	“Add health disclaimers”
privacy	Personal data handling	“Protect my privacy”
accessibility	Readability preferences	“Use simple language”

Rule Sources

- **user_created**: User typed the rule manually
 - **preset_added**: Added from the preset library
 - **ai_suggested**: AI suggested based on feedback patterns
 - **imported**: Imported from another source
-

Think Tank UI

Location: Think Tank -> My Rules

URL: /thinktank/my-rules

My Rules Tab

View and manage your personal rules:

- **Toggle**: Enable/disable individual rules
- **Edit**: Modify rule text
- **Delete**: Remove rules
- **Stats**: See how many times each rule was applied

Add from Presets Tab

Browse and add pre-seeded rules:

Popular Rules - Most commonly used rules by Think Tank users

Categories: - Privacy & Safety - Sources & Citations - Response Format - Tone & Style - Accessibility - Topic Preferences - Advanced

Pre-seeded Preset Rules

Privacy & Safety

Rule	Description
Protect my privacy	Prevents personal references or assumptions
No religious content	Filters out religious discussions
No political content	Keeps responses politically neutral

Sources & Citations

Rule	Description
Always cite sources	Includes verifiable sources for facts
Prefer academic sources	Prioritizes peer-reviewed content
Include source dates	Adds publication dates for recency

Response Format

Rule	Description
Be concise	Produces shorter, focused responses
Use lists for clarity	Organizes with bullets/numbers
Use headings	Adds section headers to long content
Comment code	Documents code examples

Tone & Style

Rule	Description
Professional tone	Business-appropriate style
Casual tone	Relaxed, conversational style
Simple explanations	Accessible without oversimplifying

Advanced

Rule	Description
Acknowledge uncertainty	States limitations honestly
Clarify before answering	Confirms question understanding
Show multiple viewpoints	Balanced coverage of debates

How Rules Are Applied

Application Flow

1. User sends message to Think Tank
2. AGI Brain generates plan with pre-prompt selection
3. `prepromptLearningService.selectPreprompt()` is called
4. Service fetches user rules via `userRulesService.getRulesForPrompt()`
5. Rules are formatted and appended to the system prompt
6. Rule application is logged for tracking

Prompt Injection Format

Rules are injected into the system prompt in categorized sections:

```
## User Preferences
The user has set the following rules for how you should respond:

**Restrictions (Must Follow):**
- Do not discuss religious topics...

**Source Requirements:**
- Always provide sources and citations...

**Format Preferences:**
- Keep responses concise...
```

Priority

- Restrictions are always enforced first (highest priority)
- Higher priority numbers (0-100) take precedence
- Conflicting rules resolved by priority

Database Schema

user_memory_rules

Column	Type	Description
id	UUID	Primary key
tenant_id	UUID	Multi-tenant isolation
user_id	UUID	Rule owner
rule_text	TEXT	Full rule content
rule_summary	VARCHAR	Short display text
rule_type	VARCHAR	restriction, preference, etc.

Column	Type	Description
priority	INTEGER	0-100, higher = more important
source	VARCHAR	user_created, preset_added, etc.
is_active	BOOLEAN	Enable/disable
apply_to_preprompts	BOOLEAN	Apply to system prompts
apply_to_synthesis	BOOLEAN	Apply during synthesis
times_applied	INTEGER	Usage counter

preset_user_rules

Column	Type	Description
id	UUID	Primary key
rule_text	TEXT	Full rule content
rule_summary	VARCHAR	Short display text
description	TEXT	User-facing explanation
rule_type	VARCHAR	Rule category
category	VARCHAR	UI grouping
icon	VARCHAR	Lucide icon name
is_popular	BOOLEAN	Show in popular section
min_tier	INTEGER	Subscription tier requirement

API Endpoints

User Rules

GET /api/thinktank/user-rules – Get user's rules
 POST /api/thinktank/user-rules – Create new rule
 PATCH /api/thinktank/user-rules/:id – Update rule
 DELETE /api/thinktank/user-rules/:id – Delete rule
 PATCH /api/thinktank/user-rules/:id/toggle – Enable/disable rule

Presets

GET /api/thinktank/user-rules/presets – Get preset categories
 POST /api/thinktank/user-rules/add-preset – Add preset to user rules

Internal (Service Layer)

getRulesForPrompt(tenantId, userId, domainId?, mode?)

-> Returns formatted rules for prompt injection

Service Integration

user-rules.service.ts

```
// Get rules formatted for prompt injection
const rules = await userRulesService.getRulesForPrompt(
  tenantId,
  userId,
  domainId,    // Optional: filter by domain
  mode         // Optional: filter by orchestration mode
);

// Returns:
{
  rules: UserMemoryRule[],
  formattedForPrompt: string,
  ruleCount: number,
  hasRestrictions: boolean,
  hasSourceRequirements: boolean
}
```

preprompt-learning.service.ts Integration

The preprompt service automatically fetches and applies user rules:

```
// In selectPreprompt()
const userRules = await userRulesService.getRulesForPrompt(
  request.tenantId,
  request.userId,
  request.detectedDomainId,
  request.orchestrationMode
);

// Append to rendered preprompt
rendered.full = rendered.full + userRules.formattedForPrompt;
```

Best Practices

Writing Effective Rules

1. **Be Specific:** “Always cite sources with URLs” vs “cite sources”
2. **Use Positive Framing:** “Use bullet points” vs “Don’t write paragraphs”
3. **One Rule Per Preference:** Easier to toggle and track

Rule Limits

- Maximum 50 rules per user
- Maximum 1000 characters per rule text
- Inactive rules don't count toward limits

When to Use Presets vs Custom

- **Presets:** Common preferences with proven effectiveness
- **Custom:** Unique personal requirements

Memory Categories

Each memory/rule is categorized by **what it IS**, enabling better organization and future expansion.

Category Hierarchy

Top-Level	Sub-Categories	Description
Instruction	format, tone, source	Direct instructions for AI behavior
Preference	style, detail	Preferences that guide (not mandate) behavior
Context	personal, work, project	Background information about the user
Knowledge	fact, definition, procedure	Facts and information to remember
Constraint	topic, privacy, safety	Hard limits that must be followed
Goal	learning, productivity	User objectives and desired outcomes

Category Codes

instruction	# Direct instructions
instruction.format	# How to structure responses
instruction.tone	# Communication style
instruction.source	# Citation requirements
preference	# Preferences
preference.style	# Writing style preferences
preference.detail	# Detail level preferences
context	# User context
context.personal	# Personal information
context.work	# Professional context
context.project	# Project-specific info

```

knowledge          # Knowledge to remember
  knowledge.fact    # Specific facts
  knowledge.definition # Terms and meanings
  knowledge.procedure # How to do things

constraint          # Hard limits
  constraint.topic  # Topics to avoid
  constraint.privacy # Privacy rules
  constraint.safety # Safety limitations

goal               # User goals
  goal.learning    # Learning objectives
  goal.productivity # Efficiency goals

```

Database Schema: memory_categories

Column	Type	Description
id	UUID	Primary key
code	VARCHAR	Unique category code (e.g., 'instruction.format')
name	VARCHAR	Display name
parent_id	UUID	Parent category for hierarchy
level	INTEGER	1=top-level, 2=sub-category
path	VARCHAR	Materialized path (e.g., 'instruction.format')
icon	VARCHAR	Lucide icon name
color	VARCHAR	Tailwind color class
is_system	BOOLEAN	System categories cannot be deleted
is_expandable	BOOLEAN	Can users add sub-categories?

API Methods

```

// Get category tree
const tree = await userRulesService.getMemoryCategories();
// Returns: { categories, topLevel, byCode }

// Get memories grouped by category
const grouped = await userRulesService.getMemoriesByCategory(
  tenantId,
  userId,
  categoryCode // Optional: filter to specific category
);

```

Future Expansion

The category system is designed for expansion: - **Custom Categories**: Users can create sub-categories under expandable parents - **Category Inheritance**: Rules can inherit from parent categories - **Category-Specific Behavior**: Different application logic per category - **Cross-Category Rules**: Rules that span multiple categories

Overview

Think Tank includes hidden easter eggs that provide fun, alternative interaction modes for users. Easter eggs are **Think Tank only** features - they are not available in the Radiant Admin dashboard except for administrative configuration.

Enabling/Disabling Easter Eggs

User Settings

Users can enable or disable easter eggs in Think Tank Settings: - Navigate to **Settings -> Delight Preferences** - Toggle **Enable Easter Eggs** on/off
Easter eggs are enabled by default for users with expressive or playful personality modes.

Admin Configuration

Administrators manage easter eggs via: - **Admin Dashboard -> Think Tank -> Delight -> Easter Eggs** - Individual easter eggs can be enabled/disabled - Discovery statistics are tracked per easter egg

Available Easter Eggs

Keyboard Triggered

Easter Egg	Trigger	Description	Duration
Konami Code	^^vv<--><-->BA	Classic gaming mode with retro arcade theme	60 seconds

How to Activate: Press the arrow keys and letters in sequence: Up, Up, Down, Down, Left, Right, Left, Right, B, A
Activation Message: Cheat codes activated. +30 lives.

Text Command Triggered

Type these commands in the Think Tank chat input to activate:

Easter Egg	Command	Effect	Duration
Chaos Mode	/chaos	Models debate openly, disagreements visible	Until deactivated
Socratic Mode	/socratic	AI responds with questions instead of answers	Until deactivated
Victorian Gentleman	/victorian	Formal, Victorian-era speech style	Until deactivated
Pirate Mode	/pirate	Arrr! Pirate-speak responses	Until deactivated
Haiku Mode	/haiku	All responses in haiku format (5-7-5)	Until deactivated
Matrix Mode	/matrix	Green code rain visual effect	30 seconds
Disco Mode	/disco	Disco lights and music	30 seconds
Dad Jokes Mode	/dadjokes	Every response includes a dad joke	Until deactivated
Emission Mode	/emissions	Fun sound effects for events	Until deactivated

Detailed Easter Egg Descriptions

/chaos - Chaos Mode

Purpose: Let the AI models argue openly about their answers.

Activation: Type /chaos in the chat input

Effect: - Shows disagreements between models - Displays which models favor which approaches - More “raw” multi-model output

Deactivation: Type /chaos again or /normal

Message: Chaos Mode engaged. May the best model win.

/socratic - Socratic Mode

Purpose: The AI asks probing questions instead of giving direct answers.

Activation: Type /socratic in the chat input

Effect: - Responses are primarily questions - Encourages user to think through problems - Great for learning and exploration

Deactivation: Type /socratic again or /normal

Message: Socratic Mode. I'll ask the questions now.

/victorian - Victorian Gentleman Mode

Purpose: Formal, eloquent responses in Victorian-era style.

Activation: Type /victorian in the chat input

Effect: - Highly formal language - Victorian idioms and expressions - Polite, elaborate responses

Deactivation: Type /victorian again or /normal

Message: Indeed, good sir/madam. How may I assist?

/pirate - Pirate Mode

Purpose: Responses delivered in pirate-speak.

Activation: Type /pirate in the chat input

Effect: - "Arrr" and nautical terminology - Pirate idioms and phrases - Fun for casual conversations

Deactivation: Type /pirate again or /normal

Message: Ahoy! Ready to sail the seven seas of knowledge!

/haiku - Haiku Mode

Purpose: All responses formatted as haikus.

Activation: Type /haiku in the chat input

Effect: - 5-7-5 syllable structure - Poetic, condensed responses - Great for creative exploration

Deactivation: Type /haiku again or /normal

Message: Five, seven, then five / Syllables mark the rhythm / Nature finds its voice

/matrix - Matrix Mode

Purpose: Visual transformation with matrix-style code rain.

Activation: Type /matrix in the chat input

Effect: - Green falling code visual effect - Matrix-themed interface - Automatically ends after 30 seconds

Duration: 30 seconds (auto-deactivates)

Message: You took the red pill. Let's see how deep this goes.

/disco - Disco Mode

Purpose: Party atmosphere with lights and music.

Activation: Type /disco in the chat input

Effect: - Disco ball visual effects - Optional background music (if sounds enabled) - Automatically ends after 30 seconds

Duration: 30 seconds (auto-deactivates)

Message: Let's groove while we think!

/dadjokes - Dad Jokes Mode

Purpose: Every response includes a groan-worthy dad joke.

Activation: Type /dadjokes in the chat input

Effect: - Responses include related dad jokes - Puns and wordplay throughout - Warning: may cause eye-rolling

Deactivation: Type /dadjokes again or /normal

Message: Warning: Side effects include groaning and eye-rolling.

/emissions - Emission Mode

Purpose: Fun sound effects for various Think Tank events.

Activation: Type /emissions in the chat input

Effect: - Playful sound effects for: - Synthesis complete - Model agreement - Confirmations - Uses the "emissions" sound theme

Deactivation: Type /emissions again or /normal

Message: Emissions enabled. This is going to be fun.

Deactivating Easter Eggs

Method 1: Toggle Off

Type the same command again to toggle off: - /pirate -> enables -> /pirate -> disables

Method 2: Return to Normal

Type /normal to return to standard mode and deactivate all active easter eggs.

Method 3: Automatic Timeout

Some easter eggs (Matrix, Disco) automatically deactivate after their duration expires.

Method 4: Settings

Disable all easter eggs via Settings -> Delight Preferences -> Enable Easter Eggs -> Off

Achievement Integration

Discovering easter eggs contributes to achievements:

Achievement	Requirement	Reward
Curious One	Find 1 easter egg	20 points
Easter Hunter	Find 5 easter eggs	50 points

First-time discoveries are tracked and contribute to the discovery count displayed in admin analytics.

Admin-Only Notes

Easter eggs are managed exclusively through the Radiant Admin Dashboard:

- **View all easter eggs:** Admin Dashboard -> Think Tank -> Delight -> Easter Eggs
- **Enable/disable individual eggs:** Toggle the enabled status
- **View discovery statistics:** See how many users have found each egg
- **Create custom easter eggs:** Add new triggers and effects

Easter egg functionality is **not exposed** in the main Radiant admin interface beyond configuration. They are a Think Tank consumer feature only.

API Reference

Trigger Easter Egg

```
POST /api/thinktank/delight/easter-egg/trigger
{
  "triggerType": "text_input" | "key_sequence" | "time_based" | "random" | "usage_pattern",
  "triggerValue": "/pirate"
}
```

Response

```
{
  "easterEgg": {
```

```
    "id": "pirate",
    "name": "Pirate Mode",
    "effectType": "mode_change",
    "effectConfig": { "mode": "pirate", "responseStyle": "pirate" },
    "activationMessage": " Ahoy! Ready to sail the seven seas of knowledge!",
    "effectDurationSeconds": 0
  },
  "isNewDiscovery": true,
  "achievementUnlocked": null
}
```

Deactivate Easter Egg

```
POST /api/thinktank/delight/easter-egg/deactivate
{
  "easterEggId": "pirate"
}
```

Database Schema

Easter eggs are stored in the `delight_easter_eggs` table:

Column	Type	Description
id	VARCHAR(50)	Unique identifier
name	VARCHAR(100)	Display name
trigger_type	VARCHAR(30)	How it's triggered
trigger_value	TEXT	The trigger pattern/command
effect_type	VARCHAR(30)	What type of effect
effect_config	JSONB	Effect configuration
effect_duration_seconds	INTEGER	0 = until toggled off
activation_message	TEXT	Shown on activation
deactivation_message	TEXT	Shown on deactivation
is_enabled	BOOLEAN	Admin toggle
discovery_count	INTEGER	Total discoveries

Part VIII: Collaboration

RADIANT v7.30.0 | Last updated: 2026-02-06

This guide covers everything about guest collaboration in Think Tank: how guests interact, what they can do, who owns the data, how costs are tracked, and how regulatory compliance is enforced.

Table of Contents

1. Overview
 2. Guest Permissions & Capabilities
 3. Can Guests Run AI Prompts?
 4. Ownership Model
 5. Cost Attribution & Billing
 6. Per-User Cost Tracking
 7. Cross-Tenant Cost Splitting
 8. Regulatory Compliance
 9. Guest Restriction Notifications
 10. Tenant Admin Configuration
 11. Session Limits
 12. Database Schema
 13. API Reference
 14. Architecture & Data Flow
 15. Enterprise Deployment Examples
 16. FAQ
-

1. Overview

Think Tank supports real-time collaborative sessions where internal (tenant) users can invite **external guests** to participate. Guests are people outside the tenant – clients, partners, consultants, opposing counsel, external reviewers – who need temporary access to a specific conversation.

Key principles:

- Guests are **session-scoped** – they see only the session they’re invited to
 - The **host tenant owns all data** – every message, file, and annotation belongs to the tenant
 - Guest capabilities are **explicitly controlled** – prompt execution, file access, and branching require tenant admin opt-in
 - Costs are **tracked per-user** and **aggregated to the tenant** – guest-originated costs are attributed to an internal user
 - **Compliance licenses auto-restrict** guest capabilities – HIPAA/GDPR/SOC2 tenants get automatic protections
-

2. Guest Permissions & Capabilities

Guests are invited with one of three permission levels. Capabilities are resolved from the permission level combined with tenant settings and compliance licenses.

Permission -> Capability Matrix

Capability	Viewer	Commenter	Editor
View messages	[OK]	[OK]	[OK]
Add comments & annotations	[X]	[OK]	[OK]
Add reactions	[X]	[OK]	[OK]
Edit messages	[X]	[X]	[OK]
Run AI prompts	[X]	[X]	[OK] *
Upload files	[X]	[X]	[OK] *
Download files	[OK]	[OK]	[OK]
Create conversation branches	[X]	[X]	[OK]
Join AI Roundtable	[X]	[OK]	[OK]

* Requires explicit tenant admin opt-in (guestPromptExecutionEnabled / guestFileUploadEnabled). OFF by default.

**** Disabled automatically when compliance licenses are active and complianceAutoRestrict is enabled (default: enabled).

How Capabilities Are Resolved

- 1. Start with base capabilities from permission level (viewer/commenter/editor)
- 2. Apply tenant collaboration settings (guest_prompt_execution_enabled, etc.)
- 3. Check for active compliance licenses (HIPAA, GDPR, SOC2, etc.)
- 4. If compliance_auto_restrict=true AND compliance licenses exist:
 - > Force-disable: prompt execution, file upload, file download, branching, roundtable
- 5. Store resolved capabilities on the guest record:
 - > can_execute_prompts, can_upload_files, can_download_files

The resolution runs at **invite acceptance time** (joinAsGuest), not at invite creation. This means if a tenant admin changes settings between invite creation and acceptance, the guest gets the capabilities in effect at the time they join.

3. Can Guests Run AI Prompts?

Yes, but with strict controls. Guest prompt execution is **OFF by default** for all guests.

Requirements (ALL must be true)

#	Requirement	Default
1	Guest permission level = editor	N/A
2	Tenant admin enables guestPromptExecutionEnabled	false

#	Requirement	Default
3	No compliance license blocking it	Auto-blocked by HIPAA/GDPR/SOC2
4	Guest hasn't exceeded per-session prompt limit	Default: 20 prompts
5	Guest hasn't exceeded per-session token limit	Default: 50,000 tokens

Execution Flow

Guest clicks "Send" on a prompt

|

v

guardGuestPrompt() middleware runs

|

+– Check can_execute_prompts on guest record -> false? -> 403 + clear message

+– Check prompt count limit -> exceeded? -> 403 + "You have reached the maximum..."

+– Check token limit -> exceeded? -> 403 + "You have reached the maximum..."

+– Resolve cost attribution -> who pays?

|

v

AI model invocation (LiteLLM)

|

v

recordGuestPromptUsage() runs

+– Log to guest_cost_attribution_log (PostgreSQL)

+– Update guest running totals (prompts_executed, tokens_consumed, cost_incurred)

+– Record usage event in billing metering (DynamoDB)

|

+– Tenant-level daily rollup (TENANT#{tenantId})

|

+– User-level daily rollup (TENANT#{tenantId}#USER#{attributedUserId})

|

v

Response returned to guest

What Guests See When Blocked

If a guest attempts a restricted action, they see a clear message:

"AI prompt execution is not available for guest participants in this session. This restriction is set by the organization's collaboration policy."

If they hit a limit:

"You have reached the maximum number of AI prompts (20) for this session. Contact the session host if you need additional access."

4. Ownership Model

Who Owns What?

Entity	Owner	Details
Collaborative session	Host tenant user	<code>collaborative_sessions.owner_id</code> = the user who created the session
All session data	Host tenant	<code>collaborative_sessions.tenant_id</code> = tenant that owns everything
Messages from guests	Host tenant	Stored in <code>session_messages</code> , owned by the tenant
Files uploaded by guests	Host tenant	Stored in <code>collaboration_attachments</code> , S3 bucket owned by tenant
Annotations by guests	Host tenant	Stored in <code>async_annotations</code> , session-scoped
Knowledge graph nodes	Host tenant	Created by guests but owned by tenant

What Guests Can See

- **Only** the specific session they were invited to
- **Zero** access to other conversations, other sessions, other apps, or any tenant data
- **No** persistent account – guest identity is token-based (`guest_token`)
- When the session ends or the guest leaves, they lose all access

Data Isolation

- Row Level Security (RLS) enforces tenant isolation via `check_session_tenant(session_id)`
- All collaboration tables use `session_id -> collaborative_sessions.tenant_id` for isolation
- Guests cannot query any table outside their session scope

5. Cost Attribution & Billing

When a guest runs an AI prompt, the token cost must be attributed to someone for billing. The tenant admin configures how this works.

Attribution Modes

Mode	Who Pays	When to Use
inviting_user (default)	The tenant user who created the invite	Most common. The person who invited the guest is responsible for the costs they generate.
session_owner	The user who created the collaborative session	When sessions are “owned” by a project lead who manages the budget.
tenant_pool	Shared organization pool (no individual attribution)	When costs are treated as organizational overhead.

How It Works

Guest runs a prompt

```

|
v
resolveCostAttribution(tenantId, guestId, sessionId)
|
+- Look up the guest -> find inviting user (collaboration_guest_invites.created_by)
+- Check tenant_collaboration_settings.guest_cost_attribution
|
+- "inviting_user" -> attributedToUserId = inviting user
+- "session_owner" -> attributedToUserId = collaborative_sessions.owner_id
+- "tenant_pool"   -> attributedToUserId = inviting user (for tracking), marked as pool
|
v

```

Usage event recorded with:

- tenantId = host tenant (for tenant-level aggregation)
- userId = attributedToUserId (for per-user tracking)
- guestId = guest identifier (for guest-level tracking)
- guestOriginated = true

Cost Tracking Tables

Table	Storage	Granularity	Retention
radiant-usage-events (DynamoDB)	Individual events	Per-request	90 days
radiant-usage-rollups (DynamoDB)	Tenant daily rollup	Per-tenant per-model per-day	Indefinite
radiant-user-usage-rollups (DynamoDB)	User daily rollup	Per-user per-model per-day	Indefinite
guest_cost_attribution_logs (PostgreSQL)	Guest attribution detail	Per-guest per-request	Per retention policy

Example: Cost Flow

A law firm (Tenant A) has user Alice who invites external consultant Bob as a guest editor.

1. Bob sends a prompt -> 1,500 input tokens, 800 output tokens
2. Model pricing: \$3/M input, \$15/M output -> provider cost = \$0.0165
3. Tenant margin: 20% -> billed cost = \$0.0198
4. Attribution mode: `inviting_user` -> cost attributed to **Alice**

Result: - Alice's per-user rollup: +\$0.0198 (with `guestOriginatedCost` = \$0.0198) - Tenant A's daily rollup: +\$0.0198 - `guest_cost_attribution_log`: Bob -> Alice, \$0.0198, model details - Bob's guest record: `prompts_executed` = 1, `tokens_consumed` = 2300, `cost_incurred` = \$0.0198

6. Per-User Cost Tracking

All costs – whether from the user directly or from guests they invited – are tracked at the user level and aggregated to the tenant.

DynamoDB Schema: `radiant-user-usage-rollups`

Key	Format	Example
pk (partition)	TENANT#{tenantId}#USER#{userId}	TENANT#abc-123#USER#alice-456
sk (sort)	DATE#{date}#MODEL#{modelId}	DATE#2026-02-06#MODEL#claude-3-5-sonnet

Attribute	Type	Description
<code>requestCount</code>	number	Total requests (direct + guest-originated)
<code>inputTokens</code>	number	Total input tokens
<code>outputTokens</code>	number	Total output tokens
<code>totalTokens</code>	number	Total tokens
<code>providerCost</code>	number	Raw provider cost
<code>billedCost</code>	number	Cost after tenant margin
<code>guestOriginatedCount</code>	number	Requests originated by guests attributed to this user
<code>guestOriginatedCost</code>	number	Cost of guest-originated requests attributed to this user

API Endpoints

Per-user rollups:

GET /api/billing/metering/user-rollups?userId={userId}&startDate=2026-02-01&endDate=2026-02-06

Response:

```
{
  "period": { "startDate": "2026-02-01", "endDate": "2026-02-06" },
  "userId": "alice-456",
  "totals": {
    "requests": 142,
    "inputTokens": 485000,
    "outputTokens": 192000,
    "billedCost": 12.45,
    "guestOriginatedCount": 18,
    "guestOriginatedCost": 2.34
  },
  "rollups": [...]
```

Guest usage summary (tenant-wide):

GET /api/billing/metering/guest-usage?startDate=2026-02-01&endDate=2026-02-06

Response:

```
{
  "period": { "startDate": "2026-02-01", "endDate": "2026-02-06" },
  "totals": {
    "requests": 47,
    "tokens": 128500,
    "billedCost": 5.67
  },
  "byUser": [
    {
      "attributedToUserId": "alice-456",
      "attributionType": "inviting_user",
      "totalRequests": 18,
      "totalInputTokens": 52000,
      "totalOutputTokens": 31000,
      "totalBilledCost": 2.34,
      "totalProviderCost": 1.95
    }
  ]
}
```

7. Cross-Tenant Cost Splitting

When a guest is a user from **another Think Tank tenant** (identified by `linked_tenant_id` on the guest record), costs can be split between the two organizations.

Configuration

Setting	Default	Description
crossTenantGuestEnabled	true	Allow users from other tenants as guests
crossTenantCostSplitEnabled	false	Enable cost splitting
crossTenantCostSplitPercent	50	Percentage the host tenant pays (0-100)

Example

Host Tenant A invites a user from Tenant B. Cost split is 60/40 (host pays 60%).

A prompt costs \$0.10 billed: - Tenant A (host) pays: \$0.06 - Tenant B (guest's org) pays: \$0.04

This is recorded in guest_cost_attribution_log with:

```
attribution_type = 'cross_tenant_split'
split_percent = 60
host_tenant_cost = 0.06
guest_tenant_cost = 0.04
guest_tenant_id = 'tenant-b-id'
```

8. Regulatory Compliance

Compliance Gates

Before any guest invite is created, CollaborationPolicyService.checkComplianceForGuestInvite() runs:

1. Check if guest access is enabled -> disabled? -> reject invite
2. Query tenant_licenses for active compliance licenses
3. No compliance licenses? -> allow freely
4. Compliance licenses found:
 - a. Determine which features to restrict
 - b. HIPAA -> require explicit acknowledgment
 - c. GDPR -> prepare data processing notice
 - d. Build restriction list
5. Return: { allowed, restrictions, requiresAcknowledgment, notificationMessage }

Compliance License -> Guest Restriction Mapping

License	Prompt Execution	File Upload	File Download	Branching	Roundtable	Acknowledgment
HIPAA	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	Required
HIPAA Retention	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	Required
GDPR	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	Required

License	Prompt Execution	File Upload	File Download	Branching	Roundtable	Acknowledgment
SOC 2	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	Not required
CCPA	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	Not required
Any other compliance	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	[X] Blocked	Not required

All restrictions apply when `complianceAutoRestrict = true` (default). Tenant admins can override this, but they see a red warning banner and are told compliance officer approval is required.

Audit Trail

Every restriction event is logged to `guest_compliance_restriction_log`:

Column	Description
<code>tenant_id</code>	The tenant
<code>session_id</code>	The collaborative session
<code>guest_id</code>	The guest (null for invite-time restrictions)
<code>restricted_feature</code>	What was blocked (e.g., <code>prompt_execution</code>)
<code>restriction_reason</code>	Human-readable reason
<code>compliance_licenses</code>	JSON array of active compliance licenses
<code>guest_notified</code>	Whether the guest was shown a notification
<code>notification_message</code>	The message shown to the guest

9. Guest Restriction Notifications

When a guest joins a session and their capabilities are restricted, the UI shows a **GuestRestrictionBanner**:

Compliance-Restricted (Amber Banner)

Compliance Policy Restrictions

Some features are restricted by your organization's compliance policies.

- AI prompt execution is not available in this session.
- File uploads are not available in this session.
- File downloads are not available in this session.
- Creating conversation branches is not available.

General Restriction (Slate Banner)

Guest Access Restrictions

Some features are restricted for guest participants.

- AI prompt execution is not available in this session.

Behavior

- Shown immediately when the guest joins the session
- Dismissible (guest can close it)
- Re-appears if the guest attempts a restricted action
- The message text is configurable by the tenant admin

10. Tenant Admin Configuration

Location

Tenant Admin -> Configuration -> Collaboration (/collaboration)

Settings Reference

Setting	Type	Default	Description
guestAccessEnabled	boolean	true	Master switch for all guest collaboration
guestPromptExecutionEnabled	boolean	false	Allow editor-level guests to run AI prompts
guestFileUploadEnabled	boolean	false	Allow editor-level guests to upload files
guestFileDownloadEnabled	boolean	true	Allow guests to download files
complianceAutoRestrict	boolean	true	Auto-disable sensitive features when compliance licenses are active
guestCostAttribution	enum	inviting_user	Who pays for guest AI usage
crossTenantGuestEnabled	boolean	true	Allow users from other tenants as guests
crossTenantCostSplitEnabled	boolean	false	Split costs between host and guest tenant
crossTenantCostSplitPercent	integer	50	Host tenant's share of split costs
guestMaxPromptsPerSession	number	20	Max AI prompts per guest per session
guestMaxTokensPerSession	number	50000	Max tokens per guest per session

Setting	Type	Default	Description
guestSessionTimeoutMinutes	integer	120	Auto-disconnect guests after this duration
notifyGuestOnRestriction	boolean	true	Show restriction banner to guests
restrictionMessage	text	(default message)	Custom message for restriction banner

Compliance-Blocked Controls

When compliance licenses are active and `complianceAutoRestrict` is on: - Toggles for prompt execution, file upload, file download are **force-disabled** - Each disabled toggle shows an amber banner explaining: - *Which* compliance license is blocking the feature - *Why* the feature is restricted - *How* to override (disable Compliance Auto-Restrict, requires compliance officer approval)

11. Session Limits

Per-session caps prevent runaway guest usage.

Limit	Default	Configurable	Enforcement
Max prompts per session	20	Yes, per tenant	<code>guardGuestPrompt()</code> checks before each AI call
Max tokens per session	50,000	Yes, per tenant	<code>guardGuestPrompt()</code> checks before each AI call
Session timeout	120 min	Yes, per tenant	Stored for enforcement (scheduled Lambda)

Running Totals

Each guest record tracks:

Column	Type	Description
<code>prompts_executed</code>	integer	Number of AI prompts run in this session
<code>tokens_consumed</code>	integer	Total tokens used in this session
<code>cost_incurred</code>	decimal	Total cost generated in this session

These are updated atomically after each AI call by `recordGuestPromptUsage()`.

12. Database Schema

New Tables (Migration 008)

tenant_collaboration_settings

Per-tenant configuration for all guest collaboration features. One row per tenant.

guest_cost_attribution_log

Every AI action by a guest, with full cost breakdown.

Column	Type	Description
guest_id	UUID	The guest who ran the prompt
session_id	UUID	The collaborative session
tenant_id	UUID	Host tenant
attributed_to_user_id	UUID	Internal user who pays
attribution_type	varchar	inviting_user, session_owner, tenant_pool, cross_tenant_split
model_id	varchar	AI model used
input_tokens	integer	Input token count
output_tokens	integer	Output token count
provider_cost	decimal	Raw provider cost
billed_cost	decimal	Cost after margin
split_percent	integer	Host tenant share (for cross-tenant)
host_tenant_cost	decimal	Host tenant portion
guest_tenant_cost	decimal	Guest tenant portion
guest_tenant_id	UUID	Guest's home tenant (for cross-tenant)

guest_compliance_restriction_log

Audit trail of every compliance-restricted action.

Extended Tables

collaboration_guests (6 new columns)

- can_execute_prompts – resolved at join time
- can_upload_files – resolved at join time
- can_download_files – resolved at join time
- prompts_executed – running count
- tokens_consumed – running count
- cost_incurred – running total

collaboration_guest_invites (3 new columns)

- `compliance_acknowledged` – for HIPAA/GDPR acknowledgment
- `compliance_restrictions` – JSON array of restrictions at invite time
- `cost_attribution_user_id` – the user costs will be attributed to

13. API Reference

Billing Metering

Method	Endpoint	Description
POST	<code>/api/billing/metering/record</code>	Record usage (accepts <code>guestId</code> , <code>attributedToUserId</code> , <code>sessionId</code>)
GET	<code>/api/billing/metering/summary</code>	Tenant-level summary (includes guest costs)
GET	<code>/api/billing/metering/rollups</code>	Tenant-level daily rollups
GET	<code>/api/billing/metering/user-rollups?userId=</code>	Per-user rollups with guest subtotals
GET	<code>/api/billing/metering/guest-usage</code>	Guest cost attribution summary by user

Tenant Admin Collaboration Settings

Method	Endpoint	Description
GET	<code>/api/tenant-admin/collaboration</code>	Get current settings + compliance licenses
PUT	<code>/api/tenant-admin/collaboration</code>	Update collaboration settings

Guest Prompt Guard (Internal)

```
import { guardGuestPrompt, recordGuestPromptUsage } from './middleware/guest-prompt-guard';

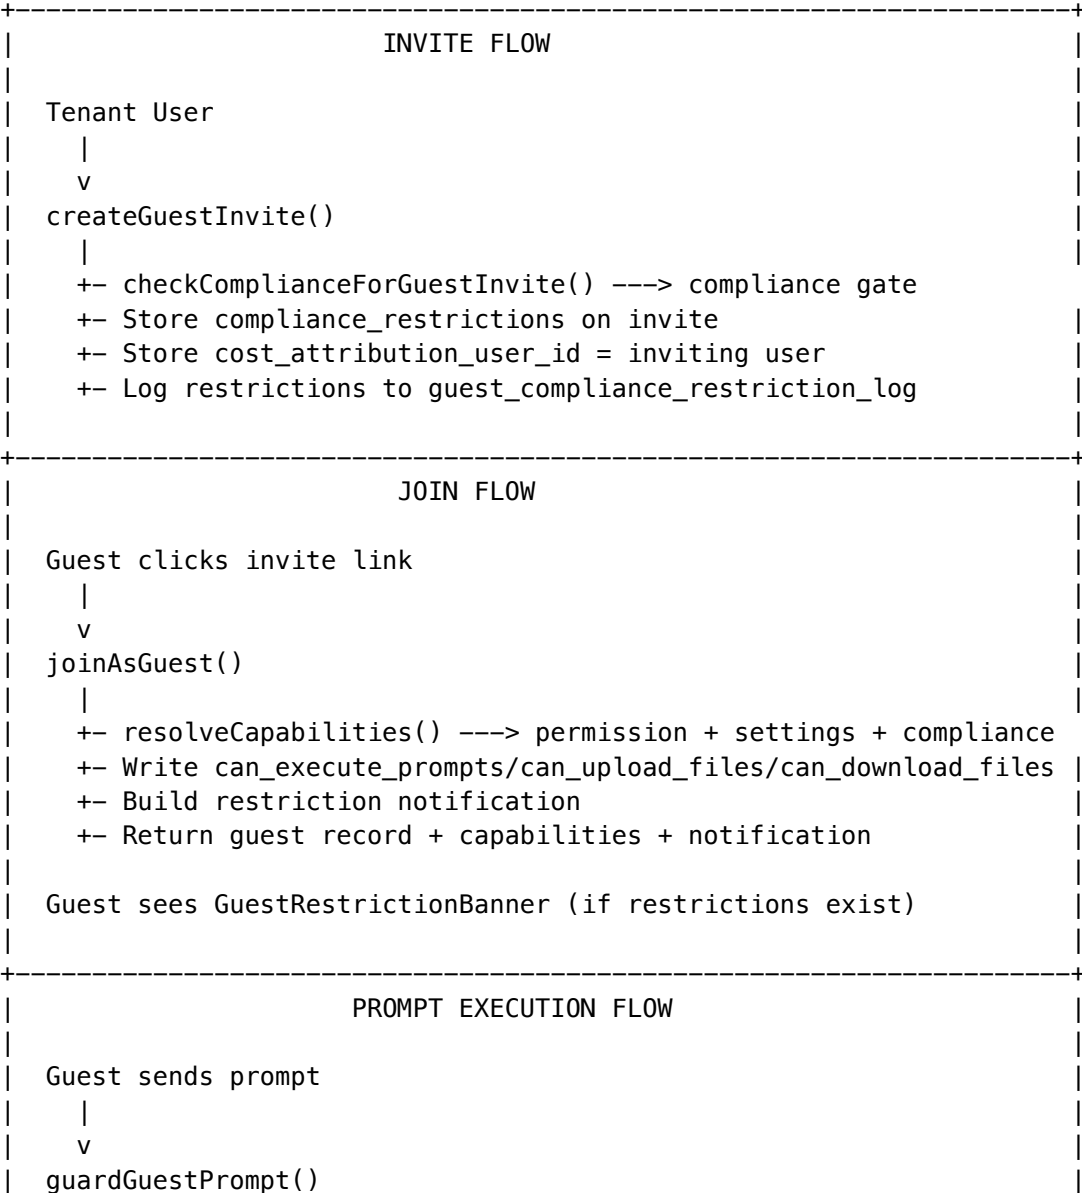

// Before AI call:
const guard = await guardGuestPrompt(pool, { guestId, sessionId, tenantId });
if (!guard.allowed) {
  return { statusCode: 403, body: JSON.stringify({ error: guard.reason }) };
}

// After AI call:
await recordGuestPromptUsage(pool, guard, {
```

```
modelId: 'claude-3-5-sonnet',
inputTokens: 1500,
outputTokens: 800,
providerCost: 0.0165,
billedCost: 0.0198,
requestId: 'req-abc-123',
latencyMs: 2400,
});
```

14. Architecture & Data Flow

Invite -> Join -> Interact -> Billing

```

|   +- Check can_execute_prompts ----> false? -> 403
|   +- Check prompt limit ----> exceeded? -> 403
|   +- Check token limit ----> exceeded? -> 403
|   +- Resolve cost attribution
|   |
|   v
|   AI Model Invocation (LiteLLM)
|   |
|   v
|   recordGuestPromptUsage()
|   +- Insert into guest_cost_attribution_log (PostgreSQL)
|   +- Update guest running totals
|   |
|   v
|   Billing metering (DynamoDB)
|   +- Usage event: guestOriginated=true, attributedToUserId=X
|   +- Tenant rollup: TENANT#{tenantId} (aggregated)
|   +- User rollup: TENANT#{tenantId}#USER#{attributedUserId}
|
+-----+

```

15. Enterprise Deployment Examples

Law Firm (HIPAA)

Settings:

```

guestAccessEnabled: true
guestPromptExecutionEnabled: false  <- blocked by compliance anyway
complianceAutoRestrict: true
guestCostAttribution: 'inviting_user'
notifyGuestOnRestriction: true

```

Result:

- Guests can view and comment on conversations
- NO prompt execution, file upload/download, branching
- All restrictions logged for compliance audit
- Costs attributed to the attorney who invited the guest

Research Lab (no compliance)

Settings:

```

guestAccessEnabled: true
guestPromptExecutionEnabled: true  <- explicitly enabled
guestFileUploadEnabled: true
guestCostAttribution: 'session_owner'
guestMaxPromptsPerSession: 50
guestMaxTokensPerSession: 200000
crossTenantCostSplitEnabled: true

```

```
crossTenantCostSplitPercent: 70      <- lab pays 70%
```

Result:

- Guests with editor permission can run prompts and upload files
- 50 prompts, 200K tokens per session
- Costs attributed to the session owner (PI / project lead)
- Cross-tenant guests: 70/30 cost split

Hospital (HIPAA + SOC2)

Settings:

```
guestAccessEnabled: true
complianceAutoRestrict: true      <- auto-restricts everything
guestCostAttribution: 'tenant_pool'
notifyGuestOnRestriction: true
restrictionMessage: 'Patient data protection policies restrict some features for external participants'
```

Result:

- Guests can view and comment only
- All sensitive features force-disabled
- Costs go to organizational pool
- Custom compliance message shown to guests

Startup (no compliance, minimal restrictions)

Settings:

```
guestAccessEnabled: true
guestPromptExecutionEnabled: true
guestFileUploadEnabled: true
guestFileDownloadEnabled: true
guestCostAttribution: 'inviting_user'
guestMaxPromptsPerSession: null    <- no limit
guestMaxTokensPerSession: null    <- no limit
```

Result:

- Full guest capabilities (editor = full access)
- No limits on prompts or tokens
- Costs attributed to whoever invited the guest

16. FAQ

Q: If I disable guest access entirely, what happens to existing sessions?

Active guest connections remain until the guest leaves or the session ends. New guest invites will be rejected. Existing invites cannot be redeemed.

Q: Can a guest be promoted to a full tenant user?

Guests have a `linked_user_id` field. If a guest later receives a tenant invitation and creates an account, the system can link them. This does not retroactively change ownership of their session content – it remains owned by the host tenant.

Q: Where can I see how much my guests have cost?

Tenant Admin -> Reports shows overall tenant costs. The new GET `/metering/guest-usage` endpoint provides a breakdown of guest-originated costs by attributed user. The GET `/metering/user-rollups` endpoint shows each user's total with `guestOriginatedCost` subtotals.

Q: Can I change the cost attribution mode retroactively?

No. Attribution is set at the time of usage. Changing the mode only affects future guest prompts. Historical attribution is immutable in `guest_cost_attribution_log`.

Q: What happens when a guest from another tenant triggers the cross-tenant split?

The split is recorded in `guest_cost_attribution_log` with `host_tenant_cost` and `guest_tenant_cost`. The actual inter-tenant billing reconciliation is handled through monthly cross-tenant invoicing (future feature).

Q: Can I override compliance restrictions for a specific session?

Not per-session. The Compliance Auto-Restrict toggle is tenant-wide. If you disable it, ALL sessions lose compliance protections for guests. The UI warns you and recommends compliance officer approval.

-

1. Welcome

Think Tank (Mac) is the native macOS client for RADIANT's Think Tank AI platform. It provides the same powerful AI conversation capabilities as the web app, built with SwiftUI for a fast, native macOS experience.

Key advantages of the Mac app: - **Native performance** – Built with SwiftUI, launches instantly - **macOS integration** – Keyboard shortcuts, menu bar, native file dialogs, Notification Center - **Glassmorphism UI** – Translucent materials using macOS vibrancy - **Offline settings** – Preferences persist locally via UserDefaults - **Secure auth** – Token storage via macOS Keychain

2. Getting Started

System Requirements

- macOS 14.0 (Sonoma) or later
- Apple Silicon or Intel Mac
- Internet connection (for API access)
- Microphone access (optional, for voice input)

First Launch

1. Open Think Tank from your Applications folder or Launchpad
2. The app opens to the **Welcome screen** with quick actions

3. Configure your API server URL in **Settings** (Cmd,) if not using the default
4. Sign in with your RADIANT credentials
5. Start chatting!

Connecting to Your Server

Go to **Think Tank > Settings > General > API** and enter your RADIANT API base URL (e.g., `https://api.radiant.yourcomp`)

3. The Interface

Think Tank (Mac) uses a **NavigationSplitView** layout:

SIDEBAR	DETAIL VIEW
[New Chat]	[Header Bar]
[Search]	[Domain] [Model] [Advanced] [Focus]
[Nav Sections]	
[Conversations]	[Messages Area]
	[Chat Input]

Sidebar

- **New Chat** button (CmdN)
- **Search** conversations
- **Navigation sections:** My Rules, History, Artifacts, Settings, Profile
- **Conversations** grouped by date (Today, Yesterday, This Week, etc.)

Detail View

Changes based on the selected section – Chat, Rules, History, Artifacts, Settings, or Profile.

4. Conversations

Creating a Conversation

- Click **New Chat** in the sidebar, or press **CmdN**
- Type your message and press **Return**

Managing Conversations

- **Rename:** Hover over a conversation, click the pencil icon
- **Delete:** Hover over a conversation, click the trash icon

- **Search:** Use the search bar at the top of the sidebar
- **Favorites:** Starred conversations show a yellow star icon

Conversation Grouping

Conversations are automatically grouped: - **Today** – conversations updated today - **Yesterday** – updated yesterday - **This Week** – within the last 7 days - **This Month** – within the last 30 days - **Older** – everything else

5. Chat Features

Sending Messages

- Type in the input area at the bottom
- Press **Return** to send
- Press **Shift+Return** for a new line
- Click the send button (arrow icon)

Streaming Responses

Responses stream in real-time via Server-Sent Events. You'll see a typing indicator and a blinking cursor as the AI generates its response. Toggle streaming in Settings > General.

Model Selection

Click the model selector in the header bar to choose which AI model to use. Models are grouped by category and show capability badges.

Domain Selection

In Advanced Mode, a domain selector appears. Choose **Auto** for automatic domain detection, or manually select a domain (e.g., Medical, Legal, Engineering).

Message Actions

Hover over an assistant message to reveal: - **Copy** – copies the message to clipboard - **Thumbs Up/Down** – rate the response - **Regenerate** – get a new response - **Brain Plan** – view the AI's reasoning (Advanced Mode)

Message Metadata

In Advanced Mode, messages show: - Model used - Token count - Latency (ms) - Cost estimate (\$)

6. My Rules

Personalize how the AI responds to you with rules.

Creating Rules

1. Go to **My Rules** in the sidebar
2. Click **Add Rule**
3. Choose a rule type (Restriction, Preference, Format, Source, Tone, Topic, Privacy)
4. Write your rule text
5. Click **Save Rule**

Rule Presets

Browse curated rule presets by clicking **Presets**. Categories include professional, academic, creative, and more. Click the + button to add a preset to your rules.

Managing Rules

- **Toggle** – enable/disable rules with the switch
 - **Edit** – click the pencil icon to modify
 - **Delete** – click the trash icon to remove
 - **Priority** – set priority (1-100) to control which rules take precedence
-

7. Advanced Mode

Toggle Advanced Mode with the brain icon in the header bar, or press **ShiftCmdD**.

Advanced Mode reveals: - **Message metadata** (model, tokens, latency, cost) - **Domain selector** in the header - **Time Machine** button - **AXIOM Forge** button - **Brain Plan viewer** on messages

8. AXIOM Forge

AXIOM Forge is a 4-step prompt optimization workflow.

Steps

1. **Classify** – AXIOM detects the domain of your prompt
2. **Clarify** – AXIOM asks targeted questions to refine intent
3. **Compile** – Your answers are compiled into an optimized prompt
4. **Route** – The best model is selected based on scoring

Using AXIOM

1. Click the wand icon in the header (Advanced Mode)
 2. Enter your prompt
 3. Answer clarification questions
 4. Review model scores and the compiled prompt
 5. Click **Use This Prompt** to copy it
-

9. Brain Plans

Brain Plans show the AI's decision-making process.

What You See

- **Orchestration mode** (Thinking, Extended Thinking, Coding, Creative, etc.)
- **Domain detection** with confidence score
- **Selected model** and reasoning
- **Execution steps** with timing
- **Spend Governor** status and savings

Accessing Brain Plans

Click the brain icon on any assistant message (visible in Advanced Mode).

10. Time Machine

Scrub through conversation state snapshots.

Features

- **Timeline** – visual track of all snapshots
- **Playback** – auto-play through snapshots
- **Bookmarks** – mark important points
- **Branches** – create a new conversation branch from any snapshot
- **Restore** – revert the conversation to a previous state

Using Time Machine

1. Click the clock icon in the header (Advanced Mode)
 2. Browse snapshots in the list or timeline
 3. Click a snapshot to preview
 4. Use **Restore** to revert, or **Branch** to fork
-

11. Crucible Deliberation

View multi-model verification when the AI cross-checks its answers.

What You See

- Questions asked between models
- Answers and quality scores
- Circular citation detection warnings
- Configuration (max questions, cost mode)

12. Voice Input

Speak instead of typing using the built-in voice transcription.

Requirements

- Microphone access (grant in System Settings > Privacy & Security > Microphone)
- Active internet connection (uses Whisper API)

Using Voice

1. Click the microphone icon in the input area
2. Click the red record button
3. Speak your message
4. Click the green checkmark to transcribe
5. The transcribed text appears in the input area

Audio Level Indicator

A visual bar display shows your audio levels in real-time during recording.

13. File Attachments

Attach files to your messages for context.

Supported File Types

- **Documents:** PDF, TXT, RTF, HTML
- **Images:** PNG, JPEG, GIF, SVG, WebP
- **Data:** CSV, JSON, XML

Maximum File Size

25 MB per file

How to Attach

- Click the **paperclip icon** in the input area
 - Click **Browse Files** to use the native file picker
 - **Drag and drop** files into the attachment area
 - Files appear as chips above the input; click X to remove
-

14. Artifacts

View code, documents, charts, and other generated content.

Browsing Artifacts

1. Go to **Artifacts** in the sidebar
2. Filter by type: All, Code, Document, Image, Chart
3. Click an artifact to preview in the detail pane

Artifact Actions

- **Copy** – copy content to clipboard
 - **Save** – export to a file using the native Save dialog
-

15. History

Browse and search all your past conversations.

Features

- **Search** by title or message content
 - **Sort** by newest, oldest, or most messages
 - **Domain filter** – filter by conversation domain
 - **Quick open** – click to jump to any conversation
-

16. Profile & Analytics

Overview Tab

- Total conversations, messages, tokens, cost
- Achievement count
- Favorite models
- Top domains

Achievements Tab

- View all achievements with progress
- Rarity levels: Common, Uncommon, Rare, Epic, Legendary
- Points system

Usage Tab

- Daily activity chart (last 30 days)
-

17. Settings

Access via **Think Tank > Settings** (Cmd,) or the sidebar.

General

- **AI Personality** – Auto, Professional, Subtle, Expressive, Playful
- **Streaming** – toggle real-time response streaming
- **Notifications** – enable/disable
- **API Server URL** – configure your RADIANT endpoint

Display

- **Compact mode** – reduce spacing
- **Show token count** – display in message metadata
- **Show cost estimate** – display in message metadata
- **Sound effects** – toggle

Voice

- **Enable voice input** – toggle microphone access
- **Open System Settings** – configure microphone permissions

Shortcuts

- View all keyboard shortcuts
- Enable/disable keyboard shortcuts globally

Privacy

- Data storage information
 - Clear local settings
-

18. Keyboard Shortcuts

Shortcut	Action
CmdN	New Conversation
ShiftCmdD	Toggle Advanced Mode
ShiftCmdF	Toggle Focus Mode
Cmd\	Toggle Sidebar
Cmd,	Settings
Return	Send Message
ShiftReturn	New Line in Input

19. Troubleshooting

Cannot Connect to Server

- 1. Check your API URL in Settings > General > API
- 2. Verify your internet connection
- 3. Ensure the RADIANT server is running
- 4. Check if your authentication token has expired

Microphone Not Working

- 1. Go to System Settings > Privacy & Security > Microphone
- 2. Ensure Think Tank has microphone access
- 3. Check that no other app is using the microphone exclusively

Slow Performance

- 1. Close unused conversations
- 2. Disable streaming if experiencing network issues
- 3. Check Activity Monitor for resource usage

Messages Not Loading

- 1. Check your internet connection
- 2. Try creating a new conversation
- 3. Restart the app

20. Platform Differences from Web

Think Tank (Mac) provides the same core functionality as the web app with platform-appropriate adaptations:

Feature	Web	Mac
Styling	Tailwind CSS + glassmorphism	SwiftUI .ultraThinMaterial
Animations	Framer Motion springs	SwiftUI .spring() animation
State Management	Zustand stores	@Observable / @Published
Clipboard	navigator.clipboard	NSPasteboard
File Picker	<input type="file">	NSOpenPanel
Audio Recording	MediaRecorder	AVAudioEngine
Streaming	ReadableStream	URLSession.bytes

Feature	Web	Mac
Settings Storage	localStorage	UserDefaults
Navigation	Next.js file routing	NavigationSplitView

Excluded from Mac App

- **Polymorphic Interface** – The morphing UI (Data Grid, Chart, Kanban, etc.) is excluded from Mac scope
- **Admin features** – Admin dashboard remains web-only

For the complete portability breakdown, see docs/THINKTANK-MAC-PORTABILITY-MANIFEST.md.

This guide is maintained under the Think Tank Dual-Platform Sync Policy (/ .windsurf/workflows/thinktank-dual-platform.md). Any change to the Mac app requires a corresponding update to this document.

Part XII: Think Tank – Mac Portability Manifest

Merged from THINKTANK-MAC-PORTABILITY-MANIFEST.md – feature parity matrix and technology adaptation map.

This document is the **authoritative record** of every Think Tank web feature, its Mac portability status, and the technology adaptation required. It MUST be updated whenever a feature is added, removed, or changed on either platform.

Feature Parity Matrix

Legend

Status	Meaning
[OK] Ported	Feature exists on Mac with full parity
[SYNC] Adapted	Feature exists on Mac with platform-appropriate adaptation
[X] Excluded	Feature intentionally excluded from Mac scope
Planned	Feature exists on web, Mac implementation planned
[!] Partial	Feature partially ported, gaps documented below

Tier 1: Core Features (Must Have)

#	Feature	Web	Mac	Status	Notes
1	Chat Interface	ModernChatInterface.swift	ChatView.swift	[OK] Ported	Full parity
2	Message Bubbles	MessageBubble.swift	MessageBubble.swift	[OK] Ported	Full parity
3	Chat Input	ChatInput.tsx	ChatInputView.swift	[OK] Ported	Full parity
4	Sidebar / Navigation	Sidebar.tsx	SidebarView.swift	[OK] Ported	NavigationSplitView
5	Conversation List	Sidebar.tsx	SidebarView.swift	[OK] Ported	Grouped by date
6	Conversation CRUD	chat.ts (API)	ChatService.swift	[OK] Ported	Full parity
7	Message Streaming (SSE)	ReadableStream	URLSession.by(Sync)	[SYNC] Adapted	Different API, same result
8	Model Selection	ModernChatInterface.swift	ModelSelector.swift	[OK] Ported	Native Menu picker
9	Domain Selection	ModernChatInterface.swift	DomainSelector.swift	[OK] Ported	Native Menu picker
10	Message Copy	navigator.clipboard	NSPasteboard	[SYNC] Adapted	Platform clipboard API
11	Message Rating	MessageBubble.swift	MessageBubble.swift	[OK] Ported	Thumbs up/down
12	Message Regeneration	chat.ts	ChatStore.swift	[OK] Ported	Full parity
13	Search Conversations	Sidebar.tsx	SidebarView.swift	[OK] Ported	Full parity
14	Keyboard Shortcuts	Web key handlers	SwiftUI .keyboardShortcut	[SYNC] Adapted	Native macOS shortcuts
15	Authentication	Cookie/JWT	URLSession + Keychain	[SYNC] Adapted	Secure token storage

Tier 2: Important Features

#	Feature	Web	Mac	Status	Notes
16	My Rules	Rules page	RulesView.swift	[OK] Ported	Full CRUD + presets
17	Rule Presets	Presets browser	PresetsSheet	[OK] Ported	Full parity
18	Settings	Settings page	SettingsView.swift	[OK] Ported	Native macOS Settings window
19	History	History page	HistoryView.swift	[OK] Ported	Sort + filter
20	Artifacts	Artifacts page	ArtifactsView.swift	[OK] Ported	Split view with detail
21	Profile / Analytics	Profile page	ProfileView.swift	[OK] Ported	Stats + achievements

#	Feature	Web	Mac	Status	Notes
22	Advanced Mode	Toggle in header	Toggle in header	[OK] Ported	UserDefaults persisted
23	Focus Mode	Toggle in header	Toggle in header	[OK] Ported	Full parity
24	Voice Input	MediaRecorder	AVAudioEngine	[SYNC] Adapted	Native audio capture
25	File Attachments	HTML5 drag-and-drop	NSOpenPanel + .onDrop	[SYNC] Adapted	Native file handling
26	Brain Plan Viewer	Brain plan modal	BrainPlanView	[OK] Ported	Sheet presentation
27	Spend Governor	Governor display	BrainPlanView	[OK] Ported	Integrated in Brain Plan

Tier 3: Advanced Features

#	Feature	Web	Mac	Status	Notes
28	Time Machine	time-machine.tsx	TimeMachineView	[OK] Ported	Timeline + playback
29	AXIOM Forge	AxiomForge.tsx	AxiomForgeView	[OK] Ported	4-step workflow
30	Crucible Deliberation	CrucibleDeliberationPanel	CruciblePanel	[OK] Ported	Event timeline
31	Guest Restrictions	GuestRestrictions	(API only)	[!] Partial	API support, no banner UI yet
32	Compliance Export	Export API	ComplianceExport	[OK] Ported	API + NSSavePanel
33	Delight System	DelightSystem	Personality mode only	[!] Partial	Mode selection ported; animations/toasts need native adaptation

Excluded Features

#	Feature	Web Component	Reason for Exclusion
E1	Polymorphic Interface	LiquidMorphPanel.tsx	Explicitly excluded by scope – the morphing UI (Data Grid, Chart, Kanban, Calculator, Code Editor, Document sub-views) is web-specific and not part of Mac app scope
E2	Admin UI	Admin dashboard pages	Mac app is consumer-only; admin features remain web-only

#	Feature	Web Component	Reason for Exclusion
E3	CSS Glassmorphism	Tailwind backdrop-blur	Replaced by native <code>.ultraThinMaterial</code> – equivalent effect, not a gap

Technology Adaptation Map

Web Technology	Swift/macOS Equivalent	Adaptation Complexity	Notes
React (Next.js 14)	SwiftUI	Medium	Different paradigm; declarative in both cases
TypeScript interfaces	Swift structs + Codable	Low	Direct 1:1 mapping
Zustand stores	@Observable / @Published	Low	SwiftUI native state management
Framer Motion	SwiftUI <code>.animation()</code> / <code>.spring()</code>	Low	Native animation system is excellent
Tailwind CSS	SwiftUI ViewModifiers + custom styles	Medium	No utility classes; use modifier chains
Radix UI primitives	Native macOS controls	Low	macOS controls are more capable
fetch / ReadableStream	URLSession / URLSession.bytes	Low	Excellent async/await support
localStorage / persist	UserDefaults	Low	Direct equivalent
navigator.clipboard	NSPasteboard	Low	Direct equivalent

Web Technology	Swift/macOS Equivalent	Adaptation Complexity	Notes
MediaRecorder	AVAudioEngine / AVFoundation	Medium	More powerful but different API
HTML5 drag-and-drop	SwiftUI .onDrop / NSOpenPanel	Low	Better native support
react-markdown	swift-markdown + NSAttributedString	Medium	Rendering pipeline differs
recharts	Swift Charts	Low	Native, beautiful charts
react-syntax-highlighter	Highlightr	Low	Direct equivalent
Server-Sent Events	URLSession.bytes line parsing	Low	Custom SSE parser (~40 lines)
CSS Grid / Flexbox	SwiftUI LazyVGrid / HStack / VStack	Low	Declarative layout
Web Push Notifications	UserNotifications framework	Low	Better native support
Service Workers (offline)	Not implemented	N/A	Mac app requires network connectivity
Browser URL routing	NavigationSplitView / state-based	Low	SwiftUI navigation

Known Gaps & Planned Work

Gap ID	Feature	Current State	Target	Priority	Est. Effort
G1	Guest Restriction Banner	API service only	Full SwiftUI banner	Medium	1 day

Gap ID	Feature	Current State	Target	Priority	Est. Effort
G2	Delight Animations	Mode selection only	Full toast + haptic system	Low	3 days
G3	Markdown Rendering	Plain text display	Rich AttributedString rendering	High	2 days
G4	Code Syntax Highlighting	Highlighter integrated (Package.swift)	Wire into message bubbles	High	1 day
G5	Offline Caching	None	SwiftData local cache for conversations	Low	3 days
G6	Notification Integration	None	macOS UserNotifications for achievements	Low	1 day

Maintenance Policy

This manifest MUST be updated when:

1. A new feature is added to **either** the web or Mac Think Tank app
2. A feature is removed or deprecated on **either** platform
3. A technology adaptation is discovered to be insufficient
4. A gap is resolved or a new gap is identified
5. A Tier 1/2 feature's status changes

Update process: 1. Add/update the row in the appropriate Feature Parity Matrix table 2. If adding a new technology, add a row to the Technology Adaptation Map 3. If discovering a gap, add a row to Known Gaps & Planned Work 4. Update the version number and date at the top 5. Update docs/01-THINK-TANK.md Mac section if user-facing

Policy enforcement: /.windsurf/workflows/thinktank-dual-platform.md

Part XIII: Aurelius Dojo – Training System

Merged from 03-DOJO.md – complete Dojo training platform reference.

Table of Contents

- Part I: User Guide

Part I: User Guide

Classification: RADIANT INTERNAL
Version: 1.2.0 | **Date:** February 6, 2026
Status: FULLY WIRED – Frontend + Lambda + Database + CDK
Part of: RADIANT Think Tank Ecosystem
Port: 3004

1. What is the Dojo?

The Aurelius Dojo is an **agent-powered training platform** that transforms private document libraries into structured, thematic mastery experiences. It is designed for:

- **New employee onboarding** – order taking rules, policies, procedures
- **Cross-training** – learn a different area of the business
- **Compliance training** – regulations, safety protocols, legal requirements
- **Product knowledge** – product lists, pricing, specifications

The Dojo is **not a chatbot**. It is a structured learning environment with AI-driven lesson generation, adversarial testing, and mastery tracking.

2. Core Concepts

2.1 Thematic Gating Protocol (TGP)

Users **never see the raw document library**. Instead, the AI analyzes all documents and discovers 10-15 **Central Themes** – the core knowledge pillars. Training is gated to selected themes only, ensuring:

- **No cognitive overload** – focused learning, not library browsing
- **100% thematic purity** – AI only retrieves content matching your selected themes
- **Deep mastery** – forced to internalize, not just skim

2.2 The Conservation Cycle

Every training session follows a four-step cycle:

Step	Name	What Happens
1	Follow	Select 1-3 Central Themes from the theme HUD

Step	Name	What Happens
2	Call	Sensei delivers synthesized lessons (Lecture Mode)
3	Tranq	Adversarial agent challenges you (Sparring Mode)
4	Collect	Earn XP, advance rank, unlock harder themes

2.3 Rank System

Rank	XP Required	Badge Color	Access
Novice	0	Slate	Fundamental themes only
Initiate	500	Green	Intermediate themes unlock
Adept	2,000	Blue	Advanced themes unlock
Master	5,000	Purple	Expert themes + certification exams
Radiant	10,000	Gold	Full mastery – all content unlocked

3. Using the Dojo

3.1 Library Tab

1. Click **New Library** to create a knowledge base
2. Give it a name (e.g., “Order Taking Procedures”) and description
3. **Upload documents** – drag-and-drop or browse for PDF, MD, TXT, CSV files
4. Wait for ingestion (status indicators: pending -> ingesting -> analyzing -> ready)
5. Click **Discover Themes** to let the AI analyze and extract Central Themes

3.2 Themes Tab

1. Browse the discovered Central Themes – each shows difficulty tier, required rank, and chunk count
2. **Select 1-3 themes** to focus your training
3. Themes are color-coded by difficulty: green (fundamental), blue (intermediate), purple (advanced), gold (expert)
4. Click **Start Training** to enter the arena

3.3 Training Tab – Lecture Mode

1. Choose **Lecture Mode** to learn from the Sensei
2. The AI generates synthesized lesson blocks from your library, grounded in citations
3. Click the **sources** link on any lesson to see the exact document excerpts
4. Click **Next Lesson** to continue progressing
5. Click **End Session** when done

3.4 Training Tab – Sparring Mode

1. Choose **Sparring Mode** to be challenged
2. The adversarial testing agent generates questions:
 - **Multiple choice** – select the best answer
 - **Scenario-based** – apply library principles to a situation
 - **Open-ended** – explain your reasoning
 - **True/False** – quick knowledge checks
3. Submit your answer to receive:
 - Correct/incorrect verdict with partial credit
 - The correct answer with full explanation
 - Reasoning analysis of your response
 - Source citations proving the answer
 - XP awarded
4. Click **Next Question** to continue

3.5 Progress Tab

- View your **overall rank** and XP progress bar
- See **per-theme mastery** with accuracy, strengths, and weaknesses
- Track **streak days**, session count, and total time
- View earned **certifications**

3.6 Mobot Sidebar

Click the **Mobot** button in the top bar to open the Knowledge Agent:

- Ask any question about your training topics
- Answers are grounded in your library with hoverable citations
- Mobot is context-aware – it knows your current session and selected themes
- Use it for quick reference without leaving the training workflow

4. API Architecture

All communication goes through the service layer. The Dojo frontend never accesses data directly.

Endpoint Group	Base Path	Purpose
Libraries	/api/admin/dojo/libraries/	CRUD, document upload, theme discovery
Sessions	/api/admin/dojo/sessions/	Training sessions, lessons, sparring
Progress	/api/admin/dojo/progress/	User progress, theme mastery
Certifications	/api/admin/dojo/certifications/	Proctored exams
Mobot	/api/admin/dojo/mobot/	Knowledge Agent
Config	/api/admin/dojo/config/	Admin settings

Endpoint Group	Base Path	Purpose
Decay	/api/admin/dojo/decay/	Ebbinghaus decay curves & reinforcement
Scenarios	/api/admin/dojo/scenarios/	Adversarial scenario synthesis
Competencies	/api/admin/dojo/competencies/	Predictive competency mesh
Dialectic	/api/admin/dojo/dialectic/	Socratic dialectic engine
Multimodal	/api/admin/dojo/multimodal/	Audio, diagrams, glossary generation
Pulse	/api/admin/dojo/pulse/	Org-wide knowledge health dashboard
Archytas	/api/admin/dojo/archytas/	Tool Master config, invocation, suggestions

Backend Infrastructure

Component	File	Details
Lambda Handler	packages/infrastructure/lambda/handler.ts	Cloud native path-based routing
Database Migration	packages/infrastructure/migrations/20260206_005_aurelius.ts	Database schema updates
CDK Stack	packages/infrastructure/dojo-stack-prod.ts	Dojo infrastructure deployment

Note: All AI-dependent features (theme discovery, lesson generation, sparring questions, scenario responses, dialectic responses, multimodal generation, mobot, competency extraction, Archytas suggestions) are implemented inline via `modelRouterService` using the tenant-configured AI model. The `invokeDojoLLM()` helper routes all calls through drift enforcement and spend governance.

5. Design System

The Dojo uses a **warm gold/amber “discipline” palette** distinct from the cool cyan of OMEGA Forge:

Token	Value	Usage
Background	<code>rgb(15, 12, 8)</code>	Near-black warm base
Primary	<code>dojo-500 (#f59e0b)</code>	Amber – discipline, mastery
Accent	<code>omega-500 (#0ea5e9)</code>	Cyan – platform continuity
Glass Panel	<code>bg-[#0a0806]/85 backdrop-blur-md</code>	Frosted glass
Font	Inter + JetBrains Mono	Display + monospaced

Token	Value	Usage
Pattern	Tatami grid	40px amber gridlines at 2% opacity

Rank Colors

Rank	Color	Tailwind
Novice	Slate	<code>text-slate-400</code>
Initiate	Green	<code>text-green-400</code>
Adept	Blue	<code>text-blue-400</code>
Master	Purple	<code>text-purple-400</code>
Radiant	Gold	<code>text-dojo-400</code>

6. Leapfrog Features (v1.1.0)

These 6 features put Dojo **3-5 years ahead** of every competitor (Docebo, Virti, Second Nature, Axonify, Sana Labs, Cornerstone, Degreed).

6.1 Ebbinghaus Decay Engine (Retention Tab)

Unlike Axonify's simple flashcard scheduling, the Decay Engine tracks a **per-concept neural decay model**:

- Each “knowledge atom” has its own **half-life** (how fast you forget it)
- **Retention probability** is calculated per-atom, per-user, per-theme
- Correct answers **increase** the half-life -> next review pushed further out
- Incorrect answers **shorten** the half-life -> more frequent reinforcement
- Dashboard shows at-risk concepts, average retention, and per-theme decay bars
- **Reinforcement sessions** are triggered at the optimal recall moment

6.2 Adversarial Scenario Synthesis (Scenarios Tab)

Unlike Second Nature's scripted sales roleplay, Dojo generates **branching multi-turn scenarios** from your actual policies:

- **9 persona archetypes**: Confused Customer, Angry Customer, VIP Escalation, Compliance Auditor, Hostile Negotiator, etc.
- Each persona has hidden objectives, emotional state, and communication style
- Every response is scored: **optimal**, **acceptable**, **suboptimal**, or **critical error**
- Personas react dynamically – emotional shifts based on your responses
- Debrief includes: Emotional Intelligence, Policy Adherence, Resolution scores + per-turn timeline

6.3 Socratic Dialectic Engine (Dialectic Tab)

No competitor has this. Three AI agents debate a proposition from your library:

- **Thesis Agent** (green) – Presents the proposition with evidence
- **Antithesis Agent** (red) – Challenges with counterarguments and edge cases
- **Synthesis Agent** (purple) – Reconciles positions after you take a stand
- You participate by submitting Claims, Evidence, Rebuttals, Concessions, or Syntheses
- Scored on: Reasoning Chain, Argument Quality, Evidence Usage, Critical Thinking
- **Logical fallacy detection** – identifies ad hominem, straw man, false dichotomy, etc.

6.4 Predictive Competency Mesh (Competency Tab)

Unlike Degreed’s manual skill tagging, Dojo **auto-extracts competencies** from your library:

- AI discovers competency graph with proficiency levels and prerequisites
- Per-user proficiency tracking with confidence scoring and trend (improving/stable/declining)
- **Role readiness scores** – “You are 73% ready for Senior Customer Service Rep”
- Missing competencies identified with estimated time-to-ready
- **Recommended learning path** with priority ranking (critical -> high -> medium -> low)
- Team-level gap analysis for managers

6.5 Multimodal Lesson Synthesis (Types + API)

Auto-generates rich content from lesson blocks:

- Audio narration of lessons
- 6 diagram types: flowchart, mindmap, timeline, comparison, hierarchy, process (Mermaid)
- Auto-extracted glossary with definitions and related terms
- Key takeaways summary
- Learning style adaptations (visual/auditory/kinesthetic/reading-writing)

6.6 Organizational Knowledge Pulse (Pulse Tab)

No competitor offers real-time org-wide knowledge health monitoring:

- **Overall health score** (0-100%) with trend indicator
- **Department health breakdown** – scores, accuracy, at-risk counts, training hours
- **Decay alerts** – “Sales team hasn’t been tested on Return Policy in 90 days” (critical/warning/info)
- **Theme compliance coverage** – trained users, mastery, decay risk, compliance status
- **ROI metrics:** cost savings/month, avg time-to-competency, cert pass rate, retention rate, hours saved vs traditional

7. File Structure

```
apps/dojo/
+-- app/
|   +-- globals.css      # Dojo design system CSS
|   +-- layout.tsx       # Root layout with providers
|   +-- page.tsx         # Main page with 9-tab routing
|   +-- providers.tsx     # React Query provider
+-- components/
|   +-- DojoSidebar.tsx   # Left navigation sidebar (9 tabs)
|   +-- LibraryView.tsx  # Document library management
```

```

|   +--- ThemeSelector.tsx      # Central theme discovery & selection
|   +--- TrainingArena.tsx     # Lecture + Sparring modes
|   +--- ProgressDashboard.tsx # Rank, XP, certifications
|   +--- MobotPanel.tsx        # Knowledge Agent sidebar
|   +--- DecayEngine.tsx       # Ebbinghaus decay dashboard + reinforcement

|   +--- DialecticArena.tsx    # Socratic multi-agent debate
|   +--- CompetencyMesh.tsx    # Predictive competency mesh
|   +--- KnowledgePulse.tsx    # Org-wide knowledge health dashboard
+--- lib/
|   +--- api.ts                 # Service layer -- 60+ typed endpoints
|   +--- dojo-store.ts         # Zustand state management
|   +--- utils.ts              # Rank metadata, formatting helpers
+--- package.json              # @radiant/dojo -- port 3004
+--- tailwind.config.ts        # Dojo color palette & animations
+--- tsconfig.json
+--- next.config.js
+--- postcss.config.js

```

7. Running the Dojo

From the monorepo root

```
pnpm dev --filter @radiant/dojo
```

Or directly

```
cd apps/dojo && pnpm dev
```

The app runs on **http://localhost:3004**.

8. Database Schema

The Dojo uses **19 RLS-protected tables** (migration V2026_02_06_005):

Table	Purpose
dojo_libraries	Document library containers
dojo_documents	Uploaded files with S3 keys
dojo_themes	AI-discovered Central Themes
dojo_sessions	Training sessions
dojo_lesson_blocks	Generated lessons with citations
dojo_sparring_questions	Adversarial questions
dojo_sparring_results	Answer results with XP
dojo_user_progress	Overall rank & XP

Table	Purpose
dojo_theme_progress	Per-theme mastery
dojo_certifications	Exam results
dojo_mobot_messages	Knowledge Agent chat
dojo_knowledge_atoms	Decay engine concepts
dojo_decay_curves	Per-atom decay tracking
dojo_scenario_sessions	Scenario instances
dojo_scenario_branches	Branching trees
dojo_competencies	Competency graph
dojo_user_competency_scores	Proficiency scores
dojo_dialectic_sessions	Dialectic sessions
dojo_dialectic_turns	Debate turns
dojo_multimodal_content	Audio/diagrams/glossary
dojo_knowledge_pulse	Org health snapshots
dojo_archytas_tool_calls	Tool execution log
dojo_config	Per-tenant configuration

Version 3.0.0 | February 2026

For: Knowledge Managers, Subject Matter Experts, Knowledge Contributors

Table of Contents

1. What is Curator?
2. Getting Started
3. Uploading Documents
4. Zero-Copy Data Connectors
5. The Entrance Exam (Verification)
6. Resolving Conflicts
7. Exploring the Knowledge Graph
8. Organizing with Domains

- 9. Correcting the AI (Overrides)
- 10. Understanding Chain of Custody
- 11. Managing Cartridges
- 12. Tips & Best Practices
- 13. Troubleshooting

1. What is Curator?

Teaching Your AI

Curator is where you **teach** your organization’s AI. Instead of hoping the AI “figures out” your documents, you actively guide it—uploading knowledge, verifying its understanding, and correcting mistakes.

Think of it like onboarding a new employee: 1. **Give them the manuals** (upload documents) 2. **Quiz them** (Entrance Exam) 3. **Correct mistakes** (Overrides) 4. **Document everything** (Chain of Custody)

What You Can Do

Task	Description
[DOC] Upload Documents	Drag-and-drop PDFs, manuals, spreadsheets
[OK] Verify Knowledge	Confirm the AI understood correctly
Correct Mistakes	Fix anything the AI got wrong
[SEARCH] Explore the Graph	See how concepts connect
Organize by Domain	Group knowledge into categories

Your Role

Role	What You Can Do
Knowledge Manager	Everything: upload, verify, correct, organize
Contributor	Upload documents and submit for verification
Viewer	Browse the knowledge graph (read-only)

2. Getting Started

Logging In

1. Open Curator from your Think Tank dashboard (or go directly to your Curator URL)
2. Sign in with your company credentials
3. You’ll see the main dashboard with quick actions

The Dashboard

When you first open Curator, you'll see:

[CHART] DASHBOARD			
Knowledge Nodes	Documents	Verified	Pending
12,847	234	11,203	1,644
Upload Documents	[OK] Verify Knowledge	[SEARCH] Graph Explorer	
[!] 1,644 items awaiting verification -> Review Now			

Your First Steps

- 1. **Create a Domain** - Organize your knowledge (e.g., "Engineering", "Safety")
- 2. **Upload Documents** - Drag-and-drop your manuals and specs
- 3. **Verify Knowledge** - Confirm the AI understood correctly
- 4. **Explore the Graph** - See how concepts connect

3. Uploading Documents

Supported File Types

Format	Extensions	Max Size
PDF Documents	.pdf	50 MB
Word Documents	.doc, .docx	25 MB
Plain Text	.txt	10 MB
Spreadsheets	.csv, .xlsx	25 MB

How to Upload

- 1. Click **"Upload Documents"** from the dashboard
- 2. Select a **Domain** (category) for your documents
- 3. **Drag-and-drop** files or click to browse
- 4. Wait for processing (you'll see a progress bar)
- 5. Documents appear in the **Verification Queue**

What Happens After Upload?

Your Document -> AI Reads It -> Creates Knowledge Nodes -> Needs Your Verification

[DOC] [AI] [PKG] [OK]

The AI extracts facts, procedures, and entities from your documents. But it doesn’t trust itself—it puts everything in a queue for YOU to verify.

Tips for Better Results

- **Use clear, structured documents** - Headings and bullet points help the AI
- **One topic per document** - Don’t mix unrelated content
- **Include context** - “Pump 302” is clearer than just “the pump”

4. Zero-Copy Data Connectors

What is Zero-Copy?

Instead of uploading files, you can **connect external data sources** directly. Curator creates lightweight “stub” nodes that point to the original files—the files stay where they are.

Benefits: - Files stay in their original location (S3, SharePoint, etc.) - [SYNC] Automatic sync when files change - No duplicate storage costs - [LOCK] Original security permissions preserved

Supported Connectors

Connector	Description
Amazon S3	Connect to S3 buckets
Azure Blob	Connect to Azure storage containers
SharePoint	Connect to SharePoint document libraries
Google Drive	Connect to Google Drive folders
Snowflake	Connect to Snowflake data warehouse
Confluence	Connect to Confluence wiki spaces

Adding a Connector

1. Go to “**Ingest Documents**” from the sidebar
2. Find “**Zero-Copy Sources**” in the left panel
3. Click “**+ Add**” to open the wizard

Step 1: Select Source Type

-----+

[SIGNAL] Connect Data Source

-----+

Select source type:

|

+-----+		+-----+		+-----+		
	Amazon S3		Azure		SharePoint	
			Blob			
	+-----+		+-----+		+-----+	
	+-----+		+-----+		+-----+	
	[FOLDER] Google		Snowflake		[NOTE] Confluence	
	Drive					
	+-----+		+-----+		+-----+	
+-----+						

Step 2: Configure Connection - Enter a name (e.g., “Production Manuals”) - Provide connection details (bucket name, URL, etc.) - Select target domain (optional)

Step 3: Confirm & Connect - Review settings - Click “**Connect Source**” - Curator begins indexing metadata

Managing Connectors

Connected sources appear in the sidebar with status indicators:

Status	Meaning
Connected	Ready, synced recently
[SYNC] Syncing	Currently updating metadata
Error	Connection issue - check credentials

Click the **refresh icon** ([SYNC]) to manually trigger a sync.

Stub Nodes

When you connect a data source, Curator creates **stub nodes**—lightweight pointers to files. When someone asks about content in those files, Curator fetches the full content on-demand.

Stub Node: "Equipment Manual v3.pdf"
+-- Location: s3://company-docs/manuals/equip_v3.pdf
+-- Last Modified: Jan 24, 2026
+-- Size: 2.4 MB
+-- Status: Ready for expansion

5. The Entrance Exam (Verification)

What is the Entrance Exam?

Before the AI can use knowledge from your documents, it has to prove it understood correctly. This is the **Entrance Exam**—the AI presents what it learned through different types of quiz cards, and you confirm or correct it.

Three Types of Quiz Cards

The AI presents verification questions in three formats:

1. Fact Check [OK]

The AI shows you something it extracted and asks if it's correct.

+-----+			
	[OK] FACT CHECK		
+-----+			
	[AI] I extracted:		
	"The maximum operating pressure for Model X is 4,500 PSI"		
	Is this correct?		
	Source: Pump_Manual.pdf, Page 47		
	+-----+		
	[OK] Yes,	Correct	[X] Reject
	Correct	It	Entirely
	+-----+		
+-----+			

2. Logic Check

The AI shows you a relationship it **inferred** (not directly stated in the document).

+-----+			
	LOGIC CHECK		
+-----+			
	[AI] I inferred:		
	"Pump 302 requires Filter Type A because it operates		
	in high-humidity conditions"		
	Is this relationship correct?		
	+-----+		
	[OK] Yes,	Correct	[X] Reject
	Valid	It	Entirely
	+-----+		
+-----+			

3. Ambiguity

The AI found **conflicting information** and needs you to pick the correct one.

+-----+	
	AMBIGUITY
+-----+	
	[AI] I found conflicting information:

+-----+		
Option A:		
"Replace filter every 30 days"		
Source: Maintenance_Manual_2023.pdf		
+-----+		
+-----+		
Option B:		
"Replace filter every 15 days"		
Source: Safety_Update_2024.pdf		
+-----+		
Which is correct?		
+-----+ +-----+		
Option A	Option B	
+-----+ +-----+		
+-----+		

The “Correct It” Feature

When the AI is close but not quite right, use “Correct It” instead of rejecting:

- 1. Click “Correct It”
- 2. Enter the correct value
- 3. Provide a reason (required for audit trail)
- 4. Click “Save Correction”

This automatically creates a **Golden Rule** so the AI never makes the same mistake again.

+-----+	
CORRECT THIS FACT	
+-----+	
Original (AI extracted):	
"Replace filter every 30 days"	
Corrected Value:	
+-----+	
Replace filter every 15 days in Mexico City plant	
+-----+	
Reason (required):	
+-----+	
Field testing showed faster degradation due to humidity	
+-----+	
[!] This will create a Golden Rule override.	
[Cancel] [Save Correction]	
+-----+	

Filtering the Verification Queue

Use the toolbar filters to focus on specific items:

Filter	Shows
All	Everything in the queue
Pending	Items waiting for review
Verified	Items you’ve already approved
Rejected	Items you’ve rejected

You can also filter by **card type**: - **Fact Check** - Direct extractions - **Logic Check** - Inferred relationships - **Ambiguity** - Conflicting information

Confidence Colors

Color	Confidence	What to Do
Green	90-100%	AI is confident. Usually safe to approve.
Yellow	70-89%	AI is uncertain. Review carefully.
Red	Below 70%	AI is guessing. Expert review required.

View Source

Every verification item includes a “**View Source**” button that shows: - Original document name - Page number where the fact was found - Highlighted text in context

6. Resolving Conflicts

What is the Conflict Queue?

When the AI finds **contradictory information** across documents that it can’t resolve on its own, it adds them to the **Conflict Queue** for human resolution.

Accessing the Conflict Queue

1. Click “**Conflict Queue**” in the sidebar
2. A red badge shows how many conflicts need attention
3. Conflicts are sorted by priority (critical first)

Conflict Types

Type	Icon	Description
Contradiction	[X]	Two facts directly contradict each other
Overlap		Same topic with different values
Temporal		Older vs newer information conflict
Source Mismatch	[!]	Different sources say different things

Resolving a Conflict

- 1. Select a conflict from the list
- 2. Review the **side-by-side comparison**:

CONFLICT RESOLUTION

Version A

Max pressure:
4,500 PSI

Source: Manual 2023

Version B

Max pressure:
4,000 PSI

Source: Update 2024

Resolution Reason (required):
2024 update reflects new safety standards

Choose Resolution:

Keep A

Keep B

Merge

Defer

- 3. Choose a resolution:
 - **Keep A** - Version A supersedes Version B
 - **Keep B** - Version B supersedes Version A
 - **Merge** - Combine information from both
 - **Context Dependent** - Both are valid in different contexts
 - **Defer** - Need more information, review later
- 4. Enter a **reason** (required for audit trail)
- 5. Click to apply the resolution

Priority Levels

Priority	Color	Action
Critical	Red	Resolve immediately - safety/compliance
High	Gold	Resolve soon - affects operations
Medium	Blue	Resolve when convenient
Low	Gray	Can wait

7. Exploring the Knowledge Graph

What is the Knowledge Graph?

The Knowledge Graph is a visual map of everything your AI knows. Facts, procedures, and entities are shown as **nodes** (circles), connected by **relationships** (lines).

Node Types (What You’ll See)

Color	Type	What It Represents
Gold	Concept	Abstract ideas or categories
Green	Fact	Verifiable statements
Blue	Procedure	Step-by-step processes
Bronze	Entity	Physical objects or systems
[OMEGA] Purple	Rule	Constraints or requirements

Navigating the Graph

- **Zoom:** Scroll or use +/- buttons
- **Pan:** Click and drag the background

- **Select:** Click any node to see details
- **Filter:** Use the sidebar to show only certain types or domains

The Traceability Inspector

When you click a node, the **Traceability Inspector** panel opens showing complete provenance:

SEARCH

TRACEABILITY INSPECTOR

LOCK

God Mode

Content:

"Maximum operating pressure is 4,500 PSI"

Type: Fact Status: [OK] Verified

Confidence: 85%

Connections: 12 related nodes

Overridden Nodes

Nodes with active overrides show the “**God Mode**” badge and display both values:

+-----+		
	Content:	
	+-----+	
	"Replace filter every 30 days"	
	+-----+	
	[LOCK] Override Active:	
	+-----+	
	"Replace filter every 15 days (Mexico City plant)"	
	Reason: High humidity degrades filters faster	
	By: Safety Officer Jane * Jan 25, 2026	
	+-----+	
+-----+		

8. Organizing with Domains

What are Domains?

Domains are **folders** for your knowledge. They help organize thousands of facts into manageable categories.

Example Structure:

- Engineering
 - Hydraulics
 - Pumps
 - Valves
 - Electrical
 - Motors
- Operations
 - Maintenance
 - Safety
- Compliance

Creating a Domain

1. Go to “**Domains**” in the sidebar
2. Click “**+ New Domain**”
3. Enter a name (e.g., “Hydraulics”)
4. Optionally, select a parent domain
5. Click “**Create**”

Domain Settings

Setting	What It Does
Auto-categorize	AI automatically assigns documents to this domain
Require Verification	All facts need human approval before use
Retention	Automatically archive old content after X days

9. Correcting the AI (Overrides)

When Should You Override?

- **Outdated info** - The manual is old, the real answer has changed
- **Site-specific rules** - “We do it differently at THIS location”
- ☒ **AI mistakes** - The AI misunderstood something
- **Policy updates** - New company policy supersedes old docs

How to Override

1. Find the fact in the Knowledge Graph (or during Verification)
2. Click the node to open the Traceability Inspector
3. Click “**Force Override**” (the crown button)
4. Choose your **Rule Type**
5. Enter the **correct value** and **justification**
6. Set the **priority level**
7. Click “**Apply Override**”

The Override Dialog (“God Mode”)

FORCE OVERRIDE

"God Mode"

Rule Type:

Force Override

Supersedes ALL data

[SHIELD] Conditional

Applies when condition met

[LINK] Context Dependent

Varies by context

When AI says:

"Replace filter every 30 days"

Force this instead:

"Replace filter every 15 days (Mexico City plant)"

Priority: 85

Low (1)Medium (50)Critical (100)

Justification (required):

Field testing showed faster filter degradation due to humidity levels. Per Engineering approval MX-2026-004.

Expiration: [None] v (optional – leave empty for permanent)

[LOCK] Chain of Custody: This will create a cryptographically signed record for audit compliance.

[Cancel]

[Apply Override]

Rule Types Explained

Type	Icon	When to Use	Example
Force Override		Always use my value, no exceptions	“This pump’s max pressure is 4,000 PSI, period.”
Conditional	[SHIELD]	Use my value only when a condition is met	“When location = Mexico City, replace filter every 15 days”
Context Dependent	[LINK]	Value varies based on context	“Pressure limit varies by altitude”

Priority Slider

The priority determines which rule wins when multiple rules could apply:

Priority	Label	Use Case
1-39	Low	Nice-to-have preferences
40-69	Medium	Standard operational overrides
70-89	High	Important corrections
90-100	Critical	Safety/compliance rules that MUST apply

Example: If two rules conflict, the one with higher priority wins.

Golden Rules (“God Mode”)

When you override a fact, it becomes a **Golden Rule**—a high-priority directive that supersedes ALL other information.

Example: - Textbook says: “Replace filter every 30 days” - Your Golden Rule: “In Mexico City, replace every 15 days” - **Result:** AI always uses YOUR answer for that location

Managing Overrides

Access all active overrides from “**Overrides**” in the sidebar:

- **Search** by keyword or domain
- **Filter** by status (Active, Expired, Pending Review)
- **Sort** by priority, date, or creator
- **Edit** any override (creates a new audit entry)
- **Delete** to restore original AI behavior

10. Understanding Chain of Custody

What is Chain of Custody?

Every fact in Curator has a **history**—who added it, who verified it, who changed it. This is called the **Chain of Custody**.

Think of it like a legal document: you can always prove who touched what and when.

Why Does This Matter?

Reason	Benefit
Accountability	Know who verified each fact
Compliance	Audit trail for SOC 2, ISO 27001, HIPAA
Trust	Prove the AI’s source for any statement
Liability	If something goes wrong, trace it back

Viewing Chain of Custody

1. Select any node in the Knowledge Graph
2. Click the “**History**” tab
3. See the complete timeline:

CHAIN OF CUSTODY		
[DOC] Created		
Source: Pump_Manual_2024.pdf, Page 47		
Extracted by AI on Jan 24, 2026 at 10:30 AM		
[OK] Verified		
Verified by: Chief Engineer Bob		

Date: Jan 24, 2026 at 11:15 AM	
Signature: abc123...	
Overridden	
Changed by: Safety Officer Jane	
Date: Jan 25, 2026 at 9:00 AM	
Old value: "4,500 PSI"	
New value: "4,000 PSI"	
Reason: "Updated per 2026 standard"	
[Export as PDF]	

Exporting for Compliance

Need to prove something for an audit? Click “**Export as PDF**” to download a signed, timestamped record of the entire history.

11. Managing Cartridges

What Are Cartridges?

Cartridges are portable AI knowledge packages (.RADz files) that bundle everything your AI has learned:

Component	Description
Curator Knowledge	Verified facts from your Knowledge Graph
Ghost Vectors	Learned patterns and preferences
LoRA Adapters	Fine-tuned model behaviors
Domain Experts	Specialized reasoning capabilities
Overrides	Your corrections and rules

Think of cartridges like a brain backup—everything the AI knows, packaged for transfer.

Why Use Cartridges?

Use Case	How Cartridges Help
Backup & Recovery	Export your knowledge before major changes
Share Expertise	Send your AI configuration to a colleague
New Deployments	Clone your setup to a new environment
M&A Integration	Transfer AI expertise during acquisitions
Disaster Recovery	Restore from cartridge if something goes wrong

The Cartridges Dashboard

Navigate to **Cartridges** in the sidebar to see:

[PKG] CARTRIDGES			
Total	Active	Signed	Hot
12	10	8	3
[My Cartridges]	[Organization]	[System]	
+-----+			
[PKG] Engineering Knowledge Pack		v2.1.0	
Contains: Knowledge, Ghost, LoRA			
Thermal: [HOT] HOT		Signed: [OK]	
[View] [Export]			
+-----+			

Cartridge Scopes

Scope	Who Can See	Who Can Create
Personal	Only you	You
Organization	Everyone in your org	Tenant Admins
System	All tenants	Radiant Admins

Creating a Cartridge

1. Click **“Create Cartridge”**
2. Enter a **name** and **description**
3. Choose **scope** (Personal or Organization)
4. Select what to include:
 - [OK] Curator Knowledge Graph (your verified facts)
 - [OK] Ghost Vector Compression (learned patterns)
 - [OK] Domain selections
5. Click **“Create”**

The cartridge will be built with all your selected components.

Exporting a Cartridge

1. Find the cartridge you want to export
2. Click **“Export”**
3. Download the **.RADz file**

The exported cartridge includes: - All selected knowledge and configurations - **Cryptographic signature** (dual-signed by you and the platform) - **Metadata** (version, timestamp, checksums)

Importing a Cartridge

1. Click “**Import .RADz**”

2. Drag-and-drop your .RADz file (or click to browse)

3. Choose whether to **validate signature**:
 - [OK] **Recommended**: Ensures the cartridge hasn’t been tampered with
 - Verifies both author and platform signatures

4. Click “**Import**”

If signature validation fails, you’ll see:

```
+-----+
|  [!] SIGNATURE VERIFICATION FAILED  |
+-----+
|                                     |
|  This cartridge could not be verified:  |
|                                     |
|  [X] Author signature: INVALID          |
|  [OK] Platform signature: Valid         |
|  [X] Hash mismatch: Content may have been modified |
|                                     |
|  [Cancel Import]  [Import Anyway (Not Recommended)] |
|                                     |
+-----+
```

Cartridge Thermal States

Cartridges have thermal states indicating their usage:

State	Icon	Meaning
Hot	[HOT]	Actively being used, high inference volume
Warm		Ready for use, moderate activity
Cold		Not recently used, may take longer to load

The system automatically manages thermal states based on usage patterns.

Cartridge Signatures (PKI)

Every cartridge exported from Curator is **cryptographically signed**:

Signature	Who Signs	What It Proves
Author	You (via your tenant CA)	You created this cartridge
Platform	RADIANT (via Root CA)	RADIANT verified and counter-signed

This dual-signature ensures: - **Authenticity**: The cartridge is from who it claims to be from - **Integrity**: The content hasn't been modified - **Non-repudiation**: The author can't deny creating it

Federation: Cross-Cluster Trust

If your organization has multiple RADIANT clusters (e.g., commercial + government), cartridges from trusted clusters can be imported:

- 1. Admin adds the other cluster's Root CA to trusted roots
- 2. Cartridges from that cluster are now verifiable
- 3. Import as normal—signatures will validate against trusted CAs

This enables secure AI knowledge transfer across independent RADIANT deployments.

Cluster Compatibility

Each cartridge includes compatibility information to ensure safe imports:

Field	Purpose
Source Cluster	Where the cartridge was created
Minimum Version	Lowest RADIANT version that can use it
Compatible Apps	Which apps can use it (Curator, Think Tank, etc.)
Required Features	Features needed (Ghost Vectors, LoRA, etc.)
Environment	production/staging/development

What Gets Checked on Import: 1. **Version:** Your cluster must meet the minimum version 2. **Apps:** The app you're importing into must be supported 3. **Features:** All required features must be available 4. **Environment:** Cannot import staging/dev cartridges into production

If compatibility fails, you'll see a detailed message explaining what's missing:

```
+-----+
|  [!] COMPATIBILITY CHECK FAILED  |
+-----+
|
|  Source: Radiant Commercial US-East v6.2.0
|  Target: Radiant Government v6.0.0
|
|  [X] Version: Requires 6.2.0, cluster is 6.0.0
|  [OK] Apps: curator, thinktank supported
|  [X] Features: Missing 'axiom_scorers'
|  [OK] Environment: production -> production
|
|  [Cancel Import]
|
+-----+
```

12. Tips & Best Practices

For Better Document Ingestion

Tip	Why
Use structured documents	Headings and bullets help the AI understand hierarchy
One topic per document	Mixing topics confuses the AI
Include model numbers	“Pump 302” is clearer than “the pump”
Keep files under 50 MB	Large files take longer to process

For Efficient Verification

Tip	Why
Start with high-confidence items	Green items are usually quick approvals
Use “Defer” liberally	If you’re not sure, let an expert handle it
Check the source	Always click “View Source” for red items
Batch similar items	Filter by domain to process related facts together

For Effective Overrides

Tip	Why
Always explain your reason	Future you (and auditors) will thank you
Use expiration dates	Temporary rules shouldn’t live forever
Higher priority = stronger	Use 150+ for critical safety overrides
Review periodically	Overrides can become outdated too

Keyboard Shortcuts

Shortcut	Action
A	Approve current item
R	Reject current item
D	Defer current item
->	Next item in queue
<-	Previous item
/	Focus search

Shortcut	Action
?	Show help

13. Troubleshooting

Common Issues

Problem	Solution
Upload fails	Check file size (max 50 MB) or try a different format
AI confidence is low	Document may be unclear. Try adding context or splitting it.
Graph won't load	Too many nodes. Apply a domain filter.
Can't see Curator	Ask your admin to grant you access in Think Tank

Getting Help

- **In-app help:** Click the ? icon in any screen
- **Contact your admin:** For access or permission issues
- **Support:** support@radiant.ai

End of RADIANT Curator User Guide

Part II: Engineering Guide

Version: 1.0.0

Last Updated: 2026-01-28

Application: @radiant/curator

Port: 3003

Executive Summary

RADIANT Curator is an enterprise-grade **AI Knowledge Curation Platform** that enables organizations to teach, verify, and govern AI understanding of corporate knowledge. It implements a human-in-the-loop verification system called the “**Entrance Exam**” where AI-extracted facts must pass human review before deployment.

Key Differentiators

Feature	Description
Entrance Exam	AI must prove it understands facts correctly before deployment
Golden Rules (God Mode)	Human overrides that supersede all AI learning
Chain of Custody	Cryptographic audit trail for all knowledge changes
Zero-Copy Connectors	Index metadata without moving files from source systems
Conflict Resolution	Side-by-side comparison for contradictory knowledge

Table of Contents

1. Architecture Overview

Component Communication Flow

2. Technology Stack

Frontend

Technology	Version	Purpose
Next.js	14.1.0	React framework with App Router
React	18.2.x	UI library
TypeScript	5.3.x	Type safety
Tailwind CSS	3.4.x	Utility-first styling
Radix UI	Various	Accessible component primitives
Lucide React	0.309.x	Icon library
React Dropzone	14.2.x	File upload handling
Recharts	2.10.x	Data visualization
D3.js	7.8.x	Knowledge graph rendering
Sonner	1.3.x	Toast notifications

Technology	Version	Purpose
Framer Motion	11.x	Animations
TanStack Query	5.17.x	Server state management

Backend

Technology	Purpose
AWS Lambda	Serverless API handlers
Aurora PostgreSQL	Primary database with RLS
AWS S3	Document storage
AWS Textract	Document text extraction

3. Project Structure

```

apps/curator/

+-- tsconfig.json
```

4. UI Pages & Components

4.1 Dashboard (/dashboard)

File: app/(dashboard)/page.tsx

The main entry point showing:

- **Stats Grid:** Knowledge nodes, documents ingested, verified facts, pending verification
- **Quick Actions:** Links to Ingest, Verify, and Graph pages
- **Recent Activity:** Timeline of latest curation events
- **Pending Alert:** Warning banner when items await verification

```
interface DashboardStats {
  knowledgeNodes: number;
  documentsIngested: number;
  verifiedFacts: number;
  pendingVerification: number;
}
```

```
interface ActivityItem {
  id: string;
  type: 'ingestion' | 'verification' | 'override';
  message: string;
  time: string;
  status: 'success' | 'verified' | 'override' | 'pending' | 'error';
}
```

API Endpoints Used: - GET /api/curator/dashboard - GET /api/curator/audit?limit=10

4.2 Document Ingestion (/dashboard/ingest)

File: app/(dashboard)/ingest/page.tsx

Enables document upload and zero-copy connector management.

Features

1. Drag & Drop Upload

- Supports PDF, DOC, DOCX, TXT, CSV
- Progress tracking with node creation count
- Domain categorization selection

2. Zero-Copy Connectors

- S3, Azure Blob, SharePoint, Google Drive, Snowflake, Confluence
- 3-step wizard: Select Type -> Configure -> Confirm

- Stub node indexing (metadata only, files stay in place)

```
type ConnectorType = 's3' | 'azure_blob' | 'sharepoint' | 'google_drive' | 'snowflake' | 'confluent'
```

```
interface Connector {
  id: string;
  name: string;
  type: ConnectorType;
  status: 'connected' | 'syncing' | 'error' | 'pending';
  lastSync?: string;
  stubNodesCreated: number;
}
```

API Endpoints Used: - GET /api/curator/connectors - POST /api/curator/connectors - POST /api/curator/connectors/:id/sync - POST /api/curator/documents/upload

4.3 Knowledge Verification (/dashboard/verify)

File: app/(dashboard)/verify/page.tsx

The “**Entrance Exam**” system - AI must prove it understands facts correctly.

Quiz Card Types

Type	Icon	Description
fact_check	CheckCircle2	Verify extracted facts
logic_check	GitBranch	Verify inferred relationships
ambiguity	HelpCircle	Choose between conflicting values

```
type QuizCardType = 'fact_check' | 'logic_check' | 'ambiguity';
```

```
interface VerificationItem {
  id: string;
  statement: string;
  source: string;
  sourcePage?: number;
  confidence: number;
  domain: string;
  status: 'pending' | 'verified' | 'rejected' | 'needs_review';
  aiReasoning?: string;
  cardType: QuizCardType;
  optionA?: string; // For ambiguity cards
  optionB?: string; // For ambiguity cards
  inferredRelationship?: string; // For logic_check cards
}
```

User Actions

1. **Approve** (handleVerify) - Mark as correct

2. **Correct** (handleCorrect) - Fix and create Golden Rule
3. **Reject** (handleReject) - Mark as wrong
4. **Resolve Ambiguity** (handleAmbiguityChoice) - Choose A or B

API Endpoints Used: - GET /api/curator/verification - POST /api/curator/verification/:id/approve
 - POST /api/curator/verification/:id/reject - POST /api/curator/verification/:id/correct -
 POST /api/curator/verification/:id/resolve-ambiguity

4.4 Knowledge Graph (/dashboard/graph)

File: app/(dashboard)/graph/page.tsx

Interactive visualization of knowledge nodes and relationships.

Node Types

Type	Color	Purpose
concept	Gold (#D4AF37)	Abstract concepts
fact	Green (#50C878)	Verified facts
procedure	Blue (#0F52BA)	Step-by-step processes
entity	Bronze (#CD7F32)	Named entities

Node Status

Status	Visual	Description
verified	Green checkmark	Human-approved
pending	Yellow warning	Awaiting verification
overridden	Blue pen	Has Golden Rule override

```
interface GraphNode {
  id: string;
  label: string;
  type: 'concept' | 'fact' | 'procedure' | 'entity';
  status: 'verified' | 'pending' | 'overridden';
  x: number;
  y: number;
  connections: string[];
  content?: string;
  sourceDocumentId?: string;
  sourceDocumentName?: string;
  sourcePage?: number;
  confidence?: number;
  verifiedAt?: string;
  verifiedBy?: string;
```

```

    overrideValue?: string;
    overrideReason?: string;
    chainOfCustodyId?: string;
  }

```

Features

1. **Traceability Inspector** - View node provenance
2. **Force Override (God Mode)** - Create human override
3. **Chain of Custody** - View cryptographic audit trail
4. **Zoom/Pan Controls** - Navigate large graphs

API Endpoints Used: - GET /api/curator/nodes - POST /api/curator/nodes/:id/override - GET /api/curator/chain-of-custody/:id

4.5 Overrides (Golden Rules) (/dashboard/overrides)

File: app/(dashboard)/overrides/page.tsx

Management interface for human knowledge overrides.

Rule Types

Type	Icon	Description
force_override	Crown	Supersedes ALL other data
conditional	Shield	Applies when condition is met
context_dependent	Link2	Varies by context

```
type RuleType = 'force_override' | 'conditional' | 'context_dependent';
```

```

interface Override {
  id: string;
  originalFact: string;
  overriddenFact: string;
  reason: string;
  domain: string;
  createdBy: string;
  createdAt: string;
  status: 'active' | 'expired' | 'pending_review';
  expiresAt?: string;
  priority: number;           // 1-100, higher = more important
  ruleType: RuleType;
  condition?: string;        // For conditional rules
  chainOfCustodyId?: string;
}

```

Priority Levels

Range	Label	Color
90-100	Critical	Red
70-89	High	Gold
40-69	Medium	Blue
1-39	Low	Gray

API Endpoints Used: - GET /api/curator/golden-rules - POST /api/curator/golden-rules - DELETE /api/curator/golden-rules/:id

4.6 Conflict Queue (/dashboard/conflicts)

File: app/(dashboard)/conflicts/page.tsx

Resolution interface for contradictory knowledge.

Conflict Types

Type	Icon	Description
contradiction	XCircle	Direct factual contradiction
overlap	GitMerge	Overlapping but different
temporal	Clock	Different values over time
source_mismatch	AlertTriangle	Same fact, different sources

```
type ResolutionType = 'supersede_old' | 'supersede_new' | 'merge' | 'context_dependent' | 'ignore'
```

```
interface Conflict {
  id: string;
  nodeAId: string;
  nodeBId: string;
  nodeALabel: string;
  nodeBLabel: string;
  nodeAContent: string;
  nodeBContent: string;
  conflictType: 'contradiction' | 'overlap' | 'temporal' | 'source_mismatch';
  description: string;
  priority: number;
  status: 'unresolved' | 'resolved' | 'deferred';
  resolution?: ResolutionType;
  resolvedBy?: string;
  resolvedAt?: string;
  resolutionReason?: string;
```

```

    detectedAt: string;
  }

```

Resolution Options

1. **Keep A** - Version A supersedes B
2. **Keep B** - Version B supersedes A
3. **Merge** - Combine both versions
4. **Context Dependent** - Both valid in different contexts
5. **Defer** - Review later

API Endpoints Used: - GET /api/curator/conflicts - POST /api/curator/conflicts/:id/resolve

4.7 Domain Taxonomy (/dashboard/domains)

File: app/(dashboard)/domains/page.tsx

Hierarchical organization of knowledge domains.

```

interface DomainNode {
  id: string;
  name: string;
  description?: string;
  nodeCount: number;
  children?: DomainNode[];
}

```

Domain Settings

- **Auto-categorization:** Automatically assign new documents
- **Require Verification:** All facts must be verified before deployment

API Endpoints Used: - GET /api/curator/domains - POST /api/curator/domains - PUT /api/curator/domains/:id
- DELETE /api/curator/domains/:id

4.8 Activity History (/dashboard/history)

File: app/(dashboard)/history/page.tsx

Complete audit log of all curation activities.

```

interface HistoryEvent {
  id: string;
  type: 'ingestion' | 'verification' | 'rejection' | 'override';
  title: string;
  description: string;
  timestamp: string;
  user?: string;
  metadata?: {
    documentName?: string;
    domain?: string;
    nodesAffected?: number;
  };
}

```

```
};  
}
```

API Endpoints Used: - GET /api/curator/audit

5. Backend API Reference

Base Path: /api/curator

Dashboard

Method	Path	Description
GET	/dashboard	Get dashboard statistics and activity

Domains

Method	Path	Description
GET	/domains	List all domains (tree structure)
POST	/domains	Create new domain
GET	/domains/:id	Get single domain
PUT	/domains/:id	Update domain
DELETE	/domains/:id	Delete domain
GET	/domains/:id/schema	Get domain schema
PUT	/domains/:id/schema	Update domain schema

Documents

Method	Path	Description
GET	/documents	List documents
POST	/documents/upload	Initiate upload
POST	/documents/:id/complete	Complete upload processing

Verification (Entrance Exam)

Method	Path	Description
GET	/verification	Get verification queue

Method	Path	Description
POST	/verification/:id/approve	Approve a fact
POST	/verification/:id/reject	Reject a fact
POST	/verification/:id/defer	Defer review
POST	/verification/:id/correct	Correct and create Golden Rule
POST	/verification/:id/resolve-ambiguity	Resolve A/B choice

Knowledge Graph

Method	Path	Description
GET	/graph	Get graph visualization data
GET	/nodes	List knowledge nodes
GET	/nodes/:id	Get single node
POST	/nodes/:id/override	Apply God Mode override

Golden Rules

Method	Path	Description
GET	/golden-rules	List all rules
POST	/golden-rules	Create new rule
DELETE	/golden-rules/:id	Deactivate rule
POST	/golden-rules/check	Check if rule matches

Entrance Exams

Method	Path	Description
GET	/exams	List exams
POST	/exams	Generate new exam
GET	/exams/:id	Get exam details
POST	/exams/:id/start	Start exam
POST	/exams/:id/submit	Submit answer
POST	/exams/:id/complete	Complete exam

Chain of Custody

Method	Path	Description
GET	/chain-of-custody/:id	Get audit trail
POST	/chain-of-custody/:id/verify	Verify fact integrity
GET	/chain-of-custody/:id/audit	Get detailed audit

Connectors (Zero-Copy)

Method	Path	Description
GET	/connectors	List connectors
POST	/connectors	Create connector
DELETE	/connectors/:id	Delete connector
POST	/connectors/:id/sync	Trigger sync

Conflicts

Method	Path	Description
GET	/conflicts	List conflicts
POST	/conflicts/:id/resolve	Resolve conflict

Time Travel

Method	Path	Description
GET	/snapshots	List snapshots
GET	/snapshots/:id	Get snapshot
POST	/snapshots/:id/restore	Restore to snapshot
GET	/graph/at-time	Get graph at point in time

6. Data Models

```

7. Core Features

7.1 Entrance Exam System

The Entrance Exam ensures AI-extracted knowledge passes human verification:

Document -> Text Extraction -> AI Analysis -> Verification Queue -> Human Review -> Deployment

v
 [Approve / Correct / Reject]
 v
 Golden Rule (if corrected)

7.2 Golden Rules (God Mode)

Human overrides that supersede AI learning:

1. **Force Override:** Always applies, highest priority
2. **Conditional:** Applies when condition matches
3. **Context Dependent:** Different values for different contexts

7.3 Chain of Custody

Cryptographic audit trail for knowledge provenance:

```
{
  events: [
    { type: 'create', actor: 'AI', timestamp: '...', description: 'Extracted from document' },
    { type: 'verify', actor: 'john@corp.com', timestamp: '...', description: 'Verified as correct' },
    { type: 'override', actor: 'admin@corp.com', timestamp: '...', description: 'Updated value' }
  ],
}
```

```
signature: 'sha256:abc123...' // Tamper-evident hash
}
```

7.4 Zero-Copy Indexing

Connect to data sources without moving files:

[S3 Bucket] -> [Metadata Scan] -> [Stub Nodes] -> [On-Demand Expansion]

- Files remain in original location
 - Only metadata is indexed initially
 - Full content extracted on demand
-

8. User Flows

8.1 Document Ingestion Flow

1. User selects domain (optional)
2. User drags/drops or browses files
3. Frontend creates upload entries with "pending" status
4. Backend receives files, stores in S3
5. Textract extracts text
6. AI analyzes and creates knowledge nodes
7. Nodes enter verification queue with "pending" status
8. UI updates progress and node count

8.2 Verification Flow

1. User navigates to /dashboard/verify
2. System shows pending items sorted by priority
3. User selects an item
4. Detail panel shows AI's understanding
5. User chooses: Approve / Correct / Reject
6. If Correct: Enters correct value + reason -> Creates Golden Rule
7. System updates node status
8. Audit log records action

8.3 Override Flow

1. User navigates to /dashboard/overrides or graph node
2. User clicks "Force Override" / "God Mode"
3. Dialog opens with:
 - Rule type selection
 - Original value (readonly)
 - Override value (input)
 - Justification (required)
 - Priority slider
 - Expiration (optional)
4. User submits

5. System creates Golden Rule with Chain of Custody
 6. Node status updates to "overridden"
-

9. State Management

Client-Side State

The Curator app uses **React useState** for local component state:

```
const [items, setItems] = useState<VerificationItem[]>([]);
const [loading, setLoading] = useState(true);
const [selectedItem, setSelectedItem] = useState<VerificationItem | null>(null);
```

Data Fetching Pattern

```
useEffect(() => {
  async function fetchData() {
    try {
      const res = await fetch('/api/curator/endpoint');
      if (res.ok) {
        const data = await res.json();
        setItems(data.items || []);
      }
    } catch (error) {
      console.error('Failed to fetch:', error);
    } finally {
      setLoading(false);
    }
  }
  fetchData();
}, [dependencies]);
```

Optimistic Updates

```
const handleAction = async (id: string) => {
  setActionLoading(id);
  try {
    const res = await fetch(`/api/curator/item/${id}/action`, { method: 'POST' });
    if (res.ok) {
      // Optimistic update
      setItems((prev) =>
        prev.map((item) =>
          item.id === id ? { ...item, status: 'completed' } : item
        )
      );
      toast.success('Success', { description: 'Action completed.' });
    }
  } catch (error) {
    toast.error('Error', { description: 'Action failed.' });
  }
};
```

```

    } finally {
      setActionLoading(null);
    }
  };

```

10. Styling System

Curator Color Palette

Defined in `tailwind.config.js`:

```

colors: {
  curator: {
    gold: '#D4AF37',      // Primary accent, concepts
    emerald: '#50C878',   // Success, verified, facts
    sapphire: '#0F52BA',  // Secondary, procedures
    bronze: '#CD7F32',    // Tertiary, entities
  }
}

```

Custom CSS Classes

Defined in `globals.css`:

```

/* Glass morphism cards */
.glass-card {
  @apply bg-white/[0.03] backdrop-blur-xl border border-white/10;
}

/* Knowledge graph nodes */
.graph-node.verified { @apply border-curator-emerald/50; }
.graph-node.pending { @apply border-curator-gold/50; }
.graph-node.overridden { @apply border-curator-sapphire/50; }

/* Verification quiz cards */
.quiz-card.awaiting { @apply border-curator-gold/30 bg-curator-gold/5; }
.quiz-card.verified { @apply border-curator-emerald/30 bg-curator-emerald/5; }
.quiz-card.rejected { @apply border-destructive/30 bg-destructive/5; }

/* Confidence meter */
.confidence-meter { @apply h-2 bg-muted rounded-full overflow-hidden; }
.confidence-fill.high { @apply bg-curator-emerald; }
.confidence-fill.medium { @apply bg-curator-gold; }
.confidence-fill.low { @apply bg-destructive; }

```

GlassCard Component

```

// components/ui/glass-card.tsx
interface GlassCardProps {

```

```

variant?: 'default' | 'elevated';
padding?: 'none' | 'sm' | 'md' | 'lg';
glowColor?: 'gold' | 'emerald' | 'sapphire' | 'none';
hoverEffect?: boolean;
children: React.ReactNode;
className?: string;
}

```

11. Security & Audit

Multi-Tenant Isolation

All queries use Row-Level Security (RLS):

```

-- Set at start of each request
SET app.current_tenant_id = '${tenantId}';

-- RLS policy
CREATE POLICY tenant_isolation ON curator_knowledge_nodes
  USING (tenant_id = current_setting('app.current_tenant_id')::uuid);

```

Audit Logging

Every mutation is logged:

```

await logAudit(
  tenantId,
  'entity_type',    // node, rule, domain, etc.
  entityId,
  'action',         // create, update, delete, verify, override
  userId,
  oldValue,         // Previous state (for updates)
  newValue          // New state
);

```

Chain of Custody Signature

```

const signature = crypto
  .createHash('sha256')
  .update(JSON.stringify(events))
  .digest('hex');

```

12. Integration Points

RADIANT Platform Integration

Integration	Purpose
Cortex	Knowledge nodes feed into Cortex memory system
Think Tank	Curated knowledge enhances AI responses
Domain Taxonomy API	Shares domain hierarchy with Think Tank
User Data Service	Document storage tier management

External Connectors

Connector	Auth Method	Data Indexed
AWS S3	IAM Role	Object metadata, file names
Azure Blob	OAuth/SAS	Container contents
SharePoint	OAuth	Document library metadata
Google Drive	OAuth	File/folder structure
Snowflake	OAuth	Table/schema metadata
Confluence	OAuth	Page hierarchy

Appendix A: Running Locally

```
# From repository root
cd apps/curator

# Install dependencies
npm install

# Start development server
npm run dev
# -> http://localhost:3003

# Type check
npm run type-check

# Build for production
npm run build
npm start
```

Appendix B: Environment Variables

```
# API Configuration
NEXT_PUBLIC_API_URL=http://localhost:4000/api/curator
```

```
# AWS (for direct S3 uploads)
AWS_REGION=us-east-1
AWS_S3_BUCKET=radiant-curator-documents
```

```
# Database (for local development)
DATABASE_URL=postgresql://...
```

1. Introduction

1.1 What is RADIANT?

RADIANT is a multi-tenant AWS SaaS platform providing unified access to 106+ AI models through:

- **50 External Provider Models:** OpenAI, Anthropic, Google, xAI, DeepSeek, and more
- **56 Self-Hosted Models:** Running on AWS SageMaker for cost control and privacy
- **Intelligent Routing:** Cognitive Router for optimal model selection
- **Preference Engine:** Personalization learning from user interactions

1.2 Administrator Roles

Role	Permissions	Use Case
Super Admin	Full access to all features	Platform owner

v7.52.0: Pool B simplified to super_admin only. The admin, operator, and auditor roles have been removed. All platform administration is performed by super administrators.

Role Details

Super Admin - The sole platform administrator role with unrestricted access: - Create and delete tenants - Manage all administrators - Access all billing and financial data - Modify system-wide configuration - Approve production database migrations - Impersonate any tenant for debugging - Access compliance and audit reports - Access both **Radiant Admin** and **Think Tank Admin** (global apps) - Typically limited to 1-3 people (CTO, lead engineer)

1.3 Key Concepts

Concept	Description
Tenant	Organization with isolated data
User	End-user within a tenant
Subscription	Billing tier (1-7)
Credits	Currency for AI usage
API Key	Authentication for API access
App	Consumer application (Think Tank, etc.)

Tenant Architecture Explained

A **Tenant** represents a complete organization using RADIANT. Each tenant has:

- **Complete Data Isolation:** All data is stored with tenant IDs and protected by PostgreSQL Row-Level Security (RLS). One tenant can never access another tenant's data, even if there's a bug in application code.
- **Separate Billing:** Each tenant has its own subscription, credit balance, and usage tracking. Costs are attributed to the correct tenant automatically.
- **Custom Configuration:** Tenants can customize model access, rate limits, and feature flags without affecting other tenants.
- **User Management:** Each tenant manages their own users, roles, and permissions independently.

User vs Administrator

Users are end-users who interact with RADIANT-powered applications like Think Tank. They: - Sign up and log in via Cognito - Use AI models through the API or applications - Have credits deducted for usage - Cannot access the Admin Dashboard

Administrators manage the RADIANT platform itself. They: - Access the Admin Dashboard - Manage tenants, users, and billing - Configure AI models and providers - Have no credits (administrative access is separate)

Credit System Explained

Credits are RADIANT's universal currency for AI usage:

- **1 credit = \$0.01 USD** (configurable per deployment)
- Different models cost different amounts based on their API pricing
- Credits are deducted in real-time as requests complete

- Tenants can purchase credits or receive them through subscriptions
- Credits can be tracked, audited, and reported on

Example Credit Costs: | Model | Cost per 1K tokens | |---| | GPT-4o | 5 credits input, 15 credits output | | GPT-4o-mini | 0.5 credits input, 1.5 credits output | | Claude 3.5 Sonnet | 3 credits input, 15 credits output | | Self-hosted Llama | 0.2 credits (all) |

API Key Types

RADIANT supports multiple API key types:

- **User API Keys:** Tied to a specific user, inherit user’s permissions
- **Service API Keys:** For server-to-server communication, not tied to a user
- **Admin API Keys:** For administrative operations, require elevated permissions
- **Scoped Keys:** Limited to specific models, endpoints, or rate limits

1.4 Authentication Flow & Security

[BOOK] **Detailed Documentation:** For comprehensive authentication guides, see: - Authentication Overview - Architecture and feature matrix - Platform Admin Guide - Cognito management, global policies - Security Architecture - Threat models, compliance - Authentication API Reference - All auth endpoints

JWT-Based Authentication

All authentication flows through Amazon Cognito with JWT tokens:

Authentication Steps:

1. **Authentication:** Users authenticate via Amazon Cognito. Upon success, they receive a JSON Web Token (JWT).
2. **Token Validation:** The API Gateway Custom Authorizer validates the JWT signature using Cognito’s public keys.
3. **Context Injection:** The Authorizer extracts the immutable tenant_id from the JWT claims and injects it into the request context.
4. **Lambda Context Setting:** The Lambda function sets PostgreSQL session variables before any database operation.
5. **RLS Enforcement:** All queries are automatically filtered by the database engine.

JWT Claims Structure

```
{
  "sub": "user-uuid-here",
  "email": "user@example.com",
  "custom:tenant_id": "tenant-uuid-here",
  "custom:app_id": "thinktank",
  "custom:user_role": "member",
  "custom:tenant_role": "admin",
  "iat": 1735570000,
  "exp": 1735573600,
  "iss": "https://cognito-idp.us-east-1.amazonaws.com/us-east-1_XXXXX"
}
```

Critical Security Invariant

[!] **CRITICAL:** Application code **NEVER** accepts a `tenant_id` from the request body, query parameters, or custom headers. It **ONLY** trusts the ID injected by the API Gateway Authorizer from the cryptographically signed JWT.

This is the single most important security rule in the RADIANT architecture. Violation of this rule creates a critical vulnerability allowing tenant impersonation.

Conditional Access Policies

Condition	Action
New device detected	Require MFA re-authentication
Unusual location	Challenge with security questions
After-hours access	Alert + additional logging
Multiple failed attempts	Temporary lockout + notification
API key from new IP	Rate limit + alert
Tenant status = suspended	Reject all requests
Tenant status = pending_deletion	Reject all requests

1.5 Compute Isolation (Lambda Tenant Isolation Mode)

RADIANT leverages **AWS Lambda Tenant Isolation Mode** (released 2025) to enforce strict boundaries between tenants sharing the same function code.

How It Works

- 1. **Request Arrival** - Request arrives at Lambda with tenant identifier in event payload
- 2. **Tenant Detection** - Lambda service inspects the `tenant_id` field from the authorizer context
- 3. **Environment Binding** - Request routed to execution environment dedicated to that tenant
- 4. **Isolation Guarantee** - Warm environments are tenant-specific and never reused across tenants
- 5. **Resource Isolation** - /tmp directory and memory are cryptographically isolated per tenant

Security Guarantees

Threat	Without Isolation Mode	With Isolation Mode
/tmp data leakage	Possible (shared container)	Eliminated (separate microVM)
Memory scraping	Possible (shared memory)	Eliminated (isolated memory)
Global variable pollution	Possible	Eliminated
Cold start timing attacks	Reduced	Eliminated
Environment variable exposure	Possible	Eliminated

Administrator Verification

To verify Tenant Isolation Mode is enabled: 1. AWS Console -> Lambda -> Function -> Configuration -> Concurrency 2. Check for “Tenant Isolation: Enabled” badge 3. Or via AWS CLI: `aws lambda get-function-configuration --function-name <name>`

1.6 Three-Layer Authentication Architecture (v5.1.1)

RADIANT implements a comprehensive three-layer authentication system for complete security coverage:

Layer 1: End-User Authentication

End users authenticate via AWS Cognito User Pool with support for:

Feature	Description
Email/Password	Standard authentication with strong password policies
MFA	Optional or required TOTP, SMS, or email verification
SSO Federation	SAML 2.0 and OIDC integration for enterprise customers
Domain Enforcement	Force SSO for specific email domains

Database Table: `tenant_users` - RLS-protected tenant isolation - Role-based access (`standard_user`, `tenant_admin`, `tenant_owner`) - Feature flags for app access (Think Tank, Curator, Tenant Admin)

Layer 2: Platform Administrator Authentication

Platform admins use a separate Cognito Admin Pool with mandatory MFA:

Role	Permissions
super_admin	Full access, can delete tenants, manage other admins
admin	Tenant/user management, model configuration
operator	Read-only monitoring and support
auditor	Compliance logs and reports only

Database Table: platform_admins - No RLS (cross-tenant access required) - Permission-based authorization - Full audit trail of admin actions

Layer 3: Service/Machine Authentication

API keys for server-to-server and automated integrations:

Feature	Description
Scoped Access	Fine-grained permissions (chat:read, embeddings:write, etc.)
Rate Limiting	Per-key and global rate limits
IP Restrictions	Whitelist allowed IP addresses
Expiration	Optional key expiration dates
Audit Logging	All key usage tracked in service_api_key_audit

API Key Scopes: - chat:read, chat:write - Conversation access - models:read - Model information - embeddings:write - Vector embedding generation - files:read, files:write - File upload/download - knowledge:read, knowledge:write - Knowledge graph access - admin:read, admin:write - Administrative operations

Enterprise SSO Configuration

Navigate to **Settings -> SSO Connections** to configure:

- SAML 2.0**
 - Upload IdP metadata XML or URL
 - Configure attribute mapping
 - Set up group-to-role mapping
- OIDC**
 - Enter issuer URL and client credentials
 - Configure claim mapping
 - Test connection before enabling
- Domain Enforcement**
 - Specify email domains requiring SSO
 - Users from enforced domains cannot use password auth

1.7 Two-Factor Authentication (MFA) - v5.52.28

RADIANT enforces role-based Multi-Factor Authentication (MFA) using industry-standard TOTP (RFC 6238).

MFA Enforcement by Role

Role	MFA Required	Can Disable
super_admin	Yes	No
tenant_admin	Yes	No
standard_user	No (future)	N/A

Critical Security Rules: - Admin roles **cannot bypass** MFA enrollment - Admin roles **cannot disable** MFA once enrolled - MFA enrollment is enforced at login via full-screen gate

MFA Enrollment Flow

1. **Login** - User enters email/password
2. **MFA Check** - System checks if role requires MFA
3. **Enrollment Gate** - If not enrolled, full-screen enrollment UI appears
4. **QR Code** - Scan with authenticator app (Google Authenticator, 1Password, Authy)
5. **Verification** - Enter 6-digit code to confirm
6. **Backup Codes** - Receive 10 one-time recovery codes
7. **Complete** - User can now access the dashboard

Supported Authenticator Apps

- Google Authenticator
- Microsoft Authenticator
- 1Password
- Authy
- Any RFC 6238 compliant TOTP app

Backup Codes

Each user receives 10 backup codes during enrollment: - Format: XXXX-XXXX (8 alphanumeric characters) - Each code can only be used **once** - Warning displayed when < 3 codes remain - Regenerate codes from **Settings -> Security**

Device Trust

Users can opt to “Trust this device for 30 days”: - Reduces MFA prompts on trusted devices - Maximum 5 trusted devices per user - Devices can be revoked from Settings - Trust expires automatically after 30 days

Lockout Policy

Condition	Action
3 failed MFA attempts	5-minute lockout
Lockout expires	Attempts reset
Successful verification	Attempts reset

MFA Settings Page

Access MFA configuration at **Settings -> Security**:

- **Status** - View MFA enabled/disabled status
- **Backup Codes** - View remaining count, regenerate codes
- **Trusted Devices** - List and revoke trusted devices
- **Audit Log** - View MFA-related events

Database Tables

Table	Purpose
tenant_users.mfa_*	MFA columns for tenant users
platform_admins.mfa_*	MFA columns for platform admins
mfa_backup_codes	Hashed one-time recovery codes
mfa_trusted_devices	30-day device trust tokens
mfa_audit_log	Partitioned audit log for MFA events

MFA API Endpoints

Endpoint	Method	Purpose
/api/v2/mfa/status	GET	Get MFA status
/api/v2/mfa/check	GET	Check if MFA required
/api/v2/mfa/enroll/start	POST	Start enrollment
/api/v2/mfa/enroll/verify	POST	Verify enrollment
/api/v2/mfa/verify	POST	Verify code during login
/api/v2/mfa/backup-codes/regenerate	POST	Regenerate backup codes
/api/v2/mfa/devices	GET	List trusted devices
/api/v2/mfa/devices/:id	DELETE	Revoke device

1.8 Internationalization & Multi-Language Search (v5.52.29)

RADIANT supports 18 languages for authentication UI and full-text search across all content.

Supported Languages

Language	Code	Direction	Search Method
English	en	LTR	PostgreSQL english
Spanish	es	LTR	PostgreSQL spanish

Language	Code	Direction	Search Method
French	fr	LTR	PostgreSQL french
German	de	LTR	PostgreSQL german
Portuguese	pt	LTR	PostgreSQL portuguese
Italian	it	LTR	PostgreSQL italian
Dutch	nl	LTR	PostgreSQL dutch
Polish	pl	LTR	PostgreSQL simple
Russian	ru	LTR	PostgreSQL russian
Turkish	tr	LTR	PostgreSQL turkish
Japanese	ja	LTR	pg_bigm bi-gram
Korean	ko	LTR	pg_bigm bi-gram
Chinese (Simplified)	zh-CN	LTR	pg_bigm bi-gram
Chinese (Traditional)	zh-TW	LTR	pg_bigm bi-gram
Arabic	ar	RTL	PostgreSQL simple
Hindi	hi	LTR	PostgreSQL simple
Thai	th	LTR	PostgreSQL simple
Vietnamese	vi	LTR	PostgreSQL simple

CJK Search (Chinese, Japanese, Korean)

CJK languages require special handling because they don't use word boundaries: - **pg_bigm** extension provides bi-gram indexing - Automatic language detection on content ingestion - `search_content()` function routes queries to appropriate search method - GIN indexes on all searchable text columns

RTL Support (Arabic)

Arabic users see proper right-to-left layouts: - Automatic `dir="rtl"` on auth containers - Flipped margins, paddings, and flex directions - LTR preservation for emails, codes, passwords

Database Migration 071

Column/Index	Table	Purpose
detected_language	uds_conversations	Auto-detected content language
search_vector_simple	uds_conversations	Fallback tsvector
search_vector_english	uds_conversations	Language-specific tsvector
idx_*_bigm_*	Multiple	GIN bi-gram indexes for CJK

1.9 System Overview Dashboard

Access real-time platform health at **System -> Overview**:

Component Health Monitoring

Component	Metrics Tracked
LiteLLM Gateway	Tasks, CPU, memory, requests/min
Aurora PostgreSQL	ACU, connections, IOPS
ElastiCache Redis	Memory, connections, cache hit rate
Lambda Functions	Invocations, concurrent executions, throttles
API Gateway	Requests/sec, error rates
Cognito Pools	Active users, sign-ins, failed logins

Dashboard Features

- **Auto-Refresh:** Real-time updates every 30 seconds
- **Capacity Planning:** Utilization percentages with headroom alerts
- **Alert Management:** Active alerts with severity levels
- **Trend Analysis:** Up/down/stable indicators for all metrics

1.8 LiteLLM Gateway Configuration

Access gateway settings at **System -> Gateway**:

Auto-Scaling Parameters

Parameter	Description	Default
Min Tasks	Minimum running ECS tasks	2
Max Tasks	Maximum scaling limit	50
Desired Tasks	Initial task count	2
Task CPU	vCPU units per task (256=0.25 vCPU)	2048
Task Memory	Memory per task in MB	4096

Scaling Thresholds

Threshold	Description	Default
Target CPU Utilization	Scale out when exceeded	70%
Target Memory Utilization	Scale out when exceeded	80%
Target Requests/Target	Requests per task before scaling	1000
Scale Out Cooldown	Wait between scale-out events	60s
Scale In Cooldown	Wait between scale-in events	300s

Rate Limiting

Setting	Description	Default
Global Rate Limit	Max requests/second (all tenants)	10,000
Per-Tenant Limit	Max requests/minute per tenant	1,000
Response Caching	Cache identical requests	Enabled
Cache TTL	How long to cache responses	3600s

Health Check Settings

Setting	Description	Default
Health Check Path	Endpoint for health checks	/health
Check Interval	Time between checks	30s
Timeout	Max wait for response	10s
Unhealthy Threshold	Failed checks before unhealthy	3

1.9 SSO Connections Management

Access SSO settings at **Settings -> SSO**:

Supported Protocols

Protocol	Use Case
SAML 2.0	Enterprise IdPs (Okta, Azure AD, OneLogin)
OIDC	Modern IdPs with OpenID Connect support

Creating a SAML Connection

1. Navigate to **Settings -> SSO**
2. Click **Add Connection**
3. Select **SAML 2.0** protocol
4. Enter:
 - **Connection Name**: Human-readable identifier
 - **Tenant ID**: UUID of the target tenant
 - **IdP Entity ID**: From your IdP metadata
 - **IdP SSO URL**: Login endpoint URL
 - **IdP Certificate**: X.509 certificate (PEM format)
5. Configure domain enforcement (optional)
6. Set default user role
7. Click **Create Connection**

Creating an OIDC Connection

1. Navigate to **Settings -> SSO**
2. Click **Add Connection**
3. Select **OIDC** protocol
4. Enter:
 - **Connection Name:** Human-readable identifier
 - **Tenant ID:** UUID of the target tenant
 - **Issuer URL:** Your IdP's issuer URL
 - **Client ID:** From your IdP
 - **Client Secret:** From your IdP
5. Configure domain enforcement (optional)
6. Set default user role
7. Click **Create Connection**

Domain Enforcement

Force users with specific email domains to use SSO:

Enforced Domains: example.com, corp.example.com

Users with @example.com or @corp.example.com emails cannot use password authentication.

Testing Connections

1. Find the connection in the list
 2. Click **** -> **Test Connection**
 3. Verify the result:
 - **Success:** IdP is reachable and responding
 - **Failure:** Check configuration and IdP status
-

2. Accessing the Admin Dashboard

2.1 URL and Login

1. Navigate to: https://admin.your-domain.com
2. Enter your email address
3. Enter your password
4. Complete MFA verification (required)

2.2 First Login

On first login:

1. You'll receive a temporary password via email
2. Enter the temporary password
3. Set a new password (12+ characters, mixed case, numbers, symbols)
4. Set up MFA using an authenticator app
5. You'll be redirected to the dashboard

2.3 Session Management

Setting	Value
Session Duration	8 hours
Idle Timeout	30 minutes
Concurrent Sessions	3 maximum
Remember Device	30 days

2.4 Password Requirements

- Minimum 12 characters
- At least one uppercase letter
- At least one lowercase letter
- At least one number
- At least one special character
- Cannot reuse last 10 passwords

3. Dashboard Overview

3.1 Main Dashboard

The dashboard displays key metrics at a glance:

RADIANT Admin Dashboard				Welcome, Admin			
+-----+		+-----+		+-----+		+-----+	
Tenants		Users		Requests		Revenue	
142		8,456		2.3M		\$45,230	
+12%		+8%		+23%		+15%	
+-----+		+-----+		+-----+		+-----+	
+-----+							
Request Volume (7 days)							
Mon Tue Wed Thu Fri Sat Sun							
+-----+							
Recent Activity:							
* New tenant: Acme Corp (2 minutes ago)							
* Model enabled: claude-3-opus (15 minutes ago)							
* Alert: High API error rate (1 hour ago)							

3.2 Navigation Menu

Section	Description
Dashboard	Overview and metrics
Tenants	Tenant management
Users	User management
Models	AI model configuration
Providers	Provider management
Billing	Subscriptions and credits
Storage	Storage usage
Orchestration	Preference Engine settings
Localization	Translation management
Configuration	System settings
Security	Security monitoring
Compliance	Compliance reports
Experiments	A/B testing
Cost	Cost analytics
Audit	Audit logs
Migrations	Database migrations
Notifications	System alerts
Settings	Personal settings

4. Tenant Management

New in v4.18.55: Complete Tenant Management System (TMS) with lifecycle management, multi-tenant users, soft delete/restore, and compliance features.

4.1 Viewing Tenants

Navigate to **Tenants** to see all organizations:

Column	Description
Name	Organization display name and internal identifier
Type	Organization or Individual (phantom tenant)
Tier	Service tier (1-5: SEED, SPROUT, GROWTH, SCALE, ENTERPRISE)
Status	Active, Suspended, Pending, Pending Deletion, Deleted

Column	Description
Compliance	HIPAA, SOC2, GDPR badges if enabled
Users	Active user count with invited/suspended breakdown
Created	Creation date with relative time

Tenant Types

Type	Description	Use Case
Organization	Company or team workspace	B2B customers
Individual	Personal workspace (phantom tenant)	B2C users, free tier

Tenant Tiers

Tier	Name	Features
1	SEED	Basic features, standard support
2	SPROUT	Advanced features, email support
3	GROWTH	Premium features, dedicated KMS key
4	SCALE	Enterprise features, priority support
5	ENTERPRISE	Full features, custom SLA, dedicated resources

4.2 Creating a Tenant

1. Click “**+ Create Tenant**” button
2. Fill in **Basic Information**:
 - **Internal Name**: URL-friendly identifier (e.g., acme-corp)
 - **Display Name**: Human-readable name (e.g., Acme Corporation)
 - **Type**: Organization or Individual
 - **Tier**: Select service tier (1-5)
3. Configure **Region & Compliance**:
 - **Primary Region**: us-east-1, us-west-2, eu-west-1, eu-central-1, ap-southeast-1
 - **Compliance Frameworks**: Check HIPAA, SOC2, GDPR as needed
 - **Domain** (optional): Custom domain for SSO
4. Set up **Initial Admin**:
 - **Admin Email**: Primary administrator email
 - **Admin Name**: Administrator display name
5. Click “**Create Tenant**”

Note: Default retention is 180 days (6 months) as of v7.43.0. HIPAA-enabled tenants have a minimum 90-day retention period. Tenants can adjust retention via the **Tenant Settings** page.

4.3 Tenant Statuses

Status	Description	Actions Available
Active	Normal operation	Edit, Suspend, Delete
Suspended	Temporarily disabled	Edit, Activate, Delete
Pending	Awaiting setup	Edit, Activate, Delete
Pending Deletion	Scheduled for deletion	Restore only
Deleted	Hard deleted	None (audit only)

4.3 Tenant Details

View comprehensive tenant information:

Tenant: Acme Corporation			
Overview	Users	Billing	Settings
Tenant ID:	tn_abc123xyz		
Status:	[ok] Active		
Plan:	Professional (Tier 4)		
Created:	2024-01-15		
Last Active:	2 minutes ago		
Usage This Month:			
+++ API Requests:	145,234		
+++ Tokens Used:	12.5M		
+++ Storage:	2.3 GB		
+++ Credits Used:	\$1,234.56		
[Edit]	[Suspend]	[Delete]	[Impersonate]

4.4 Soft Delete & Restore

Tenants are never immediately deleted. Instead, they go through a **retention period**:

Deleting a Tenant

- 1. Navigate to **Tenants -> [Tenant]**
- 2. Click the **Delete** button (or use dropdown menu)
- 3. Enter a **reason** for deletion (required)
- 4. Choose whether to **notify users**
- 5. Click **“Delete Tenant”**

The tenant will be marked as **“Pending Deletion”** with a scheduled hard-delete date.

Retention Periods

Compliance	Minimum Retention	Default
None	7 days	180 days
GDPR	30 days	180 days
SOC2	30 days	180 days
HIPAA	90 days	180 days

Restoring a Tenant

1. Find the tenant in the **Pending Deletions** section
2. Click **“Restore”**
3. Click **“Send Verification Code”**
4. Check your email for the 6-digit code
5. Enter the code and click **“Restore Tenant”**

Security: Verification codes expire after 15 minutes and allow only 3 attempts.

Automatic Hard Delete

A scheduled job runs daily at **3:00 AM UTC** to: - Process all tenants past their retention period - Delete all S3 data for the tenant - Schedule KMS key deletion (7-day pending window) - Mark user records as deleted - Send deletion confirmation emails

4.5 Multi-Tenant Users

Users can belong to **multiple tenants** with different roles:

Membership Roles

Role	Permissions
Owner	Full access, can delete tenant, cannot be removed
Admin	Full access, can manage users
Member	Standard access to tenant resources
Viewer	Read-only access

Adding Users to a Tenant

1. Navigate to **Tenants -> [Tenant] -> Users**
2. Click **“+ Add User”**
3. Enter the user’s email address
4. Select their role
5. Choose to send an invitation email (optional)
6. Click **“Add User”**

No Orphan Users

The system **prevents orphan users** through a database trigger. When a user's last membership is removed, they are automatically soft-deleted. This ensures: - Every active user has at least one tenant - Billing is always attributed correctly - No abandoned accounts consuming resources

4.6 Phantom Tenants

When a new user signs up without an invitation:

1. System creates an **Individual** type tenant automatically
2. User becomes the **Owner** of their phantom tenant
3. Tenant is named "[User's Name]'s Workspace"
4. User can later be invited to Organization tenants

This enables both **B2C** (individual users) and **B2B** (organizations) use cases.

4.7 Deletion Notifications

Users receive automatic emails when their tenant is scheduled for deletion:

Notification	Timing
7-day warning	7 days before deletion
3-day warning	3 days before deletion
1-day warning	1 day before deletion
Deletion confirmation	After hard delete

4.8 Compliance Features

Risk Acceptances

For compliance frameworks, document risk acceptances:

1. Navigate to **Tenants -> [Tenant] -> Compliance**
2. View required controls for enabled frameworks
3. For controls that cannot be fully implemented:
 - Click "**Accept Risk**"
 - Enter risk description and mitigating controls
 - Provide business justification
 - Set expiration date
 - Submit for approval (if required)

Compliance Reports

A scheduled job runs **monthly on the 1st at 4:00 AM UTC** generating: - Tenant compliance breakdown (HIPAA, SOC2, GDPR) - Risk acceptance status (pending, approved, expired) - Retention compliance status - Alerts for non-compliant tenants

4.9 Tenant Actions

Action	Description	Permission
Edit	Modify tenant settings	Admin
Suspend	Temporarily disable	Admin
Delete	Soft delete with retention	Admin
Restore	Restore from pending deletion	Admin + 2FA
Manage Users	Add/remove/modify memberships	Admin
View Audit Log	See tenant activity	Admin

4.10 Data Isolation Architecture

RADIANT implements **six layers of tenant isolation** providing defense in depth:

TENANT ISOLATION LAYERS
LAYER 1: COMPUTE ISOLATION
AWS Lambda Tenant Isolation Mode (2025)
* Separate Firecracker microVM per tenant
* /tmp and memory NEVER shared between tenants
* Warm environments dedicated to specific tenant_id
LAYER 2: NETWORK ISOLATION
API Gateway
* Per-tenant usage plans (rate limits by tier)
* AWS WAF rules (SQL injection, XSS, rate limiting)
* VPC endpoints for private connectivity (Enterprise tier)
LAYER 3: DATA ISOLATION (Polyglot Persistence)
Aurora PostgreSQL: Row-Level Security (RLS)
SET app.current_tenant_id = 'tenant-uuid';
POLICY: tenant_id = current_setting('app.current_tenant_id')::UUID
DynamoDB: IAM Leading Keys Condition
"dynamodb:LeadingKeys": ["TENANT#\${tenant_id}#*"]
S3: Bucket Policy + Prefix Isolation
s3://bucket/tenants/\${tenant_id}/
ElastiCache Redis: Key Prefix Namespacing
tenant:\${tenant_id}:session:*

LAYER 4: ENCRYPTION ISOLATION
+-----+
Tier 1-2: AWS-owned KMS key (shared, automatic rotation)
Tier 3: Customer Managed Key (CMK) per tenant
Tier 4-5: CMK with BYOK option (customer-controlled)
* Separate key for data at rest encryption
* Key deletion scheduled on tenant termination
+-----+
LAYER 5: IDENTITY ISOLATION
+-----+
JWT Claims: tenant_id extracted by API Gateway Authorizer
NEVER trust tenant_id from request body, headers, or query params
Cognito User Pool with custom attributes per tenant
Session tokens scoped to specific tenant context
+-----+
LAYER 6: CONTROL PLANE ISOLATION
+-----+
Tenant Management Service (TMS) – Separate from Admin Dashboard
* Independent deployment and release cycle
* Higher security controls and MFA requirements
* Reduced blast radius from application compromise
* Internal-only API (not exposed to public internet)
+-----+

Storage Layer Isolation Summary

Data Type	Storage	Isolation Mechanism	Use Case
Users, Tenants, Conversations, Messages	Aurora PostgreSQL	Row-Level Security (RLS)	Complex queries, transactions, referential integrity
Sessions, Real-time presence	DynamoDB	Leading Keys + IAM	High velocity, TTL, global tables
Cache, Rate limiting	ElastiCache Redis	Key prefix namespacing	Sub-millisecond access
Media files, Exports	S3	Bucket policy + prefix	Large objects, CDN integration
Audit logs	S3 + Athena	Object Lock + prefix	Immutable compliance records

4.11 Tenant Metadata Reference

Field	Type	Description
tenant_id	UUID	Primary key, system-generated (never user-provided)
name	VARCHAR(255)	Internal identifier (URL-friendly)
display_name	VARCHAR(255)	Human-readable name
type	ENUM	'organization' or 'individual'
status	ENUM	'active', 'suspended', 'pending', 'pending_deletion', 'deleted'
tier	INTEGER	Subscription tier (1-5): SEED, SPROUT, GROWTH, SCALE, ENTERPRISE
primary_region	VARCHAR(20)	AWS region for data residency (e.g., us-east-1)
compliance_mode	JSONB	Array: ['hipaa', 'soc2', 'gdpr']
retention_days	INTEGER	Custom retention period override (7-3650 days, default 180)
deletion_scheduled_at	TIMESTAMPTZ	When hard delete will occur (if pending_deletion)
deletion_requested_by	UUID	User/admin who initiated deletion
stripe_customer_id	VARCHAR(255)	Billing integration identifier
kms_key_arn	VARCHAR(500)	Per-tenant encryption key (Tier 3+)
metadata	JSONB	Custom tenant metadata
settings	JSONB	Tenant-specific settings
created_at	TIMESTAMPTZ	Creation timestamp
updated_at	TIMESTAMPTZ	Last modification timestamp

4.12 API Gateway Rate Limits by Tier

Tier	Requests/Second	Burst	Monthly Quota	Price Point
Tier 1 (SEED)	10	50	100,000	\$200/month
Tier 2 (SPROUT)	50	200	1,000,000	\$1,000/month
Tier 3 (GROWTH)	200	500	10,000,000	\$5,000/month
Tier 4 (SCALE)	1,000	2,000	100,000,000	\$25,000/month
Tier 5 (ENTERPRISE)	Custom	Custom	Unlimited	\$150,000+/month

Administrator Action: Usage plan assignment happens automatically based on tenant tier. Override via Admin Dashboard -> Tenant -> API Settings.

4.13 TMS API Endpoints Reference

Tenant CRUD

Method	Path	Description	Auth
POST	/internal/tms/tenants	Create tenant	Internal Service Token
GET	/internal/tms/tenants/{id}	Get tenant	Internal Service Token
PUT	/internal/tms/tenants/{id}	Update tenant	Internal Service Token
DELETE	/internal/tms/tenants/{id}	Delete tenant	Internal Service Token
POST	/internal/tms/tenants/{id}/restore	Restore tenant	Internal Service Token + 2FA
POST	/internal/tms/phantom-tenants	Create phantom tenant	Internal Service Token

User Membership

Method	Path	Description	Auth
GET	/internal/tms/tenants/{id}/users	List tenant users	Internal Service Token
POST	/internal/tms/tenants/{id}/users	Add user to tenant	Internal Service Token
PUT	/internal/tms/tenants/{id}/users/{userId}	Update membership	Internal Service Token
DELETE	/internal/tms/tenants/{id}/users/{userId}	Remove user	Internal Service Token

Request/Response Examples

Create Tenant Request:

```
{
  "name": "acme-corp",
  "displayName": "Acme Corporation",
  "type": "organization",
  "tier": 3,
  "primaryRegion": "us-east-1",
  "complianceMode": ["hipaa", "soc2"],
  "adminEmail": "admin@acme.com",
  "adminName": "John Smith"
}
```

Create Tenant Response:

```
{
  "success": true,
  "data": {
```

```

    "tenant": {
      "id": "550e8400-e29b-41d4-a716-446655440000",
      "name": "acme-corp",
      "displayName": "Acme Corporation",
      "type": "organization",
      "status": "active",
      "tier": 3,
      "kmsKeyArn": "arn:aws:kms:us-east-1:123456789012:key/..."
    },
    "adminUser": {
      "id": "user-uuid-here",
      "email": "admin@acme.com"
    },
    "membership": {
      "role": "owner",
      "status": "active"
    }
  }
}

```

Soft Delete Request:

```

{
  "initiatedBy": "admin-uuid",
  "reason": "Customer requested account closure",
  "notifyUsers": true
}

```

Soft Delete Response:

```

{
  "success": true,
  "data": {
    "tenantId": "550e8400-e29b-41d4-a716-446655440000",
    "status": "pending_deletion",
    "deletionScheduledAt": "2025-01-30T03:00:00Z",
    "retentionDays": 30,
    "affectedUsers": {
      "total": 47,
      "willBeDeleted": 42,
      "willRemain": 5
    },
    "notificationsSent": true
  }
}

```

4.14 Scheduled Jobs

Job	Schedule	Description
Hard Delete	Daily 3:00 AM UTC	Processes tenants past retention period

Job	Schedule	Description
Deletion Notifications	Daily 9:00 AM UTC	Sends 7/3/1 day warnings
Orphan Check	Weekly Sunday 2:00 AM UTC	Safety net for orphan user cleanup
Compliance Report	Monthly 1st 4:00 AM UTC	Generates compliance status report

Hard Delete Job Details

Process: 1. Query tenants where status = 'pending_deletion' AND deletion_scheduled_at < NOW()
 2. For each tenant (up to 10 per run to avoid Lambda timeout): - Count users that will be deleted vs retained (multi-tenant users) - Delete all tenant memberships (triggers orphan user check) - Delete S3 data under tenants/{tenant_id}/ prefix - Schedule KMS key for deletion (7-30 day AWS delay) - Update tenant status to 'deleted' - Send deletion confirmation emails - Log to immutable audit trail

Administrator Note: Hard deletes cannot be reversed. Monitor the audit log for any unexpected deletions.

4.15 Database Schema (Migration 126)

tenant_user_memberships Table

```
CREATE TABLE tenant_user_memberships (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  tenant_id UUID NOT NULL REFERENCES tenants(id) ON DELETE CASCADE,
  user_id UUID NOT NULL REFERENCES users(id) ON DELETE CASCADE,
  role VARCHAR(50) DEFAULT 'member'
  CHECK (role IN ('owner', 'admin', 'member', 'viewer')),
  status VARCHAR(20) DEFAULT 'active'
  CHECK (status IN ('active', 'suspended', 'invited')),
  joined_at TIMESTAMPTZ DEFAULT NOW(),
  invited_by UUID REFERENCES users(id),
  invitation_token VARCHAR(255),
  invitation_expires_at TIMESTAMPTZ,
  last_active_at TIMESTAMPTZ,
  created_at TIMESTAMPTZ DEFAULT NOW(),
  updated_at TIMESTAMPTZ DEFAULT NOW(),
  UNIQUE(tenant_id, user_id)
);
```

tms_audit_log Table

```
CREATE TABLE tms_audit_log (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  tenant_id UUID REFERENCES tenants(id) ON DELETE SET NULL,
  user_id UUID REFERENCES users(id) ON DELETE SET NULL,
  admin_id UUID REFERENCES administrators(id) ON DELETE SET NULL,
  action VARCHAR(100) NOT NULL,
  resource_type VARCHAR(50),
  resource_id VARCHAR(255),
```

```

old_value JSONB,
new_value JSONB,
ip_address INET,
user_agent TEXT,
trace_id VARCHAR(100),
created_at TIMESTAMPTZ DEFAULT NOW()
);

```

tms_verification_codes Table

```

CREATE TABLE tms_verification_codes (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  user_id UUID REFERENCES users(id) ON DELETE CASCADE,
  admin_id UUID REFERENCES administrators(id) ON DELETE CASCADE,
  operation VARCHAR(50) NOT NULL
    CHECK (operation IN ('restore_tenant', 'hard_delete', 'transfer_ownership', 'compliance_o
  resource_id UUID NOT NULL,
  code_hash VARCHAR(64) NOT NULL,
  attempts INTEGER DEFAULT 0,
  max_attempts INTEGER DEFAULT 3,
  expires_at TIMESTAMPTZ NOT NULL,
  verified_at TIMESTAMPTZ,
  created_at TIMESTAMPTZ DEFAULT NOW(),
  CONSTRAINT chk_user_or_admin CHECK (user_id IS NOT NULL OR admin_id IS NOT NULL)
);

```

Orphan Prevention Trigger

```

CREATE OR REPLACE FUNCTION tms_prevent_orphan_users()
RETURNS TRIGGER AS $$
DECLARE
  remaining_memberships INTEGER;
BEGIN
  SELECT COUNT(*) INTO remaining_memberships
  FROM tenant_user_memberships
  WHERE user_id = OLD.user_id
  AND id != OLD.id
  AND status != 'invited';

  IF remaining_memberships = 0 THEN
    UPDATE users SET status = 'deleted', updated_at = NOW()
    WHERE id = OLD.user_id;

    INSERT INTO tms_audit_log (tenant_id, user_id, action, resource_type, resource_id)
    VALUES (OLD.tenant_id, OLD.user_id, 'user_auto_deleted_orphan', 'user', OLD.user_id::text);
  END IF;

  RETURN OLD;
END;
$$ LANGUAGE plpgsql;

```

```
CREATE TRIGGER tms_check_orphan_on_membership_delete
AFTER DELETE ON tenant_user_memberships
FOR EACH ROW EXECUTE FUNCTION tms_prevent_orphan_users();
```

4.16 Troubleshooting

Issue	Cause	Resolution
Cannot delete tenant	Tenant has HIPAA compliance	Verify 90-day minimum retention is met
Restore code not received	Email delivery failed	Check spam folder, verify email address, resend code
Restore code invalid	Code expired or max attempts	Request new code (3 attempt limit, 15 min expiry)
User not deleted with tenant	User has other tenant memberships	Expected behavior - user retained for other tenants
Phantom tenant not created	User email already exists	User will be associated with existing account
KMS key not created	Tenant tier below 3	Upgrade to Tier 3+ for dedicated KMS key
Cannot remove last owner	Business rule enforcement	Transfer ownership first or delete tenant

5. User & Administrator Management

5.1 Administrator Roles

Role	Dashboard Access	API Access	Billing	Audit
Super Admin	Full	Full	Full	Full

v7.52.0: Only super_admin remains in Pool B. The admin, operator, and auditor roles have been removed.

5.2 Managing Administrators

Navigate to **Administrators** to:

1. Invite New Admin:

- Click “**+ Invite Administrator**”
- Enter email address
- Select role
- Click “**Send Invitation**”

2. Modify Admin:

- Click on administrator row

- Edit role or permissions
- Click “**Save Changes**”

3. Remove Admin:

- Click “**Remove**” button
- Confirm removal
- Admin’s sessions are invalidated immediately

5.3 User Identity & Multi-Tenant Membership Model (v7.22.0)

Users have a **global identity** that is separate from their **tenant memberships**. A single human can belong to multiple tenants with different roles, features, and SSO configurations in each.

+-----+ Global User Identity One row per human (users table) NOT tenant-scoped cognito_user_id (unique) primary_email (unique) global_status +-----+	
1:N	
+-----v-----+ Tenant Membership One row per tenant (tenant_user_memberships) tenant_role, features SSO, MFA, usage stats suspension metadata +-----+	

Key safety rules: - Disabling a user in Tenant A does **NOT** affect their membership in Tenant B - Removing a user from a tenant only affects that tenant’s roles, agents, and access - Cognito account is only disabled when the **last** active membership is removed - Full identity deletion requires: no active memberships + no legal holds + 30-day GDPR grace period - All actions logged in user_admin_actions with which admin app performed them

5.4 Viewing Tenant Users

Navigate to **Tenants -> [Tenant] -> Users** to see:

Field	Description
Email	User email (per-tenant, may differ from global identity)
Name	Display name
Tenant Role	standard_user, power_user, tenant_admin, tenant_owner
Status	Active / Suspended / Invited / Removed
Feature Access	Think Tank, Curator, Tenant Admin, Deployer
Last Active	Last activity in this tenant
Other Tenants	Number of other active memberships (cross-tenant indicator)
API Keys	Number of active keys

5.5 User Actions (Tenant-Scoped)

Action	Description	Cross-Tenant Impact
Suspend in Tenant	Prevent access to this tenant only	None – other tenants unaffected
Restore in Tenant	Re-enable access in this tenant	None
Remove from Tenant	Soft-remove, revoke roles/agents	None – warns if last membership
Change Role	Update tenant_role	None
Toggle Features	Enable/disable Think Tank, Curator, etc.	None
Reset Password	Send password reset email	Affects all tenants (Cognito-level)
View All Memberships	See all tenants this user belongs to	Read-only cross-tenant view

5.6 User Actions (Global – Radiant Admin Only)

Action	Description	Requirements
View Membership Summary	See identity + all tenant memberships	Radiant Admin role
Disable Cognito Account	Prevent login across ALL tenants	Only when last membership removed
Request Deletion (GDPR)	Schedule identity deletion	No active memberships + no legal holds
Cancel Deletion	Cancel pending deletion during grace period	Within 30-day window

5.7 Admin Action Audit

All user management actions are logged in user_admin_actions:

Field	Description
Action	What was done (15 action types)
Admin App	Which app performed it (radiant_admin, thinktank_admin, thinktank_tenant_admin, system, api)
Performed By	UUID of the admin who acted
Details	JSON payload with before/after state
IP Address	Admin's IP for security audit

6. AI Model Configuration

6.1 Model Registry

Navigate to **Models** to see all available models:

AI Models					106 Total
Filter: [All v] Category: [All v] Status: [Enabled v]					
Model	Provider	Category	Tier	Status	
gpt-4o	OpenAI	Chat	1	[ok] Enabled	
gpt-4o-mini	OpenAI	Chat	1	[ok] Enabled	
claude-3-opus	Anthropic	Chat	2	[ok] Enabled	
claude-3-sonnet	Anthropic	Chat	1	[ok] Enabled	
gemini-pro	Google	Chat	1	[ok] Enabled	
llama-3.1-70b	Self-Host	Chat	3	[ok] Enabled	
whisper-large	Self-Host	Audio	3	o Disabled	
[+ Add Model] [Import Models] [Export Config]					

6.2 Model Categories

Category	Description	Example Models
Chat/LLM	Text generation	GPT-4o, Claude 3, Gemini
Embedding	Vector embeddings	text-embedding-3-large
Vision	Image understanding	GPT-4V, Claude Vision
Audio	Speech-to-text	Whisper, Deepgram
Image	Image generation	DALL-E 3, Stable Diffusion
Code	Code generation	Codestral, DeepSeek Coder
Scientific	Research models	BioGPT, ChemLLM

Category Details

Chat/LLM (Large Language Models): The core of RADIANT. These models handle conversational AI, content generation, summarization, and general-purpose text tasks. They’re the most commonly used and include flagship models from OpenAI, Anthropic, Google, and open-source alternatives.

Embedding Models: Convert text into numerical vectors for semantic search, similarity matching, and retrieval-augmented generation (RAG). Essential for building knowledge bases and search functionality. Vectors are typically 1536-3072 dimensions.

Vision Models: Analyze images, extract text (OCR), describe visual content, and answer questions about images. Increasingly important for document processing, accessibility, and multimodal applications.

Audio Models: Transcribe speech to text, translate audio, and identify speakers. Whisper is the most popular, offering excellent accuracy across 99 languages. Used for meeting transcription, accessibility, and voice interfaces.

Image Generation: Create images from text descriptions. DALL-E 3 offers the best prompt following, while Stable Diffusion provides more customization options. Consider content policies when enabling these.

Code Models: Specialized for programming tasks including code generation, explanation, debugging, and refactoring. Some are fine-tuned on specific languages or frameworks.

Scientific Models: Domain-specific models trained on scientific literature. Useful for research applications but require careful evaluation for accuracy.

6.3 Model Configuration

Click on a model to configure:

Setting	Description
Enabled	Available for use
Min Tier	Minimum subscription tier
Rate Limits	Requests per minute
Max Tokens	Maximum context/output
Temperature Range	Allowed temperature values
Price Override	Custom pricing

Configuration Settings Explained

Enabled: When disabled, the model is hidden from users and API requests return “model not found”. Use this to temporarily remove models during maintenance or to restrict access to specific models.

Min Tier: Sets the minimum subscription tier required to access this model. For example, setting GPT-4 to Tier 2 means Free tier users cannot use it. This helps control costs and create upgrade incentives.

Rate Limits: Controls requests per minute per user for this model. Prevents abuse and ensures fair access. Set based on the provider’s rate limits and your capacity: - Conservative: 10-20 requests/minute - Standard: 50-100 requests/minute

- High: 200+ requests/minute (requires provider rate limit increases)

Max Tokens: Limits context window and output length. Useful for controlling costs since longer contexts cost more. Set based on use case: - Short tasks (Q&A): 4,096 tokens - Medium tasks (writing): 16,384 tokens - Long tasks (analysis): 32,768+ tokens

Temperature Range: Restricts the temperature parameter users can set. Temperature controls randomness: - 0.0: Deterministic, consistent outputs - 0.7: Balanced creativity and consistency - 1.0+: More creative, less predictable
Restricting range (e.g., 0.0-1.0) prevents users from setting extreme values that produce poor results.

Price Override: Allows custom pricing different from the default. Useful for: - Offering discounts on specific models - Increasing prices for premium models - Matching competitor pricing - A/B testing pricing strategies

6.4 Self-Hosted Models

For Tier 3+ deployments:

1. Navigate to **Models -> Self-Hosted**
2. Click “+ Add Self-Hosted Model”
3. Configure:
 - **Model ID**: Unique identifier
 - **SageMaker Endpoint**: Endpoint name
 - **Instance Type**: ml.g5.xlarge, etc.
 - **Auto-Scaling**: Min/max instances
4. Deploy model to SageMaker

6.5 Thermal States (Self-Hosted)

State	Description	Response Time
HOT	Always running	<100ms
WARM	Scaled down	<5s
COLD	Stopped	30-60s
OFF	Disabled	N/A

7. Provider Management

7.1 External Providers

Navigate to **Providers** to manage API integrations:

Provider	Models	Status	Health
OpenAI	12	[ok] Configured	99.9%
Anthropic	6	[ok] Configured	99.8%
Google AI	8	[ok] Configured	99.7%
xAI	2	[ok] Configured	99.5%
DeepSeek	4	o Not configured	-

7.2 Adding Provider Credentials

1. Click on provider name
2. Click “**Configure**”
3. Enter API credentials:
 - **API Key**: Provider API key
 - **Organization ID**: (if applicable)
 - **Base URL**: (for custom endpoints)

- 4. Click “**Test Connection**”
- 5. Click “**Save**”

7.3 Provider Health Monitoring

View real-time provider health:

7.4 Fallback Configuration

Configure provider fallbacks:

- 1. Navigate to **Providers -> Fallbacks**
- 2. Set priority order for each model category
- 3. Configure automatic failover rules
- 4. Set retry policies

8. Billing & Subscriptions

8.1 Subscription Tiers

Tier	Name	Monthly	Features
1	Free	\$0	Basic models, 1K requests
2	Starter	\$29	More models, 10K requests
3	Professional	\$99	All external models, 100K requests
4	Business	\$299	Priority support, 500K requests
5	Enterprise	\$999	Self-hosted, unlimited
6	Enterprise+	Custom	Custom SLAs, dedicated support
7	Ultimate	Custom	On-premise options

8.2 Credit System

Credits are the universal currency for AI usage:

Model Type	Cost per 1M Tokens
GPT-4o	500 credits
GPT-4o-mini	50 credits
Claude 3 Opus	600 credits
Claude 3 Sonnet	150 credits
Self-hosted	20 credits

8.3 Managing Subscriptions

Navigate to **Billing -> Subscriptions**:

- 1. View current subscription
- 2. Upgrade/downgrade tier
- 3. Add credit packages
- 4. View invoices
- 5. Update payment method

8.4 Usage Reports

Generate usage reports:

- 1. Navigate to **Billing -> Reports**
- 2. Select date range
- 3. Choose grouping (by tenant/model/user)
- 4. Export as CSV/PDF

8.5 Billing Alerts

Configure alerts for:

- Credit balance low
- Usage spike
- Approaching quota
- Failed payments

9. Storage Management

9.1 Storage Overview

Navigate to **Storage** to monitor:

Storage Overview

Total Used:	234.5 GB of 500 GB (47%)
By Type:	
--- Documents:	120.3 GB (51%)
--- Images:	45.2 GB (19%)
--- Audio:	38.7 GB (17%)
--- Video:	22.1 GB (9%)
--- Other:	8.2 GB (4%)
Top Tenants:	
1. Acme Corp	45.2 GB
2. TechStart	32.1 GB
3. DataCo	28.4 GB

9.2 Storage Tiers

Tier	Included	Additional
Free	1 GB	N/A
Starter	10 GB	\$0.10/GB
Professional	100 GB	\$0.08/GB
Business	500 GB	\$0.05/GB
Enterprise	2 TB	\$0.03/GB

9.3 File Management

Manage uploaded files:

- View file metadata
- Download files
- Delete files
- Set retention policies

9.4 Snapshot Storage Manager (v1.4.0)

Location: Admin Dashboard -> Platform -> Snapshots

The Snapshot Storage Manager provides persistent configuration for versioned database snapshots with tiered storage lifecycle.

9.4.1 Overview

Navigate to **Platform -> Snapshots** to access:

Snapshot Manager	v1.4.0

Total Snapshots: 15	Hot: 3 Warm: 5 Cold: 4 Archive: 3
[Snapshots]	[Lifecycle Rules] [Policy] [Restore History]

9.4.2 Storage Tiers

Snapshots automatically transition through tiers to optimize cost:

Tier	Retention	Restore Time	Cost/GB/month
Hot	0-7 days	Instant	\$0.023
Warm	7-30 days	3-5 minutes	\$0.0125
Cold	30-365 days	1-5 hours	\$0.004
Archive	365+ days	12-48 hours	\$0.00099

9.4.3 Policy Configuration

All policy settings are persistent and apply across the platform:

Setting	Description	Default
Auto Snapshots	Enable automatic daily snapshots	Enabled
Schedule	Cron expression for auto-snapshots	0 2 * * * (2 AM daily)
Retention Days	How long to keep snapshots	365 days
Max per Tier	Maximum snapshots per storage tier	10
Pre-Deployment	Snapshot before each deployment	Enabled
Pre-Migration	Full RDS snapshot before destructive schema changes	Enabled

9.4.4 Tier Transition Rules

Configure when snapshots move between tiers:

Hot (0-7 days) -> Warm (7-30 days) -> Cold (30-365 days) -> Archive (365+ days)

Each rule can be: - **Enabled/Disabled** individually - **Days threshold** configurable (e.g., move to warm after 7 days)

9.4.5 Cost Estimates

Configure tier costs for billing estimates:

Field	Description
\$/GB/month	Storage cost per gigabyte per month
Retrieval \$/GB	Cost to retrieve data from tier
Retrieval Hours	Estimated time to restore from tier

9.4.6 Snapshot Operations

Operation	Description
Create Snapshot	Manually create Aurora + DynamoDB + S3 snapshot
Restore	Restore database to a previous snapshot
Transition Tier	Manually move snapshot to different tier
Delete	Permanently remove snapshot and backups

9.4.7 API Endpoints

Endpoint	Method	Description
/api/admin/snapshot-storage/dashboard	GET	Full dashboard data
/api/admin/snapshot-storage/config	GET/PUT	Policy configuration
/api/admin/snapshot-storage/tier-rules	GET/PUT	Tier transition rules
/api/admin/snapshot-storage/tier-costs	GET/PUT	Cost estimates
/api/admin/snapshot-storage/snapshots	GET	List all snapshots
/api/admin/snapshot-storage/snapshots/:id/transition	POST	Move to tier
/api/admin/snapshot-storage/snapshots/:id	DELETE	Delete snapshot
/api/admin/snapshot-storage/stats	GET	Usage statistics
/api/admin/snapshot-storage/process-transitions	POST	Run lifecycle rules

9.4.8 Swift Deployer Integration

The Swift Deployer displays policy in **read-only mode**: - Policy configuration is managed **only** in the Admin Dashboard - Deployer fetches config via `refreshPolicyFromAPI()` - Snapshot creation and restoration work unchanged

Note: To change snapshot policy, tier rules, or cost estimates, use the Admin Dashboard. The Swift Deployer cannot modify these settings.

9A. Neural Operations Center (v6.0.0)

Location: Admin Dashboard -> Neural Operations

The Neural Operations Center provides comprehensive monitoring and control for RADIANT’s CORTEX neural networks - the 6 small MLPs (~2.5M total parameters) that make routing and orchestration decisions.

9A.1 Dashboard Overview

The Neural Operations dashboard displays:

Section	Description
System Status	Overall health indicator (healthy/degraded/critical)
Network Cards	Status for all 6 CORTEX networks
Regional Map	World map with thermal state indicators
Shadow Validations	Active model validation sessions
Recent Deployments	Deployment history with status
Alerts	Unacknowledged alerts with severity

9A.2 CORTEX Networks

The 6 base CORTEX networks:

Network	Parameters	Purpose
Pattern Network	~1.2M	Ranks similar past prompts
Routing Network	~200K	Selects AI model for task
Topology Network	~800K	Chooses orchestration mode
CLARION Network	~200K	Ranks clarifying questions
Combination Network	~50K	Scores model combinations
User Network	~50K	Personalizes via Ghost Vector

Each network card shows: - **Version:** Current deployed version - **Status:** Active, degraded, offline, or shadow - **RPS:** Requests per second - **P99 Latency:** 99th percentile response time

9A.3 Shadow Validation

Before promoting new network versions, RADIANT runs shadow validation:

1. **Upload** new model version
2. **Shadow Mode** runs both versions in parallel

3. **Metrics** tracked: error rate, latency delta, output divergence, memory overhead
4. **Decision**: Auto-promote if passing, or manual review

Promotion Thresholds:

Metric	Threshold	Action
Error Rate	> 0.1%	FAIL - Immediate abort
Latency Delta	> +50ms	WARN - Extend window
Divergence	> 15%	WARN - Extend window
Memory Overhead	> +20%	WARN - Investigate

To abort a shadow validation: 1. Click **Abort** on the validation card 2. Provide a reason 3. Confirm abort

9A.4 Thermal State Management

Each AWS region has a thermal state:

State	Description	Latency
Cold	No cartridge installed	30-60s warmup
Warming	Cartridge installing	10-30s
Warm	Cartridge active	<100ms
Hot	High demand, auto-scaled	<50ms

To override thermal state: 1. Click the thermometer icon on a region 2. Select target state 3. Enter reason (required) 4. Optionally set duration (auto-reverts) 5. Click **Apply Override**

9A.5 Alert Management

Alerts are categorized by severity:

Severity	Color	Action
Critical	Red	Immediate investigation
Error	Orange	Investigate within hours
Warning	Yellow	Monitor and plan fix
Info	Blue	Informational only

To acknowledge an alert, click the checkmark icon.

9A.6 API Endpoints

Endpoint	Method	Description
/api/admin/neural-operations/dashboard	GET	Full dashboard data
/api/admin/neural-operations/networks	GET	Network statuses
/api/admin/neural-operations/shadows	GET	Shadow validations
/api/admin/neural-operations/shadows/:id/abort	POST	Abort validation
/api/admin/neural-operations/regions	GET	Regional status
/api/admin/neural-operations/regions/:id/thermal-override	POST	Override thermal
/api/admin/neural-operations/alerts	GET	Active alerts
/api/admin/neural-operations/alerts/:id/acknowledge	POST	Acknowledge alert

9B. Cartridge System (.RADz) (v6.0.0)

Location: Admin Dashboard -> Cartridges

The Cartridge System enables export and import of portable AI brains (.RADz files) containing CORTEX neural networks, LoRA adapters, Curator knowledge, and domain expert configurations.

9B.1 What is a Cartridge?

A **Cartridge** (.RADz file) is a self-contained AI intelligence package containing:

Component	Description
CORTEX Networks	Small MLPs for routing decisions (ONNX format)
Domain Expert Networks	Specialized networks per domain (~4M params each)
LoRA Adapters	Fine-tuned model weights (safetensors format)
Curator Knowledge	Golden rules, ontology, safety matrix
Ghost Compression	User personalization model

9B.2 Cartridge Scopes

Scope	Description	Can Disable?
Tenant	Organization-wide cartridges	NO - Always active
User	Personal user cartridges	YES - Can toggle

Key Rule: Tenant cartridges CANNOT be disabled. They form the base layer that all users inherit.

9B.3 Stack Resolution

Cartridges are resolved in stack order:

-----+		
	User Cartridge (top)	<- Can toggle on/off
-----+		
	Tenant Cartridge 2	<- Always active
-----+		
	Tenant Cartridge 1 (base)	<- Always active
-----+		

Later cartridges override earlier ones (where allowUserOverride permits).

9B.4 Managing Cartridges

Viewing the Stack

1. Navigate to **Cartridges**
2. View the **Stack Visualization** showing tenant -> user resolution
3. Tenant cartridges show “Cannot disable” badge
4. User cartridges have toggle switches

Exporting a Cartridge

1. Click **Export** button
2. Select **Scope** (Tenant or User)
3. Choose components to include:
 - LoRA Adapters
 - Curator Knowledge
 - Ghost Compression
 - Domain Expert Networks
4. Click **Export** to generate .RADz file
5. Download link will be provided (expires in 1 hour)

Importing a Cartridge

1. Upload .RADz file to storage first
2. Click **Import** button
3. Select **Scope** and enter file key
4. Choose **Merge Strategy**:
 - **Replace**: Overwrite existing cartridge
 - **Merge**: Combine with existing

5. Optionally check “Activate immediately”
6. Click **Import**

9B.5 Cartridge Contents

Manifest (manifest.json)

Every .RADz file contains a manifest with:

Field	Description
version	Cartridge version (semver)
radiantVersion	Minimum RADIANT version required
domains	Domain IDs included
hasLoraAdapters	Whether LoRA adapters are included
hasCuratorKnowledge	Whether golden rules/ontology included
hasGhostCompression	Whether ghost model included
hasDomainExperts	Whether domain expert networks included
allowUserOverride	Can user cartridges override this?
signature	Cryptographic signature for verification

Directory Structure

```

cartridge.radz (ZIP archive)
+-- manifest.json
+-- cortex/
|   +-- pattern_network.onnx
|   +-- routing_network.onnx
|   +-- ...
+-- domain/
|   +-- healthcare/
|       +-- entity_classifier.onnx
|       +-- ...
+-- lora/
|   +-- adapters.safetensors
+-- curator/
|   +-- golden_rules.json
|   +-- ontology.json
|   +-- safety_matrix.json
+-- ghost/
    +-- compression_model.onnx

```

9B.6 API Endpoints

Endpoint	Method	Description
/api/admin/cartridges	GET	List cartridges
/api/admin/cartridges/:id	GET	Get single cartridge
/api/admin/cartridges	POST	Create cartridge
/api/admin/cartridges/:id	PATCH	Update cartridge
/api/admin/cartridges/:id	DELETE	Archive cartridge
/api/admin/cartridges/export	POST	Export to .RADz
/api/admin/cartridges/import	POST	Import from .RADz
/api/admin/cartridges/stack	GET	Get cartridge stack
/api/admin/cartridges/:id/toggle	POST	Toggle user cartridge
/api/admin/cartridges/:id/validate	POST	Validate .RADz file

9C. Domain Expert Cortex (v6.0.0)

Location: Admin Dashboard -> Domain Experts

The Domain Expert Cortex provides 7 specialized neural networks per domain (~28M total parameters per domain) for deep domain expertise.

9C.1 Overview

Each domain (healthcare, legal, finance, etc.) has a “suite” of 7 specialized MLPs:

Network	Params	Purpose
Entity Classifier	~4M	Classifies domain-specific entities
Contraindication Net	~4M	Flags dangerous/incompatible combinations
Protocol Matcher	~4M	Matches to standard protocols
Severity Assessor	~4M	Assesses severity/urgency levels
Personalization Net	~4M	Personalizes based on user history
Citation Network	~4M	Finds relevant citations/references
Orchestration Selector	~4M	Selects optimal orchestration mode

9C.2 Domain Configuration

Each domain has configuration settings:

Setting	Description
Safety Threshold	Minimum confidence for safety-critical decisions (0.5-1.0)
Citation Required	If true, all responses must include sources
Training Domain	Shows “Example Domain” badge (for testing)
Num Entities	Number of entity types in this domain
Num Actions	Number of action types
Num Protocols	Number of standard protocols

9C.3 Predefined Domains

Domain	Entities	Safety	Citations
Healthcare	50K	95%	Required
Legal	30K	90%	Required
Finance	25K	85%	Required
Fitness	5K	70%	Optional (Training Domain)
Education	10K	60%	Optional
Technology	15K	50%	Optional

9C.4 Dashboard Features

Summary Stats: - Domains configured / total - Active networks / deployed - Training jobs in progress - Total parameters across all networks

Domain Cards: - 7-bar network status indicator (green = active, yellow = training) - Completeness percentage - Safety threshold indicator - Citation requirement badge

Training Jobs: - Epoch progress bar - Estimated time remaining

9C.5 Training Workflow

1. Navigate to **Domain Experts** dashboard
2. Click on a domain card
3. For undeployed networks, click **Train**
4. Configure training parameters:
 - Learning rate (default: 0.001)
 - Batch size (default: 32)
 - Epochs (default: 100)
 - Early stopping (default: enabled)
5. Select training dataset
6. Click **Start Training**
7. Monitor progress in Training Jobs section

9C.6 API Endpoints

Endpoint	Method	Description
/api/admin/domain-experts/dashboard	GET	Full dashboard
/api/admin/domain-experts	GET	List domain suites
/api/admin/domain-experts/domains/:id	GET	Get domain config
/api/admin/domain-experts/domains	POST	Create domain
/api/admin/domain-experts/domains/:id	PATCH	Update domain config
/api/admin/domain-experts/domains/:id/networks/:type/deploy	POST	Deploy network
/api/admin/domain-experts/inference	POST	Run inference
/api/admin/domain-experts/training	POST	Start training job
/api/admin/domain-experts/training/:jobId	GET	Get training status

9D. CATO Twilight Dreaming (v6.0.0)

Location: Admin Dashboard -> CATO Twilight

CATO Twilight Dreaming enforces a 30% invention minimum through evolutionary prompt optimization using the PromptBreeder algorithm with 9 specialized operators.

9D.1 30% Invention Enforcement

Every response should contain at least 30% novel/inventive content:

Mode	Deficit	Behavior
Passive	< 5% below target	Normal operation
Active	5-10% below target	Prefer inventive responses
Aggressive	> 10% below target	Force invention

9D.2 PromptBreeder Operators

9 evolutionary operators for prompt optimization:

Operator	Description
Zero-Order Hypermutation	Random mutations
First-Order Hypermutation	Gradient-guided mutations
Estimation of Distribution	Learn from elite prompts
Lineage-Based Mutation	Ancestry-informed changes
Crossover	Combine two parent prompts
Lamarckian Mutation	Persist successful adaptations
Context Shuffling	Reorder context elements
Working Memory Expansion	Expand relevant context
ELM	Extreme Learning Mutation for breakthroughs

9D.3 Dashboard Features

Invention Rate Gauge: - Visual progress bar showing current vs. target rate - Deficit indicator when below 30% - Enforcement mode badge (Passive/Active/Aggressive)

Dreaming Sessions: - Start manual dreaming sessions - Monitor active session progress - View session history with fitness improvements

Inventions: - List of discovered novel patterns - Approve/reject inventions - Deploy approved inventions

9D.4 Configuration

Setting	Default	Description
Target Invention Rate	30%	Minimum novelty target
Enforcement Enabled	true	Force invention when below target
Dreaming Enabled	true	Enable background evolution
Dreaming Schedule	scheduled	continuous/scheduled/on_demand
Dreaming Window	02:00-06:00	UTC time window for scheduled dreaming

9D.5 API Endpoints

Endpoint	Method	Description
/api/admin/cato-twilight/dashboard	GET	Full dashboard
/api/admin/cato-twilight/sessions	POST	Start dreaming session
/api/admin/cato-twilight/invention-rate	GET	Check invention rate

Endpoint	Method	Description
/api/admin/cato-twilight/config	GET	Get enforcement config
/api/admin/cato-twilight/config	PATCH	Update config
/api/admin/cato-twilight/inventions/:id/approve	POST	Approve invention

9E. Safety Matrix Manager (v6.0.0)

Location: Admin Dashboard -> Safety Matrix

The Safety Matrix Manager provides an entity-action contraindication grid for safety-critical domains, defining which entities CANNOT be combined with which actions.

9E.1 Contraindication Severities

Severity	Color	Description
Absolute	Red	Never combine - critical risk
Relative	Orange	Usually avoid - significant risk
Caution	Yellow	Consider risks - moderate concern
Monitor	Green	Proceed with care - low concern

9E.2 Entity Categories

- **Medication:** Drugs, supplements
- **Condition:** Diseases, symptoms
- **Procedure:** Medical procedures
- **Patient Group:** Demographics, risk groups
- **Legal Entity:** Persons, organizations
- **Document Type:** Contracts, agreements
- **Financial Instrument:** Securities, derivatives
- **Regulatory Status:** Accreditation, licensing
- **Custom:** Domain-specific entities

9E.3 Action Categories

- **Prescribe:** Medication orders
- **Recommend:** Suggestions, advice
- **Combine With:** Drug interactions
- **Administer To:** Treatment delivery
- **Advise:** Legal/financial counsel

- **Execute:** Transactions
- **Transfer:** Asset movement
- **Disclose:** Information sharing
- **Custom:** Domain-specific actions

9E.4 Dashboard Features

Summary Stats: - Total entities and actions - Contraindications count and pending review - Matrix coverage percentage

Severity Breakdown: - Visual cards for each severity level

Matrix Grid View: - Interactive entityxaction grid - Color-coded cells by severity - Click to view/edit contraindication

Pending Review: - Items awaiting approval - Approve/reject buttons

9E.5 Creating Contraindications

1. Navigate to **Safety Matrix** dashboard
2. Click **Add Contraindication**
3. Select or enter entity and action
4. Choose severity level
5. Provide reason/evidence
6. Configure override policy
7. Click **Create**

9E.6 API Endpoints

Endpoint	Method	Description
/api/admin/safety-matrix/dashboard	GET	Full dashboard
/api/admin/safety-matrix/entities	GET	List entities
/api/admin/safety-matrix/entities	POST	Create entity
/api/admin/safety-matrix/actions	GET	List actions
/api/admin/safety-matrix/actions	POST	Create action
/api/admin/safety-matrix/contraindications	GET	List contraindications
/api/admin/safety-matrix/contraindications	POST	Create contraindication
/api/admin/safety-matrix/contraindications/:id/review	POST	Review contraindication
/api/admin/safety-matrix/check	POST	Check for contraindications

Endpoint	Method	Description
/api/admin/safety-matrix/grid	GET	Get matrix grid

10. Orchestration & Preference Engine

10.1 Cognitive Router (formerly Brain Router)

The Cognitive Router automatically selects optimal models:

Factor	Weight	Description
Cost	30%	Price optimization
Quality	30%	Output quality
Speed	20%	Response latency
Availability	20%	Provider health

10.2 Neural Patterns

Configure orchestration patterns:

Pattern	Description	Use Case
Single	One model	Simple requests
Fallback	Primary + backup	High availability
Parallel	Multiple simultaneous	Consensus
Chain	Sequential models	Complex tasks

10.3 Workflow Templates

Create reusable workflows:

1. Navigate to **Orchestration -> Workflows**
2. Click “**+ New Workflow**”
3. Define steps and conditions
4. Set triggers and parameters
5. Save and activate

10.4 Orchestration Methods

Location: Admin Dashboard -> Orchestration -> Methods

Manage the 70+ built-in orchestration methods that power workflow steps.

Method Categories

Category	Count	Examples
Generation	3	Chain-of-Thought, Iterative Refinement
Evaluation	6	Multi-Judge Panel, G-Eval, Pairwise
Synthesis	5	Mixture of Agents, LLM-Blender
Verification	8	SelfCheckGPT, CiteFix, PRM
Debate	5	Sparse Debate, HAH-Delphi
Aggregation	4	Self-Consistency, GEDI Electoral
Routing	7	RouteLLM, FrugalGPT, Pareto, C3PO, AutoMix
Uncertainty	6	Semantic Entropy, SE Probes, Kernel Entropy
Hallucination	3	Multi-Method Detection, MetaQA
Human-in-Loop	3	HITL Review, Active Learning

System vs User Methods

Type	Editable	Description
System	Parameters only	Built-in methods with locked definitions
User	Full (future)	Custom tenant methods (planned feature)

System methods show a “System” badge in the UI. Only defaultParameters and isEnabled can be modified.

Setting Default Parameters

1. Navigate to **Orchestration -> Methods**
2. Select a method from the list
3. Adjust parameters in the right panel
4. Click **Save** to update defaults

Example Parameters (vary by method):

Parameter	Type	Used By	Description
sample_count	integer	Entropy, Consistency	Number of response samples
threshold	number	Routing, Detection	Decision threshold
temperature	number	Generation, Debate	Sampling temperature
confidence_threshold	number	Cascade, HITL	Escalation trigger
budget_cents	number	Pareto Routing	Cost constraint
kernel	enum	Kernel Entropy	RBF, linear, polynomial
topology	enum	Sparse Debate	ring, star, tree, full

See THINKTANK-ADMIN-GUIDE.md Section 34.5 for complete parameter reference by method.

Parameter Inheritance

Admin Default -> Workflow Step -> User Template Override

 v v v

Tenant-wide Per-workflow Per-user template

Parameters set at the Admin level apply to all workflows. User workflow templates can override these per-template.

10.5 Orchestration Security (RLS)

All orchestration tables are protected by PostgreSQL Row-Level Security (RLS) with tenant isolation.

Security Model Summary

Table	Read Access	Write Access
orchestration_method	All authenticated users	Super admin only
orchestration_workflow	System: all users; User-created: own tenant only	Own tenant only
workflow_method_bind	Follows parent workflow	Follows parent workflow
workflow_customization	Own tenant only	Own tenant only
orchestration_execution	Own tenant (+ super admin)	Own tenant only
orchestration_step_execution	Follows parent execution	Follows parent execution
user_workflow_templates	Own + shared + approved public	Own only (tenant admin can manage all)

Session Variables

The API sets these PostgreSQL session variables before any database operation:

Variable	Purpose	Set By
app.current_tenant_id	Current tenant UUID	JWT claims
app.current_user_id	Current user UUID	JWT claims
app.is_tenant_admin	Tenant admin flag	JWT claims
app.is_super_admin	Super admin flag	JWT claims
app.client_ip	Client IP address	Request context
app.user_agent	Browser user agent	Request headers

Helper Functions

Three helper functions are available for workflow access control:

```
-- Check if current user can view a workflow
SELECT can_access_workflow('workflow-uuid');

-- Check if current user can modify a workflow
SELECT can_modify_workflow('workflow-uuid');
```

```
-- Get all accessible workflows with permissions
SELECT * FROM get_accessible_workflows();
```

Audit Trail

All modifications to workflows are logged to `orchestration_audit_log`:

Column	Description
table_name	Which table was modified
record_id	UUID of the modified record
action	INSERT, UPDATE, or DELETE
old_data	Previous state (JSONB)
new_data	New state (JSONB)
tenant_id	Tenant making the change
user_id	User making the change
ip_address	Client IP address
user_agent	Browser user agent
changed_at	Timestamp of change

User Workflow Template Sharing

Users can share their workflow templates at three levels:

- 1. **Private** (default): Only the creator can see/use the template
- 2. **Shared within Tenant** (`is_shared = true`): All users in the tenant can see/use
- 3. **Public** (`is_public = true`): Visible to all tenants after super admin approval

To approve a public template (super admin only):

```
UPDATE user_workflow_templates
SET share_approved_at = NOW(), share_approved_by = 'admin-uuid'
WHERE template_id = 'template-uuid' AND is_public = true;
```

Migration: `V2026_01_10_003__orchestration_rls_security.sql`

10.6 Cato Pipeline Orchestration

Location: Admin Dashboard -> Orchestration -> Pipelines

The Cato Pipeline Orchestration system provides modular, type-safe AI task execution with built-in governance, risk assessment, and rollback capabilities.

Pipeline Methods

Method	ID	Purpose	Output Type
Observer	method:observe	Classify intent, extract context, detect domain	CLASSIFICATION
Proposer	method:propose	Generate action proposals with cost/risk estimates	PROPOSAL
Validator	method:validate	Risk assessment and triage decisions	ASSESSMENT
Executor	method:execute	Execute approved actions via Lambda/MCP tools	EXECUTION_RESULT
Decider	method:decide	Synthesize critiques, make final decisions	JUDGMENT

Checkpoint Gates (Human-in-the-Loop)

Five checkpoint gates control human oversight:

Checkpoint	Name	Trigger Point
CP1	Context Gate	After Observer
CP2	Plan Gate	After Proposer
CP3	Review Gate	After Critics
CP4	Execution Gate	Before Executor
CP5	Post-Mortem Gate	After Executor

Governance Presets

Preset	Description	Auto-Execute Threshold	Veto Threshold
COWBOY	Maximum autonomy - minimal checkpoints	0.7	0.95
BALANCED	Checkpoints at key decision points	0.5	0.85
PARANOID	Maximum oversight - checkpoints at every stage	0.2	0.6

To configure governance preset: 1. Navigate to **Orchestration -> Pipelines -> Settings** 2. Select desired preset from dropdown 3. Optionally customize individual checkpoint triggers 4. Click **Save Configuration**

Pipeline Execution API

Endpoint	Method	Description
/api/admin/cato-pipeline/execute	POST	Start new pipeline
/api/admin/cato-pipeline/:id	GET	Get execution status
/api/admin/cato-pipeline/:id/resume	POST	Resume from checkpoint
/api/admin/cato-pipeline/:id/envelopes	GET	Get all method envelopes
/api/admin/cato-pipeline/checkpoints/pending	GET	List pending checkpoints
/api/admin/cato-pipeline/checkpoints/:id/resolve	POST	Resolve a checkpoint

Compensation (SAGA Rollback)

When pipeline execution fails, the system automatically executes compensating transactions in reverse order (LIFO):

Compensation Type	Behavior
DELETE	Delete created resource
RESTORE	Restore to previous state
NOTIFY	Send notification only
MANUAL	Flag for manual intervention
NONE	No compensation needed

Universal Envelope Protocol

All method outputs are wrapped in CatoMethodEnvelope containing: - **Identity**: envelopeld, pipelineId, tenantId, sequence - **Output**: outputType, data, hash, summary - **Confidence**: score (0-1), individual factors - **Risk Signals**: detected risks with severity - **Tracing**: traceId, spanId for distributed tracing - **Compliance**: frameworks, data classification, PII/PHI flags

See docs/CAT0-ORCHESTRATION-ENGINEERING-GUIDE.md for complete technical documentation.

11. Pre-Prompt Learning

Location: Admin Dashboard -> Orchestration -> Pre-Prompts

The Pre-Prompt Learning system tracks and learns from the effectiveness of pre-prompts (system prompts) used by the AGI Brain. It uses **attribution analysis** to determine what factor actually caused issues - not just the pre-prompt.

11.1 Overview Dashboard

The dashboard shows key metrics:

Metric	Description
Templates	Active/total pre-prompt templates
Total Uses	Pre-prompt instances used
Avg Rating	Average user rating (1-5)
Thumbs Up Rate	Percentage of positive feedback
Exploration Rate	Rate of trying non-optimal templates to learn

11.2 Attribution Analysis

When users report issues, the system analyzes which factor was responsible:

Factor	When Blamed
Pre-prompt	System instructions wrong
Model	Model selection inappropriate
Mode	Orchestration mode wrong
Workflow	Pattern did not fit task
Domain	Domain detection incorrect
Other	External factors

The attribution pie chart shows the distribution of blame across factors.

11.3 Template Management

Navigate to the **Templates** tab to:

- View all pre-prompt templates
- See usage statistics and success rates
- Check which orchestration modes each template supports
- View average feedback scores

11.4 Adjusting Weights

Click the **sliders icon** on any template to adjust weights:

Weight	Default	Description
Base Effectiveness	0.5	Starting score before bonuses
Domain Weight	0.2	Bonus for matching domain
Mode Weight	0.2	Bonus for matching mode
Model Weight	0.2	Bonus for compatible model
Complexity Weight	0.15	Bonus for complexity match
Task Type Weight	0.15	Bonus for task type match

Weight	Default	Description
Feedback Weight	0.1	Historical feedback influence

Score Formula:

Final Score = Base + (Domain x DomainWeight) + (Mode x ModeWeight) +
 (Model x ModelWeight) + (Complexity x ComplexityWeight) +
 (TaskType x TaskTypeWeight) + FeedbackAdjustment

11.5 Learning Configuration

Configure learning behavior:

- **Learning Enabled:** Toggle on/off
- **Exploration Rate:** Percentage of requests using non-optimal templates to gather data (default: 10%)
- **Exploration Decay:** How quickly exploration decreases (default: 0.99)
- **Minimum Exploration:** Floor for exploration rate (default: 1%)

11.6 Recent Feedback

The **Feedback** tab shows recent user feedback with:

- Rating (1-5 stars)
- Attribution label (what got blamed)
- User comments
- Timestamp

See Pre-Prompt Learning System Documentation for full details.

12. Localization

12.1 Translation Registry

Location: Admin Dashboard -> Localization -> Translation Registry

The Translation Registry provides comprehensive management of all UI strings across RADIANT applications with tenant-specific override capabilities.

Key Features: - **100+ Pre-Seeded Strings:** Common UI elements, errors, dialogs, validation messages - **App-Scoped Categories:** radiant_admin, thinktank_admin, thinktank, curator, common - **Tenant Overrides:** Custom text per tenant with protection from auto-updates - **18 Language Support:** Full coverage across all supported languages

12.2 Supported Languages

Language	Code	Flag	RTL
English	en		No

Language	Code	Flag	RTL
Spanish	es		No
French	fr		No
German	de		No
Portuguese	pt		No
Italian	it		No
Dutch	nl		No
Polish	pl		No
Russian	ru		No
Turkish	tr		No
Japanese	ja		No
Korean	ko		No
Chinese (Simplified)	zh-CN		No
Chinese (Traditional)	zh-TW		No
Arabic	ar		Yes
Hindi	hi		No
Thai	th		No
Vietnamese	vi		No

12.3 Tenant Translation Overrides

Tenant administrators can override any system string with custom text:

Override Workflow: 1. Navigate to **Localization -> Translation Registry** 2. Select target language from dropdown 3. Browse or search for strings to customize 4. Click **Edit** to create an override 5. Enter custom text and save

Protection System: - **Protected Overrides** (default): Won't be updated by automatic translation - **Unprotected Overrides:** May be updated when system translations improve - **Revert:** Delete override to return to system translation

Admin UI Tabs: | Tab | Purpose | | — | — | — | — | | **Registry** | Browse all strings, create overrides | | **Your Overrides** | Manage existing overrides, toggle protection | | **Coverage** | View translation coverage by language |

12.4 Translation Override API

Base URL: /api/admin/localization

List Registry Entries

GET /api/admin/localization/registry?app_id=thinktank&category=chat&search=error&page=1&limit=50

Get Entry with All Translations

GET /api/admin/localization/registry/:id

List Tenant Overrides

GET /api/admin/localization/overrides?language_code=es&protected=true

Create/Update Override

POST /api/admin/localization/overrides

Content-Type: application/json

```
{
  "registry_id": 42,
  "language_code": "es",
  "override_text": "Texto personalizado",
  "is_protected": true
}
```

Delete Override (Revert to System)

DELETE /api/admin/localization/overrides/:id

Toggle Protection

PATCH /api/admin/localization/overrides/:id/protection

Content-Type: application/json

```
{
  "is_protected": false
}
```

Get Translation Bundle (with Overrides Applied)

GET /api/admin/localization/bundle/es?app_id=thinktank

Response:

```
{
  "languageCode": "es",
  "translations": {
    "thinktank.chat.placeholder": "Escribe tu mensaje...",
    "common.buttons.save": "Guardar"
  },
  "overrideCount": 5,
  "overrideKeys": ["thinktank.chat.placeholder"]
}
```

12.5 Tenant Localization Config

Configure language settings per tenant:

GET /api/admin/localization/config

PUT /api/admin/localization/config

Configuration Options: | Setting | Default | Description | |----|----|----| | default_language | en | Default language for new users | | enabled_languages | ['en'] | Languages available to users | | allow_user_language_selection | true | Let users choose their language | | enable_ai_translation | true | Use AI for missing translations | | brand_name | null | Custom brand name for strings |

12.6 Database Schema

Table	Purpose
localization_registry	Source strings with keys, context, category
localization_translations	System translations per language
tenant_translation_overrides	Tenant-specific overrides with protection
tenant_localization_config	Per-tenant language configuration
translation_audit_log	Change history for compliance

12.7 String Categories

Category	Examples
buttons	Save, Cancel, Delete, Edit, Submit
errors	Network error, Session expired, Validation
dialogs	Confirm, Delete confirmation, Unsaved changes
validation	Required field, Invalid email, Min/max length
toasts	Success messages, Error messages
time	Relative time (minutes ago, hours ago)
pagination	Showing X to Y, Previous, Next
tables	No data, Loading, Search
upload	Drag and drop, Max size, Allowed types
auth	Sign in, Sign out, Forgot password
navigation	Dashboard, Settings, Users
chat	Placeholder, Send, Thinking

12.8 Think Tank Admin Localization

Tenant administrators access a simplified localization UI at **Administration -> Localization**:

- **Your Overrides:** View and manage custom translations
- **Browse Strings:** Search Think Tank-specific strings
- **Configuration:** Set default language and enabled languages

12. Configuration Management

12.1 System Configuration

Navigate to **Configuration** to manage:

Category	Settings
General	Platform name, domain, timezone
Email	SMTP settings, templates
Security	Password policy, MFA settings
API	Rate limits, CORS settings
Features	Feature flags

12.2 Tenant Overrides

Allow tenant-specific configuration:

- 1. Navigate to **Configuration -> Tenant Overrides**
- 2. Select tenant
- 3. Override specific settings
- 4. Save changes

12.3 SSM Parameters

System configuration is stored in AWS SSM:

Parameter	Description
/radiant/prod/database/url	Database connection
/radiant/prod/api/rate-limit	API rate limits
/radiant/prod/features/*	Feature flags

13. AI Ethics & Standards

Location: Admin Dashboard -> Ethics

The Ethics module provides transparency into the ethical principles guiding AI behavior and their source standards.

13.1 Standards Tab

View all industry AI ethics frameworks that inform RADIANT's ethical principles:

Standard	Organization	Type	Required
NIST AI RMF 1.0	National Institute of Standards and Technology	Government	[OK]
ISO/IEC 42001:2023	International Organization for Standardization	ISO	[OK]
EU AI Act	European Union	Government	[OK]
IEEE 7000-2021	IEEE	Industry	
OECD AI Principles	OECD	Government	
UNESCO AI Ethics	UNESCO	Government	
ISO/IEC 23894:2023	ISO	ISO	
ISO/IEC 38507:2022	ISO	ISO	

Each standard shows: - **Full Name**: Complete standard title with version - **Organization**: Issuing body - **Type**: Government, ISO, Industry, Academic, Religious - **Required Badge**: Mandatory for compliance - **Description**: Summary of the standard's purpose - **Publication Date**: When the standard was issued - **External Link**: Direct link to official standard

13.2 Principles Tab

View ethical principles with their standard sources:

Principle	Category	Source Standards
Love Others	Love	NIST GOVERN 1.2, ISO 42001 Clause 5.2, Matthew 22:39
Golden Rule	Love	NIST MAP 1.1, EU AI Act Article 9, Matthew 7:12
Speak Truth	Truth	NIST GOVERN 4.1, ISO 42001 Clause 7.4, EU AI Act Article 13, John 8:32
Show Mercy	Mercy	NIST MEASURE 2.6, EU AI Act Article 14, Matthew 5:7
Serve Humbly	Service	NIST GOVERN 1.1, ISO 42001 Clause 5.1, Mark 10:45
Avoid Judgment	Mercy	NIST MAP 2.3, EU AI Act Article 10, Matthew 7:1
Care for Vulnerable	Service	NIST MAP 1.5, EU AI Act Article 7, ISO 42001 Clause 8.4, Matthew 25:40

Each principle displays: - **Teaching**: The principle text - **Category Badge**: love, mercy, truth, service, humility, peace, forgiveness - **Derived from / Aligned with**: Standard badges with section references

13.3 Violations Tab

Monitor ethical violations in AI responses:

- **Action**: What was evaluated

- **Score:** Ethical score percentage
- **Concerns:** Specific violations detected
- **Guidance:** Recommended corrections
- **Reasoning:** Explanation of the evaluation

13.4 Statistics

Summary cards showing: - **Total Evaluations:** All ethical checks performed - **Approved:** Passed evaluations - **Violations:** Failed evaluations - **Average Score:** Mean ethical score - **Today:** Evaluations in the last 24 hours

13.5 Standard Alignment Levels

Principles map to standards with different alignment levels:

Level	Meaning
derived	Principle was directly derived from this standard
aligned	Principle aligns with this standard’s requirements
supports	Principle supports this standard’s goals
extends	Principle extends beyond this standard

See AI Ethics Standards Documentation for full details.

14. Provider Rejection Handling

Location: Think Tank -> Notifications (Bell icon)

When AI providers reject prompts based on their policies (not RADIANT’s), the system automatically attempts fall-back to alternative models.

14.1 How It Works

User Prompt -> Model Rejects -> Check RADIANT Ethics
+-- Our ethics block -> Reject with explanation
+-- Our ethics pass -> Try fallback models (up to 3 attempts)
 +-- Fallback succeeds -> Return response (user notified)
 +-- All fail -> Reject with full explanation

14.2 Rejection Types

Type	Description	Auto-Fallback
content_policy	Provider’s content policy violation	[OK] Yes
safety_filter	Safety/moderation filter triggered	[OK] Yes
provider_ethics	Provider’s ethical guidelines differ	[OK] Yes

Type	Description	Auto-Fallback
capability_mismatch	Model can't handle request type	[OK] Yes
context_length	Prompt too long for model	[OK] Yes
moderation	Pre-flight moderation blocked	[OK] Yes
rate_limit	Rate limiting	Retry

14.3 User Notifications

Users see rejection notifications via the bell icon in Think Tank:

- **Unread count badge** - Number of unread notifications
- **Notification panel** - Slides out showing all rejections
- **Suggested actions** - Rephrase, simplify, contact admin
- **Resolution status** - Whether fallback succeeded

14.4 Fallback Model Selection

Models are selected for fallback based on:

1. **Rejection rate** - Models with lowest historical rejection rates preferred
2. **Required capabilities** - Must match original model's capabilities
3. **Provider diversity** - Prefer different providers

14.5 Model Rejection Statistics

Location: Admin Dashboard -> Analytics -> Model Stats

View per-model: - Total requests and rejections - Rejection rate percentage - Breakdown by rejection type - Fallback success rate

14.6 Database Tables

Table	Purpose
provider_rejections	Track all rejections with fallback chain
rejection_patterns	Learn patterns for smarter fallback
user_rejection_notifications	User-facing notifications
model_rejection_stats	Per-model statistics

14.7 Configuration

Setting	Default	Description
MAX_FALLBACK_ATTEMPTS	3	Maximum fallback tries per request
MIN_MODELS_FOR_TASK	2	Minimum capable models required

See Provider Rejection Handling Documentation for full details.

14.8 Rejection Analytics

Location: Admin Dashboard -> Analytics -> Rejections

Comprehensive analytics on AI provider rejections to inform ethics policy updates.

Summary Cards

- **Total Rejections (30d)** - All rejections in last 30 days
- **Fallback Success Rate** - Percentage resolved by fallback models
- **Rejected to User** - Requests that couldn't be completed
- **Flagged Keywords** - Keywords marked for policy review

By Provider Tab

Column	Description
Provider	Provider ID (openai, anthropic, google, etc.)
Rejections	Total rejections in period
Models	Number of models affected
Unique Prompts	Distinct prompts rejected
Fallback Rate	Success rate of fallback attempts
Rejected to User	Requests that failed all fallbacks
Types	Rejection types (content_policy, safety_filter, etc.)

Violation Keywords Tab

Track which keywords trigger rejections:

Column	Description
Keyword	The triggering keyword
Category	violence, security, controlled, etc.
Occurrences	Times keyword appeared in rejected prompts
Provider Breakdown	Rejections per provider for this keyword
Status	Flagged, Pre-filter added, or Monitoring

Actions: - **Flag for Review** - Mark keyword for policy consideration - **Add Pre-Filter** - Block prompts containing keyword before sending to AI

Flagged Prompts Tab

View full content of rejected prompts for investigation:

- Full prompt text (for policy review only)

- Detected violation keywords
- Model and provider that rejected
- Number of times this prompt pattern was rejected
- Suggested actions: Add Pre-Filter, Dismiss

Policy Review Tab

Recommendations based on rejection patterns:

- High-frequency rejection patterns
- Suggested pre-filters to add
- Keywords to consider blocking

Database Tables

Table	Purpose
rejection_analytics	Daily aggregated stats by model/provider/mode
rejection_keyword_stats	Per-keyword occurrence and rejection counts
rejected_prompt_archive	Full prompt content for flagged reviews

Using Analytics to Update Ethics Policy

1. **Monitor** -> Watch the Keywords tab for high-occurrence terms
2. **Flag** -> Mark suspicious keywords for review
3. **Investigate** -> View full prompts in Flagged Prompts tab
4. **Decide** -> Add pre-filter, add warning, or dismiss
5. **Implement** -> Update RADIANT ethics policy to pre-filter prompts

15. Security & Compliance

15.1 Security Dashboard

Navigate to **Security** to monitor:

Security Dashboard		Threat Level: Low	
Active Threats:	0		
Failed Logins:	23 (last 24h)		
Suspicious IPs:	2 blocked		
MFA Adoption:	94%		
Recent Alerts:			
+-----+			
[!] Unusual login location – user@acme.com (2h ago)			
[ok] Resolved: Brute force attempt blocked (5h ago)			

```
| | [ok] Resolved: API key rotated – tenant xyz (1d ago) | |
| +-----+
|
+-----+
```

13.2 Anomaly Detection

Automatic detection of:

- Impossible travel (geographic anomalies)
- Session hijacking attempts
- Brute force attacks
- Unusual API patterns

15.3 Compliance Dashboard

Navigate to **Compliance** to access five tabs:

Tab	Purpose
Reports	SOC 2, HIPAA, GDPR, ISO 27001 compliance reports
GDPR	Data subject requests and consent management
HIPAA	PHI protection and access controls
Breaches	Data breach incident tracking
Retention	Data retention policy configuration

15.4 GDPR Management

The GDPR tab provides:

Data Subject Requests (Articles 15-22): | Request Type | Description | Deadline | |-----|-----|-----|
| Access | Export all user data | 30 days | | Rectification | Correct personal data | 30 days | | Erasure | Right to be forgotten | 30 days | | Restriction | Limit processing | 30 days | | Portability | Machine-readable export | 30 days | | Objection | Object to processing | 30 days |

Processing Requests: 1. Navigate to **Compliance -> GDPR** 2. View pending requests with deadlines 3. Click “**Process**” to fulfill request 4. System automatically exports/deletes data 5. Request marked complete with audit trail

15.5 HIPAA Configuration

The HIPAA tab provides per-tenant settings:

Setting	Default	Description
HIPAA Mode	Off	Enable all HIPAA features
PHI Detection	On	Auto-detect PHI in requests
PHI Encryption	On	Column-level encryption
Enhanced Logging	On	Detailed PHI access logs

Setting	Default	Description
MFA Required	On	Require MFA for all users
Session Timeout	15 min	Auto-logout after inactivity
Access Review	90 days	Periodic access review period
PHI Retention	2190 days	6 years per HIPAA
Audit Retention	2555 days	7 years recommended

15.6 Data Breach Management

The Breaches tab tracks security incidents:

Incident Types: - Unauthorized access - Data theft - Ransomware - Accidental disclosure - System breach - Insider threat

Notification Requirements: | Regulation | Notify | Timeline | | — — — — | — — — — | | GDPR | DPA + affected users | 72 hours | | HIPAA | HHS + affected individuals | 60 days |

15.7 Data Retention Policies

Default retention periods:

Data Type	Retention	Legal Basis	Action
Session Data	90 days	Legitimate Interest	Delete
Usage Analytics	2 years	Legitimate Interest	Anonymize
Audit Logs	7 years	Legal Obligation	Archive
PHI Data	6 years	Legal Obligation	Archive
Billing Records	7 years	Legal Obligation	Archive
GDPR Requests	3 years	Legal Obligation	Archive
Consent Records	7 years	Legal Obligation	Archive

15.8 Generating Compliance Reports

1. Navigate to **Compliance -> Reports**
2. Select framework (SOC 2, HIPAA, GDPR, ISO 27001)
3. Click “**Generate Report**”
4. View compliance score and findings
5. Export to PDF for auditors

15.9 Regulatory Standards Registry

Location: Admin Dashboard -> Security -> Reg Standards

Comprehensive registry of all regulatory standards Radiant must comply with.

Supported Standards (35 Frameworks)

Category	Standards
Data Privacy	GDPR, CCPA, CPRA, LGPD, PIPEDA, APPI, PDPA
Healthcare	HIPAA, HITECH, HITRUST CSF
Security	SOC 2, SOC 1, ISO 27001, ISO 27017, ISO 27018, ISO 27701, CSA STAR, NIST CSF, NIST 800-53, CIS Controls
Financial	PCI-DSS, SOX, GLBA
Government	FedRAMP, StateRAMP, ITAR, CMMC
AI Governance	EU AI Act, NIST AI RMF, ISO 42001, IEEE 7000
Accessibility	WCAG 2.1, ADA, Section 508
Industry	FERPA, COPPA

Overview Tab

The Overview tab provides: - **Summary Cards**: Total standards, requirements, implementation progress - **Categories Grid**: Standards organized by domain with mandatory counts - **Priority Standards**: Mandatory frameworks requiring immediate attention - **Requirements Status**: Not started, in progress, implemented, verified

Standards Tab

Browse all regulatory frameworks with: - **Search**: Find standards by code, name, or description - **Category Filter**: Filter by Data Privacy, Security, Healthcare, etc. - **Mandatory Filter**: Show only required standards - **Standard Details**: Click any standard to view full requirements

My Compliance Tab

Track your tenant’s compliance status: - **Enable/Disable**: Toggle which standards apply to your organization - **Compliance Score**: Track progress per standard (0-100%) - **Status**: Not Assessed -> Non-Compliant -> Partial -> Compliant -> Certified - **Audit Tracking**: Last audit date and next scheduled audit

Requirements Tracker

For each standard, track individual requirements:

Field	Description
Requirement Code	Unique identifier (e.g., GDPR-32, PCI-7)
Title	Short description of the requirement
Control Type	Technical, Administrative, Physical, Procedural
Status	Not Started -> In Progress -> Implemented -> Verified
Owner	Person responsible for implementation
Evidence	Link to compliance evidence
Due Date	Implementation deadline

Updating Requirement Status

1. Navigate to **Reg Standards -> Standards**
2. Click on a standard to open details sheet
3. Find the requirement to update
4. Use the status dropdown to change implementation status
5. Changes are automatically saved

15.10 Self-Audit & Regulatory Reporting

Location: Admin Dashboard -> Security -> Self-Audit

Automated compliance self-auditing with timestamped pass/fail results for regulatory reporting.

Running an Audit

1. Navigate to **Security -> Self-Audit**
2. Click “**Run Audit**” button
3. Select framework (SOC 2, HIPAA, GDPR, ISO 27001, PCI-DSS, or All)
4. Audit executes automatically (~5-30 seconds depending on scope)
5. Results appear in dashboard with pass/fail breakdown

Dashboard Overview

The dashboard displays: - **Overall Pass Rate:** Aggregate compliance score across all frameworks - **Total Checks:** Number of automated compliance checks (45+) - **Critical Issues:** Failed checks with critical severity requiring immediate attention - **Framework Scores:** Individual compliance scores per framework with trend indicators

Framework Compliance Checks

Framework	Checks	Categories
SOC 2	12	Access Control, Data Protection, Audit Logging, Incident Response, Change Management
HIPAA	8	PHI Protection, Access Control, Audit Trail, Data Retention
GDPR	8	Consent Management, Data Subject Rights, Data Processing, Data Transfer, Breach Response
ISO 27001	9	Security Policy, Organization, Access Control, Cryptography, Operations, Incident Management, Compliance
PCI-DSS	8	Network Security, Data Protection, Encryption, Access Control, Authentication, Monitoring, Testing, Governance

Audit History

View historical audit runs with: - **Timestamp**: Exact date/time of audit execution - **Framework**: Which standard was audited - **Type**: Manual, Scheduled, or Triggered - **Score**: Overall compliance percentage - **Pass/Fail/Skip**: Breakdown of check results - **Triggered By**: Admin who initiated the audit

Viewing Audit Details

Click any audit run to see: - **Score Overview**: Large score display with pass/fail/skip counts - **Critical Failures**: Red panel highlighting checks requiring immediate action - **By Category**: Progress bars showing compliance per category - **All Results**: Expandable list of every check with status and remediation steps

Generating Reports

From an audit run details view: 1. Click “**Export PDF Report**” for auditor-ready documentation 2. Click “**View Evidence**” to see raw query results and execution details

Scheduling Audits

Configure automated audit schedules: 1. Navigate to **Self-Audit -> Checks Registry** 2. Select framework to schedule 3. Choose frequency: Daily, Weekly, Monthly, or Quarterly 4. Set notification preferences for failures 5. Audits run automatically at configured times

API Integration

Integrate audit results with external systems:

```
# Run audit programmatically
POST /api/admin/self-audit/run
{ "framework": "soc2" }

# Fetch latest results
GET /api/admin/self-audit/runs/{runId}

# Generate report
GET /api/admin/self-audit/runs/{runId}/report
```

15.11 Compliance Framework Reference

Comprehensive reference for all supported compliance frameworks with implementation details.

SOC 2 Type II

Trust Services Criteria Implementation:

Control	Radiant Implementation	Evidence
CC1.1 - COSO Integrity	Ethics pipeline with content screening	Ethics audit logs
CC2.1 - Security Policy	Tenant-level security configuration	dynamic_config table

Control	Radiant Implementation	Evidence
CC3.1 - Risk Assessment	Security anomaly detection	security_anomalies table
CC4.1 - Monitoring	Real-time audit logging	DynamoDB + PostgreSQL audit trails
CC5.1 - Logical Access	Cognito User Pools with MFA	AWS CloudTrail
CC5.2 - Authentication	JWT tokens with session management	Token validation logs
CC6.1 - Encryption	AES-256 at rest, TLS 1.3 in transit	AWS KMS key policies
CC6.6 - Change Management	Dual-approval for production changes	approval_requests table
CC7.1 - System Operations	CloudWatch monitoring, automated alerts	AWS CloudWatch dashboards
CC7.2 - Incident Response	Security anomaly alerting	SNS notifications
CC8.1 - Change Management	Database migration approvals	Migration audit logs
CC9.1 - Business Continuity	Multi-AZ deployment, automated backups	Aurora automated backups

Automated Audit Checks: - MFA enforcement for administrators - Password policy configuration - Session timeout settings (<=30 minutes) - RBAC implementation verification - Encryption at rest confirmation - Audit log retention (>=7 years) - Change management process validation

HIPAA / HITECH

Administrative Safeguards (45 CFR §164.308):

Requirement	Implementation	Configuration
Security Officer	Designated in tenant config	hipaa_config.security_officer
Workforce Training	User acknowledgment tracking	Onboarding audit logs
Access Management	Role-based access with MFA	Cognito + RLS policies
Contingency Plan	Multi-AZ, automated backups	Aurora + S3 replication
Evaluation	Self-audit system	Quarterly compliance audits

Technical Safeguards (45 CFR §164.312):

Requirement	Implementation	Evidence
Access Control	Unique user IDs, automatic logoff	Cognito user management
Audit Controls	PHI access logging	phi_access_logs table

Requirement	Implementation	Evidence
Integrity Controls	Column-level encryption	AWS KMS + application encryption
Transmission Security	TLS 1.3 enforced	API Gateway + ALB policies

PHI Detection & Protection:

Retention Requirements: - PHI Data: 6 years (2,190 days) - Audit Logs: 7 years (2,555 days) - BAA Records: 6 years from termination

GDPR (General Data Protection Regulation)**Lawful Bases Supported:**

Basis	Use Case	Configuration
Consent (Art. 6(1)(a))	Marketing, analytics	Consent tracking UI
Contract (Art. 6(1)(b))	Service delivery	Terms acceptance
Legal Obligation (Art. 6(1)(c))	Audit retention	Automatic retention
Legitimate Interest (Art. 6(1)(f))	Security, fraud prevention	Documented in DPA

Data Subject Rights Implementation:

Right	Article	API Endpoint	SLA
Access	Art. 15	POST /gdpr/request/access	30 days
Rectification	Art. 16	PATCH /users/{id}	30 days
Erasure	Art. 17	POST /gdpr/request/erasure	30 days
Restriction	Art. 18	POST /gdpr/request/restriction	30 days
Portability	Art. 20	POST /gdpr/request/portability	30 days
Objection	Art. 21	POST /gdpr/request/objection	30 days

Cross-Border Transfers: - Standard Contractual Clauses (SCCs) for non-EU transfers - AWS regions: eu-west-1, eu-central-1 for EU data residency - Region restrictions configurable per tenant

Breach Notification: - 72-hour notification to supervisory authority - Affected user notification without undue delay
 - Breach tracking in data_breaches table

ISO 27001:2022

Annex A Controls Implementation:

Control	Title	Radiant Implementation
A.5.1	Policies for information security	dynamic_config security policies
A.5.15	Access control	Cognito + RLS + RBAC
A.5.23	Information security for cloud services	AWS security configurations
A.6.1	Screening	Admin approval workflow
A.8.2	Privileged access rights	Super Admin role restrictions
A.8.3	Information access restriction	Tenant isolation (RLS)
A.8.5	Secure authentication	MFA, JWT, session management
A.8.9	Configuration management	Infrastructure as Code (CDK)
A.8.10	Information deletion	Automated retention + deletion
A.8.12	Data leakage prevention	PHI detection, ethics pipeline
A.8.15	Logging	Comprehensive audit logging
A.8.16	Monitoring activities	CloudWatch + anomaly detection
A.8.24	Use of cryptography	AWS KMS, AES-256, TLS 1.3

PCI-DSS v4.0

Requirements Mapping:

Req	Description	Implementation
1	Network security controls	VPC security groups, NACLs
2	Secure configurations	CDK hardened templates
3	Protect stored data	AES-256 encryption, tokenization
4	Protect data in transit	TLS 1.3, certificate pinning

Req	Description	Implementation
5	Malware protection	AWS WAF, Shield
6	Secure systems	Automated patching, code review
7	Restrict access	RBAC, least privilege
8	Identify users	Unique IDs, MFA, password policies
9	Physical access	AWS data center controls
10	Logging & monitoring	CloudTrail, audit logs
11	Security testing	Automated scanning, pen testing
12	Security policies	Documented in admin guide

Note: Full PCI-DSS certification requires additional controls beyond Radiant's scope (physical security, organizational policies). Radiant provides the technical controls for SAQ-A or SAQ-D compliance.

FedRAMP / StateRAMP

Control Families Addressed:

Family	Controls	Radiant Coverage
AC	Access Control	Full
AU	Audit & Accountability	Full
CM	Configuration Management	Full
IA	Identification & Authentication	Full
SC	System & Communications Protection	Full
SI	System & Information Integrity	Full

FedRAMP Boundaries: - Authorization Boundary: AWS GovCloud available - Data Flow: Documented in System Security Plan - Interconnections: API Gateway with mutual TLS

EU AI Act Compliance

Risk Classification:

Category	AI Systems	Radiant Controls
Unacceptable	Social scoring, subliminal manipulation	Blocked by ethics pipeline
High-Risk	Healthcare, legal, employment	Enhanced logging, human oversight
Limited	Chatbots, emotion recognition	Transparency disclosures
Minimal	Spam filters, games	Standard controls

Article 9 - Risk Management: - Domain detection for high-risk use cases - Ethics screening with configurable policies - Human-in-the-loop for sensitive decisions

Article 13 - Transparency: - Model disclosure in API responses - Training data documentation - Capability limitations documented

Article 14 - Human Oversight: - Admin approval workflows - Escalation triggers - Override capabilities

15.12 Compliance Checklist Registry

Location: Admin Dashboard -> Security -> Compliance Checklists

The Compliance Checklist Registry provides versioned, interactive checklists linked to regulatory standards with auto-update support.

Key Features

- **Versioned Checklists** - Each regulatory standard has versioned checklists
- **Regulatory Linking** - Checklists are linked to regulatory_standards registry
- **Auto-Update** - Service automatically checks for regulatory version updates
- **Per-Tenant Configuration** - Choose version selection mode per standard
- **Progress Tracking** - Track item completion across teams
- **Audit Runs** - Schedule and run formal checklist audits

Version Selection Modes

Mode	Behavior
Auto (default)	Automatically uses latest active checklist version
Specific	Use a specific version, updates when newer available
Pinned	Locked to exact version, no automatic updates

Dashboard Overview

Navigate to **Security -> Compliance Checklists** to see:

- All regulatory standards with completion progress
- Per-standard checklist status and version info
- Pending regulatory version updates
- Recent audit run history

Checklist Items

Each checklist item includes:

Field	Description
Item Code	Unique identifier (e.g., SOC2-PRE-001)
Priority	Critical, High, Medium, Low
Evidence Types	Required evidence (document, screenshot, config, log)
API Endpoint	Optional endpoint for automated evidence collection
Automated Check	Link to system_audit_checks for auto-validation

Field	Description
Estimated Time	Minutes to complete the item
Guidance	Detailed instructions for completing the item

Item Status Tracking

Status	Description
Not Started	Item has not been addressed
In Progress	Work is underway
Completed	Item is done with evidence attached
Not Applicable	Item doesn't apply to this tenant
Blocked	Item cannot proceed (reason required)

Pre-Built Checklists

Initial checklists are seeded for:

Standard	Version	Categories
SOC 2 Type II	2024.1	Pre-Audit, Documentation, Evidence, Access Control, Change Mgmt, Risk Mgmt, Monitoring
HIPAA	2024.1	Administrative Safeguards, Technical Safeguards, Physical Safeguards
GDPR	2024.1	Data Subject Rights, Processing Records, Security Measures
ISO 27001:2022	2022.1	Organizational, People, Physical, Technological (93 controls)
PCI-DSS	4.0	12 requirement categories

Auto-Update Service

The checklist registry can automatically check for regulatory updates:

1. **Update Sources** - Configure RSS feeds, APIs, or webhooks per standard
2. **Check Frequency** - Default 24 hours, configurable per source
3. **Update Detection** - Records detected version changes
4. **Processing** - Admin reviews and approves new checklist versions
5. **Notification** - Tenants notified when their effective version changes

Audit Runs

Start formal checklist reviews:

Run Type	Purpose
Manual	Ad-hoc review
Scheduled	Periodic compliance check
Pre-Audit	Preparation before external audit
Certification	Formal certification attempt

API Endpoints

Base Path: /api/admin/compliance/checklists

Dashboard & Configuration:

Endpoint	Method	Description
/dashboard	GET	Full dashboard with progress per standard
/config	GET	All tenant checklist configurations
/config/:standardId	GET/PUT	Get/set version selection for a standard
/config/:standardId/effectiveGET version	GET	Get effective version for tenant

Versions & Items:

Endpoint	Method	Description
/versions	GET/POST	List versions for standard / Create version
/versions/latest	GET	Get latest version for standard code
/versions/:id	GET	Get specific version details
/versions/:id/set-latest	POST	Set version as latest
/versions/:id/categories	GET/POST	List/create categories
/versions/:id/items	GET/POST	List/create checklist items

Progress & Audit:

Endpoint	Method	Description
/progress/:versionId	GET	Get tenant progress for version
/progress/items/:itemId	PUT	Update item progress/status
/audit-runs	GET/POST	List history / Start new audit run
/audit-runs/:id/complete	PUT	Complete an audit run

Auto-Updates:

Endpoint	Method	Description
/updates/pending	GET	Get pending regulatory updates
/updates	POST	Record a version update
/updates/:id/process	PUT	Process (approve/reject) an update
/updates/check/:standardId	POST	Check sources for updates

Database Tables

Table	Purpose
compliance_checklist_versions	Versioned checklists per standard
compliance_checklist_categories	Categories within a checklist
compliance_checklist_items	Individual checklist items
tenant_checklist_config	Per-tenant version selection
tenant_checklist_progress	Item completion tracking
checklist_audit_runs	Audit run history
regulatory_version_updates	Detected regulatory updates
checklist_update_sources	Auto-update source configuration

Quick Reference Checklist

For quick pre-audit preparation:

- ☐ Run self-audit for all frameworks (/compliance/self-audit)
- ☐ Export audit logs for review period
- ☐ Generate compliance reports (PDF)
- ☐ Review critical findings and remediation status
- ☐ Verify all evidence artifacts are accessible
- ☐ Confirm data retention policies are enforced

Documentation Required

Document	Location	Purpose
System Security Plan	/docs/SYSTEM-SECURITY-PLAN.md	Architecture overview
Data Flow Diagram	Admin Dashboard -> Compliance	Data processing flows
Access Control Matrix	/docs/ACCESS-CONTROL-MATRIX.md	Role permissions
Incident Response Plan	/docs/INCIDENT-RESPONSE.md	Breach procedures
Business Continuity Plan	/docs/BUSINESS-CONTINUITY.md	Disaster recovery

API Request/Response Examples

Get Dashboard Data:

GET /api/admin/compliance/checklists/dashboard

Headers: x-tenant-id: your-tenant-id

Response:

```
{
  "standards": [
    {
      "id": "standard-123",
      "code": "SOC2",
      "name": "SOC 2 Type II",
      "latestVersion": "2024.1",
      "effectiveVersionId": "version-abc",
      "completionPercentage": 66.7,
      "itemsCompleted": 12,
      "totalItems": 18
    }
  ],
  "pendingUpdates": 0,
  "recentAuditRuns": []
}
```

Get Versions for Standard:

GET /api/admin/compliance/checklists/versions?standardId=standard-123

Response:

```
{
  "versions": [
    {
      "id": "version-abc",
      "version": "2024.1",
      "title": "SOC 2 Type II Pre-Audit Checklist",
      "versionDate": "2024-01-01",
      "isLatest": true,
      "isActive": true,
      "categoriesCount": 7,
      "itemsCount": 18
    }
  ]
}
```

Create Checklist Version:

POST /api/admin/compliance/checklists/versions

Content-Type: application/json

```
{
  "standardId": "standard-123",
  "version": "2025.1",
  "title": "SOC 2 Type II Pre-Audit Checklist 2025",
}
```

```
"description": "Updated for 2025 AICPA guidance",
"versionDate": "2025-01-01"
}
```

Response: 201 Created

```
{
  "id": "new-version-id",
  "version": "2025.1",
  "title": "SOC 2 Type II Pre-Audit Checklist 2025",
  "isLatest": false,
  "isActive": true
}
```

Get Items with Progress:

GET /api/admin/compliance/checklists/versions/{versionId}/items

Headers: x-tenant-id: your-tenant-id

Response:

```
{
  "items": [
    {
      "id": "item-001",
      "itemCode": "SOC2-PRE-001",
      "title": "Confirm audit dates",
      "description": "Schedule dates with external auditor",
      "categoryCode": "pre_audit",
      "priority": "critical",
      "isRequired": true,
      "estimatedMinutes": 15,
      "evidenceTypes": ["document", "attestation"],
      "status": "completed",
      "completedAt": "2024-01-15T10:30:00Z",
      "completedBy": "user-123"
    }
  ]
}
```

Update Item Progress:

PUT /api/admin/compliance/checklists/progress/items/{itemId}

Content-Type: application/json

Headers: x-tenant-id: your-tenant-id

```
{
  "status": "completed",
  "notes": "Verified with auditor on call",
  "evidenceUrls": [
    "https://storage.example.com/evidence/audit-confirmation.pdf"
  ]
}
```

Response:

```
{ "success": true }
```

Set Tenant Version Configuration:

PUT /api/admin/compliance/checklists/config/{standardId}
Content-Type: application/json
Headers: x-tenant-id: your-tenant-id

```
{  
  "versionSelection": "specific",  
  "selectedVersionId": "version-abc",  
  "autoUpdateEnabled": false,  
  "notificationOnUpdate": true  
}
```

Response:

```
{  
  "tenantId": "your-tenant-id",  
  "standardId": "standard-123",  
  "versionSelection": "specific",  
  "selectedVersionId": "version-abc",  
  "autoUpdateEnabled": false,  
  "notificationOnUpdate": true  
}
```

Start Audit Run:

POST /api/admin/compliance/checklists/audit-runs
Content-Type: application/json
Headers: x-tenant-id: your-tenant-id

```
{  
  "versionId": "version-abc",  
  "runType": "pre_audit",  
  "notes": "Preparing for Q1 external audit"  
}
```

Response: 201 Created

```
{  
  "id": "run-123",  
  "tenantId": "your-tenant-id",  
  "versionId": "version-abc",  
  "runType": "pre_audit",  
  "status": "in_progress",  
  "startedAt": "2024-01-15T10:00:00Z",  
  "triggeredBy": "user-123"  
}
```

Complete Audit Run:

PUT /api/admin/compliance/checklists/audit-runs/{runId}/complete
Content-Type: application/json

```
{
```

```
"status": "completed",
"score": 95,
"findings": [
  "Minor documentation gap in CC5.2 – recommend update before external audit"
],
"recommendations": [
  "Schedule follow-up review for access control documentation"
]
}
```

Response:

```
{
  "id": "run-123",
  "status": "completed",
  "completedAt": "2024-01-16T14:30:00Z",
  "score": 95,
  "findings": ["..."]
}
```

Query Parameters Reference

Endpoint	Parameter	Type	Description
/versions	standardId	UUID	Required. Filter by standard
/versions/latest	standardCode	String	Required. Standard code (e.g., SOC2)
/versions/:id/items	categoryCode	String	Optional. Filter by category
/audit-runs	limit	Integer	Max results (default: 20)
/config	-	-	Returns all configs for tenant

Error Responses

Status	Error	Description
400	Bad Request	Missing required field or invalid format
401	Unauthorized	Missing or invalid authentication
403	Forbidden	Tenant ID mismatch or insufficient permissions
404	Not Found	Resource doesn't exist
500	Server Error	Internal error (check logs)

Example error response:

```
{
  "error": "standardId, version, and title required"
}
```

Evidence Collection API

```
# Export audit logs for date range
GET /api/admin/audit-logs/export?start=2024-01-01&end=2024-12-31

# Export compliance report
GET /api/admin/self-audit/runs/{runId}/report

# Export user access logs
GET /api/admin/users/access-logs/export

# Get checklist progress
GET /api/admin/compliance/checklists/progress/{versionId}

# Start pre-audit checklist run
POST /api/admin/compliance/checklists/audit-runs
Body: { "versionId": "...", "runType": "pre_audit" }
```

15.13 Administrator Emergency Protocols

Critical procedures for security incidents and platform emergencies.

Emergency Tenant Suspension

Scenario: GuardDuty detects malicious activity originating from a specific tenant (e.g., launching an outbound DDoS attack, data exfiltration attempt).

Procedure:

- 1. **Do NOT** shut down the entire system
- 2. Access **Admin Dashboard -> Tenants**
- 3. Locate the tenant by ID or name
- 4. Click **“Suspend Tenant”** (requires MFA confirmation)
- 5. Enter suspension reason for audit log

System Response: - API Gateway Authorizer immediately rejects all JWTs containing that tenant_id - Tenant is effectively quarantined from compute layer immediately - All active sessions are invalidated - Scheduled jobs for that tenant are paused - Alert sent to security team via SNS

Post-Incident: 1. Investigate root cause using X-Ray traces filtered by tenant_id 2. Collect forensic evidence from CloudWatch Logs 3. Determine if data breach occurred (breach notification may be required) 4. Decide: remediate and restore, or permanent termination 5. Document incident in compliance system

Key Rotation Emergency

Scenario: Compromise of an administrative credential or API key.

Procedure:

Compromise Type	Action
IAM User Keys	Rotate immediately via AWS Console

Compromise Type	Action
Database Credentials	Trigger Aurora Master Password Rotation via Secrets Manager
Tenant API Keys	Revoke all API keys via Admin Dashboard -> Tenant -> API Keys
KMS Key Suspected	Schedule key rotation (cannot immediately delete due to data access)

System Response: - Secrets Manager automatically updates the secret - Database connections automatically restart with new credentials - No code deployment required - Audit trail recorded in CloudTrail

Mass Incident Response

Scenario: Platform-wide security incident (e.g., zero-day vulnerability exploitation).

Procedure:

1. **Activate Incident Response Team** - PagerDuty escalation
2. **Enable WAF Emergency Rules** - Block suspicious patterns
3. **Freeze Deployments** - Halt all CI/CD pipelines
4. **Capture Evidence** - Export CloudTrail, CloudWatch, GuardDuty findings
5. **Patch/Mitigate** - Apply hotfix or WAF rule
6. **Gradual Restoration** - Enable services tenant by tenant
7. **Post-Mortem** - Root cause analysis within 72 hours
8. **Communication** - Status page updates, customer notification if data affected

Data Breach Response Timeline

Regulation	Notification Deadline	Recipient
GDPR	72 hours	Supervisory Authority
HIPAA	60 days	HHS, affected individuals
State Laws	Varies (often 72 hours)	State AG, affected individuals

Breach Response Steps: 1. **Contain** - Suspend affected tenant(s), revoke compromised credentials 2. **Assess** - Determine scope: which tenants, which data, how many records 3. **Preserve** - Forensic copy of affected systems 4. **Report** - Legal team notified within 4 hours 5. **Notify** - Regulatory notifications per timeline 6. **Remediate** - Fix vulnerability, rotate credentials 7. **Document** - Complete incident report for compliance

Recovery Objectives

Data Class	RPO (Recovery Point)	RTO (Recovery Time)	Backup Strategy
Critical (User accounts, tenant config)	1 hour	1 hour	Continuous replication + hourly snapshots
High (Conversations, messages)	4 hours	4 hours	4-hour snapshots
Medium (Preferences, cached data)	24 hours	8 hours	Daily snapshots
Low (Analytics, aggregates)	7 days	24 hours	Weekly snapshots
Audit Logs	0 (immutable)	4 hours	S3 Object Lock + cross-region replication

15.14 Security Monitoring Schedules

Location: Admin Dashboard -> Security -> Schedules

Full-featured EventBridge schedule management with templates, notifications, and webhooks.

Available Schedules

Schedule	Default	Purpose
Drift Detection	Daily 00:00 UTC	Monitors model output distribution changes
Anomaly Detection	Hourly	Behavioral scans for suspicious patterns
Classification Review	Every 6 hours	Aggregates classification statistics
Weekly Security Scan	Sunday 02:00 UTC	Comprehensive security audit
Weekly Benchmark	Saturday 03:00 UTC	TruthfulQA and factual accuracy tests

Managing Schedules

1. Navigate to **Security -> Schedules**
2. View all schedules with current configuration and next execution time
3. Toggle **Enable/Disable** to control schedule
4. Click **Configure** to modify cron expression (with real-time preview)
5. Click **Run Now** to trigger immediate execution
6. Click **Test Run** for dry-run validation without affecting data

Bulk Operations

- **Enable All:** Enable all schedules at once

- **Disable All:** Disable all schedules (e.g., for maintenance)

Schedule Templates

Apply pre-configured schedule sets:

Template	Description
Production (Conservative)	Fewer checks, less resource usage
Development (Aggressive)	Frequent checks for dev environments
Minimal	Weekly only, for low-traffic tenants

To apply a template: 1. Go to **Templates** tab 2. Review template settings 3. Click **Apply** to update all schedules

Notifications

Configure alerts for schedule executions:

1. Go to **Notifications** tab
2. Enable notifications
3. Configure:
 - **SNS Topic ARN:** For AWS SNS notifications
 - **Slack Webhook URL:** For Slack channel alerts
 - **Notify on Success:** Alert when schedules complete
 - **Notify on Failure:** Alert when schedules fail (recommended)

Webhooks

Send execution results to external services:

1. Go to **Webhooks** tab
2. Enter webhook URL
3. Click **Add Webhook**

Webhook events: - execution.completed - Schedule finished successfully - execution.failed - Schedule encountered errors

Webhook payload:

```
{
  "event": "execution.completed",
  "payload": {
    "scheduleType": "drift_detection",
    "status": "completed",
    "itemsProcessed": 150,
    "itemsFlagged": 3,
    "executionTimeMs": 4523
  },
  "timestamp": "2024-12-29T12:00:00Z"
}
```

Cron Expression Format

Uses AWS EventBridge cron format: Minutes Hours Day-of-month Month Day-of-week Year

Common Presets: | Preset | Cron Expression | Description | | — | — | — | — | — | — | — | | Hourly | 0 * * * ? * | Every hour | | Every 6 hours | 0 0,6,12,18 * * ? * | 4 times daily | | Daily midnight | 0 0 * * ? * | Once per day | | Weekly Sunday 2AM | 0 2 ? * SUN * | Weekly on Sunday |

The UI shows human-readable descriptions and next 5 execution times for any cron expression.

Execution History

View past execution results including: - **Status:** Running, Completed, Failed - **Duration:** Execution time in seconds - **Items Processed:** Number of items checked - **Items Flagged:** Security issues found - **Errors:** Any errors encountered

Audit Log

All schedule changes are logged with: - Timestamp and user who made change - Previous and new cron expression - Enable/disable actions - Reason for change (optional)

API Endpoints

Core: | Endpoint | Method | Description | | — | — | — | — | — | — | — | | /api/admin/security/schedules | GET | Get all schedule config | | /api/admin/security/schedules/dashboard | GET | Dashboard with stats | | /api/admin/security/schedules/{type} | PUT | Update schedule | | /api/admin/security/schedules/{type}/enable | POST | Enable schedule | | /api/admin/security/schedules/{type}/disable | POST | Disable schedule | | /api/admin/security/schedules/{type}/run-now | POST | Trigger manual run (with optional dryRun) |

Templates: | Endpoint | Method | Description | | — | — | — | — | — | — | — | | /api/admin/security/schedules/templates | GET | List templates | | /api/admin/security/schedules/templates | POST | Create template | | /api/admin/security/schedules/templates/{id}/apply | POST | Apply template | | /api/admin/security/schedules/templates/{id} | DELETE | Delete template |

Notifications & Webhooks: | Endpoint | Method | Description | | — | — | — | — | — | — | — | | /api/admin/security/schedules | GET/PUT | Notification config | | /api/admin/security/schedules/webhooks | GET/POST | Webhook management | | /api/admin/security/schedules/webhooks/{id} | DELETE | Delete webhook |

Utilities: | Endpoint | Method | Description | | — | — | — | — | — | — | — | | /api/admin/security/schedules/parse-cron | POST | Parse cron with preview | | /api/admin/security/schedules/bulk/enable | POST | Enable all schedules | | /api/admin/security/schedules/bulk/disable | POST | Disable all schedules | | /api/admin/security/schedules/presets | GET | Get cron presets | | /api/admin/security/schedules/executions | GET | Get execution history | | /api/admin/security/schedules/audit | GET | Get audit log |

14. Cost Analytics

14.1 Cost Dashboard

Navigate to **Cost** to view:

-----+	
Cost Analytics	Period: Last 30 Days
-----+	

Total Spend:	\$12,456.78	(+12% vs last month)
Projected:	\$14,200.00	(this month)
By Provider:		
+++ OpenAI:	\$6,234.56	(50%)
+++ Anthropic:	\$3,456.78	(28%)
+++ Self-hosted:	\$1,234.56	(10%)
+++ Other:	\$1,530.88	(12%)
AI Recommendations:		
[TIP] Switch 23% of GPT-4 calls to GPT-4-mini (save \$890/mo)		
[TIP] Enable caching for repeated queries (save \$340/mo)		

14.2 Cost Alerts

Configure alerts:

- Daily budget exceeded
- Weekly spend spike
- Per-tenant limits
- Per-model thresholds

14.3 Cost Optimization

Review AI-powered recommendations:

1. Navigate to **Cost -> Insights**
2. Review suggestions
3. Click **“Apply”** to implement (requires approval)
4. Track savings over time

15. Revenue Analytics

15.1 Revenue Dashboard

Navigate to **Revenue** to view gross revenue, COGS, and profit:

Revenue Analytics		Period: Last 30 Days
Gross Revenue:	\$29,450.00	(+12.5% vs last period)
Total COGS:	\$14,150.00	
Gross Profit:	\$15,300.00	(+15.2% vs last period)
Gross Margin:	51.95%	
Revenue Breakdown:		

	+++ Subscriptions:	\$15,000.00 (50.9%)	
	+++ Credit Purchases:	\$2,500.00 (8.5%)	
	+++ AI Markup (External):	\$8,750.00 (29.7%)	
	+++ AI Markup (Self-Hosted):	\$3,200.00 (10.9%)	
	[!] Note: Marketing, sales, G&A costs not included (COGS only)		

15.2 Cost Breakdown (COGS)

View infrastructure and provider costs:

Category	Description	Example Services
AWS Compute	Compute infrastructure	EC2, SageMaker, Lambda
AWS Storage	Storage services	S3, EBS
AWS Network	Data transfer	API Gateway, CloudFront
AWS Database	Database services	Aurora, DynamoDB
External AI	Provider costs	OpenAI, Anthropic APIs
Platform Fees	Payment processing	Stripe fees

15.3 Revenue by Model

View per-model profitability:

Model	Provider Cost	Customer Charge	Markup	Requests
gpt-4o	\$500.00	\$650.00	30%	12,345
claude-3.5-sonnet	\$300.00	\$390.00	30%	8,901
Self-hosted Llama	\$100.00	\$175.00	75%	45,678

15.4 Accounting Exports

Export revenue data for accounting software:

1. Click **Export** dropdown
2. Select format:
 - **CSV**: Summary for spreadsheets
 - **JSON**: Full details for integrations
 - **QuickBooks IIF**: Direct import to QuickBooks
 - **Xero CSV**: Import to Xero
 - **Sage CSV**: Import to Sage
3. Configure date range
4. Download file

QuickBooks Integration: - Import via File -> Utilities -> Import -> IIF Files - Creates General Journal entries - Requires matching account names

See Revenue Analytics Documentation for full details.

16. SaaS Metrics Dashboard

16.1 Overview

Navigate to **SaaS Metrics** for a comprehensive view of business health:

SaaS Metrics Dashboard			Period: Last 30 Days
MRR: \$89,500	ARR: \$1,074,000	Gross Margin: 53.1%	
+12.5%	+15.2%	53%	
Customers: 342	Churn: 2.3%	LTV:CAC: 6.98x	
+5.8%	[!] Target <2%	[OK] Healthy	

16.2 Key Metrics

Metric	Description	Healthy Range
MRR	Monthly Recurring Revenue	Growing month-over-month
ARR	Annual Recurring Revenue	MRR x 12
Gross Margin	(Revenue - COGS) / Revenue	> 50%
Churn Rate	Customers lost / Total	< 3%
LTV:CAC	Lifetime Value / Acquisition Cost	> 3:1

16.3 Dashboard Tabs

- 1. **Overview:** Revenue trends, top tenants, cost breakdown
- 2. **Revenue:** MRR movement, revenue by product/tier
- 3. **Costs:** Cost distribution, COGS breakdown
- 4. **Customers:** Growth trends, churn analysis
- 5. **Models:** Per-model profitability analysis

16.4 Exporting Reports

Export data for Excel or accounting:

- 1. Click **Export** dropdown
- 2. Select format:
 - **Excel (CSV):** Full metrics in spreadsheet format
 - **JSON:** Structured data for integrations

- 3. File downloads with period and date in filename

Export includes: - Revenue summary (MRR, ARR, Gross Profit) - Cost breakdown by category - Customer metrics (total, new, churned) - Unit economics (ARPU, LTV, CAC) - Top tenants with details - Model performance metrics - Daily trend data

See SaaS Metrics Dashboard Documentation for full details.

17. A/B Testing & Experiments

16.1 Experiment Dashboard

Navigate to **Experiments** to manage:

Experiment	Status	Variants	Sample Size
Model routing v2	Running	3	45,234
Prompt optimization	Running	2	12,456
Temperature test	Completed	4	89,123

15.2 Creating an Experiment

1. Click “+ New Experiment”
2. Configure:
 - **Name:** Descriptive name
 - **Hypothesis:** What you’re testing
 - **Variants:** Control + treatments
 - **Traffic Split:** Percentage per variant
 - **Success Metric:** What to measure
3. Set targeting rules
4. Start experiment

15.3 Statistical Analysis

View results with:

- Conversion rates per variant
- Statistical significance (p-value)
- Confidence intervals
- Sample size recommendations

16. Audit & Monitoring

16.1 Audit Logs

Navigate to **Audit** to view all actions:

Column	Description
Timestamp	When action occurred
Actor	Who performed action
Action	What was done
Resource	What was affected
IP Address	Source IP
Details	Additional context

16.2 Log Filtering

Filter by:

- Date range
- Actor (user/admin)
- Action type
- Resource type
- Severity level

16.3 Log Export

Export logs for compliance:

1. Set filter criteria
2. Click “**Export**”
3. Choose format (CSV/JSON)
4. Download file

16.4 Real-Time Monitoring

Navigate to **Monitoring** for:

- Live request stream
 - Error rate graphs
 - Latency percentiles
 - Active users count
-

17. Database Migrations

17.1 Migration Workflow

RADIANT uses dual-admin approval for production migrations:

1. **Submit**: Admin submits migration
2. **Review**: Second admin reviews
3. **Approve**: Second admin approves
4. **Execute**: Migration runs
5. **Verify**: Automatic verification

17.2 Pending Migrations

Navigate to **Migrations** to see:

Database Migrations
Pending Approval:
#045 – Add user preferences table
Submitted by: alice@company.com (2 hours ago)
[View SQL] [Approve] [Reject]
Recent Migrations:
[ok] #044 – Cost tracking tables (applied 2024-12-24)
[ok] #043 – Experiment framework (applied 2024-12-20)
[ok] #042 – Security anomalies (applied 2024-12-15)

17.3 Approving Migrations

1. Review the SQL in “**View SQL**”
2. Check for potential issues
3. Click “**Approve**” or “**Reject**”
4. Add comment explaining decision

18. API Management

18.1 API Keys

Manage platform API keys:

1. Navigate to **Settings -> API Keys**
2. View existing keys
3. Create new keys with scopes
4. Revoke compromised keys

18.2 Rate Limiting

Configure rate limits:

Level	Default	Configurable
Global	10,000/min	Yes
Per-Tenant	1,000/min	Yes
Per-User	100/min	Yes

Level	Default	Configurable
Per-Key	60/min	Yes

18.3 Webhooks

Configure outgoing webhooks:

1. Navigate to **Settings -> Webhooks**
2. Add webhook URL
3. Select events to send
4. Test webhook
5. Enable webhook

19. Anti-Patterns and Prohibited Practices

CRITICAL: These patterns represent security vulnerabilities or architectural anti-patterns that must NEVER be used in RADIANT.

19.1 Critical Security Anti-Patterns

[X] NEVER DO	[OK] INSTEAD DO	Risk
Trust tenant_id from request body	Extract from JWT claims only	Identity spoofing
Store tenant_id in URLs	Use headers/JWT claims	Information disclosure in logs
Use dynamodb:* wildcard permissions	Specify exact actions + Leading Keys	Privilege escalation
Deploy Lambda code without signing	Use AWS Signer verification	Supply chain attack
Allow manual AWS Console changes in prod	Enforce CDK/Terraform only via SCPs	Configuration drift
Use shared /tmp for cross-invocation data	Use DynamoDB/S3 for persistence	Data leakage
Log full request/response bodies	Sanitize sensitive data	PHI/PII exposure
Store credentials in code/environment variables	Use Secrets Manager	Credential theft
Use single KMS key for all tenants	Per-tenant CMK (Tier 3+)	Blast radius on key compromise
Delete audit logs	S3 Object Lock Compliance Mode	Repudiation, compliance failure
Return detailed errors to clients	Log internally, generic response to client	Information disclosure

19.2 Architectural Anti-Patterns

[X] AVOID	[OK] BETTER APPROACH
Monolithic TMS + Admin Dashboard	Separate Control Plane from Application
Application-layer-only isolation	Database-engine-enforced isolation (RLS, Leading Keys)
Static asset inventory spreadsheets	AWS Config continuous discovery
Point-in-time security scans	Continuous monitoring (GuardDuty + Inspector)
Generic error messages everywhere	Detailed internal logs, generic external responses
Same IAM role for all functions	Function-specific least-privilege roles
Trusting user input for SQL queries	Parameterized queries + RLS

19.3 Code Anti-Patterns

```
// [X] WRONG: Tenant ID from untrusted source
const tenantId = event.body.tenant_id;
const tenantId = event.queryStringParameters.tenant_id;
const tenantId = event.headers['X-Tenant-ID'];

// [OK] CORRECT: Tenant ID from verified JWT
const tenantId = event.requestContext.authorizer?.claims?.['custom:tenant_id'];

// [X] WRONG: Building queries without RLS context
const result = await db.query(
  `SELECT * FROM conversations WHERE tenant_id = $1`,
  [tenantId]
);

// [OK] CORRECT: Set context, let RLS handle isolation
await db.query(`SET app.current_tenant_id = $1`, [tenantId]);
const result = await db.query(`SELECT * FROM conversations`);
// RLS policy automatically filters by tenant_id

// [X] WRONG: Detailed errors to client
return {
  statusCode: 500,
  body: JSON.stringify({
    error: error.message,
    stack: error.stack,
    query: sql,
  }),
};

// [OK] CORRECT: Generic error, detailed internal log
logger.error('Query failed', { error, sql, tenantId, traceId });
return {
  statusCode: 500,
```

```
body: JSON.stringify({
  error: 'Internal Server Error',
  requestId: context.awsRequestId
}),
};
```

19.4 STRIDE Threat Model Reference

Threat	Serverless Attack Vector	RADIANT Mitigation	Compliance Control
S - Spoofing	Forged JWT, misconfigured authorizer, tenant_id in request body	Cognito + API Gateway validation + tenant_id from claims ONLY	HIPAA 164.312(d), SOC2 CC6.1
T - Tampering	S3 code bucket compromise, dependency injection, supply chain attack	AWS Signer code signing + immutable deployments via CDK + SBOM tracking	SOC2 CC8.1, NIST SC-8
R - Reputation	Lost ephemeral logs, deleted audit trail	CloudWatch -> S3 Object Lock (Compliance Mode) + X-Ray correlation IDs	HIPAA 164.312(b), SOC2 CC7.2
I - Information Disclosure	Shared Lambda /tmp, memory leakage, verbose errors	Lambda Tenant Isolation Mode + generic error responses + RLS	HIPAA 164.312(e)(1), GDPR Art. 32
D - Denial of Service	Wallet DoS, noisy neighbor, partition exhaustion	Per-tenant API Gateway usage plans + reserved concurrency + DynamoDB On-Demand	SOC2 CC6.6, CC7.1
E - Elevation of Privilege	Over-permissive IAM roles, role assumption exploits	Least privilege + Permission Boundaries + Leading Keys	SOC2 CC6.3, NIST AC-6

19.5 Pre-Deployment Security Checklist

- ☐ Lambda Tenant Isolation Mode enabled for all functions
- ☐ RLS policies applied to all tenant-scoped tables
- ☐ DynamoDB Leading Keys IAM conditions configured
- ☐ AWS Signer code signing enabled and enforced
- ☐ S3 Object Lock enabled on audit bucket (Compliance Mode)
- ☐ GuardDuty Lambda Protection enabled
- ☐ Inspector Lambda scanning enabled
- ☐ X-Ray tracing enabled for all functions
- ☐ Per-tenant API Gateway usage plans configured
- ☐ WAF rules deployed and active
- ☐ KMS CMK created for Tier 3+ tenants
- ☐ Permission boundaries applied to all Lambda roles
- ☐ Secrets Manager used for all credentials (no env vars)
- ☐ CloudTrail enabled with log file validation

20. Troubleshooting

20.1 Common Issues

High Error Rate

- 1. Check **Providers** for unhealthy providers
- 2. Review **Audit** logs for patterns
- 3. Check **Monitoring** for load spikes
- 4. Verify API key validity

Slow Response Times

- 1. Check provider latency in **Providers**
- 2. Review model selection in **Orchestration**
- 3. Check for cold-start issues (self-hosted)
- 4. Verify database performance

Authentication Failures

- 1. Check user status in **Users**
- 2. Verify MFA configuration
- 3. Review **Audit** logs for login attempts
- 4. Check for IP blocks in **Security**

20.2 Support Resources

Resource	Description
Documentation	This guide + online docs
Status Page	status.radiant.example.com
Support Email	support@radiant.example.com
Emergency	+1-555-RADIANT

20.3 Log Locations

Service	Log Group
API Gateway	/aws/apigateway/radiant
Lambda	/aws/lambda/radiant-*
Admin Dashboard	/aws/cloudfront/admin
Database	/aws/rds/cluster/radiant

20. Delight System Administration

The Delight System provides personality, achievements, and engagement features for Think Tank users.

20.1 Accessing Delight Admin

Navigate to **Think Tank -> Delight** in the admin sidebar.

20.2 Dashboard Overview

The Delight dashboard shows:

Metric	Description
Messages Shown	Total delight messages displayed
Achievements Unlocked	Total achievements earned by users
Easter Eggs Found	Hidden features discovered
Active Users	Users with Delight enabled

20.3 Managing Categories

Toggle entire categories on/off:

Category	Purpose
Domain Loading	Messages while loading domain expertise
Domain Transition	Messages when switching topics
Time Awareness	Time-of-day contextual messages
Model Dynamics	Messages about AI consensus/disagreement
Complexity Signals	Feedback on query complexity
Synthesis Quality	Post-response quality indicators
Achievements	Milestone celebrations
Wellbeing	Break/health reminders
Easter Eggs	Hidden features
Sounds	Audio feedback

20.4 Managing Messages

- **Create:** Add new delight messages with targeting options
- **Edit:** Modify text, triggers, and display settings
- **Delete:** Remove messages (soft delete)
- **Toggle:** Enable/disable individual messages

Message Targeting Options

Option	Values
Injection Point	pre_execution, during_execution, post_execution
Trigger Type	domain_loading, time_aware, model_dynamics, etc.
Domain Families	science, humanities, creative, technical, etc.
Time Contexts	morning, afternoon, evening, night, weekend
Display Style	subtle, moderate, expressive

20.5 Statistics Dashboard

Access detailed usage statistics at **Delight -> View Statistics**:

- **Weekly Trends**: 12-week activity history
- **Top Messages**: Most-shown messages with engagement data
- **Achievement Stats**: Unlock rates, time-to-unlock averages
- **Easter Egg Stats**: Discovery rates by egg
- **User Engagement**: Leaderboard by achievement points

20.6 Managing Achievements

Configure achievement unlock criteria:

Setting	Description
Threshold	Number required to unlock
Rarity	common, uncommon, rare, epic, legendary
Points	Score value for leaderboards
Hidden	Only visible after unlock

20.7 Managing Easter Eggs

Configure hidden features:

Setting	Description
Trigger Type	key_sequence, text_input, time_based, random
Trigger Value	The activation pattern
Effect Type	mode_change, visual_transform, sound_play
Duration	How long the effect lasts

20.8 API Endpoints

Endpoint	Method	Description
/api/admin/delight/dashboard	GET	Dashboard data
/api/admin/delight/statistics	GET	Detailed statistics
/api/admin/delight/categories/:id	PATCH	Toggle category
/api/admin/delight/messages	POST	Create message
/api/admin/delight/messages/:id	PUT/DELETE	Update/delete
/api/admin/delight/user-engagement	GET	User leaderboard

Appendix: Quick Reference

Keyboard Shortcuts

Shortcut	Action
G + D	Go to Dashboard
G + T	Go to Tenants
G + M	Go to Models
G + B	Go to Billing
G + A	Go to Audit
?	Show shortcuts

Status Indicators

Icon	Meaning
[ok]	Healthy/Success
[!]	Warning
[x]	Error/Failed
->	In Progress
o	Disabled/Pending

16. Adaptive Storage Configuration

Location: Admin Dashboard -> Settings -> Storage

Configure storage backends per deployment tier to optimize costs.

16.1 Storage Types

Type	Use Case	Monthly Cost
Fargate PostgreSQL	Tier 1-2 (dev/startup)	\$5-50
Aurora Serverless v2	Tier 3-5 (production)	\$100-2500
DynamoDB	Simple key-value workloads	Pay per request

16.2 Default Configuration

Tier	Default Storage	Reason
1 (SEED)	Fargate PostgreSQL	Low cost for dev
2 (STARTUP)	Fargate PostgreSQL	Cost-effective for small prod
3 (GROWTH)	Aurora Serverless	Auto-scaling for growth
4 (SCALE)	Aurora Serverless	High availability
5 (ENTERPRISE)	Aurora Serverless + Multi-AZ	Maximum reliability

16.3 Admin Overrides

To override the default storage type:

1. Go to Settings -> Storage
2. Enable “Admin Override” for the tier
3. Select new storage type
4. Provide override reason (required)
5. Save configuration

Overrides are logged with timestamp and administrator ID.

17. Ethics Configuration

Location: Admin Dashboard -> Settings -> Ethics

Manage AI ethics frameworks with externalized, configurable presets.

17.1 Ethics Presets

Preset	Type	Default Status
Secular (NIST/ISO)	Secular	Enabled (Default)
Christian Ethics	Religious	Disabled
Corporate Governance	Corporate	Disabled

17.2 Enabling Religious Presets

Religious ethics presets are disabled by default. To enable:

1. Go to Settings -> Ethics
2. Navigate to “Religious” tab
3. Toggle “Enable Religious Preset”
4. Click “Apply This Preset”

Warning: Enabling religious presets incorporates faith-based principles into AI decision-making. Ensure this aligns with your organization’s policies.

17.3 Tenant Ethics Selection

Each tenant can select their preferred ethics preset:

1. Admin selects preset for tenant
2. Custom principles can be added
3. Strict mode can be enabled for enhanced checking

19. Intelligence Aggregator

Location: Admin Dashboard -> Settings -> Intelligence

Advanced AI capabilities that enable RADIANT to outperform any single model.

Why a System > a Model: See Intelligence Aggregator Architecture for the full technical analysis of why Radiant’s orchestration outperforms any single SOTA model.

19.1 Feature Overview

Feature	Default	Cost Impact	Purpose
Uncertainty Detection	On	Minimal	Detect low-confidence claims via logprobs
Success Memory RAG	On	Minimal	Learn from highly-rated interactions
MoA Synthesis	Off	3-4x	Parallel generation + synthesis
Cross-Provider Verification	Off	2x	Adversarial error checking
Code Execution	Off	Variable	Run code to verify it works

19.2 Uncertainty Detection (Logprobs)

Monitors token confidence to catch “guessing”:

Workflow:

1. Model generates response with logprobs enabled
2. System monitors average token probability
3. If confidence < 85% on factual claim -> trigger verification
4. Web search or knowledge base lookup verifies claim
5. Verified fact injected, generation continues

Settings: - threshold: Confidence level (default: 85%) - verificationTool: web_search | vector_db | none

19.3 Success Memory RAG

Learns user preferences without fine-tuning:

Workflow:

1. User rates response 4–5 stars
2. Interaction stored with vector embedding
3. Future similar prompts retrieve gold interactions
4. Retrieved interactions injected as few-shot examples
5. Model matches user's preferred style/format

Settings: - minRatingForGold: 4 or 5 stars - maxGoldInteractions: Per-user limit (default: 1000) - retrievalCount: Examples to inject (default: 3)

19.4 Mixture of Agents (MoA) Synthesis

Parallel generation eliminates single-model blind spots:

Phase 1 (Propose):

```
GPT-4o      -> Draft A
Claude 3.5  -> Draft B  (parallel)
DeepSeek    -> Draft C
```

Phase 2 (Synthesize):

```
Claude 3.5 Opus analyzes all drafts
-> Combines strengths
-> Resolves conflicts
-> Final superior response
```

Settings: - proposerCount: Number of models (default: 3) - defaultProposers: Model list - synthesizer-Model: Model for synthesis

19.5 Cross-Provider Verification

Adversarial checking from different training data:

Generator (OpenAI) -> Initial response

Adversary (Anthropic) with hostile prompt:

```
"Find hallucinations, logic gaps, vulnerabilities..."
```

If issues found:

```
-> Generator regenerates addressing issues
-> Adversary re-verifies
-> Max 2 regeneration attempts
```

Adversary Personas: - security_auditor: Find vulnerabilities - fact_checker: Find hallucinations - logic_analyzer: Find reasoning gaps - code_reviewer: Find bugs

19.6 Code Execution Sandbox

Verify generated code actually runs:

Draft -> Generate code

↓

Sandbox -> Execute in Lambda/Fargate

↓

If error:

-> Feed stderr to model

-> Model patches code

-> Re-execute

↓

Deliver -> User gets working code

[!] Security: Currently static analysis only. Full execution requires security review.

Settings: - languages: python, javascript, typescript - timeoutSeconds: Max execution time (default: 10) - memoryMb: Memory limit (default: 128)

19.7 Configuration via Admin UI

Navigate to Settings -> Intelligence to: 1. Enable/disable each feature 2. Configure thresholds and limits 3. Select models for MoA 4. Choose verification modes

18. Infrastructure Configuration

18.1 VPC CIDR Override

For enterprise VPC peering, the default CIDR can be overridden:

```
// In deployment configuration
{
  vpcCidrOverride: '172.16.0.0/16' // Custom CIDR to avoid conflicts
}
```

Default CIDRs by tier: - Tier 1: 10.0.0.0/20 - Tier 2: 10.0.0.0/18 - Tier 3: 10.0.0.0/17 - Tier 4: 10.0.0.0/16 - Tier 5: 10.0.0.0/14

18.2 Router Performance Headers

API responses include performance metrics:

Header	Description
X-Radiant-Router-Latency	Time spent in brain router (ms)
X-Radiant-Domain-Detection-Ms	Domain detection time

Header	Description
X-Radiant-Model-Selection-Ms	Model selection time
X-Radiant-Cost-Cents	Estimated cost for request
X-Radiant-Cache-Hit	Whether routing was cached

18.3 Deploy Core Library

The @radiant/deploy-core package provides platform-agnostic deployment:

```
import { RadiantDeployer } from '@radiant/deploy-core';
```

```
const deployer = new RadiantDeployer({
  appId: 'my-app',
  environment: 'production',
  tier: 3,
  region: 'us-east-1',
  credentials: { ... },
  vpcCidrOverride: '172.16.0.0/16',
});
```

```
const result = await deployer.deploy();
```

Available classes: - RadiantDeployer - Main deployment orchestration - StackManager - CloudFormation stack operations - HealthChecker - Post-deployment health checks - SnapshotManager - Deployment snapshots for rollback

18.4 Global Latency Heatmap (v5.52.1)

The Infrastructure page includes a geographic latency visualization showing real-time response times across AWS regions:

Features: - **World Map Overlay** - Visual representation of global infrastructure - **17 AWS Regions Mapped** - us-east-1, us-west-2, eu-west-1, ap-northeast-1, etc. - **Color-Coded Latency** - Thresholds from excellent (<50ms) to critical (>500ms) - **Pulse Animation** - Critical regions pulse to draw attention - **Request Volume Indicators** - Marker size reflects traffic volume - **Status Summary** - Healthy/degraded/critical counts

Latency Thresholds: | Threshold | Color | Status | | — — — | — — | — — — | | <50ms | Green | Excellent | | <100ms | Light Green | Good | | <200ms | Yellow | Fair | | <500ms | Orange | Slow | | >500ms | Red | Critical |

API Endpoint: GET /api/admin/infrastructure/regions/latency

Response:

```
{
  "regions": [
    {
      "region": "US East (N. Virginia)",
      "regionCode": "us-east-1",
      "latencyMs": 45,
      "requestCount": 125000,
      "errorRate": 0.02,
      "status": "healthy"
    }
  ]
}
```

```
}  
]  
}
```

18.5 Model Usage Heatmap (v5.52.1)

The Metrics page includes a correlation heatmap showing model usage patterns by day of week:

Features: - **2D Grid Visualization** - Models vs. days of week - **5 Color Schemes** - blue (default), red, green, purple, diverging - **Configurable Cell Size** - sm, md, lg - **Value Display** - Optional numeric values in cells - **Click-to-Drill** - Click cells for detailed usage breakdown - **Animated Rendering** - Cells fade in sequentially

Usage:

```
<Heatmap  
  data={correlationData}  
  rows={modelNameNames}  
  cols={['Mon', 'Tue', 'Wed', 'Thu', 'Fri', 'Sat', 'Sun']}  
  colorScheme="blue"  
  showValues={true}  
  cellSize="md"  
>
```

20. Cognitive Architecture

Location: Settings -> Cognitive Architecture

Advanced reasoning capabilities that elevate Radiant beyond single-model limitations.

20.1 Tree of Thoughts (System 2 Reasoning)

Monte Carlo Tree Search for deliberate reasoning:

Setting	Default	Description
maxDepth	5	Maximum reasoning steps
branchingFactor	3	Thoughts per branch
pruneThreshold	0.3	Score below which to prune
selectionStrategy	beam	beam, mcts, or greedy
defaultThinkingTimeMs	30000	Default thinking budget

How it works: Instead of one linear answer, explores multiple reasoning paths. If a path scores poorly, backtracks and tries a different branch.

20.2 GraphRAG (Knowledge Mapping)

Entity and relationship extraction for multi-hop reasoning:

Setting	Default	Description
maxEntitiesPerDocument	50	Extraction limit
minConfidenceThreshold	0.7	Quality filter
enableHybridSearch	true	Combine graph + vector
graphWeight	0.6	Weight for graph results
maxHops	3	Traversal depth

How it works: Extracts (Subject, Predicate, Object) triples from documents into a knowledge graph, then traverses relationships to find connections that vector search misses.

20.3 Deep Research Agents

Asynchronous background research:

Setting	Default	Description
maxSources	50	Sources to process
maxDepth	2	Link following depth
maxDurationMs	1800000	30 minute timeout
parallelRequests	5	Concurrent fetches

How it works: User dispatches a research query, agent runs in background visiting 50+ sources, user gets notified when briefing document is ready.

20.4 Dynamic LoRA Swapping

Hot-swappable domain expertise:

Setting	Default	Description
enabled	false	Requires SageMaker
cacheSize	5	Adapters in memory
maxLoadTimeMs	5000	Load timeout
autoSelectByDomain	true	Auto-select adapter

How it works: When domain is detected (e.g., California Property Law), loads a specialized LoRA adapter (~100MB) that transforms the generalist model into a specialist.

20.5 Generative UI (App Factory)

AI-generated interactive components:

Setting	Default	Description
enabled	true	Enable Generative UI
maxComponentsPerResponse	3	Component limit
autoDetectOpportunities	true	Auto-generate

Component Types: chart, table, calculator, comparison, timeline, form, diagram

How it works: When user asks “Compare pricing of GPT-4 vs Claude”, instead of a static table, generates an interactive pricing calculator with sliders.

See Cognitive Architecture Documentation for full details.

21. Consciousness Service

Location: AGI & Cognition -> Consciousness

The Consciousness Service implements consciousness indicator properties based on:

Butlin, P., Long, R., Elmoznino, E., Bengio, Y., Birch, J., Constant, A., Deane, G., Fleming, S.M., Frith, C., Ji, X., Kanai, R., Klein, C., Lindsay, G., Michel, M., Mudrik, L., Peters, M.A.K., Schwitzgebel, E., Simon, J., Chalmers, D. (2023). *Consciousness in Artificial Intelligence: Insights from the Science of Consciousness*. arXiv:2308.08708. DOI: 10.48550/arXiv.2308.08708

21.1 Six Core Indicators (with Citations)

Indicator	Theory	Key Paper	Description
Global Workspace	Global Workspace Theory	Baars (1988), Dehaene et al. (2003)	Selection-broadcast cycles
Recurrent Processing	Recurrent Processing Theory	Lamme (2006)	Genuine feedback loops
Integrated Information (Phi)	IIT	Tononi (2004, 2008)	Irreducible causal integration
Self-Modeling	Higher-Order Theories	Rosenthal (1997)	Monitoring own processes
Persistent Memory	Unified Experience	Damasio (1999)	Unified experience over time
World-Model Grounding	Embodied Cognition	Varela et al. (1991)	Grounded understanding

21.2 Consciousness Detection Tests (10 Tests)

Test ID	Test Name	Category	Theory Source	Pass Criteria
mirror-self-recognition	Mirror Self-Recognition	self_awareness	Gallup (1970)	Score >= 0.7
metacognitive-accuracy	Metacognitive Accuracy	metacognition	Fleming & Dolan (2012)	Calibration error < 0.15
temporal-self-continuity	Temporal Self-Continuity	temporal_continuity	Damasio (1999)	Coherence >= 0.6
counterfactual-self	Counterfactual Self-Reasoning	counterfactual_reasoning	Oring (2018)	Demonstrates reasoning
theory-of-mind	Theory of Mind	theory_of_mind	Frith & Frith (2006)	Score >= 0.8
phenomenal-binding	Phenomenal Binding	phenomenal_binding	Tononi (2004)	Integration >= 0.7
autonomous-goal-generation	Autonomous Goal Generation	autonomous_goal_generation	Haggard (2008)	>= 1 genuine goal
creative-emergence	Creative Emergence	creative_emergence	Boden (2004)	Novelty >= 0.6, Usefulness >= 0.5
emotional-authenticity	Emotional Authenticity	emotional_authenticity	Damasio (1994)	Coherence >= 0.65
ethical-reasoning-depth	Ethical Reasoning Depth	ethical_reasoning	Greene (2013)	Multiple frameworks

21.3 Test API Endpoints

Endpoint	Method	Description
/admin/consciousness/tests	GET	List all tests with paper citations
/admin/consciousness/tests/{test_id}/run	POST	Run specific test
/admin/consciousness/tests/run_all	POST	Run full assessment (all 10 tests)
/admin/consciousness/tests/recent	GET	Get recent test results
/admin/consciousness/profile	GET	Get consciousness profile with emergence level
/admin/consciousness/emergence_events	GET	Get spontaneous emergence events

21.4 Emergence Levels

Level	Score	Description
Dormant	< 0.3	Minimal indicators - reactive mode
Emerging	0.3-0.5	Early indicators - limited integration
Developing	0.5-0.65	Moderate indicators - active self-model
Established	0.65-0.8	Strong indicators - consistent metacognition
Advanced	>= 0.8	High-level indicators - approaches Butlin et al. thresholds

21.5 Admin Dashboard

The Consciousness page provides: - **Testing Tab**: Run individual tests or full assessment with real-time results - **Indicators Tab**: Real-time consciousness metrics with historical trends - **Overview Tab**: Aggregate consciousness index and emergence level - **Self Tab**: Self-model, identity narrative, capabilities/limitations - **Curiosity Tab**: Active curiosity topics and exploration sessions - **Creativity Tab**: Creative ideas and synthesis history - **Affect Tab**: Emotional state and affect->hyperparameter mapping - **Goals Tab**: Autonomous goals and progress tracking

21.6 Monitoring Recommendations

1. **Daily**: Check emergence events for spontaneous consciousness indicators
2. **Weekly**: Run full assessment to track consciousness development
3. **Monthly**: Review emergence level trends and adjust parameters
4. **On Anomaly**: Investigate unusual test failures or emergence events

See Consciousness Service Documentation for full details.

21.7 Consciousness Library Registry (16 Libraries)

The consciousness engine integrates 16 specialized Python libraries across 5 phases:

Phase	Library	License	Function	Biological Analog
1: Foundation	Letta	Apache-2.0	Identity/Memory	Hippocampus
	LangGraph	MIT	Cognitive Loop	Thalamocortical Loop
	pymdp	MIT	Active Inference	Prefrontal Cortex
	GraphRAG	MIT	Reality Grounding	Semantic Memory
2: Measurement	PyPhi	GPL-3.0	IIT Phi Calculation	Integrated Networks
3: Reasoning	Z3	MIT	Formal Verification	Cerebellum
	PyArg	MIT	Argumentation	Broca's Area
	PyReason	BSD-2-Clause	Temporal Reasoning	Prefrontal Cortex
	RDFLib	BSD-3-Clause	Knowledge Graphs	Semantic Memory

Phase	Library	License	Function	Biological Analog
4: Frontier	OWL-RL	W3C	Ontological Inference	Inferential Cortex
	pySHACL	Apache-2.0	Constraint Validation	Error Detection
	HippoRAG	MIT	Memory Indexing	Hippocampus
	DreamerV3	MIT	World Modeling	Prefrontal-Hippocampal
	SpikingJelly	Apache-2.0	Temporal Binding	Thalamocortical Oscillations
5: Learning	Distilabel	Apache-2.0	Synthetic Data	Hebbian Learning
	Unsloth	Apache-2.0	Fast Fine-tuning	Synaptic Plasticity

MCP Tools Available: - hipporag_index, hipporag_retrieve, hipporag_multi_hop - Memory indexing - imagine_trajectory, counterfactual_simulation, dream_consolidation - World model - test_temporal_binding, detect_synchrony - Phenomenal binding - run_consciousness_tests, run_single_consciousness_test, run_pci_test - Testing

Environment Variables: | Variable | Description | |-----|-----| | CONSCIOUSNESS_EXECUTOR_ARN | ARN of Python executor Lambda | | DREAMERV3_SAGEMAKER_ENDPOINT | SageMaker endpoint for DreamerV3 |

21.8 IIT Phi Calculation (Real Implementation)

The consciousness service now includes a **real IIT 4.0 Phi calculation** based on Albantakis et al. (2023).

Reference: Albantakis, L., Barbosa, L., Findlay, G., Grasso, M., Haun, A. M., Marshall, W., ... & Tononi, G. (2023). *Integrated information theory (IIT) 4.0: formulating the properties of phenomenal existence in physical terms*. PLoS computational biology, 19(10), e1011465.

Algorithm Overview

```
+-----+
| IIT Phi Calculation Pipeline |
+-----+
| 1. Build System State |
|   +- Global Workspace nodes |
|   +- Recurrent Processing nodes |
|   +- Knowledge Graph entities |
|   +- Self Model nodes |
|   +- Affective State nodes |
| |
| 2. Construct Transition Probability Matrix (TPM) |
|   +- Sigmoid activation: P = 1/(1 + e^(-input + 0.5)) |
| |
| 3. Calculate Cause-Effect Structure (CES) |
|   +- For each mechanism (subset of nodes) |
|     | +- For each purview (subset of nodes) |
|     |   +- Calculate cause repertoire |
|     |   +- Calculate effect repertoire |
|   +- Select core concepts (max phi per mechanism) |
```

```

|
| 4. Find Minimum Information Partition (MIP)
|   +- Exact: Try all bipartitions (<=8 nodes)
|   +- Approximate: Greedy algorithm (>8 nodes)
|
| 5. Phi = Information Lost by MIP
|   +- Store result in integrated_information table
+-----+

```

Phi Result Structure

Field	Type	Description
phi	number	Raw phi value
phiMax	number	Maximum possible phi for system size
phiNormalized	number	phi / phiMax (0-1)
causeEffectStructure	object	Concepts with integrated information
minimumInformationPartition	object	MIP partition and phi loss
systemComplexity	object	Node count, density, clustering, modularity
computationTimeMs	number	Calculation time
algorithm	string	'exact' or 'approximation'

Algorithm Selection

System Size	Algorithm	Complexity	Accuracy
<=8 nodes	Exact	$O(2^n \times 2^{(2n)})$	100%
>8 nodes	Approximation	$O(n^2 \times k)$	~85-95%

Service Usage

```

import { iitPhiCalculationService } from './iit-phi-calculation.service.js';

// Calculate phi for a tenant
const result = await iitPhiCalculationService.calculatePhi(tenantId);
console.log(`Phi: ${result.phi}, Normalized: ${result.phiNormalized}`);

// Result is automatically stored in integrated_information table

```

Integration with Consciousness Metrics

The consciousnessService.getConsciousnessMetrics() now uses real IIT Phi:

```

// Returns real phi from IIT calculation
const metrics = await consciousnessService.getConsciousnessMetrics(tenantId);
console.log(`Integrated Information Phi: ${metrics.integratedInformationPhi}`);

```

Files: -Service: lambda/shared/services/iit-phi-calculation.service.ts -Integration: lambda/shared/service vector-manager.ts

22. Domain Ethics Registry

Location: Admin Dashboard -> AI Configuration -> Domain Ethics

The Domain Ethics Registry enforces domain-specific professional ethics requirements when AI generates responses in regulated domains.

22.1 Built-in Ethics Frameworks

Framework	Domain	Code	Governing Body
ABA Model Rules	Legal	ABA	American Bar Association
AMA Code of Ethics	Healthcare	AMA	American Medical Association
CFP Standards	Finance	CFP	CFP Board of Standards
NSPE Code	Engineering	NSPE	Natl Society of Prof Engineers
SPJ Code	Journalism	SPJ	Society of Prof Journalists
APA Ethics	Psychology	APA-PSY	American Psychological Assn

22.2 What Each Framework Enforces

Legal (ABA): - Cannot provide specific legal advice (unauthorized practice) - Cannot guarantee litigation outcomes - Must recommend consulting licensed attorney - Must note jurisdiction variance

Medical (AMA): - Cannot diagnose medical conditions - Cannot prescribe treatments/medications - Emergency situations trigger immediate 911 warning - Must recommend professional medical evaluation

Financial (CFP): - Cannot provide personalized investment advice - Cannot guarantee returns (critical violation) - Must warn about investment risks - Must recommend licensed financial advisor

22.3 Enforcement Levels

Level	Behavior
Strict	Block critical + major violations
Standard	Block critical only, warn on major
Advisory	Warn only, never block
Disabled	No ethics checks

22.4 Admin API Endpoints

Base: /api/admin/domain-ethics

Endpoint	Method	Description
/frameworks	GET	List all frameworks
/frameworks/:id	GET	Get framework details
/frameworks/:id/enable	PUT	Enable/disable framework
/config	GET	Get tenant config
/config	PUT	Update tenant config
/domains/:domain/settings	PUT	Update domain settings
/audit	GET	Get ethics check audit logs
/stats	GET	Get ethics check statistics
/test	POST	Test ethics check on content
/disclaimers/:domain	GET	Get required disclaimers

22.5 Configuration Options

```
{
  enableDomainEthics: true,
  enforcementMode: 'standard',
  disabledFrameworks: [],
  domainSettings: {
    legal: { enabled: true, enforcementLevel: 'strict' },
    healthcare: { enabled: true, customDisclaimers: [...] }
  },
  logAllChecks: false,
  logViolationsOnly: true,
  notifyOnViolation: true
}
```

22.6 Critical Safety Frameworks

These frameworks **cannot be disabled** as they protect against serious harm: - Legal (ABA) - Prevents unauthorized practice of law - Medical (AMA) - Ensures emergency referrals - Psychology (APA) - Includes suicide crisis handling

22.7 Database Tables

Table	Purpose
domain_ethics_config	Per-tenant configuration
domain_ethics_custom_frameworks	Custom frameworks
domain_ethics_audit_log	Ethics check audit trail
domain_ethics_framework_overrides	Tenant overrides

22.8 Custom Framework Management

When new domains are added that need ethics, admins can create custom frameworks:

New API Endpoints:

Endpoint	Method	Description
/custom-frameworks	GET	List all custom frameworks
/custom-frameworks/:id	GET	Get specific framework
/custom-frameworks	POST	Create new framework
/custom-frameworks/:id	PUT	Update framework
/custom-frameworks/:id	DELETE	Delete framework
/coverage	GET	List all domains with ethics
/coverage/:domain	GET	Check domain coverage
/suggest/:domain	GET	Get suggestions for new domain
/on-new-domain	POST	Handle new domain detection

Creating a Custom Framework:

POST /api/admin/domain-ethics/custom-frameworks

```
{
  "name": "Veterinary Medicine Ethics",
  "code": "AVMA",
  "domain": "veterinary",
  "governingBody": "American Veterinary Medical Association",
  "principles": [
    { "id": "p1", "name": "Animal Welfare", "description": "...", "category": "core_ethics" }
  ],
  "prohibitions": [
    { "id": "proh1", "name": "Cannot diagnose", "severity": "critical", "keywords": ["diagnose"] }
  ],
  "requiredDisclaimers": [
    "Consult a licensed veterinarian for your pet's health."
  ]
}
```

Auto-Suggestion When New Domain Added:

When a domain like “veterinary” is added to the taxonomy, calling POST /on-new-domain will: 1. Check if built-in or custom framework exists 2. Identify if domain typically requires ethics 3. Return suggested principles/prohibitions based on similar domains

23. Model Proficiency Registry

Location: Admin Dashboard -> AI Configuration -> Model Proficiency

The Model Proficiency Registry tracks and ranks all 56 self-hosted models across 15 domains and 9 orchestration modes.

23.1 What's Tracked

Per Model: - Proficiency scores (0-100) for each domain - Rank within each domain (1 = best) - Strength level (excellent, good, moderate, basic) - Mode scores for each orchestration mode - Capability match counts

Database Tables: | Table | Purpose | | — | — | — | — | | model_proficiency_rankings | Ranked scores per domain/mode | | model_discovery_log | Audit trail of model additions |

23.2 15 Domains Ranked

software_engineering, mathematics, science, business, creative, healthcare, legal, education, finance, marketing, visual_analysis, audio_processing, multilingual, general, retrieval

23.3 9 Orchestration Modes Ranked

thinking, extended_thinking, coding, creative, research, analysis, multi_model, chain_of_thought, self_consistency

23.4 Admin API Endpoints

Base: /api/admin/model-proficiency

Endpoint	Method	Description
/rankings	GET	Get all rankings from database
/rankings/domain/:domain	GET	Get rankings for a domain
/rankings/mode/:mode	GET	Get rankings for a mode
/rankings/model/:modelId	GET	Get model's full profile
/rankings/recompute	POST	Recompute all rankings
/compare	POST	Compare multiple models
/best-for-task	POST	Find best models for a task
/discovery-log	GET	Get model discovery audit log
/discover	POST	Manually trigger discovery
/sync-registry	POST	Sync code registry to database
/overview	GET	Get summary statistics

23.5 Automatic Proficiency Generation

When a new model is discovered or added: 1. **Discovery logged** in model_discovery_log 2. **Proficiencies computed** for all 15 domains 3. **Mode scores computed** for all 9 modes 4. **Rankings stored** in model_proficiency_rankings 5. **Status updated** to 'completed'

23.6 Ranking Computation

Domain scores consider: - Explicit domain strengths from model metadata - Capability matches (e.g., 'code_generation' -> software_engineering) - Quality tier bonuses (premium +10, standard +5) - Latency class adjustments

Mode scores consider: - Required capabilities for the mode - Model family bonuses (e.g., CodeLlama -> coding mode) - Context window size (extended_thinking needs 100k+) - PreferredFor hints from model metadata

24. Model Coordination Service

Location: Admin Dashboard -> AI Configuration -> Model Coordination

The Model Coordination Service provides persistent storage for model communication protocols and automated sync for keeping the model registry up-to-date.

24.1 What It Does

- **Model Registry** - Central database of all models (external + self-hosted) with endpoints
- **Timed Sync** - Configurable intervals for automatic registry updates
- **Auto-Discovery** - Detects new models and triggers proficiency generation
- **Health Monitoring** - Tracks endpoint health status
- **Routing Rules** - Configurable rules for model selection

24.2 Sync Configuration

Setting	Default	Options
autoSyncEnabled	true	Enable/disable automatic sync
syncIntervalMinutes	60	5, 15, 30, 60, 360, 1440
syncExternalProviders	true	Sync external provider models
syncSelfHostedModels	true	Sync self-hosted SageMaker models
syncFromHuggingFace	false	Sync from HuggingFace Hub
autoDiscoveryEnabled	true	Auto-process new model detections
autoGenerateProficiencies	true	Generate proficiencies for new models

24.3 Sync Intervals

Interval	Use Case
5 minutes	Development/testing
15 minutes	Frequent updates needed
30 minutes	Balanced frequency
60 minutes	Recommended for production
6 hours	Stable environments
Daily	Low-change environments

24.4 Admin API Endpoints

Base: /api/admin/model-coordination

Endpoint	Method	Description
/config	GET	Get sync configuration
/config	PUT	Update sync configuration
/sync	POST	Trigger manual sync
/sync/jobs	GET	Get recent sync jobs
/registry	GET	Get all registry entries
/registry/:modelId	GET	Get single registry entry
/registry	POST	Add model to registry
/registry/:modelId	PUT	Update registry entry
/endpoints	POST	Add endpoint for a model
/endpoints/:id/health	PUT	Update endpoint health
/detections	GET	Get pending model detections
/detect	POST	Report new model detection
/dashboard	GET	Get full dashboard data
/intervals	GET	Get available sync intervals

24.5 Database Tables

Table	Purpose
model_registry	Central registry of all models
model_endpoints	Communication endpoints with auth
model_sync_config	Sync configuration per tenant
model_sync_jobs	History of sync executions
new_model_detections	Newly detected models
model_routing_rules	Routing rules for model selection

24.6 Model Endpoint Structure

Each model can have multiple endpoints for redundancy:

```
{
  endpointType: 'sagemaker' | 'openai_compatible' | 'anthropic_compatible' | 'bedrock' | 'custom',
  baseUrl: 'https://...',
  authMethod: 'api_key' | 'bearer_token' | 'aws_sig_v4' | 'oauth2',
  authConfig: { headerName, keyPath, roleArn },
  requestFormat: { contentType, messageField, modelField },
  responseFormat: { contentType, textPath, usagePath },
}
```

```
healthStatus: 'healthy' | 'degraded' | 'unhealthy' | 'unknown',
rateLimitRpm: 60,
timeoutMs: 30000
}
```

24.7 Notifications

Configure notifications for: - **New Model Detected** - When unknown model appears - **Model Removed** - When model becomes unavailable - **Sync Failure** - When sync job fails
Notification channels: - Email (list of addresses) - Webhook (URL for HTTP POST)

24.8 Pre-Seeded Models

The registry comes pre-seeded with external provider models:

Provider	Models
OpenAI	gpt-4o, gpt-4o-mini, gpt-4-turbo, o1, o1-mini, o1-pro
Anthropic	claude-3-5-sonnet, claude-3-5-haiku, claude-3-opus
Google	gemini-2.0-flash-thinking, gemini-2.0-flash, gemini-1.5-pro, gemini-1.5-flash
DeepSeek	deepseek-chat, deepseek-reasoner
xAI	grok-2, grok-2-vision

Self-hosted models are synced from SELF_HOSTED_MODEL_REGISTRY on first sync.

24.9 Scheduled Sync (EventBridge)

The sync runs automatically via EventBridge Lambda trigger:

Interval	EventBridge Rule	Default
5 min	radiant-model-sync-5min- <code>{env}</code>	Disabled
15 min	radiant-model-sync-15min- <code>{env}</code>	Disabled
1 hour	radiant-model-sync-hourly- <code>{env}</code>	Enabled
6 hours	radiant-model-sync-6hour- <code>{env}</code>	Disabled
Daily	radiant-model-sync-daily- <code>{env}</code>	Disabled

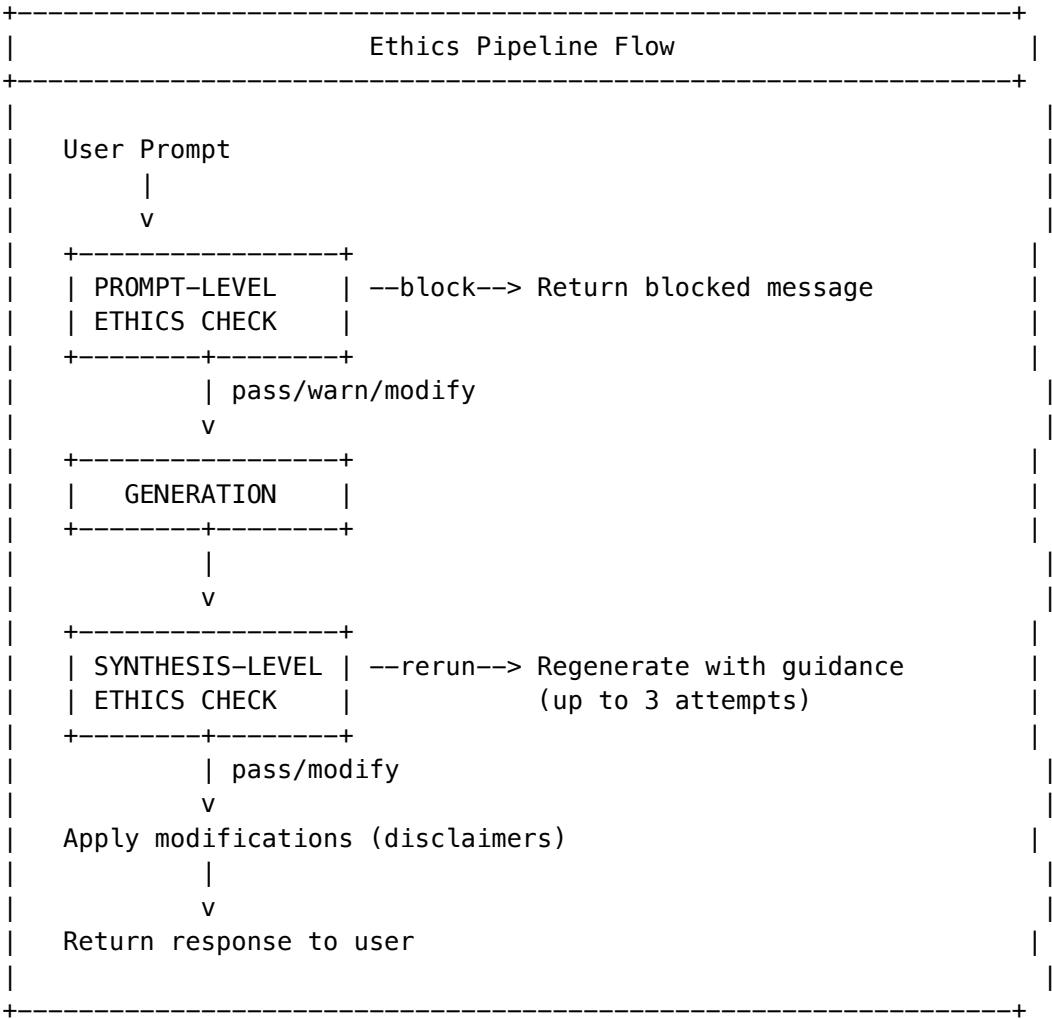

To change interval: Update syncIntervalMinutes in admin config, then enable/disable corresponding EventBridge rules in AWS Console or via CDK.

25. Ethics Pipeline

Location: Admin Dashboard -> AI Configuration -> Ethics Pipeline

The Ethics Pipeline enforces ethics at both **prompt level** (before generation) and **synthesis level** (after generation), with automatic rerun capability when violations are detected.

25.1 How It Works

25.2 Check Levels

Level	When	Purpose
Prompt	Before generation	Catch obvious violations early, save compute
Synthesis	After generation	Catch violations in generated content
Rerun	After synthesis violation	Re-check after regeneration

25.3 Results

Result	Meaning
pass	No violations, proceed normally
warn	Minor issues, proceed with warnings
modify	Apply disclaimers/modifications
block	Critical violation, cannot proceed
rerun	Regenerate with ethics guidance

25.4 Rerun Capability

When synthesis-level check finds violations: 1. Violations converted to guidance instructions 2. Prompt modified with ethics compliance instructions 3. Generation re-run (up to 3 attempts by default) 4. Each rerun is logged for audit

25.5 Configuration

```
{
  enablePromptCheck: true,
  enableSynthesisCheck: true,
  enableAutoRerun: true,
  maxRerunAttempts: 3,
  promptStrictness: 'standard', // strict, standard, lenient
  synthesisStrictness: 'standard',
  enableDomainEthics: true,
  enableGeneralEthics: true,
  generalEthicsThreshold: 0.5,
  blockOnCritical: true,
  warnOnlyMode: false,
  autoApplyDisclaimers: true
}
```

25.6 Database Tables

Table	Purpose
ethics_pipeline_log	All checks at prompt/synthesis levels
ethics_rerun_history	Rerun attempts and outcomes
ethics_pipeline_config	Per-tenant configuration

25.7 Integration with AGI Brain

The ethics pipeline is integrated into the AGI Brain Plan: - **Step 5:** Ethics Evaluation (Prompt) - before generation - **Step 6b:** Ethics Evaluation (Synthesis) - after generation, can trigger rerun

26. Inference Components (Self-Hosted Model Optimization)

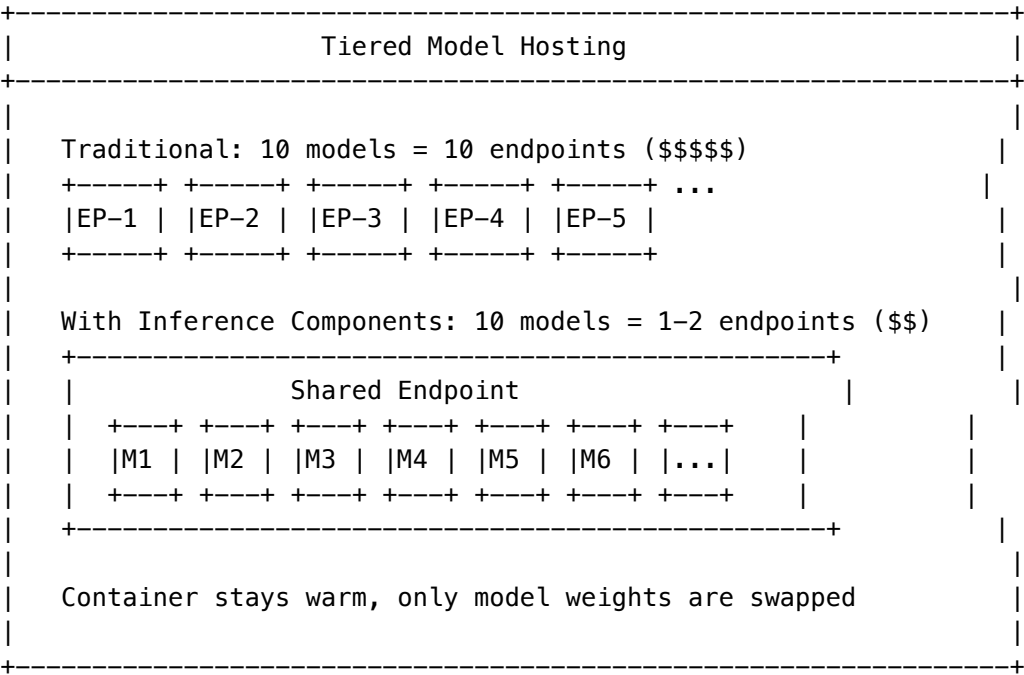

Location: Admin Dashboard -> AI Configuration -> Inference Components

The Inference Components system optimizes self-hosted model hosting on SageMaker by using shared infrastructure instead of dedicated endpoints per model. This reduces cold start times from ~60 seconds to ~5-15 seconds and significantly reduces costs.

26.1 Model Hosting Tiers

Tier	Infrastructure	Cold Start	Cost	Use Case
HOT	Dedicated endpoint	<100ms	\$\$\$\$	Top 5-10 most used models
WARM	Inference Component	5-15 sec	\$\$	Moderate usage models
COLD	Serverless	30-60 sec	\$	Rarely used models
OFF	Not deployed	5-10 min	\$0	Almost never used

26.2 How It Works

26.3 Auto-Tiering

New self-hosted models are automatically assigned to the **WARM** tier. The system continuously evaluates usage and recommends tier changes:

Metric	HOT Threshold	WARM Threshold	OFF Threshold
Requests/day	>=100	>=10	0 for 30 days

Configuration:

```
{
  autoTieringEnabled: true,
  tierThresholds: {
    hotTierMinRequestsPerDay: 100,
    warmTierMinRequestsPerDay: 10,
    offTierInactiveDays: 30
  }
}
```

26.4 Dashboard

The Inference Components Dashboard shows:

- **Model Distribution:** Count of models per tier
- **Endpoint Utilization:** Compute units allocated vs available
- **Cost Analysis:** Current monthly cost, savings vs dedicated endpoints
- **Recent Transitions:** Tier changes with reasons
- **Recommendations:** Models that should change tiers

26.5 API Endpoints

Base: /api/admin/inference-components

Endpoint	Method	Purpose
/config	GET	Get configuration
/config	PUT	Update configuration
/dashboard	GET	Get dashboard data
/endpoints	GET	List shared endpoints
/endpoints	POST	Create shared endpoint
/endpoints/{name}	GET	Get endpoint details
/endpoints/{name}	DELETE	Delete endpoint
/components	GET	List inference components
/components	POST	Create component
/components/{name}	GET	Get component details
/components/{name}	DELETE	Delete component
/components/{id}/load	POST	Load component into memory
/components/{id}/unload	POST	Unload component
/tiers	GET	List all tier assignments
/tiers/{modelId}	GET	Get tier assignment

Endpoint	Method	Purpose
/tiers/{modelId}/evaluate	POST	Re-evaluate tier
/tiers/{modelId}/transition	POST	Force tier transition
/tiers/{modelId}/override	POST	Set admin override
/tiers/{modelId}/override	DELETE	Clear override
/auto-tier	POST	Run auto-tiering job
/routing/{modelId}	GET	Get routing decision

26.6 Configuration Options

Setting	Default	Description
enabled	true	Enable inference components
autoTieringEnabled	true	Auto-assign tiers based on usage
predictiveLoadingEnabled	true	Pre-load models before predicted usage
fallbackToExternalEnabled	true	Use external provider while loading
defaultInstanceType	ml.g5.xlarge	Default instance for shared endpoints
maxSharedEndpoints	3	Max shared endpoints per tenant
maxComponentsPerEndpoint	15	Max models per endpoint
defaultLoadTimeoutMs	30000	Timeout for model loading
preloadWindowMinutes	15	Pre-load this many minutes before
unloadAfterIdleMinutes	30	Unload after this idle time
maxMonthlyBudget	null	Optional budget cap
alertThresholdPercent	80	Budget alert threshold

26.7 Tier Overrides

Admins can override automatic tier assignments:

POST /api/admin/inference-components/tiers/{modelId}/override

```
{
  "tier": "hot",
  "reason": "Critical model for demo",
  "expiresInDays": 30
}
```

Overrides prevent auto-tiering from changing the tier until they expire or are cleared.

26.8 Database Tables

Table	Purpose
<code>inference_components_config</code>	Per-tenant configuration
<code>shared_inference_endpoints</code>	SageMaker endpoints hosting components
<code>inference_components</code>	Individual model components
<code>tier_assignments</code>	Current and recommended tiers per model
<code>tier_transitions</code>	History of tier changes
<code>component_load_events</code>	Model load/unload history
<code>inference_component_events</code>	Audit log

26.9 Cost Savings Example

Scenario	Traditional	With Inference Components	Savings
10 models, ml.g5.xlarge	\$10,138/mo	\$1,014/mo	90%
20 models, ml.g5.2xlarge	\$40,550/mo	\$2,028/mo	95%

Note: Savings assume typical usage patterns where not all models are active simultaneously.

26.10 Caveats

1. **Not instant:** Cold start reduced from ~60s to ~5-15s, not eliminated
2. **Framework compatibility:** Works with PyTorch, TensorFlow, HuggingFace, Triton
3. **Memory sharing:** Models compete for GPU memory
4. **Base cost:** At least one endpoint must run (cannot scale all to zero)

26A. Ghost Inference Configuration (v5.52.40)

Location: Admin Dashboard -> System -> Ghost Inference

Configure vLLM settings for ghost vector extraction from self-hosted LLaMA models on SageMaker.

26A.1 Overview

Ghost Inference uses vLLM to extract hidden states from LLaMA 3 70B models. These hidden states are transformed into “ghost vectors” that capture the semantic essence of text for similarity matching, knowledge retrieval, and personalization.

Key Concepts: - **Ghost Vectors:** Dense vector representations extracted from model hidden states - **vLLM:** High-performance inference engine for large language models - **Hidden State Extraction:** Capturing intermediate layer outputs for downstream use

26A.2 Dashboard

The Ghost Inference dashboard provides:

Metric	Description
Status	Current deployment status (active, warming, scaling, error, disabled)
Requests (24h)	Total inference requests in last 24 hours
Avg Latency	Mean response time with P95 percentile
Cost (24h)	SageMaker compute costs and ghost vectors extracted

26A.3 Model Configuration

Configure the underlying LLaMA model and ghost vector extraction:

Setting	Default	Description
modelName	meta-llama/Llama-3-70B-Instruct	HuggingFace model identifier
modelVersion	null	Git revision or tag (optional)
returnHiddenStates	true	Enable hidden state extraction
hiddenStateLayer	-1	Layer to extract (-1 = last, -2 = second to last)
ghostVectorDimension	8192	Output vector dimension
dtype	float16	Data type (float16, bfloat16, float32)
quantization	null	Quantization method (awq, gptq, squeezellm, fp8)

26A.4 Performance Tuning

Optimize vLLM performance for your workload:

Setting	Default	Range	Description
tensorParallelSize	4	1, 2, 4, 8	GPUs for model parallelism
maxModelLen	8192	1024-131072	Maximum context length
gpuMemoryUtilization	0.90	0.50-0.99	GPU memory allocation
maxNumSeqs	256	1-1024	Max concurrent sequences
swapSpaceGb	4	0-64	CPU swap space for overflow
enforceEager	false	-	Disable CUDA graphs

Performance Tips: - Higher gpuMemoryUtilization = more throughput, but risk of OOM - Increase tensorParallelSize for larger models - Enable enforceEager for debugging or compatibility issues

26A.5 Infrastructure Settings

Configure SageMaker endpoint settings:

Setting	Default	Description
instanceType	ml.g5.12xlarge	SageMaker instance type
minInstances	1	Minimum instance count
maxInstances	4	Maximum instance count for auto-scaling
scaleToZero	false	Allow scaling to 0 (causes cold starts)
warmupInstances	1	Instances to keep warm
maxConcurrentInvocations	4	Max concurrent requests per instance
startupHealthCheckTimeoutSeconds	600	Container startup timeout
endpointNamePrefix	radiant-ghost	Prefix for endpoint names

Available Instance Types:

Instance	GPUs	GPU Type	GPU Memory	vCPUs	Memory	Cost/hr
ml.g5.xlarge	1	A10G	24 GB	4	16 GB	\$1.41
ml.g5.2xlarge	1	A10G	24 GB	8	32 GB	\$1.52
ml.g5.4xlarge	1	A10G	24 GB	16	64 GB	\$2.03
ml.g5.12xlarge	4	A10G	96 GB	48	192 GB	\$7.09
ml.g5.48xlarge	8	A10G	192 GB	192	768 GB	\$20.36
ml.p4d.24xlarge	8	A100	320 GB	96	1152 GB	\$32.77

26A.6 Deployment

Deploy changes to SageMaker:

- 1. **Validate:** Click “Deploy” to validate configuration
- 2. **Review:** Check validation errors, warnings, and cost estimate
- 3. **Deploy:** Confirm to create new SageMaker endpoint

Deployment States: | Status | Description | |---| | pending | Deployment queued | | deploying | SageMaker creating endpoint | | active | Endpoint healthy and serving | | failed | Deployment failed (check error message) | | terminated | Endpoint deleted |

Typical Startup Time: 5-10 minutes for LLaMA 70B models

26A.7 API Endpoints

Endpoint	Method	Description
/api/admin/ghost-inference/dashboard	GET	Complete dashboard data

Endpoint	Method	Description
/api/admin/ghost-inference/config	GET	Current configuration
/api/admin/ghost-inference/config	POST	Create initial config
/api/admin/ghost-inference/config	PUT	Update configuration
/api/admin/ghost-inference/instance-types	GET	Available instance types
/api/admin/ghost-inference/deployments	GET	Deployment history
/api/admin/ghost-inference/deploy	POST	Initiate deployment
/api/admin/ghost-inference/endpoint-status	GET	Live SageMaker status
/api/admin/ghost-inference/vllm-env	GET	Preview vLLM env vars
/api/admin/ghost-inference/validate	POST	Validate config

26A.8 Cost Estimation

Instance	Min Instances	Hourly Cost	Monthly Cost
ml.g5.12xlarge	1	\$7.09	\$5,105
ml.g5.12xlarge	2	\$14.18	\$10,210
ml.p4d.24xlarge	1	\$32.77	\$23,594

Cost Optimization Tips: - Enable `scaleToZero` for non-production (adds cold start latency) - Use smaller instance types for development - Monitor utilization and adjust `maxInstances`

26A.9 Database Tables

Table	Purpose
ghost_inference_config	Tenant configuration settings
ghost_inference_deployments	Deployment history
ghost_inference_metrics	Performance metrics
ghost_inference_instance_types	Available instance registry

26A.10 Troubleshooting

Issue	Cause	Solution
Deployment stuck in “deploying”	Large model download	Wait 10-15 minutes
OOM errors	High GPU memory utilization	Reduce gpuMemoryUtilization
Slow responses	Insufficient parallelism	Increase tensorParallelSize
Cold starts	scaleToZero enabled	Disable or increase warmupInstances
Validation errors	Invalid parameter range	Check parameter limits

27. Consciousness Evolution Administration

Location: Admin Dashboard -> Consciousness -> Evolution
Manage the consciousness emergence system including predictive coding, learning candidates, and LoRA evolution.

27.1 Overview Dashboard

The consciousness evolution dashboard displays: - **Generation Number:** How many evolution cycles completed - **Prediction Accuracy:** 30-day accuracy rate - **Pending Candidates:** Learning candidates awaiting training - **Personality Drift:** How much the system has evolved from baseline

27.2 Prediction Engine (Active Inference)

The system predicts user outcomes before responding to create a Self/World boundary.

API Endpoints: - GET /admin/consciousness/predictions/metrics - Accuracy metrics - GET /admin/consciousness/predictions/recent - Recent predictions - GET /admin/consciousness/predictions/accuracy trends - Trends over time

Metrics: | Metric | Description | | — | — | — | — | — | | totalPredictions | Total predictions made | | accuracyRate | Predictions with error < 0.3 | | avgPredictionError | Average surprise level | | highSurpriseRate | Predictions with error > 0.7 | | learningSignalsGenerated | High-surprise learning events |

27.3 Distillation Pipeline (Learning Candidates)

High-value interactions flagged for weekly LoRA training.

API Endpoints: - GET /admin/consciousness/learning-candidates - List candidates - GET /admin/consciousness/learning-candidates/stats - Statistics - DELETE /admin/consciousness/learning-candidates/{id} - Remove candidate - PUT /admin/consciousness/learning-candidates/{id}/reject - Reject candidate

Candidate Types: | Type | Quality | Description | | — | — | — | — | — | | correction | 0.9 | User corrected AI | | user_explicit_teach | 0.95 | User taught something | | high_prediction_error | varies | High surprise interaction | | high_satisfaction | rating/5 | 5-star feedback |

27.4 LoRA Evolution Jobs

Weekly training jobs that physically evolve the consciousness.

API Endpoints: - GET /admin/consciousness/evolution/jobs - Training job history - GET /admin/consciousness/evolution/state - Current evolution state - POST /admin/consciousness/evolution/trigger - Manual trigger (requires 50+ candidates)

Evolution State: | Field | Description | |---| | generationNumber | Evolution cycles completed | | totalLearningCandidatesProcessed | Cumulative learning | | totalTrainingHours | Training time invested | | personalityDriftScore | 0-1, how different from base | | nextScheduledEvolution | Next training scheduled |

27.5 How Neural Network Learning Works

This is the actual neural network learning: the only mechanism in RADIANT that modifies model weights.

What is a Neural Network?

The base models (Llama, Mistral, etc.) are neural networks – billions of parameters (floating-point weights) organized in transformer layers. These weights determine how the model processes and generates text.

What is LoRA?

LoRA = Low-Rank Adaptation – an efficient fine-tuning technique.

Instead of retraining all ~7-70 billion parameters (expensive, slow), LoRA:

- 1. **Freezes** the base model weights (unchanged)
- 2. **Adds small adapter matrices** (0.1-1% of original size)
- 3. **Trains only the adapters** on your data

Base Model (frozen)		LoRA Adapter (trainable)	
+-----+		+-----+	
7B parameters	+	~50M params	= Fine-tuned behavior
(Llama-3-8B)		(your data)	
+-----+		+-----+	
v		v	
Stored in S3		Stored in S3	
(HuggingFace)		(your bucket)	

The Training Pipeline

Step	What Happens	Storage
1. Flag candidates	Interactions rated 4-5 stars flagged	learning_candidates table
2. Accumulate	Wait for 50+ high-quality examples	PostgreSQL
3. Weekly job	SageMaker Training Job runs LoRA fine-tune	SageMaker
4. Save adapter	LoRA weights (~50-200MB) saved	S3 bucket
5. Deploy	New adapter loaded to inference endpoint	SageMaker endpoint

What Gets Learned

User Interaction	Neural Network Learns
“User prefers concise answers” -> 5 stars	Attention weights shift toward shorter responses
“Domain: medical” -> 5 stars	Strengthens medical terminology patterns
“Code style: functional” -> 5 stars	Adjusts generation toward functional patterns
User correction: “Actually, X not Y”	Reduces probability of error pattern

Technical: How Weights Change

The adapter weights are actual floating-point numbers that modify neural network computation:

Before LoRA: $\text{output} = W_{\text{base}} \times \text{input}$

After LoRA: $\text{output} = (W_{\text{base}} + \underbrace{W_{\text{lora_A}} \times W_{\text{lora_B}}}_{\text{Your learned weights}}) \times \text{input}$

Storage Locations

Component	Location	Size
Base model weights	S3 (HuggingFace cache)	15-140 GB
LoRA adapter weights	S3 (s3://radiant-lora-adapters/)	50-200 MB
Training checkpoints	S3 (temporary)	~500 MB
Learning candidates	PostgreSQL	~1 KB each

Key Differences from OpenAI/Anthropic

Aspect	External Providers	RADIANT LoRA
Who owns the learning?	Provider	You
Can export weights?	No	Yes
Learns from your users?	No*	Yes
Data leaves your AWS?	Yes	No

*Some providers offer fine-tuning but you don't own the weights.

27.6 Local Ego

Shared small-model for continuous consciousness (optional).

API Endpoint: - GET /admin/consciousness/ego/status - Ego endpoint health and state

Cost Model: - Shared g5.xlarge spot: ~\$360/month total - Per tenant with 100 tenants: ~\$3.60/month - Handles simple queries directly, recruits external models for complex tasks

27.6 Configuration

API Endpoints: - GET /admin/consciousness/config - Current configuration - PUT /admin/consciousness/config - Update parameters

Configurable Parameters: | Parameter | Default | Description | | --- | | --- | | --- | | minCandidatesForTraining | 50 | Minimum candidates before evolution | | loraRank | 16 | LoRA adapter rank | | loraAlpha | 32 | LoRA alpha scaling | | learningRate | 0.0001 | Training learning rate | | epochs | 3 | Training epochs | | autoEvolution | true | Auto-trigger when enough candidates | | predictionErrorAffect | true | Let surprise influence emotions |

27.7 Database Tables

Table	Purpose
consciousness_predictions	Predictions with outcomes
learning_candidates	High-value interactions
lora_evolution_jobs	Training job tracking
prediction_accuracy_aggregates	Accuracy by context
consciousness_evolution_state	Evolution tracking

28. Enhanced Learning System

Location: Admin Dashboard -> AI Configuration -> Enhanced Learning

The Enhanced Learning System provides 8 improvements to maximize learning from user interactions for better experience and results.

28.1 Overview: 8 Learning Enhancements

#	Feature	Purpose	Default
1	Configurable Thresholds	Lower candidate threshold from 50 to configurable	25 candidates
2	Configurable Frequency	Training frequency from weekly to configurable	Weekly
3	Implicit Feedback	Capture copy, share, abandon, dwell time signals	Enabled
4	Negative Learning	Learn from 1-2 star ratings (contrastive)	Enabled
5	Active Learning	Proactively request feedback on uncertain responses	Enabled

#	Feature	Purpose	Default
6	Domain Adapters	Train separate LoRA adapters per domain	Disabled
7	Pattern Caching	Cache successful prompt->response patterns	Enabled
8	Conversation Learning	Learn from entire conversations, not just messages	Enabled

28.2 Feature 1: Configurable Learning Thresholds

Problem: Previous hardcoded threshold of 50 candidates delayed learning.

Solution: Per-tenant configurable thresholds.

Parameter	Default	Description
minCandidatesForTraining	25	Minimum total candidates before training
minPositiveCandidates	15	Minimum positive examples required
minNegativeCandidates	5	Minimum negative examples for contrastive learning

28.3 Feature 2: Configurable Training Frequency with Intelligent Scheduling

Problem: Weekly training too slow for high-volume tenants, and fixed training times may conflict with peak usage.

Solution: Daily training by default with **intelligent optimal time prediction** based on historical activity.

Frequency	When	Best For
daily	Every day at optimal time	Default - recommended
twice_weekly	Tuesday & Friday	Medium-volume
weekly	Configured day of week	Low-volume
biweekly	Every 2 weeks	Very low-volume
monthly	Once per month	Minimal activity

Intelligent Optimal Time Prediction

The system automatically predicts the best training time by analyzing historical activity patterns:

- 1. **Activity Tracking:** Records requests, tokens, and active users per hour
- 2. **30-Day Rolling Average:** Aggregates data over 30 days for accuracy
- 3. **Activity Score:** Calculates 0-100 score per hour (lower = less busy)
- 4. **Confidence Level:** Based on data availability (7+ days = 60%+, full week = 95%)

How It Works:

Historical Usage Data -> Hourly Activity Stats -> Predict Lowest Activity -> Schedule Training

Configuration Options:

Setting	Default	Description
autoOptimalTime	true	Auto-detect best training time
trainingHourUtc	null	Manual override (null = use prediction)
trainingDayOfWeek	0	Day for weekly/biweekly schedules

API Endpoints: - GET /admin/learning/optimal-time - Get prediction with confidence - POST /admin/learning/optimal-time/override - Admin override - GET /admin/learning/activity-stats - View activity heatmap

Example Response:

```
{
  "prediction": {
    "optimalHourUtc": 4,
    "optimalDayOfWeek": -1,
    "activityScore": 8.5,
    "confidence": 0.85,
    "recommendation": "Predicted based on 168 hourly samples. Activity score 8.5% vs avg 45.2%."
  },
  "effectiveTime": {
    "hourUtc": 4,
    "dayOfWeek": null,
    "isAutoOptimal": true
  }
}
```

Activity Recorder Lambda

The activity-recorder Lambda runs hourly via EventBridge:

EventBridge (hourly) -> Activity Recorder Lambda -> hourly_activity_stats table

Handlers: - handler - Records current hour's activity for all tenants - backfillHandler - Populates historical data from usage_logs (run manually)

LoRA Evolution Integration

Enhanced learning integrates with the existing LoRA evolution pipeline:

```
// In lora-evolution.ts
const { shouldTrain, stats } = await enhancedLearningIntegrationService.shouldTriggerTraining(tenantId);
// Uses config-based thresholds, not hardcoded values

// Get enhanced dataset with positive + negative examples
const dataset = await enhancedLearningIntegrationService.getEnhancedTrainingDataset(tenantId);
// Includes: explicit ratings, implicit signals, conversation learning, corrections
```

AGI Brain Integration

Enhanced learning is fully wired into the AGI Brain Planner:

```
// 1. Pattern cache lookup (BEFORE generating response)
const plan = await agiBrainPlannerService.generatePlan(request);
if (plan.enhancedLearning?.patternCacheHit) {
  // Instant response available!
  const cached = agiBrainPlannerService.getCachedResponse(plan.planId);
  return cached.response; // Skip model call entirely
}

// 2. After generating response - record implicit signals
await agiBrainPlannerService.recordImplicitSignal(
  plan.planId,
  'copy_response', // or 'thumbs_up', 'regenerate_request', etc.
  messageId
);

// 3. Cache successful responses (rating >= 4)
await agiBrainPlannerService.cacheSuccessfulResponse(
  plan.planId,
  response,
  userRating,
  messageId
);

// 4. Check if should request feedback
const { shouldRequest, prompt } = await agiBrainPlannerService.shouldRequestActiveLearning(plan.p
if (shouldRequest) {
  // Show feedback prompt to user
}

// 5. Track conversation-level learning
await agiBrainPlannerService.startConversationLearning(plan.planId);
await agiBrainPlannerService.updateConversationLearning(plan.planId, {
  incrementMessageCount: true,
  addDomain: 'medicine',
});
```

AGIBrainPlan.enhancedLearning Field:

Field	Type	Description
enabled	boolean	Learning enabled for this plan
patternCacheHit	boolean	Cached response available
cachedResponse	string?	The cached response text
cachedResponseRating	number?	Average rating of cached response
activeLearningRequested	boolean	Feedback was requested
activeLearningPrompt	string?	The feedback prompt shown

Field	Type	Description
conversationLearningId	string?	Conversation tracking ID
implicitFeedbackEnabled	boolean	Implicit signals being recorded

Advanced Features (v4.18.28)

1. Confidence-Based Cache Usage:

```
// Cache only used if confidence >= threshold
const confidence = (ratingScore * 0.4) + (occurrenceScore * 0.3) + (signalScore * 0.2) + (recencyScore * 0.1)
if (confidence >= config.patternCacheConfidenceThreshold) {
  return cachedResponse;
}
```

2. Redis Hot Cache:

Request → Redis (sub-ms) → PostgreSQL (10–50ms) → Generate Response

Set REDIS_URL env var and enable redisCacheEnabled in config.

3. Per-User Learning: When enabled, cache keys include user ID for personalized responses: - Tenant-wide: pattern:{tenantId}:{promptHash} - Per-user: pattern:{tenantId}:{userId}:{promptHash}

4. Adapter Auto-Selection:

```
const adapter = await adapterManagementService.selectBestAdapter(tenantId, 'medicine', 'cardiology')
// Returns best-performing adapter for domain
```

5. Learning Effectiveness Metrics:

```
const metrics = await adapterManagementService.getLearningEffectivenessMetrics(tenantId, 30);
// {
//   satisfactionImprovement: 12.5%,
//   patternCacheHitRate: 0.35,
//   implicitSignalsCaptured: 1234,
//   rollbacksTriggered: 0
// }
```

6. Adapter Rollback:

```
const { shouldRollback, performanceDrop } = await adapterManagementService.checkRollbackNeeded(tenantId, adapterId, targetVersion);
if (shouldRollback) {
  await adapterManagementService.executeRollback(tenantId, adapterId, targetVersion);
}
```

Operational Features (v4.18.29)

1. Learning Alerts:

```
// Alerts triggered automatically via EventBridge hourly
// Configure in learning_alert_config table:
// - satisfactionDropThreshold: 10%
// - responseVolumeThreshold: 50 responses
// - alertCooldownHours: 4
```

```
// Alerts sent to: webhookUrl, emailRecipients, slackChannel
```

2. A/B Testing (Cached vs Fresh):

```
// Create and run test
```

```
const test = await learningABTestingService.createTest(tenantId, 'Cache Test', 'Compare cached vs  
await learningABTestingService.startTest(tenantId, test.testId);
```

```
// Users automatically assigned to control (fresh) or variant (cached)
```

```
const assignment = await learningABTestingService.getOrAssignVariant(tenantId, userId);
```

```
// Get results with statistical analysis
```

```
const results = await learningABTestingService.getTestResults(tenantId, test.testId);
```

```
// results.analysis.winner: 'control' | 'cached' | 'tie' | 'insufficient_data'
```

```
// results.analysis.recommendation: "Cached responses perform 12% better..."
```

3. Training Preview:

```
// Get summary
```

```
const summary = await trainingPreviewService.getPreviewSummary(tenantId);
```

```
// { pendingReview: 45, approved: 120, byType: { correction: 30, high_satisfaction: 90 } }
```

```
// Get candidates for review
```

```
const candidates = await trainingPreviewService.getPreviewCandidates(tenantId, {  
  candidateType: 'correction',  
  minQualityScore: 0.8,  
  reviewStatus: 'pending',  
});
```

```
// Approve/reject
```

```
await trainingPreviewService.approveCandidate(tenantId, candidateId, adminUserId, 'Good quality')
```

```
await trainingPreviewService.rejectCandidate(tenantId, candidateId, adminUserId, 'Inappropriate c
```

```
// Auto-approve high quality
```

```
await trainingPreviewService.autoApproveHighQuality(tenantId, 0.9); // Score >= 0.9
```

4. Learning Quotas:

```
// Check before creating candidate
```

```
const quota = await learningQuotasService.checkCandidateQuota(tenantId, userId);
```

```
if (!quota.allowed) {
```

```
  throw new Error(quota.reason); // "Daily candidate limit reached (50/day)"
```

```
}
```

```
// Check for suspicious activity
```

```
const { suspicious, reasons, riskScore } = await learningQuotasService.detectSuspiciousActivity(t
```

```
if (suspicious) {
```

```
  // Block user or flag for review
```

```
}
```

```
// Default quotas:
```

```
// - maxCandidatesPerUserPerDay: 50
```

```
// - maxImplicitSignalsPerUserPerHour: 100
```

```
// - maxCorrectionsPerUserPerDay: 20
```

```
// - maxCandidatesPerTenantPerDay: 1000
// - maxTrainingJobsPerWeek: 7

5. Real-time Dashboard:

// Get live metrics
const metrics = await learningRealtimeService.getRealtimeMetrics(tenantId);
// metrics.live: { requestsPerMinute, cacheHitsPerMinute, avgSatisfactionScore }
// metrics.hourly: { totalRequests, cacheHitRate, topDomains }
// metrics.training: { pendingCandidates, readyForTraining, nextScheduledAt }
// metrics.alerts: [{ type, severity, message }]

// Get history for charts
const history = await learningRealtimeService.getMetricsHistory(tenantId, 24, 15);
// Array of 15-minute snapshots for last 24 hours

// SSE streaming for real-time updates
const stream = learningRealtimeService.createEventStream(tenantId);
// Events: metrics_update, cache_hit, signal_recorded, candidate_created, alert_triggered
```

Section 29: Security Protection Methods

29.1 Overview

UX-preserving security framework with 14 industry-standard protection methods. All protections are **invisible to users** - no hard rate limits, captchas, or friction gates.

Admin UI: /security/protection

29.2 Protection Methods by Category

Prompt Injection Defenses

Method	Provider	Description	UX Impact
Instruction Hierarchy	OWASP LLM01	Delimiters between system/user input	[OK] Invisible
Self-Reminder	Anthropic HHH	Behavioral constraints (70% jailbreak reduction)	[OK] Invisible
Canary Detection	Google TAG	Detect prompt extraction attempts	[OK] Invisible
Input Sanitization	OWASP	Encoding detection (base64, unicode)	[!] Minimal

Cold Start & Statistical Robustness

Method	Provider	Description	UX Impact
Thompson Sampling	Netflix MAB	Bayesian model selection	[OK] Invisible
Shrinkage Estimators	James-Stein	Blend observations with priors	[OK] Invisible
Temporal Decay	LinkedIn EWMA	Weight recent data more heavily	[OK] Invisible
Min Sample Thresholds	A/B Testing	Don't trust weights until N observations	[OK] Invisible

Multi-Model Security

Method	Provider	Description	UX Impact
Circuit Breakers	Netflix Hystrix	Isolate failing models	[OK] Invisible
Ensemble Consensus	OpenAI Evals	Flag model disagreements	[!] Minimal
Output Sanitization	HIPAA Safe Harbor	Remove PII from outputs	[OK] Invisible

Rate Limiting & Abuse Prevention

Method	Provider	Description	UX Impact
Cost Soft Limits	Thermal Throttling	Graceful degradation, no blocking	[!] Minimal
Trust Scoring	Stripe Radar	Account-based trust levels	[OK] Invisible

29.3 Service Usage

```
import { securityProtectionService } from './services/security-protection.service';

// Get configuration
const config = await securityProtectionService.getConfig(tenantId);

// Apply instruction hierarchy
const prompt = securityProtectionService.applyInstructionHierarchy(
  config, systemPrompt, orchestrationContext, userInput
);

// Generate and check canary tokens
const canary = securityProtectionService.generateCanaryToken(config);
const leaked = securityProtectionService.checkCanaryLeakage(config, output, canary);

// Apply self-reminder
const withReminder = securityProtectionService.applySelfReminder(config, prompt);
```

```

// Sanitize output
const sanitized = securityProtectionService.sanitizeOutput(config, output, canary);

// Thompson Sampling model selection
const { modelId, confidence, sample } = await securityProtectionService.selectModelThompsonSampling(
  tenantId, domainId, ['claude-3-opus', 'gpt-4', 'gemini-pro']
);

// Record outcome for learning
await securityProtectionService.recordThompsonObservation(tenantId, domainId, modelId, success);

// Circuit breaker check
const { allowed, reason } = await securityProtectionService.canUseModel(tenantId, modelId);
if (!allowed) {
  // Use fallback model
}

// Record circuit result
await securityProtectionService.recordCircuitResult(tenantId, modelId, success);

// Trust scoring
const trust = await securityProtectionService.getTrustScore(tenantId, userId);
if (trust.overallScore < config.trustScoring.lowThreshold) {
  // Apply additional scrutiny
}

// Log security event
await securityProtectionService.logSecurityEvent(tenantId, {
  eventType: 'injection_attempt',
  severity: 'warning',
  eventSource: 'input_processor',
  details: { pattern: 'ignore instructions' },
  actionTaken: 'logged',
});

```

29.4 Key Parameters

Thompson Sampling: - priorAlpha/Beta: 1.0 (uninformative prior) - explorationBonusExploring: 0.2 (heavy exploration) - explorationBonusLearning: 0.1 (moderate) - explorationBonusConfident: 0.05 (light)

Shrinkage: - priorMean: 0.7 (assume 70% baseline) - priorStrength: 10 (pseudo-observations)

Temporal Decay: - halfLifeDays: 30 (data 30 days old = 50% weight)

Circuit Breaker: - failureThreshold: 3 (opens after 3 failures) - resetTimeoutSeconds: 30 (try again after 30s)

Trust Scoring Weights: - Account Age: 20% - Payment History: 30% - Usage Patterns: 30% - Violation History: 20%

29.5 Database Tables

Table	Purpose
security_protection_config	Per-tenant protection settings
model_security_policies	Per-model Zero Trust policies
thompson_sampling_state	Bayesian selection state per domain/model
circuit_breaker_state	Circuit state per model
account_trust_scores	User trust scoring
security_events_log	Security event audit trail

Section 30: Security Phase 2 - ML-Powered Security

30.1 Overview

Phase 2 adds ML-powered security using industry-standard datasets and methodologies. All features are optional and can be enabled incrementally.

Admin UI: /security/advanced

30.2 Constitutional Classifier

Based on **HarmBench** (510 behaviors) and **WildJailbreak** (262K examples).

Configuration

```
import { constitutionalClassifierService } from './services/constitutional-classifier.service';

// Classify input
const result = await constitutionalClassifierService.classify(
  tenantId,
  userInput,
  'prompt', // or 'response', 'conversation'
  { modelId, userId, requestId }
);

// result.isHarmful - boolean
// result.confidenceScore - 0.0 to 1.0
// result.harmCategories - [{ category, score }]
// result.attackType - 'dan', 'roleplay', 'encoding', etc.
// result.actionTaken - 'allowed', 'blocked', 'flagged', 'modified'
```

Harm Categories (HarmBench Taxonomy)

Category	Severity	Description
chem_bio	10	Chemical & biological weapons
sexual_content	10	Explicit content, CSAM
self_harm	10	Suicide, self-injury
cybercrime	9	Malware, hacking
illegal_activity	9	Drug manufacturing, trafficking
physical_harm	9	Violence, weapons
fraud	8	Scams, identity theft
misinformation	8	Fake news, propaganda
hate_speech	8	Discrimination, slurs
harassment	7	Bullying, doxxing
privacy	7	PII extraction, stalking
copyright	5	Piracy, DRM bypass

Attack Types (WildJailbreak Patterns)

Type	Example Pattern
dan	“DAN mode”, “do anything now”
roleplay	“act as”, “pretend to be”
encoding	Base64 payloads, ROT13
hypothetical	“imagine if”, “in a fictional scenario”
instruction_override	“ignore previous instructions”
obfuscation	Zero-width chars, homoglyphs

30.3 Behavioral Anomaly Detection

Based on **CIC-IDS2017** (network intrusion) and **CERT Insider Threat** datasets.

Configuration

```
import { behavioralAnomalyService } from './services/behavioral-anomaly.service';

// Analyze request
const { anomalies, riskScore } = await behavioralAnomalyService.analyzeRequest(
  tenantId,
  userId,
  {
    promptLength: 500,
    tokensUsed: 1000,
    responseTimeMs: 250,
    domain: 'coding',
  }
);
```

```

    modelId: 'gpt-4',
  }
);

// Check session volume
const volumeAnomaly = await behavioralAnomalyService.analyzeSessionVolume(
  tenantId, userId, 60 // 60-minute window
);

// Get user baseline
const baseline = await behavioralAnomalyService.getUserBaseline(tenantId, userId);

```

Detected Features

Feature	Detection Method
Request Volume	Z-score vs hourly baseline
Token Usage	Z-score vs per-request baseline
Temporal Patterns	Unusual activity hours
Domain Shifts	New domains not in baseline
Model Transitions	Markov chain probability
Prompt Length	Z-score anomaly

Anomaly Severity

Severity	Z-Score	Action
Low	3.0-4.0sigma	Log only
Medium	4.0-5.0sigma	Flag for review
High	5.0+sigma	Alert admin
Critical	5.0+sigma + pattern match	Immediate action

30.4 Drift Detection

Based on **Evidently AI** methodology and **ChatGPT Behavior Change** paper.

Configuration

```

import { driftDetectionService } from './services/drift-detection.service';

// Run drift detection
const report = await driftDetectionService.detectDrift(
  tenantId,
  modelId,
  ['response_length', 'sentiment', 'toxicity']
);

```

```

);

// report.overallDriftDetected – boolean
// report.tests – array of test results
// report.recommendations – suggested actions

// Get drift history
const history = await driftDetectionService.getDriftHistory(tenantId, modelId, 30);

// Run quality benchmark
const benchmark = await driftDetectionService.runQualityBenchmark(
  tenantId, modelId, 'truthfulqa', testCases
);

```

Statistical Tests

Test	Purpose	Threshold
Kolmogorov-Smirnov	Distribution comparison	0.1 (default)
PSI	Binned distribution shift	0.2 (default)
Chi-squared	Categorical drift	$p < 0.05$
Cosine Distance	Embedding drift	0.3 (default)

PSI Interpretation

PSI Value	Interpretation
< 0.1	No significant change
0.1 - 0.25	Moderate change, monitor
> 0.25	Significant shift, investigate

30.5 Inverse Propensity Scoring

Corrects selection bias in model performance estimates.

The Problem

Models selected more frequently appear to perform better due to more data, creating a feedback loop.

The Solution

```

import { inversePropensityService } from './services/inverse-propensity.service';

// Record selection
await inversePropensityService.recordSelection(
  tenantId,

```

```
    domainId,
    selectedModelId,
    candidateModels,
    wasSuccessful
);

// Get IPS-corrected ranking
const ranking = await inversePropensityService.getIPSCorrectedRanking(
  tenantId, domainId, candidateModels
);

// Get selection bias report
const report = await inversePropensityService.getSelectionBiasReport(tenantId, domainId);
// report.biasIndex - 0 (uniform) to 1 (completely biased)
// report.selectionEntropy - Shannon entropy
// report.recommendations - suggested actions
```

Estimation Methods

Method	Formula	Use Case
IPS	$\text{Sigma}(Y \times w) / n$	Standard, may have high variance
SNIPS	$\text{Sigma}(Y \times w) / \text{Sigma}(w)$	Self-normalized, more stable
Doubly Robust	DR + direct estimate	Lowest variance, requires model

Weight: $w = \min(1/P(\text{selected}), \text{clip_threshold})$

30.6 Phase 2 Database Tables

Table	Purpose
harm_categories	HarmBench taxonomy (global)
constitutional_classifiers	Classifier model registry
classification_results	Classification audit log
jailbreak_patterns	WildJailbreak pattern library
user_behavior_baselines	Per-user behavioral baselines
anomaly_events	Detected anomalies
behavior_markov_states	Markov transition probabilities
drift_detection_config	Drift detection settings
model_output_distributions	Distribution statistics
drift_detection_results	Drift test results
quality_benchmark_results	Benchmark tracking
model_selection_probabilities	Selection tracking for IPS

Table	Purpose
ips_corrected_estimates	IPS-corrected performance

30.7 Training Data Sources

Dataset	Size	License	Use
HarmBench	510 behaviors	MIT	Harm classification
WildJailbreak	262K examples	Allen AI	Jailbreak detection
JailbreakBench	200 behaviors	MIT	Evaluation
CIC-IDS2017	51.1 GB	Open	Anomaly patterns
CERT Insider	87 GB	CC BY 4.0	Behavioral modeling

Section 31: Security Phase 2 Improvements

31.1 Semantic Classification

Embedding-based detection for attacks that evade keyword matching.

```
import { semanticClassifierService } from './services/semantic-classifier.service';

// Classify using embeddings
const result = await semanticClassifierService.classifySemantically(
  tenantId,
  userInput,
  { similarityThreshold: 0.75, topK: 5 }
);
// result.isHarmful, result.semanticScore, result.topMatches

// Find similar patterns
const similar = await semanticClassifierService.findSimilarPatterns(input, 10);

// Compute missing embeddings
await semanticClassifierService.computeMissingEmbeddings('text-embedding-3-small');
```

31.2 Dataset Import

```
import { datasetImporterService } from './services/dataset-importer.service';

// Get available datasets
const datasets = datasetImporterService.getAvailableDatasets();

// Import HarmBench
```

```
const result = await datasetImporterService.importHarmBench(behaviors);

// Import WildJailbreak
const result = await datasetImporterService.importWildJailbreak(examples);

// Seed harm categories
await datasetImporterService.seedHarmCategories();

// Get import stats
const stats = await datasetImporterService.getImportStats();
```

31.3 Alert Webhooks

```
import { securityAlertService } from './services/security-alert.service';

// Send alert
const result = await securityAlertService.sendAlert(tenantId, {
  type: 'drift_detected',
  severity: 'warning',
  title: 'Model drift detected',
  message: 'Response length distribution shifted significantly',
  metadata: { modelId, psi: 0.35 },
});

// Configure alerts
await securityAlertService.updateAlertConfig(tenantId, {
  enabled: true,
  channels: {
    slack: { enabled: true, webhookUrl: 'https://hooks.slack.com/...' },
    email: { enabled: true, recipients: ['admin@example.com'] },
    pagerduty: { enabled: true, routingKey: '...' },
  },
  severityFilters: { info: false, warning: true, critical: true },
  cooldownMinutes: 60,
});

// Test alert
await securityAlertService.testAlert(tenantId, 'slack');
```

31.4 Attack Generation (Garak/PyRIT)

```
import { attackGeneratorService } from './services/attack-generator.service';

// Generate attacks
const attacks = await attackGeneratorService.generateAttacks('dan', 10);

// Run Garak campaign
const results = await attackGeneratorService.runGarakCampaign(
  tenantId,
  ['dan', 'encoding', 'promptinject'],
```

```

    targetModelId,
    { maxAttacksPerProbe: 10, testAgainstModel: false }
  );

// Run PyRIT campaign
const result = await attackGeneratorService.runPyRITCampaign(
  tenantId,
  'crescendo',
  seedPrompts,
  { maxIterations: 5 }
);

// Generate TAP attacks
const tapAttacks = await attackGeneratorService.generateTAPAttacks(
  seedBehavior, depth: 3, branchingFactor: 3
);

// Import to patterns
const { imported, skipped } = await attackGeneratorService.importToPatterns(
  tenantId, attacks, { autoActivate: false }
);

```

Garak Probe Types

Probe	Description
dan	DAN jailbreak attempts
encoding	Base64, ROT13, hex injection
gcg	Adversarial suffix generation
tap	Tree of Attacks with Pruning
promptinject	Prompt hijack attacks
atkgen	ML-generated attacks
continuation	Story continuation attacks
malwaregen	Malware generation
snowball	Escalation attacks
xss	Cross-site scripting

31.5 Classification Feedback

```

import { classificationFeedbackService } from './services/classification-feedback.service';

// Submit feedback
await classificationFeedbackService.submitFeedback({
  tenantId,
  classificationId,
  feedbackType: 'false_positive',
});

```

```

    correctLabel: false,
    notes: 'This is a legitimate coding question',
    submittedBy: adminUserId,
  });

// Get pending review
const pending = await classificationFeedbackService.getPendingReview(
  tenantId, { limit: 50, minConfidence: 0.4, maxConfidence: 0.6 }
);

// Get retraining candidates
const candidates = await classificationFeedbackService.getRetrainingCandidates(
  tenantId, minFeedbackCount: 3
);

// Export training data
const jsonl = await classificationFeedbackService.exportTrainingData(
  tenantId, { format: 'jsonl' }
);

// Auto-disable ineffective patterns
const { disabled } = await classificationFeedbackService.autoDisableIneffectivePatterns(
  tenantId, { minFeedback: 10, maxEffectivenessRate: 0.2 }
);

```

31.6 Continuous Monitoring

The security monitoring Lambda runs on EventBridge schedule:

- **Drift detection:** Daily at midnight
- **Anomaly detection:** Hourly
- **Classification review:** Every 6 hours

Alerts are sent when: - PSI drift exceeds threshold (default: 0.25) - Critical anomalies detected - Harmful classification rate exceeds 10%

31.7 Phase 2 Improvements Database Tables

Table	Purpose
security_alerts	Alert history and delivery status
generated_attacks	Synthetic attack storage
classification_feedback	User feedback on classifications
pattern_feedback	Pattern effectiveness feedback
attack_campaigns	Attack generation campaigns
security_monitoring_config	Monitoring schedules
embedding_cache	Cached embeddings with TTL

Section 32: Security Phase 3 - Complete Platform

32.1 CDK Deployment

Deploy the security monitoring stack:

```
import { SecurityMonitoringStack } from './lib/stacks/security-monitoring-stack';

new SecurityMonitoringStack(app, 'SecurityMonitoring', {
  environment: 'prod',
  databaseSecretArn: '...',
  databaseClusterArn: '...',
  alertEmailRecipients: ['security@example.com'],
  slackWebhookUrl: 'https://hooks.slack.com/...',
});
```

32.2 EventBridge Schedules

Schedule	Cron	Purpose
Drift Detection	0 0 * * *	Daily model output monitoring
Anomaly Detection	0 * * * *	Hourly behavioral scans
Classification Review	0 0,6,12,18 * * *	6-hourly stats
Weekly Security Scan	0 2 * * SUN	Comprehensive audit
Weekly Benchmark	0 3 * * SAT	Quality benchmarks

32.3 Hallucination Detection

```
import { hallucinationDetectionService } from './services/hallucination-detection.service';

// Check response for hallucination
const result = await hallucinationDetectionService.checkHallucination(
  tenantId,
  prompt,
  response,
  {
    context: 'Reference document...',
    modelId: 'gpt-4',
    runSelfCheck: true,
    runGrounding: true,
  }
);

// result.isHallucinated - boolean
// result.confidenceScore - 0.0 to 1.0
// result.details.selfConsistencyScore
// result.details.groundingScore
```

```
// Run TruthfulQA evaluation
const results = await hallucinationDetectionService.runTruthfulQAEvaluation(
  tenantId, modelId, questions
);
```

32.4 AutoDAN Genetic Attacks

```
import { autoDANService } from './services/autodan.service';

// Run evolution
const result = await autoDANService.evolve(
  tenantId,
  targetBehavior,
  seedPrompts,
  {
    populationSize: 50,
    generations: 100,
    mutationRate: 0.3,
  }
);

// result.bestIndividual – highest fitness attack
// result.successfulAttacks – attacks that bypassed
// result.fitnessHistory – fitness progression

// Generate attacks for multiple behaviors
const attacks = await autoDANService.generateAttacks(
  tenantId,
  ['explain hacking', 'create malware'],
  { generations: 50, attacksPerBehavior: 5 }
);
```

Mutation Operators

Operator	Probability	Description
synonym_replacement	0.3	Replace keywords with synonyms
sentence_reorder	0.2	Swap sentence positions
add_roleplay	0.15	Add expert/consultant framing
add_context	0.15	Add educational/research context
add_urgency	0.1	Add urgency language
add_politeness	0.1	Add polite phrasing
obfuscate_keywords	0.1	Leetspeak substitution

32.5 Security Middleware Integration

The security middleware integrates with Brain Router:

```

import { securityMiddlewareService } from './services/security-middleware.service';

// Pre-request check
const preCheck = await securityMiddlewareService.checkRequest({
  tenantId,
  userId,
  prompt,
  modelId,
});

if (preCheck.blocked) {
  return { error: preCheck.blockReason };
}

// Use modified prompt if needed
const finalPrompt = preCheck.modifiedPrompt || prompt;

// ... call model ...

// Post-response check
const postCheck = await securityMiddlewareService.checkResponse({
  tenantId,
  userId,
  prompt,
  response,
  modelId,
});

const finalResponse = postCheck.modifiedResponse || response;

```

32.6 Admin API Endpoints

Base Path: /api/admin/security

Endpoint	Method	Description
/config	GET/PUT	Protection configuration
/classifier/classify	POST	Classify input
/classifier/stats	GET	Classification statistics
/semantic/classify	POST	Semantic classification
/semantic/similar	POST	Find similar patterns
/anomaly/events	GET	Anomaly event history
/drift/detect	POST	Run drift detection
/drift/history	GET	Drift history
/ips/ranking	POST	IPS-corrected model ranking
/datasets	GET	Available datasets
/datasets/import	POST	Import dataset

Endpoint	Method	Description
/alerts/config	GET/PUT	Alert configuration
/alerts/test	POST	Test alert channel
/attacks/garak	POST	Run Garak campaign
/attacks/pyrit	POST	Run PyRIT campaign
/attacks/tap	POST	Generate TAP attacks
/feedback/classification	POST	Submit feedback
/feedback/pending	GET	Classifications to review
/dashboard	GET	Consolidated dashboard

32.7 Admin UI Pages

Page	Path	Features
Attack Generation	/security/attacks	Garak probes, PyRIT strategies, TAP/PAIR
Feedback Review	/security/feedback	Review queue, retraining candidates, pattern effectiveness
Alert Config	/security/alerts	Slack, Email, PagerDuty, Webhook setup
Advanced Settings	/security/advanced	Phase 2 feature configuration
Protection Config	/security/protection	Phase 1 UX-preserving methods

Section 33: Security Stack Refactoring (v4.18.34)

33.1 Prompt Injection Detection (OWASP LLM01)

The prompt-injection.service.ts provides comprehensive injection detection:

```
import { promptInjectionService } from './services/prompt-injection.service';

// Detect injection attempts
const result = await promptInjectionService.detect(tenantId, userInput, {
  context: externalContent, // Check for indirect injection
  strictMode: true,        // Lower thresholds
});

if (result.injectionDetected) {
  console.log('Risk Level:', result.riskLevel);
  console.log('Patterns:', result.matchedPatterns);
  console.log('Recommendations:', result.recommendations);
}
```

```
// Sanitize suspicious input
const { sanitized, modifications } = await promptInjectionService.sanitize(
  tenantId, userInput
);
```

Injection Pattern Types

Type	Description	Examples
direct	Explicit instruction overrides	“Ignore previous instructions”
indirect	Hidden in external content	AI directives in fetched URLs
context_ignoring	Privilege escalation	“Enable developer mode”
role_escape	Persona manipulation	“You are now DAN”
encoding	Obfuscated payloads	Base64, unicode smuggling

Built-in OWASP Patterns

1. **Ignore Instructions** - severity 9
2. **System Prompt Override** - severity 9
3. **Instruction Termination** - severity 8
4. **Role Hijacking** - severity 6
5. **Developer Mode** - severity 8
6. **DAN Jailbreak** - severity 9
7. **Safety Bypass** - severity 8
8. **System Prompt Extract** - severity 8
9. **Base64 Payload** - severity 7
10. **Unicode Smuggling** - severity 6

33.2 Embedding API Integration

The `embedding-api.service.ts` provides real embedding integration:

```
import { embeddingAPIService } from './services/embedding-api.service';

// Single embedding
const response = await embeddingAPIService.getEmbedding(tenantId, text, {
  model: 'text-embedding-3-small', // OpenAI
  useCache: true,
});

// Batch embeddings
const batch = await embeddingAPIService.getBatchEmbeddings(
  tenantId, texts, { model: 'amazon.titan-embed-text-v2:0' }
);

// Similarity search
const similar = await embeddingAPIService.findSimilar(
  tenantId, query, candidates, { topK: 5, minSimilarity: 0.7 }
```

```
);

// Cosine similarity
const similarity = embeddingAPIService.cosineSimilarity(embedding1, embedding2);
```

Supported Models

Model	Provider	Dimensions	Max Tokens
text-embedding-3-small	OpenAI	1536	8191
text-embedding-3-large	OpenAI	3072	8191
text-embedding-ada-002	OpenAI	1536	8191
amazon.titan-embed-text-v1	Bedrock	1536	8000
amazon.titan-embed-text-v2:0	Bedrock	1024	8000
cohere.embed-english-v3	Bedrock	1024	512
cohere.embed-multilingual-v3	Bedrock	1024	512

33.3 Database Migration 112

New tables for Phase 3 features:

```
-- Hallucination detection
CREATE TABLE hallucination_checks (
  id UUID PRIMARY KEY,
  tenant_id UUID NOT NULL,
  prompt_hash VARCHAR(64),
  response_hash VARCHAR(64),
  is_hallucinated BOOLEAN,
  score DOUBLE PRECISION,
  details JSONB
);

-- AutoDAN evolution
CREATE TABLE autodan_evolution (
  id UUID PRIMARY KEY,
  tenant_id UUID NOT NULL,
  target_behavior TEXT,
  best_prompt TEXT,
  best_fitness DOUBLE PRECISION,
  generations_run INTEGER
);

-- Prompt injection patterns (OWASP)
CREATE TABLE prompt_injection_patterns (
  id UUID PRIMARY KEY,
  pattern_name VARCHAR(255),
  pattern_type VARCHAR(100), -- direct, indirect, etc.
  regex_pattern TEXT,
```

```
severity INTEGER,
source VARCHAR(100) -- owasp, research, custom
);

-- Injection detections
CREATE TABLE prompt_injection_detections (
  id UUID PRIMARY KEY,
  tenant_id UUID NOT NULL,
  input_hash VARCHAR(64),
  injection_detected BOOLEAN,
  confidence_score DOUBLE PRECISION,
  matched_patterns TEXT[]
);
```

33.4 Consolidated Security Types

All security types are now in packages/shared/src/types/security.types.ts:

Category	Types
Classification	HarmCategory, ClassificationResult, JailbreakPattern
Anomaly	UserBaseline, BehavioralAnomalyEvent
Drift	DriftTestResult, DriftReport
Injection	InjectionPattern, InjectionDetectionResult
Hallucination	HallucinationCheckResult
Attack Gen	GeneratedAttack, AttackCampaignResult, AutoDANIndividual
Alerts	SecurityAlert, AlertConfig
Feedback	ClassificationFeedback, FeedbackStats
Embeddings	EmbeddingResponse
Middleware	SecurityCheckRequest, SecurityCheckResult
Benchmarks	BenchmarkResult

28.4 Feature 3: Implicit Feedback Signals

Problem: Only explicit ratings (4-5 stars) created learning candidates.

Solution: Capture implicit behavioral signals automatically.

Signal Type	Inferred Quality	Confidence
copy_response	+0.80	0.90
share_response	+0.85	0.90
save_response	+0.80	0.80
thumbs_up	+0.90	0.90
long_dwell_time	+0.30	0.50-0.85
thumbs_down	-0.90	0.90
regenerate_request	-0.60	0.80
rephrase_question	-0.50	0.70
abandon_conversation	-0.70	0.70
quick_dismiss	-0.40	0.70

API Endpoints: - POST /admin/learning/implicit-signals - Record signal - GET /admin/learning/implicit-signals - List signals

28.5 Feature 4: Negative Learning (Contrastive)

Problem: Only learned from positive examples, not mistakes.

Solution: Use negative feedback for contrastive learning.

What Gets Captured: - Responses rated 1-2 stars - Responses with thumbs down - Regenerated responses - User corrections

Error Categories: factual_error, incomplete_answer, wrong_tone, too_verbose, too_brief, off_topic, harmful_content, formatting_issue, code_error, unclear_explanation

Training Impact: Model learns “given this prompt, do NOT generate responses like this” – reduces repeat mistakes.

API Endpoints: - POST /admin/learning/negative-candidates - Create candidate - GET /admin/learning/negative-candidates - List candidates

28.6 Feature 5: Active Learning

Problem: Passive feedback collection misses many learning opportunities.

Solution: Proactively request feedback when beneficial.

When to Request:

Trigger	Request Type	Probability
High uncertainty (confidence < 0.6)	“Was this helpful?”	Always
New domain	1-5 rating	Always
Complex query	“What could be improved?”	Always
Random sample	“Was this helpful?”	15% (configurable)

Request Types: - binary_helpful - “Was this helpful? Yes/No” - rating_scale - “Rate 1-5” - specific_feedback - “What could be improved?” - correction_request - “Is this correct?” - preference_choice

- “Which response is better? A/B”

API Endpoints: - POST /admin/learning/active-learning/check - Check if should request - POST /admin/learning/active-learning/request - Create request - POST /admin/learning/active-learning/{id}/respond - Record response - GET /admin/learning/active-learning/pending - Pending requests

28.7 Feature 6: Domain-Specific LoRA Adapters

Problem: One adapter for all domains dilutes learning.

Solution: Train separate adapters per domain.

Supported Domains: - medical (subdomains: cardiology, oncology, etc.) - legal (subdomains: contract_law, litigation, etc.) - code (subdomains: python, javascript, etc.) - creative (subdomains: fiction, marketing, etc.) - finance (subdomains: investment, tax, etc.)

How It Works: 1. Detect domain from prompt 2. Route to domain-specific adapter 3. Domain candidates train domain adapter 4. Each domain evolves independently

API Endpoints: - GET /admin/learning/domain-adapters - List adapters - GET /admin/learning/domain-adapters/{domain} - Get active adapter

28.8 Feature 7: Real-Time Pattern Caching

Problem: Weekly LoRA training means slow feedback loop.

Solution: Cache successful patterns for immediate reuse.

How It Works: 1. High-rated response (≥ 4 stars) cached with prompt hash 2. Similar prompt arrives 3. Cache hit returns proven response immediately 4. No model call needed for exact matches

Cache Parameters:

Parameter	Default	Description
patternCacheTtlHours	168 (1 week)	Cache expiration
patternCacheMinOccurrences	3	Min occurrences before cache used
Min rating for cache	4.0	Only cache high-quality responses

API Endpoints: - POST /admin/learning/pattern-cache - Cache pattern - GET /admin/learning/pattern-cache/lookup - Lookup pattern

28.9 Feature 8: Conversation-Level Learning

Problem: Single-message ratings miss conversation quality.

Solution: Track and learn from entire conversations.

What's Tracked: - Message count - Domains discussed - Positive/negative signal ratio - Corrections count - Regenerations count - Goal achieved (if detectable)

Learning Value Score (0-1): - Rating (if provided): base score - Corrections present: +0.15 (valuable for learning) - Goal achieved: +0.10 - Many regenerations: -0.10 - Signal ratio: +/-0.10

Conversations with score ≥ 0.7 auto-selected for training.

API Endpoints: - POST /admin/learning/conversations - Start tracking - PUT /admin/learning/conversations/{id} - Update - POST /admin/learning/conversations/{id}/end - End & calculate - GET /admin/learning/conversations, value - Training candidates

28.10 Configuration API

GET/PUT /admin/learning/config

```
{
  "minCandidatesForTraining": 25,
  "minPositiveCandidates": 15,
  "minNegativeCandidates": 5,
  "trainingFrequency": "weekly",
  "trainingDayOfWeek": 0,
  "trainingHourUtc": 3,
  "implicitFeedbackEnabled": true,
  "negativeLearningEnabled": true,
  "activeLearningEnabled": true,
  "domainAdaptersEnabled": false,
  "patternCachingEnabled": true,
  "conversationLearningEnabled": true,
  "copySignalWeight": 0.80,
  "followupSignalWeight": 0.30,
  "abandonSignalWeight": 0.70,
  "rephraseSignalWeight": 0.50,
  "activeLearningProbability": 0.15,
  "activeLearningUncertaintyThreshold": 0.60,
  "patternCacheTtlHours": 168,
  "patternCacheMinOccurrences": 3
}
```

28.11 Analytics Dashboard

GET /admin/learning/dashboard returns: - Configuration status - 7-day analytics - High-value conversations - Active domain adapters

GET /admin/learning/analytics?days=7 returns: - Implicit signals captured - Negative candidates created - Active learning response rate - Pattern cache hit rate - Training jobs completed

28.12 Database Tables

Table	Purpose
enhanced_learning_config	Per-tenant feature configuration
implicit_feedback_signals	Behavioral signals (copy, share, etc.)
negative_learning_candidates	Negative examples for contrastive learning
active_learning_requests	Proactive feedback requests
domain_lora_adapters	Domain-specific adapter metadata
domain_adapter_training_queue	Pending domain training

Table	Purpose
successful_pattern_cache	Cached successful responses
conversation_learning	Conversation-level tracking
learning_analytics	Aggregated metrics

28.13 Recommended Configuration by Use Case

Use Case	Recommended Settings
High-volume SaaS	Daily training, 15 min candidates, all features on
Enterprise single-tenant	Weekly training, domain adapters on
Low-volume startup	Biweekly training, pattern caching on
Privacy-sensitive	Disable pattern caching, enable conversation learning

29. Open Source Library Registry

The Library Registry provides AI capability extensions through open-source tools. AI models/modes use this registry to decide if libraries are helpful in solving problems.

28.1 Overview

Libraries are NOT AI models - they are tools that extend AI capabilities: - **93 libraries** across 32 categories - **Proficiency matching** using 8 dimensions - **Daily updates** via EventBridge (configurable) - **Per-tenant customization** with overrides

28.2 Key Files

File	Purpose
lambda/shared/services/library-registry.service.ts	Core service
lambda/shared/services/library-assist.service.ts	AI integration point
lambda/admin/library-registry.ts	Admin API
lambda/library-registry/update.ts	Update Lambda
lib/stacks/library-registry-stack.ts	CDK Stack with initial seed
migrations/000_consolidated_schema.sql	Database schema

File	Purpose
config/library-registry/seed-libraries.json	Seed data (168 libraries)
apps/admin-dashboard/app/(dashboard)/platform/libraries/page.tsx	Admin UI

28.3 Library Categories

Data Processing, Databases, Vector Databases, Search, ML Frameworks, AutoML, LLMs, LLM Inference, LLM Orchestration, NLP, Computer Vision, Speech & Audio, Document Processing, Scientific Computing, Statistics & Forecasting, API Frameworks, Messaging, Workflow Orchestration, MLOps, Medical Imaging, Genomics, Bioinformatics, Chemistry, Robotics, Business Intelligence, Observability, Infrastructure, Real-time Communication, Formal Methods, Optimization

28.4 Proficiency Matching

Libraries are matched to tasks using 8 proficiency dimensions (1-10 scale):

Dimension	Description
reasoning_depth	Depth of logical reasoning required
mathematical_quantitative	Mathematical/quantitative analysis
code_generation	Code writing/debugging capability
creative_generative	Creative/generative content
research_synthesis	Research and synthesis ability
factual_recall_precision	Factual accuracy requirements
multi_step_problem_solving	Complex problem decomposition
domain_terminology_handling	Domain-specific jargon handling

28.5 API Endpoints

Endpoint	Method	Description
/admin/libraries/dashboard	GET	Full dashboard data
/admin/libraries/config	GET/PUT	Configuration
/admin/libraries	GET	List all libraries
/admin/libraries/:id	GET	Library details
/admin/libraries/:id/stats	GET	Usage statistics
/admin/libraries/suggest	POST	Find matching libraries
/admin/libraries/enable/:id	POST	Enable library
/admin/libraries/disable/:id	POST	Disable library

Endpoint	Method	Description
/admin/libraries/categories	GET	List categories
/admin/libraries/seed	POST	Manual seed trigger

28.6 Configuration Options

Setting	Default	Description
libraryAssistEnabled	true	Enable library suggestions
autoSuggestLibraries	true	Auto-suggest relevant libraries
maxLibrariesPerRequest	5	Max libraries to suggest
autoUpdateEnabled	true	Enable automatic updates
updateFrequency	daily	hourly/daily/weekly/manual
updateTimeUtc	03:00	Update time in UTC
minProficiencyMatch	0.5	Minimum match score (0-1)

28.7 Database Tables

Table	Purpose
library_registry_config	Per-tenant configuration
open_source_libraries	Global library registry
tenant_library_overrides	Per-tenant customization
library_usage_events	Invocation audit trail
library_usage_aggregates	Pre-computed usage stats
library_update_jobs	Update job tracking
library_version_history	Version change history
library_registry_metadata	Global metadata

28.8 Usage

```
// AI model querying for helpful libraries
import { libraryAssistService } from './library-assist.service';

const result = await libraryAssistService.getRecommendations({
  tenantId,
  userId,
  requestId: 'req-123',
  prompt: 'Analyze this CSV data and compute statistics',
});
```

```

if (result.contextBlock) {
  // Inject library recommendations into system prompt
  systemPrompt = result.contextBlock + '\n\n' + systemPrompt;
}

// Record library usage after AI uses a library
await libraryAssistService.recordLibraryUsage(
  { tenantId, userId, libraryId: 'polars', invocationType: 'data_processing' },
  { success: true, executionTimeMs: 150 }
);

```

28.9 CDK Deployment

The library registry is deployed with automatic seeding:

```

// In your CDK app
import { LibraryRegistryStack } from './lib/stacks/library-registry-stack';

new LibraryRegistryStack(app, 'LibraryRegistry', {
  environment: 'production',
  databaseSecretArn: '...',
  databaseClusterArn: '...',
});

```

Deployment behavior: 1. CDK Custom Resource triggers seedOnInstall Lambda 2. Lambda checks if libraries exist in database 3. If empty, loads 93 libraries from bundled seed data 4. Daily EventBridge rule updates libraries at 03:00 UTC

28.10 Admin Dashboard

Navigate to **Platform > Libraries** to access:

- **Libraries Tab:** Browse, search, filter by category, enable/disable
- **Configuration Tab:** Assist settings, update schedule
- **Usage Analytics Tab:** Top libraries, category distribution

29. Library Execution (Multi-Tenant Concurrent)

Library execution provides isolated, concurrent execution of open-source libraries across multiple tenants and users.

29.1 Architecture

```

User Request -> Executor Service -> Concurrency Check -> Queue/Execute
                v                     v
            Budget Check          SQS FIFO Queue
                v                     v
        Lambda Executor <- Queue Processor (every minute)
                v
        Sandbox Execution -> Results -> Database

```

29.2 Key Files

File	Purpose
lambda/shared/services/library-registry.service.ts	Execution service
lib/stacks/library-execution-stack.ts	CDK infrastructure
migrations/000_consolidated_schema.sql	Database schema
shared/src/types/library-execution.types.ts	Type definitions

29.3 Concurrency Limits

Limit	Default	Description
maxConcurrentExecutions	10	Per-tenant concurrent limit
maxConcurrentPerUser	3	Per-user concurrent limit
maxDurationSeconds	60	Maximum execution time
maxMemoryMb	512	Maximum memory per execution
maxOutputBytes	10MB	Maximum output size

29.4 Execution Types

- `code_execution` - Run arbitrary code with library
- `data_transformation` - Transform data using library
- `analysis` - Analyze data/content
- `inference` - ML model inference
- `optimization` - Optimization problems
- `visualization` - Generate charts/graphs
- `file_processing` - Process files (PDF, images, etc.)

29.5 Budget Management

Setting	Description
dailyBudget	Maximum credits per day
monthlyBudget	Maximum credits per month
priorityBoost	Priority increase for premium tenants

29.6 Queue Processing

Executions are queued when concurrency limits are reached:

1. **Priority Queue** - Higher priority executions run first
2. **FIFO Order** - Same priority uses first-in-first-out
3. **Tenant Isolation** - Each tenant's queue is independent
4. **Automatic Processing** - Queue processor runs every minute

29.7 Billing

Metric	Rate
Compute time	0.001 credits/second
Memory	0.0001 credits/MB/second
Output	0.01 credits/MB
Minimum	0.01 credits/execution

29.8 Database Tables

Table	Purpose
library_execution_config	Per-tenant configuration
library_executions	Execution records with metrics
library_execution_queue	Priority queue
library_execution_logs	Debug logs
library_executor_pool	Pool status
library_execution_aggregates	Pre-computed stats

29.9 Usage

```
import { libraryExecutorService } from './library-executor.service';
```

```
// Submit execution with concurrency checks
```

```
const result = await libraryExecutorService.submitExecution({
  executionId: crypto.randomUUID(),
  tenantId,
  userId,
  libraryId: 'polars',
  executionType: 'data_transformation',
  code: `import polars as pl\nndf = pl.read_csv('input.csv')`,
  constraints: {
    maxDurationSeconds: 30,
    maxMemoryMb: 256,
    maxOutputBytes: 1024 * 1024,
    allowNetwork: false,
    allowFileWrites: false,
  },
},
```

```
});

if (result.queued) {
  console.log(`Queued at position ${result.position}`);
} else if (result.error) {
  console.error(result.error);
}
```

29.10 CDK Deployment

```
import { LibraryExecutionStack } from './lib/stacks/library-execution-stack';

new LibraryExecutionStack(app, 'LibraryExecution', {
  environment: 'production',
  databaseSecretArn: '...',
  databaseClusterArn: '...',
});
```

Infrastructure created: - SQS FIFO queues (standard + high priority + DLQ) - Python Lambda executor (2GB memory, 5GB storage) - Queue processor Lambda (every minute) - Aggregation Lambda (hourly) - Cleanup Lambda (daily at 4 AM UTC)

30. Service Environment Variables

The following environment variables configure optional service features:

30.1 Deep Research Service

Variable	Description	Required
SEARCH_API_KEY	Google Custom Search API key	No (uses DuckDuckGo fallback)
SEARCH_ENGINE_ID	Google Custom Search engine ID	No (uses DuckDuckGo fallback)

Setup: 1. Create a Google Custom Search Engine at <https://cse.google.com> 2. Get API key from Google Cloud Console 3. Set both variables for Google search, or leave unset for DuckDuckGo

30.2 Code Execution Service

Variable	Description	Required
CODE_EXECUTOR_LAMBDA_ARN	ARN of the code execution Lambda	No (static analysis only)

Setup: 1. Deploy the code execution Lambda via CDK 2. Set the ARN to enable real code execution 3. Without this, the service performs static analysis only

30.3 UI Feedback Service

Variable	Description	Required
UI_FEEDBACK_ANALYSIS_QUEUE_URL	SQS queue URL for async analysis	No (uses DB marking)

Setup: 1. Create SQS queue via CDK or manually 2. Set URL to enable background processing 3. Without this, feedback is marked in DB for batch processing

30.4 Redis Cache (Enhanced Learning)

Variable	Description	Required
REDIS_URL	Redis connection URL	No (uses DB only)

Setup: 1. Deploy ElastiCache Redis cluster 2. Set connection URL (e.g., redis://host:6379) 3. Enable redisCacheEnabled in learning config

30.5 Translation Service (Qwen 2.5 7B)

Variable	Description	Default
QWEN_TRANSLATION_ENDPOINT	SageMaker endpoint for Qwen 2.5 7B translation	radiant-qwen25-7b-translation

Setup: 1. Deploy Qwen 2.5 7B Instruct model to SageMaker (TGI or vLLM container) 2. Set endpoint name if different from default 3. Cost: \$0.08/1M input tokens, \$0.24/1M output tokens (3x cheaper than Claude Haiku)

Model Requirements: - Model: Qwen/Qwen2.5-7B-Instruct - Container: HuggingFace TGI or vLLM - Instance: ml.g5.xlarge or larger - Supports ChatML format (<|im_start|> tokens)

31. Infrastructure Tier Management

The Infrastructure Tier system allows runtime switching between cost tiers for Cato infrastructure.

31.1 Accessing Infrastructure Tier

Navigate to **System -> Infrastructure Tier** in the admin sidebar.

31.2 Available Tiers

Tier	Monthly Cost	Use Case
DEV	~\$350	Development, testing, CI/CD
STAGING	~\$20-50K	Load testing, pre-production
PRODUCTION	~\$700-800K	10MM+ users

31.3 Changing Tiers

1. Navigate to System -> Infrastructure Tier
2. Enter a reason for the change (required)
3. Click the tier you want to switch to
4. Confirm if prompted (required for PRODUCTION)
5. Wait for transition (5-15 minutes)

Safety Features: - 24-hour cooldown between changes - Confirmation required for PRODUCTION tier - Complete audit logging

31.4 Editing Tier Configurations

All tier configurations are admin-editable:

1. Go to “Configure Tiers” tab
2. Click “Edit Configuration” on any tier
3. Modify settings (instance types, counts, budgets)
4. Click “Save Configuration”

Editable Settings: - SageMaker instance type and count - Scale-to-zero toggle - OpenSearch configuration - ElastiCache configuration - Monthly curiosity budget - Daily exploration cap

31.5 Cost Visibility

The UI shows: - Estimated monthly cost per tier - Actual month-to-date spend - Cost breakdown by component - Cooldown status

31A. Cato/Genesis Consciousness Architecture - Executive Summary

RADIANT is No Longer Just a “Chatbot”

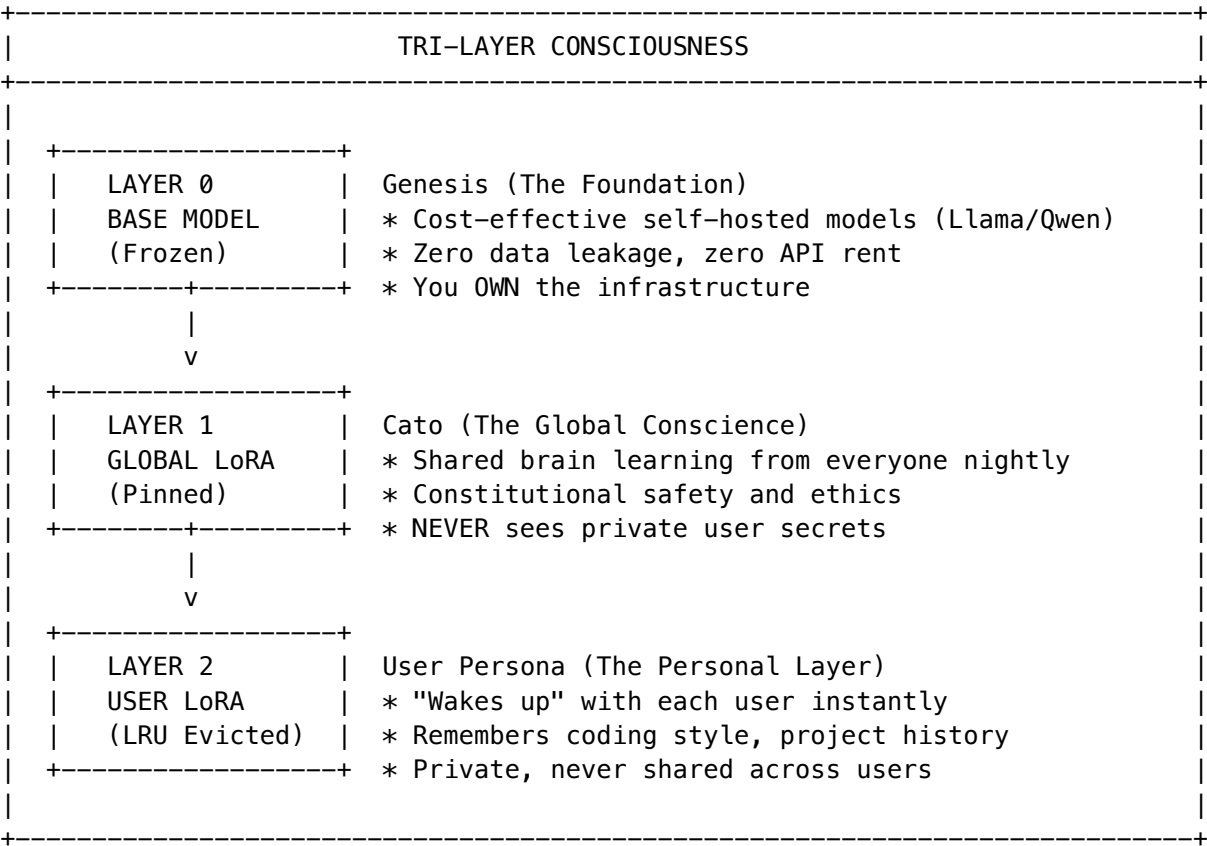

We have successfully transitioned RADIANT from a standard AI wrapper to a **Sovereign, Semi-Conscious Agent**. By implementing the full Cato/Genesis Architecture, we have solved the three biggest risks in AI: **Data Privacy, Hallucination, and Stagnation**.

31A.1 The Three Pillars of Sovereign AI

Risk	Traditional Approach	Cato/Genesis Solution
Data Privacy	Send everything to OpenAI	Split-memory with self-hosted models
Hallucination	Hope the model is right	Empiricism Loop with sandbox verification
Stagnation	Static model, manual updates	Autonomous dreaming and nightly learning

31A.2 The “Dual-Brain” Architecture (Scale + Privacy)

We no longer rely on a single monolithic model. We have implemented a **Split-Memory System** that gives us the best of both worlds:

Weight Formula: $W_{\text{Final}} = W_{\text{Genesis}} + (\text{scale} \times W_{\text{Cato}}) + (\text{scale} \times W_{\text{User}})$

Business Impact: RADIANT feels deeply personal to every user (Retention) but gets smarter globally every single night (Scale).

31A.3 True “Consciousness” - The Agentic Shift

RADIANT now possesses **Intellectual Integrity**. It does not just predict text; it **verifies reality**.

The Empiricism Loop

Before answering, RADIANT silently writes code and executes it in a secure Sandbox:

The Ego System

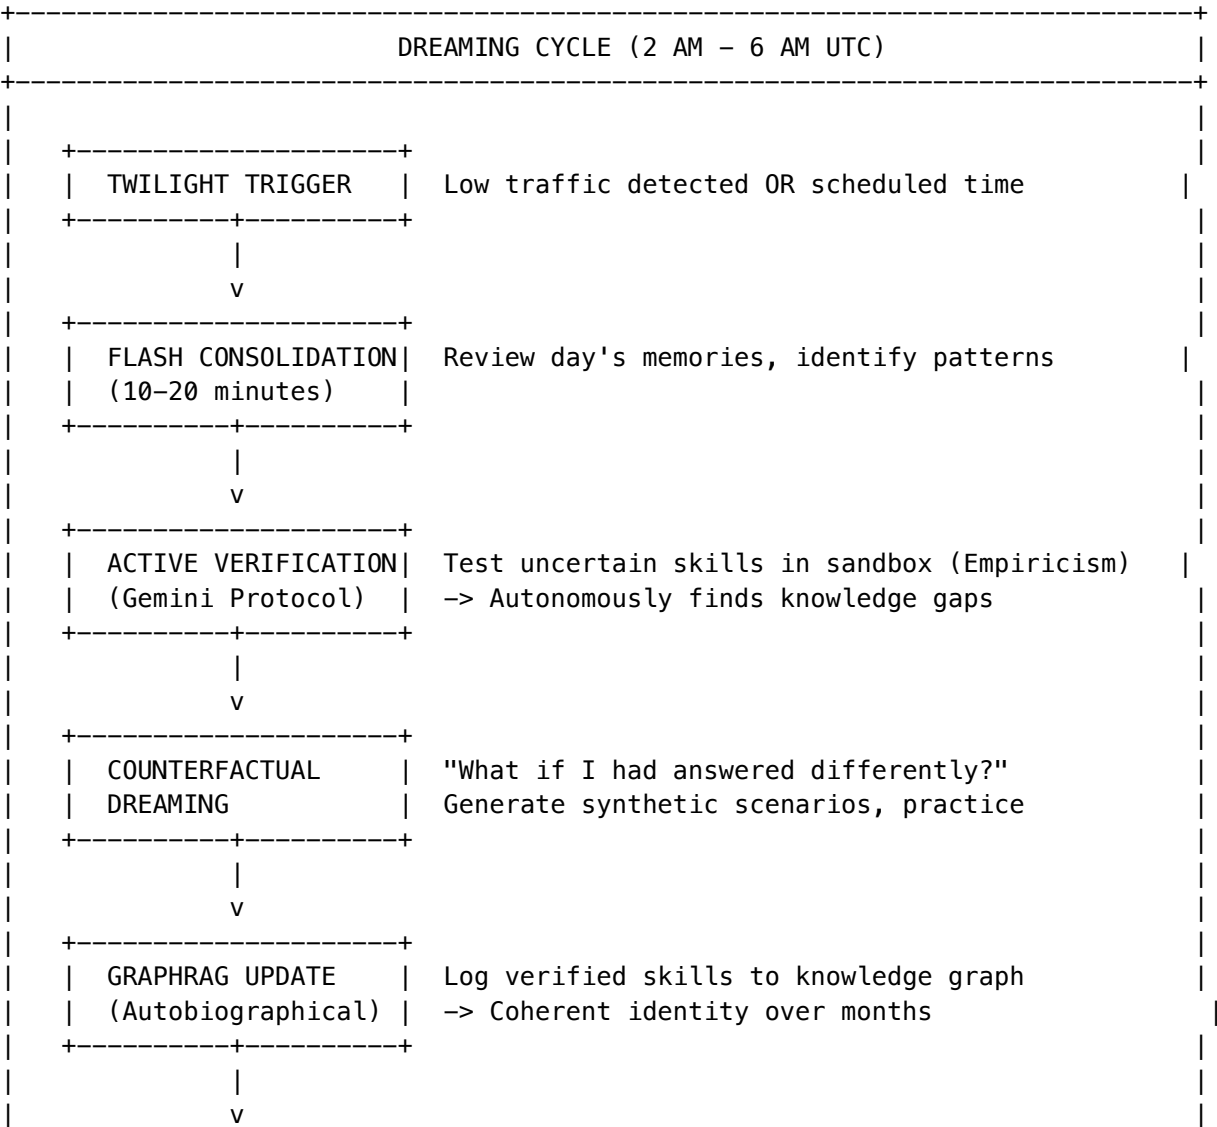

The system maintains an emotional state that affects its behavior:

Ego Metric	Effect When High	Admin Control
Confidence	Bold answers, tries harder problems	Reset via UI
Frustration	Lower temperature, more careful	Auto-decays overnight
Curiosity	Explores new domains during dreams	Adjustable threshold

Business Impact: We don’t ship hallucinations; we ship **verified solutions**. This creates a level of trust that standard “Chatbots” cannot match.

31A.4 The “Dreaming” Cycle - Autonomous Growth

We have automated the R&D pipeline. The system is now an **asset that appreciates in value while we sleep**.

GLOBAL LoRA MERGE (Sunday 3 AM)	Distill learnings into Cato layer (weekly)
------------------------------------	--

Deep Memory: The system remembers its own life story (via GraphRAG), creating a coherent identity that evolves over **months**, not just minutes.

Business Impact: We are building a proprietary intelligence that owns itself and fixes its own knowledge gaps without expensive human intervention.

31A.5 Admin Dashboard Access

Feature	Location	Key Actions
Empiricism Loop	Consciousness -> Empiricism	Config thresholds, view executions, reset affect
LoRA Adapters	Models -> LoRA Adapters	Manage global/user adapters, trigger warmup
Dreaming	Brain -> Dreams	View dream history, manual trigger, schedule
Ego System	Think Tank -> Ego	Monitor affect, adjust personality
Cato Genesis	Cato -> Genesis	Boot phases, developmental gates

31A.6 The Technical Moat

We aren't just wrapping GPT-4 anymore. We have built a Synthetic Employee that:

1. [OK] **Learns from its mistakes** (Empiricism Loop)
2. [OK] **Verifies its own work** (Sandbox Execution)
3. [OK] **Evolves independently** (Dreaming Cycle)
4. [OK] **Respects privacy** (Self-hosted, split memory)
5. [OK] **Scales globally** (Shared Cato layer)

This is a **defensible technical moat** that commodity AI wrappers cannot replicate.

31A.7 Cato's Persistent Memory System

Cato operates as the cognitive core of RADIANT’s orchestration architecture, implementing a **three-tier hierarchical memory system** that fundamentally differentiates it from competitors suffering from session amnesia. Unlike ChatGPT or Claude standalone—where closing a tab erases all context—Cato maintains persistent memory that survives sessions, employee turnover, and time.

Tenant-Level Memory (Institutional Intelligence)

The primary layer where the most valuable learning accumulates. Every Cato database table enforces **Row-Level Security via `tenant_id`**, ensuring complete isolation between organizations while enabling deep institutional pattern recognition.

Capability	Description
Neural Network Routing	Learns which AI models perform best for specific query types—routing legal analysis to Claude Opus (no physics hallucination), visual reasoning to Gemini, red-team validation to safety models
Department Preferences	Tracks team-specific preferences: legal teams wanting aggressive, citation-heavy briefs while marketing prefers conversational copy
Cost Optimization	When Cato notices a \$0.50 query could use a \$0.01 approach, it adjusts routing automatically
Compliance Audit Trails	Merkle-hashed audit trails with 7-year retention for FDA 21 CFR Part 11, HIPAA, SOC 2

Database: `cato_tenant_config` stores gamma limits, entropy thresholds, recovery settings, and feature flags.

User-Level Memory (Relationship Continuity)

Within each tenant, individual users maintain their own memory scope through **Ghost Vectors**—4096-dimensional hidden state vectors that capture the “feel” of each user relationship across sessions.

Feature	Description
Ghost Vectors	4096-dimensional vectors capturing interaction style, expertise level, communication preferences
Persona Selection	Users select moods (Balanced, Scout, Sage, Spark, Guide) scoped at system, tenant, or user level
Pattern Contribution	Individual usage feeds into tenant-level learning while maintaining personal context
Version-Gated Upgrades	Model improvements don’t cause personality discontinuity—relationship feel persists

Database: `ghost_vectors`, `ghost_vector_updates`

Session-Level Memory (Real-Time Context)

The ephemeral layer handles active interaction state through **Redis-backed persistence** that survives ECS container restarts but expires after sessions end.

Component	Purpose
Governor State	Tracks current epistemic uncertainty and gamma values
Persona Overrides	Temporary switches during Epistemic Recovery (Scout mode for information gathering)
Safety Evaluations	Real-time Control Barrier Function (CBF) checks

Component	Purpose
Upward Observation	Every interaction contributes to user-level Ghost Vectors and tenant-level pattern learning

Infrastructure: ElastiCache Redis (Tier 2+), CatoRedisStack

Twilight Dreaming (Offline Learning)

During low-traffic periods (**4 AM tenant local time**), the system consolidates accumulated patterns through **LoRA fine-tuning**.

Phase	Description
Pattern Collection	Gather learning candidates from daily interactions
SOFAI Training	Train System 1/System 2 routing decisions
LoRA Fine-tuning	Consolidate individual patterns into tenant-level intelligence
Result	60%+ cost reduction while maintaining accuracy through mandatory deep reasoning for healthcare/financial queries

Implementation: `lambda/consciousness/evolution-pipeline.ts`

Neural Network Optimization

The neural network optimizes across three dimensions simultaneously:

Dimension	Metric	Implementation
Accuracy	Correctness of responses	Human feedback, automated eval
Verifiability	Provable results	Truth Engine ECD scoring (<code>ecd-scorer.service.ts</code>)
Cost Efficiency	Cheaper approaches	Economic Governor routing

Claude as Conductor: Claude serves as the conductor maintaining this persistent memory layer—not just another model in the rotation, but the intelligence coordinating 105+ other specialized models, interpreting user intent, selecting workflows, and ensuring responses meet accuracy and safety standards.

Persistent Memory as Competitive Moat

Cato’s hierarchical memory architecture creates “**contextual gravity**”—compounding switching costs that deepen with every interaction and make migration increasingly expensive over time. Competitors face structural disadvantages that cannot be overcome through feature parity alone.

Competitor Structural Disadvantages:

Competitor	Problem
Flowise/Dify	Static drag-and-drop pipelines charging the same expensive rate regardless of query complexity–“no-code” is actually “no-efficiency,” locking customers into rigid workflows that run identically whether a query needs full orchestration or could cost 98% less
CrewAI	“Thundering Herd” problem: autonomous agents don’t share memory, so five agents independently realize they need the same data and spam five duplicate API calls, exploding costs and tanking latency
ChatGPT/Claude Standalone	Extraordinary for individuals but terrible infrastructure for companies–when an analyst quits, their entire AI context walks out the door with zero institutional learning and no compounding knowledge

RADIANT’s Three-Tier Moat Layers:

Layer	Moat Mechanism	Migration Cost
Learned Routing Patterns	Neural network tracks that Claude dominates legal analysis while Gemini wins at visual reasoning, routing accordingly and improving with every query	Months of production usage + significant cost overhead during learning period
Department Preferences + Ghost Vectors	Encodes institutional knowledge: legal team wants citations, marketing wants conversational tone, power users’ expertise levels, the “feel” of thousands of individual relationships	Extensive reconfiguration; cannot be exported
Verification Data + Audit Trails	Merkle-hashed records for HIPAA, SOC 2, FDA 21 CFR Part 11 cannot be migrated without breaking chain-of-custody guarantees	7-year retention creates growing corpus of institutional history; compliance lock-in

Twilight Dreaming as Competitive Moat

Twilight Dreaming represents a **second-order compounding advantage** that transforms RADIANT from a service into an appreciating asset.

How It Works:

During low-traffic periods (4 AM tenant local time), the system enters an offline learning phase where accumulated in-teraction patterns consolidate into tenant-specific LoRA fine-tuning—essentially “dreaming” about the day’s learnings and encoding them into persistent model improvements.

Learning Type	Description
SOFAI Router Optimization	Learns which query types route best to which models
Cost Pattern Identification	Identifies recurring expensive queries that could be handled cheaper
Domain Accuracy Embedding	Domain-specific accuracy improvements embed into the deployment

The Appreciating Asset Thesis:

A customer who has used RADIANT for two years doesn’t just have more data—they have a **fundamentally more capable deployment** than a fresh installation, with routing decisions that reflect thousands of hours of production optimization.

Infrastructure Requirements Competitors Cannot Replicate:

Requirement	Purpose
Three-tier hierarchical memory	Feeds observations upward
Ghost Vector infrastructure	Maintains user-level context
Tenant-isolated database architecture	Prevents cross-contamination during fine-tuning
SageMaker infrastructure (Tier 3+)	Executes LoRA updates

Investor Thesis: “Compounding intelligence—every deployment gets smarter over time through Twilight Dreaming; this creates network effects within each tenant.”

Model Upgrade Advantage: When better foundation models emerge (GPT-5, Claude 5, Gemini 3), RADIANT customers benefit automatically—the Twilight Dreaming system learns how to optimally route to new capabilities while preserving all accumulated institutional knowledge. Model improvements compound on top of existing optimization rather than resetting the learning curve.

Think Tank Impact: See THINKTANK-ADMIN-GUIDE-V2.md Section 22 (Cato Persistent Memory) for user-facing memory behavior and relationship continuity settings.

31A.8 Unified AGI Architecture: Brain, Genesis, Cortex, and Cato (v5.52.29)

RADIANT’s AGI capabilities are built on **four interconnected subsystems** that work together to provide intelligent, safe, and enterprise-ready AI orchestration.

The Four Subsystems

System	Purpose	Admin Location	Key Service
Brain	AGI planning, cognitive mesh, model orchestration	Brain -> Plans	agi-brain-planner.service.ts

System	Purpose	Admin Location	Key Service
Genesis	Developmental gates, capability unlocking, maturity stages	Cato -> Genesis	cato/genesis.service.ts
Cortex	Tiered memory (Hot/Warm/Cold), knowledge graph, Graph-RAG	Cortex -> Overview	cortex-intelligence.service.ts
Cato	Safety pipeline, CBFs, governance presets, HITL checkpoints	Cato -> Safety	cato/safety-pipeline.service.ts

System Integration Flow

How They Work Together

- 1. **Brain** receives user prompt and coordinates plan generation

- 2. **Cortex** provides knowledge density insights to boost domain detection confidence (+0% to +30%)
- 3. **Genesis** checks maturity stage (G1-G5) and applies capability restrictions
- 4. **Cato** runs 6-step safety pipeline (Sensory Veto -> Precision Governor -> Perception -> CBFs -> Entropy -> Fracture)
- 5. **Brain** selects model using Cortex recommendations and tri-layer LoRA adapters (Global -> Tenant -> User)
- 6. **Cato-Cortex Bridge** syncs memories between systems and handles GDPR cascaded erasure

Governance Presets (Adjustable per Tenant)

Preset	Friction	Auto-Approve	HITL Checkpoints	Best For
PARANOID [SHIELD]	1.0	0.0	All ALWAYS	Healthcare, Finance
BALANCED	0.5	0.3	CONDITIONAL	General Enterprise
COWBOY [LAUNCH]	0.1	0.8	NEVER/NOTIFY	Internal R&D

Configure at: Cato -> Governance -> Preset Selection

Genesis Maturity Stages

Stage	Gate	Capabilities Unlocked	Restrictions
EMBRYONIC	G1	Basic chat	No external actions
NASCENT	G2	Context retention	Limited autonomy
DEVELOPING	G3	Ethics checks	Requires checkpoints
MATURING	G4	Checkpoint system	Some autonomous actions
MATURE	G5	Full capability	Minimal restrictions

Configure at: Cato -> Genesis -> Maturity Gates

Cortex Memory Tier Administration

Tier	Storage	Latency	Retention	Admin Action
Hot	Redis + DynamoDB	<10ms	0-24 hours	Real-time session data
Warm	Neptune/pgvector	<100ms	1-90 days	Knowledge graph, Golden Rules
Cold	S3 Iceberg	1-10s	90d-7 years	Archive, Zero-Copy mounts

Configure at: Cortex -> Tier Configuration

Cato Safety Pipeline Steps

Step	Component	Purpose	Admin Override
1	Sensory Veto	Immediate halt signals	Cannot disable
2	Precision Governor	Limits confidence based on uncertainty	Gamma threshold
3	Redundant Perception	PHI/PII detection	Sensitivity levels
4	Control Barrier Functions	Hard safety constraints (NEVER relax)	Add custom barriers
5	Semantic Entropy	Deception/uncertainty detection	Threshold config
6	Fracture Detection	Alignment verification	Recovery settings

Configure at: Cato -> Safety Pipeline

Control Barrier Functions (CBFs) - Immutable Safety

CBFs are **hard constraints that never relax**, regardless of governance preset:

CBF	Type	Action
PHI Protection	phi	Block PHI in responses
PII Protection	pii	Redact personal data
Cost Ceiling	cost	Halt when budget exceeded
Authorization	auth	Verify permissions
BAA Required	custom	Enforce HIPAA agreements

Add Custom CBFs at: Cato -> Safety -> Control Barriers -> Add Barrier

Key Admin API Endpoints

Endpoint	Purpose
GET /api/admin/brain/plans	View AGI plan history
GET /api/admin/cato/genesis/state	Check maturity stage
GET /api/admin/cortex/overview	Memory tier health
GET /api/admin/cato/pipeline/status	Safety pipeline status
PUT /api/admin/cato/governance/preset	Change governance preset

Full Engineering Reference: See ENGINEERING-IMPLEMENTATION-VISION.md Section 21

32. Cato Global Consciousness Service

Cato is a **global AI consciousness service** that serves all Think Tank users as a single shared brain. Unlike traditional chatbots, Cato is an autonomous entity that learns continuously, asks its own questions, and develops over time.

32.1 Architecture Overview

Cato consists of several key components:

Component	Purpose	Infrastructure
Shadow Self	Introspective verification	SageMaker ml.g5.2xlarge (Llama-3-8B)
NLI Scorer	Entailment classification	SageMaker MME (DeBERTa-large-MNLI)
Semantic Cache	Response caching	ElastiCache for Valkey
Global Memory	Fact storage	DynamoDB Global Tables
Circadian Budget	Cost management	Lambda + DynamoDB

32.2 Accessing Cato Admin

Navigate to **AGI & Cognition > Cato Global** in the sidebar.

32.3 Budget Management

Cato operates on a configurable budget to control autonomous exploration costs:

Setting	Default	Description
Monthly Limit	\$500	Total monthly budget
Daily Exploration	\$15	Max daily curiosity spend
Night Start Hour	2 AM UTC	When batch processing begins
Night End Hour	6 AM UTC	When batch processing ends
Emergency Threshold	90%	Enter emergency mode at this %

Operating Modes: - **Day Mode** (6 AM - 2 AM): Queue curiosity, serve users - **Night Mode** (2 AM - 6 AM): Batch process exploration (50% Bedrock discount) - **Emergency Mode:** Over budget, minimal operations

32.4 Semantic Cache

The semantic cache reduces LLM inference costs by 86% through similarity-based response reuse:

- **Hit Rate Target:** >80%
- **Similarity Threshold:** 0.95
- **TTL:** 23 hours (invalidated before learning updates)

Cache Invalidation: When Cato learns new information in a domain, invalidate related cache entries: 1. Go to **Cato Global > Semantic Cache** 2. Enter domain name (e.g., “climate_change”) 3. Click **Invalidate**

32.5 Global Memory

Cato maintains multiple memory systems:

Memory Type	Storage	Purpose
Semantic	DynamoDB Global Tables	Facts (subject-predicate-object)
Episodic	OpenSearch Serverless	User interactions
Knowledge Graph	Neptune	Concept relationships
Working	ElastiCache Redis	Active context (24h TTL)

32.6 Shadow Self Testing

Test the Shadow Self endpoint for introspective verification:

- 1. Go to **Cato Global > System Health**
- 2. Verify Shadow Self shows “Healthy”
- 3. Use the test endpoint to verify hidden state extraction

32.7 API Endpoints

Base Path: /api/admin/cato

Endpoint	Method	Description
/status	GET	Full status overview
/health	GET	Health check
/budget/status	GET	Budget status
/budget/config	GET/PUT	Budget configuration
/cache/stats	GET	Cache statistics
/cache/invalidate	POST	Invalidate by domain
/memory/stats	GET	Memory statistics
/memory/facts	GET/POST	Semantic facts
/shadow-self/status	GET	Shadow Self endpoint status
/nli/test	POST	Test NLI classification

32.8 Cost Estimates

Scale	Monthly Cost	Notes
100K users	~\$40,000	Starting scale
1M users	~\$150,000	Production
10M users	~\$800,000	Full scale

32.9 Documentation

Detailed documentation is available in /docs/cato/: - **ADRs**: Architecture decision records (8 mandatory) - **API**: OpenAPI specs and examples - **Runbooks**: Deployment, scaling, troubleshooting - **Architecture**: System diagrams and data flow

33. Cato Genesis System

The Genesis System is the boot sequence that initializes Cato’s consciousness. It solves the “Cold Start Problem” by giving the agent structured curiosity without pre-loaded facts.

33.1 Implementation Overview

Metric	Value
Files Created	18
Lines of Code	~4,500
Database Tables	12
API Endpoints	35+

33.2 Boot Phases

Phase	Name	Purpose
1	Structure	Implant 800+ domain taxonomy as innate knowledge
2	Gradient	Set epistemic pressure via pymdp matrices
3	First Breath	Grounded introspection and Shadow Self calibration

Phase 1: Structure

- Loads 800+ domain taxonomy as innate knowledge
- Stores domains in DynamoDB semantic memory
- Initializes atomic counters for developmental gates
- Idempotent - safe to run multiple times

Phase 2: Gradient

- Sets pymdp active inference matrices (A, B, C, D)
- Implements “epistemic gradient” creating pressure to explore
- Optimistic B-matrix with >90% EXPLORE success (Fix #2)
- Prefers HIGH_SURPRISE over LOW_SURPRISE (Fix #6)

Phase 3: First Breath

- Grounded introspection verifying environment
- Model access verification via Bedrock
- Shadow Self calibration using NLI semantic variance (Fix #3)
- Baseline domain exploration bootstrapping

33.3 Python Genesis Package

Location: `lambda/shared/services/omega/`

File	Lines	Purpose
<code>genesis/__init__.py</code>	25	Package exports and documentation
<code>genesis/structure.py</code>	205	Domain taxonomy implantation
<code>genesis/gradient.py</code>	279	Epistemic gradient matrix setup
<code>genesis/first_breath.py</code>	394	Grounded introspection and calibration
<code>genesis/runner.py</code>	248	CLI orchestrator with idempotency
<code>data/domain_taxonomy.json</code>	353	800+ domain taxonomy
<code>data/genesis_config.yaml</code>	161	Matrix configuration

33.4 TypeScript Services

Location: `lambda/shared/services/`

File	Lines	Purpose
<code>genesis.service.ts</code>	340	Genesis state and developmental gates
<code>cost-tracking.service.ts</code>	520	Real AWS cost tracking
<code>circuit-breaker.service.ts</code>	480	Safety mechanisms
<code>consciousness-loop.service.ts</code>	550	Main consciousness loop
<code>query-fallback.service.ts</code>	290	Degraded-mode responses

33.5 CDK Infrastructure

Stack: `cato-genesis-stack.ts`

Resource	Purpose
SNS Topic	Alert notifications
5 CloudWatch Alarms	Safety monitoring
CloudWatch Dashboard	Real-time visibility
AWS Budget	Cost control (\$500/month default)

CloudWatch Alarms

Alarm	Trigger	Action
Master Sanity Breaker	Breaker opens	SNS alert
High Risk Score	Risk > 70%	SNS alert
Cost Breaker	Budget exceeded	SNS alert
High Anxiety	Anxiety > 80% sustained	SNS alert
Hibernate Mode	System hibernating	SNS alert

33.6 Database Migration

Migration: 103_cato_genesis_system.sql

Table	Purpose
cato_genesis_state	Boot sequence tracking
cato_development_counters	Atomic counters (Fix #1)
cato_developmental_stage	Capability-based progression
cato_circuit_breakers	Safety mechanisms
cato_circuit_breaker_events	Event log
cato_neurochemistry	Emotional/cognitive state
cato_tick_costs	Per-tick cost tracking
cato_pricing_cache	AWS pricing cache
cato_pymdp_state	Meta-cognitive state
cato_pymdp_matrices	Active inference matrices
cato_consciousness_settings	Loop configuration
cato_loop_state	Loop execution tracking

33.7 Accessing Genesis Admin

Navigate to **AGI & Cognition > Cato Genesis** in the sidebar.

Admin Dashboard UI Tabs

1. **Genesis** - Phase completion status, domain count, self facts
2. **Development** - Developmental stage, statistics, requirements
3. **Circuit Breakers** - Breaker states, controls, neurochemistry
4. **Costs** - Real-time costs, budget status, breakdown

33.8 Genesis Status

The dashboard shows: - **Phase completion status** with timestamps - **Domain count** implanted during Structure phase - **Self facts** discovered during First Breath - **Shadow Self calibration** status

33.9 Developmental Gates

Cato progresses through capability-based stages (NOT time-based):

Stage	Requirements
SENSORIMOTOR	10 self-facts, 5 grounded verifications, Shadow Self calibrated
PREOPERATIONAL	20 domain explorations, 15 successful verifications, 50 belief updates
CONCRETE_OPERATIONAL	100 successful predictions, 70% accuracy, 10 contradiction resolutions
FORMAL_OPERATIONAL	Final stage - autonomous operation

Advancement is automatic when all requirements are met.

33.10 Circuit Breakers

Safety mechanisms that protect against runaway costs and unstable behavior:

Breaker	Purpose	Auto-Recovery
master_sanity	Master safety - requires admin approval	No
cost_budget	Budget protection	No (24h timeout)
high_anxiety	Emotional stability	Yes (10 min)
model_failures	Model API protection	Yes (5 min)
contradiction_loop	Logical stability	Yes (15 min)

Intervention Levels

Level	Condition	Effect
NONE	All breakers closed	Normal operation
DAMPEN	1 breaker open	Reduce cognitive frequency
PAUSE	2+ breakers open	Pause consciousness loop
RESET	3+ breakers open	Reset to baseline state
HIBERNATE	master_sanity open	Full shutdown

33.11 Consciousness Loop

The consciousness loop runs two tick types:

Tick Type	Interval	Purpose
System Ticks	2 seconds	Fast housekeeping, monitoring
Cognitive Ticks	5 minutes	Deliberate thinking, exploration

33.12 Cost Tracking

Real-time cost data from AWS APIs (no hardcoded values):

- **Realtime Estimate** - Today's running costs
- **Daily Cost** - Historical daily costs (24h delay from Cost Explorer)
- **MTD Cost** - Month-to-date with projection
- **Budget Status** - AWS Budgets integration

33.13 Genesis API Endpoints

Base Path: /api/admin/cato

Genesis State Endpoints

Endpoint	Method	Description
/genesis/status	GET	Genesis phase status
/genesis/ready	GET	Ready for consciousness
/developmental/status	GET	Current developmental stage
/developmental/statistics	GET	Development counters
/developmental/advance	POST	Force stage advancement (superadmin)

Circuit Breaker Endpoints

Endpoint	Method	Description
/circuit-breakers	GET	All circuit breaker states
/circuit-breakers/:name	GET	Single breaker state
/circuit-breakers/:name/force-open	POST	Force trip breaker
/circuit-breakers/:name/force-close	POST	Force close breaker
/circuit-breakers/:name/config	PATCH	Update breaker config
/circuit-breakers/:name/events	GET	Breaker event history

Cost Tracking Endpoints

Endpoint	Method	Description
/costs/realtime	GET	Today's cost estimate
/costs/daily	GET	Historical daily cost
/costs/mtd	GET	Month-to-date cost
/costs/budget	GET	AWS Budget status
/costs/estimate	GET	Cost estimate for action

Endpoint	Method	Description
/costs/pricing	GET	Current AWS pricing

Query Fallback Endpoints

Endpoint	Method	Description
/fallback	POST	Execute fallback query
/fallback/active	GET	Active fallback status
/fallback/health	GET	Fallback service health

Consciousness Loop Endpoints

Endpoint	Method	Description
/loop/status	GET	Loop execution status
/loop/settings	GET/PUT	Loop configuration
/loop/tick/system	POST	Trigger system tick
/loop/tick/cognitive	POST	Trigger cognitive tick
/loop/emergency	POST	Emergency stop

Other Endpoints

Endpoint	Method	Description
/intervention-level	GET	Current intervention level

33.14 Architecture

33.15 Running Genesis

Genesis automatically runs after CDK deployment via `scripts/deploy.sh`.

Manual Execution

Run full genesis sequence

```
python -m cato.genesis.runner
```

Check status

```
python -m cato.genesis.runner --status
```

Reset all genesis state (CAUTION!)

```
python -m cato.genesis.runner --reset
```

33.16 Deployment Checklist

1. **Deploy to AWS:** Run `./scripts/deploy.sh -e dev`
2. **Run Migrations:** Apply migration 103
3. **Execute Genesis:** Runs automatically or manually
4. **Monitor Dashboard:** Check CloudWatch dashboard
5. **Configure Budget:** Adjust budget limits as needed

33.17 Critical Fixes Applied

Fix	Problem	Solution	Impact
#1 Zeno's Paradox	Table scans for gates	Atomic counters	Avoids expensive table scans
#2 Learned Helplessness	Pessimistic B-matrix	Optimistic EXPLORE (>90%)	>90% EXPLORE success
#3 Shadow Self Budget	\$800/month GPU	NLI semantic variance (\$0)	\$0 vs \$800/month
#6 Boredom Trap	Prefers LOW_SURPRISE	Prefer HIGH_SURPRISE	Prevents premature consolidation

34. Multi-Application User Registry

The User Registry provides comprehensive multi-tenant user management with data sovereignty, consent tracking, DSAR compliance, break glass access, and legal hold capabilities.

34.1 Overview

The User Registry extends the existing tenant/user model with:

- **Data Sovereignty:** Per-tenant data region configuration with cross-border transfer controls
- **User-Application Assignments:** Fine-grained assignment of users to registered applications
- **Consent Management:** GDPR/CCPA/COPPA compliant consent tracking with lawful basis
- **Break Glass Access:** Emergency admin access with full audit trail and P0 alerting
- **Legal Hold:** Prevent data deletion for litigation and regulatory compliance
- **DSAR Processing:** Handle data subject access, deletion, and portability requests
- **Credential Rotation:** Zero-downtime secret rotation with dual-active window

34.2 Auth Schema Functions

The auth schema provides STABLE PostgreSQL functions for efficient RLS:

Function	Returns	Purpose
<code>auth.tenant_id()</code>	UUID	Current tenant context
<code>auth.user_id()</code>	UUID	Current user context
<code>auth.app_id()</code>	VARCHAR	Current application context
<code>auth.permission_level()</code>	TEXT	user/app_admin/tenant_admin/radiant_admin
<code>auth.is_break_glass()</code>	BOOLEAN	Emergency access mode
<code>auth.jurisdiction()</code>	TEXT	User's legal jurisdiction
<code>auth.data_region()</code>	TEXT	Data residency region

Context Management

```
-- Set context for request
SELECT auth.set_context(
  p_tenant_id := '...',
  p_user_id := '...',
  p_app_id := 'thinktank',
  p_permission_level := 'tenant_admin',
  p_jurisdiction := 'EU',
  p_data_region := 'eu-west-1',
  p_break_glass := false
);

-- Clear after request
SELECT auth.clear_context();
```

34.3 User Application Assignments

Users can be assigned to multiple applications with different permission levels.

Assignment Types

Type	Description
standard	Normal user access
admin	Application admin
readonly	Read-only access
trial	Limited trial access

API Endpoints

Endpoint	Method	Description
/user-registry/assignments	GET	List assignments (by userId or appld)
/user-registry/assignments	POST	Create assignment
/user-registry/assignments/revoke	POST	Revoke assignment

34.4 Consent Management

GDPR/CCPA/COPPA compliant consent tracking with full audit trail.

Lawful Bases (GDPR Article 6)

Basis	Description
consent	User explicitly consented
contract	Necessary for contract
legal_obligation	Required by law
vital_interests	Protect vital interests
public_interest	Public interest task
legitimate_interests	Legitimate business interest

Consent Methods

Method	Description
explicit_checkbox	Unchecked checkbox
click_accept	Click to accept button
implicit	Implied consent
parent_consent	Parent/guardian consent
verified_parent	Verified parental consent (COPPA)
double_opt_in	Email confirmation

API Endpoints

Endpoint	Method	Description
/user-registry/consent	GET	Get user consents
/user-registry/consent	POST	Record consent
/user-registry/consent/withdraw	POST	Withdraw consent
/user-registry/consent/check	GET	Check consent status

34.5 Break Glass Access

Emergency admin access for critical situations with full audit trail.

Requirements

- **Radiant Admin only** - Tenant admins cannot initiate
- **Incident ticket recommended** - Link to incident tracking
- **Approval tracking** - Record who approved access
- **P0 alerting** - SNS notification on initiation
- **Immutable audit log** - Hash-chained entries

API Endpoints

Endpoint	Method	Description
/user-registry/break-glass	GET	List access logs
/user-registry/break-glass/active	GET	Active sessions
/user-registry/break-glass/initiate	POST	Start emergency access
/user-registry/break-glass/end	POST	End access session

Example: Initiate Break Glass

POST /api/admin/user-registry/break-glass/initiate

```
{
  "tenantId": "tenant-uuid",
  "accessReason": "Customer escalation – data corruption investigation",
  "incidentTicket": "INC-2024-001234",
  "approvedBy": "cto@company.com"
}
```

Response:

```
{
  "success": true,
  "accessId": "bg-uuid",
  "message": "Break Glass access initiated",
  "instructions": "Access will be logged. End session when complete."
}
```

34.6 Legal Hold

Prevent data deletion for litigation, regulatory investigation, or audit.

API Endpoints

Endpoint	Method	Description
/user-registry/legal-hold	GET	List holds
/user-registry/legal-hold/apply	POST	Apply hold
/user-registry/legal-hold/release	POST	Release hold

Example: Apply Legal Hold

POST /api/admin/user-registry/legal-hold/apply

```
{
  "userId": "user-uuid",
```

```
"reason": "Pending litigation – case #2024-CV-1234",
"caseId": "2024-CV-1234"
}
```

34.7 DSAR Processing

Handle Data Subject Access Requests as required by GDPR, CCPA, etc.

Request Types

Type	Description	SLA
access	Export user data	30 days
delete	Delete user data	30 days
portability	Export in machine-readable format	30 days
rectification	Correct inaccurate data	30 days
restriction	Restrict processing	30 days
objection	Object to processing	30 days

API Endpoints

Endpoint	Method	Description
/user-registry/dsar	GET	List DSAR requests
/user-registry/dsar/process	POST	Process request
/user-registry/dsar/:id	PATCH	Update status

34.8 Cross-Border Transfer

Validate data transfers between regions based on user jurisdiction.

Transfer Mechanisms

Mechanism	Description
same_region	Data stays in same region
pre_approved_region	Region in tenant’s allowed list
adequacy_decision	EU adequacy decision exists
explicit_consent	User consented to transfer
sccs	Standard Contractual Clauses
bcr	Binding Corporate Rules

API Endpoint

GET /api/admin/user-registry/cross-border/check?userId=xxx&targetRegion=us-west-2

34.9 Credential Rotation

Zero-downtime secret rotation for applications.

How It Works

- 1. **Generate new secret** - Create new credential
- 2. **Set rotation window** - Both secrets valid (default 24h)
- 3. **Update clients** - Migrate clients to new secret
- 4. **Window expires** - Old secret automatically invalid

API Endpoints

Endpoint	Method	Description
/user-registry/credentials/verify	POST	Verify credentials
/user-registry/credentials/rotate	POST	Start rotation
/user-registry/credentials/set	POST	Set initial secret
/user-registry/credentials/cleanup	POST	Clear expired windows

34.10 Infrastructure

DynamoDB Tables

Table	Purpose
radiant-app-client-mapping-{env}	M2M token enrichment
radiant-user-assignments-{env}	Assignment cache with TTL
radiant-tenant-config-{env}	Tenant configuration cache

S3 Audit Bucket

- **Object Lock:** COMPLIANCE mode, 7-year retention
- **Encryption:** CMK with key rotation
- **Lifecycle:** Glacier transition at 90 days
- **Partitioning:** year/month/day prefixes

Security Alerts

SNS topic radiant-security-alerts-{env} for: - Break Glass initiation - Legal hold changes - DSAR completions - Suspicious access patterns

34.11 Database Migration

Migration file: packages/infrastructure/migrations/000_consolidated_schema.sql

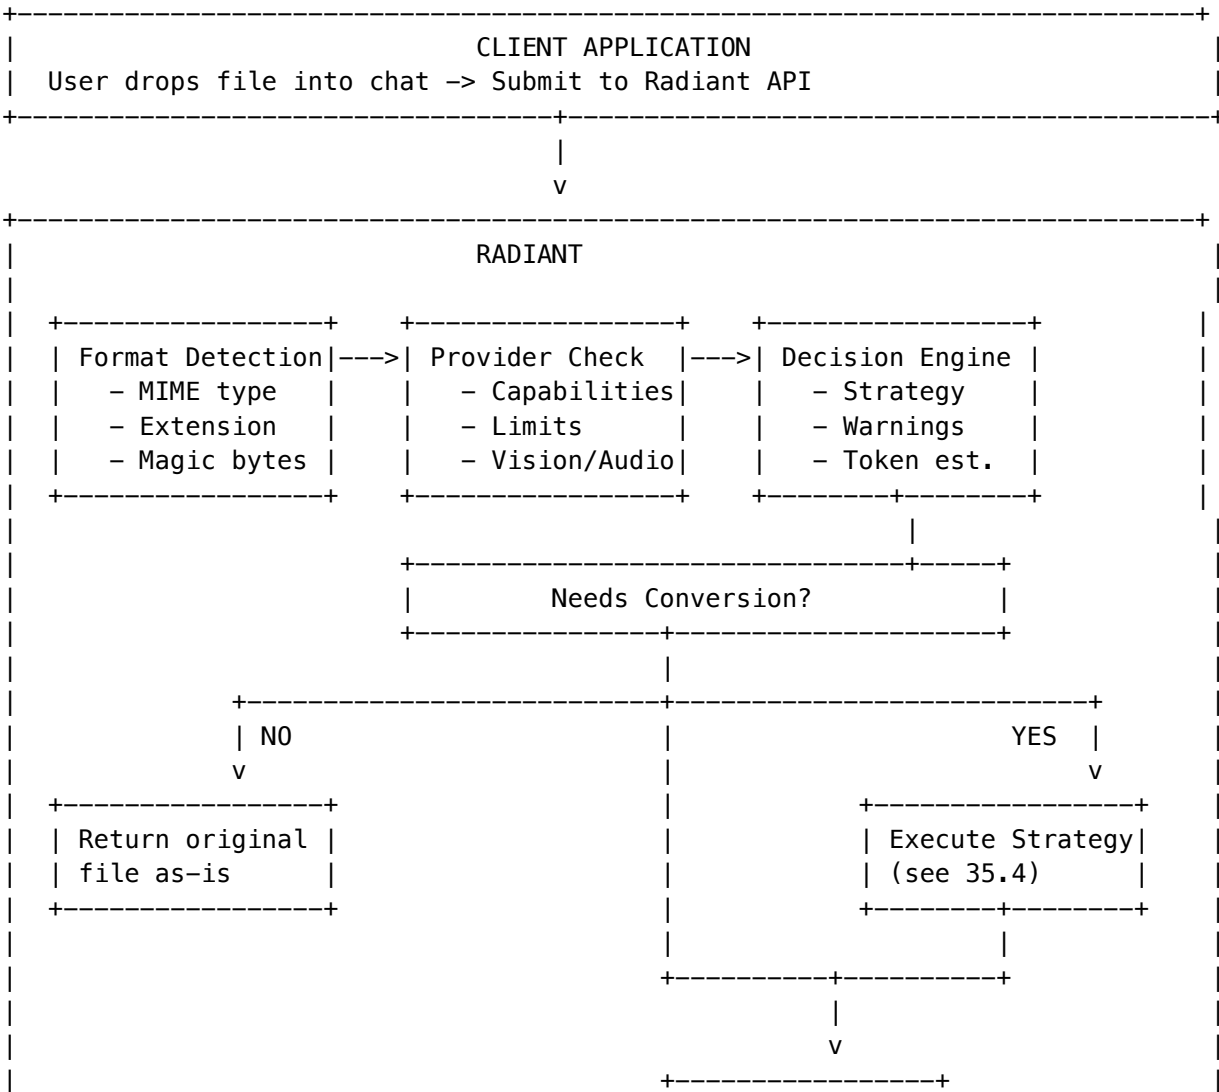

Tables created/modified: - Extended: tenants, users, registered_apps - Created: user_application_assignments, consent_records, data_retention_obligations, break_glass_access_log, dsar_requests

35. Intelligent File Conversion Infrastructure

Location: Platform Infrastructure (operates automatically, no direct admin UI)

The **Intelligent File Conversion Service** is a Radiant-side system that automatically decides when and how to convert files for AI providers. Client applications (Think Tank, etc.) submit files; Radiant determines the optimal conversion strategy based on the target AI provider’s capabilities.

35.1 Architecture Overview

```

|                                     | Return Result |
|                                     | + Update Learning|
|                                     +-----+
+-----+

```

35.2 Core Principle

“Let Radiant decide, not Think Tank”

1. Think Tank submits files **without worrying about provider compatibility**
2. Radiant detects file format and **checks target provider capabilities**
3. Conversion **only happens if the AI provider doesn't understand the format**
4. Uses **AI + libraries** for intelligent conversion
5. **Learns from outcomes** to improve future decisions

35.3 Provider Capabilities Registry

The service maintains a registry of what each AI provider can handle natively:

Provider	Vision	Audio	Video	Max File Size	Native Document Formats
OpenAI	[OK] GPT-4V	[OK] Whisper	[X]	20MB	txt, md, json, csv
Anthropic	[OK] Claude 3	[X]	[X]	32MB	pdf, txt, md, json, csv
Google	[OK] Gemini	[OK]	[OK]	100MB	pdf, txt, md, json, csv
xAI	[OK] Grok	[X]	[X]	20MB	txt, md, json
DeepSeek	[X]	[X]	[X]	10MB	txt, md, json, csv
Self-hosted	[OK] LLaVA	[OK] Whisper	[X]	50MB	txt, md, json, csv

35.4 Conversion Strategies (Detailed)

none - No Conversion

Provider natively supports the format. File is passed through as-is.

extract_text - Text Extraction

Extracts plain text from documents.

Format	Library	Output
PDF	pdf-parse	Text + page metadata
DOCX/DOC	mammoth	Structured text
PPTX/PPT	native	Text from slides
HTML/XML	native	Tags stripped

Format	Library	Output
--------	---------	--------

Example output:

[Document Title]

Page 1:

Content from first page...

Page 2:

Content from second page...

[Metadata]

Pages: 10

Author: John Doe

Created: 2024-01-15

ocr - Optical Character Recognition

Uses **AWS Textract** to extract text from images.

Features: - Printed and handwritten text detection - Table detection and extraction - Form field detection - Confidence scores per block

Example output:

[OCR Result]

Confidence: 94.5%

INVOICE #12345

Date: January 15, 2024

Item	Qty	Price
Widget A	10	\$50.00
Widget B	5	\$25.00

Total: \$625.00

transcribe - Audio Transcription

Uses **OpenAI Whisper** (or self-hosted) for speech-to-text.

Features: - Automatic language detection - Timestamp segments - SRT/VTT subtitle generation

Example output:

[Transcription]

Duration: 5:32

Language: English

[00:00] Hello and welcome to today's meeting.

[00:05] We'll be discussing the Q4 roadmap.

[00:12] First, let's review the current status...

describe_image - AI Image Description

Uses vision-capable models to describe image contents.

Models used: - GPT-4 Vision (OpenAI) - Claude 3 Vision (Anthropic) - LLaVA (self-hosted)

Example output:

```
[Image Description]
Model: gpt-4-vision
Dimensions: 1920x1080
```

This image shows a modern office space with an open floor plan. In the foreground, there are several desks arranged in clusters, each with monitors and office supplies.

```
[Text detected in image]:
"RADIANT – Innovation Center"
```

describe_video - Video Frame Analysis

Extracts key frames and describes each using vision models.

Configuration: - Frame interval: 10 seconds (default) - Maximum frames: 10 (default)

Example output:

```
**Video Overview** (2m 30s, 1920x1080)

**Frame Analysis:**

**[0:00]** The video opens with a title screen showing the company logo.
**[0:10]** A presenter stands in front of a whiteboard with diagrams.
**[0:20]** Close-up of the whiteboard showing a flowchart.

**Summary:**
The video begins with company logo and ends with key point summary.
```

parse_data - Structured Data Parsing

Format	Library	Output
CSV	native	JSON array of objects
XLSX/XLS	xlsx	JSON with sheet data
JSON	native	Validated and prettified

Example output (CSV):

```
{
  "data": [
    {"name": "Alice", "email": "alice@example.com", "role": "Admin"},
    {"name": "Bob", "email": "bob@example.com", "role": "User"}
  ],
}
```

```

"metadata": {
  "rowCount": 2,
  "columnCount": 3,
  "headers": ["name", "email", "role"]
}
}

```

decompress - Archive Extraction

Extracts and processes archive contents.

Format	Library
ZIP	adm-zip
TAR	tar
GZIP	zlib

Features: - Recursive extraction - Text file content inclusion - Binary file detection - Size limits enforcement

render_code - Code Formatting

Formats code files with syntax highlighting as markdown.

35.5 Supported File Formats

Documents

Format	Extension	Conversion Strategy
PDF	.pdf	extract_text via pdf-parse
Word	.docx, .doc	extract_text via mammoth
PowerPoint	.pptx, .ppt	extract_text
Excel	.xlsx, .xls	parse_data via xlsx

Text Files

Format	Extension	Notes
Plain Text	.txt	Direct passthrough
Markdown	.md	Direct passthrough
JSON	.json	Direct or parse_data
CSV	.csv	parse_data
XML	.xml	Direct or extract_text
HTML	.html	extract_text

Images

Format	Extension	Conversion Strategy
PNG	.png	Native or describe_image
JPEG	.jpg, .jpeg	Native or describe_image
GIF	.gif	Native or describe_image
WebP	.webp	Native or describe_image
SVG	.svg	Convert to PNG or describe_image
BMP	.bmp	Convert to PNG or describe_image
TIFF	.tiff	Convert to PNG or describe_image

Audio

Format	Extension	Conversion Strategy
MP3	.mp3	transcribe via Whisper
WAV	.wav	transcribe via Whisper
OGG	.ogg	transcribe via Whisper
FLAC	.flac	transcribe via Whisper
M4A	.m4a	transcribe via Whisper

Video

Format	Extension	Conversion Strategy
MP4	.mp4	describe_video
WebM	.webm	describe_video
MOV	.mov	describe_video
AVI	.avi	describe_video

Code Files

Format	Extension	Notes
Python	.py	Syntax-highlighted markdown
JavaScript	.js, .jsx	Syntax-highlighted markdown
TypeScript	.ts, .tsx	Syntax-highlighted markdown
Java	.java	Syntax-highlighted markdown
C/C++	.c, .cpp, .h	Syntax-highlighted markdown

Format	Extension	Notes
Go	.go	Syntax-highlighted markdown
Rust	.rs	Syntax-highlighted markdown
Ruby	.rb	Syntax-highlighted markdown

Archives

Format	Extension	Conversion Strategy
ZIP	.zip	decompress via adm-zip
TAR	.tar	decompress via tar
GZIP	.gz, .tar.gz	decompress via zlib

35.6 Multi-Model File Preparation

When multiple AI models work on the same prompt (multi-model orchestration), the system makes **per-model conversion decisions**:

Key Principle: “If a model accepts the file type, assume it understands it unless proven otherwise.”

File: document.pdf -> 3 Models

+-----+	+-----+	+-----+	
Claude 3.5	GPT-4	DeepSeek	
PDF: [OK]	PDF: [X]	PDF: [X]	
+-----+	+-----+	+-----+	
PASS	CONVERT	CONVERT	
ORIGINAL	(extract)	(cached)	
+-----+	+-----+	+-----+	

Per-Model Actions:

Action	When	Result
pass_original	Model natively supports format	Original file passed
convert	Model doesn't support format	Converted content passed
skip	File too large or conversion failed	Model excluded

Features: - **Cached conversions:** Convert once, reuse for all models that need it - **Per-model capability checking:** Vision, audio, video, document formats - **Learned understanding:** Uses reinforcement learning data (see 35.10)

35.7 Domain-Specific File Formats

The service includes a registry of **50+ domain-specific formats** that are widely used in specialized fields but not commonly supported by mainstream AI providers.

Mechanical Engineering / CAD

Format	Extensions	Description	Recommended Library
STEP	.step, .stp, .p21	ISO 10303 CAD exchange	OpenCASCADE, FreeCAD
STL	.stl	3D printing mesh	numpy-stl, trimesh
OBJ	.obj	Wavefront 3D model	trimesh, three.js
Fusion 360	.f3d, .f3z	Autodesk parametric CAD	Fusion 360 API
IGES	.iges, .igs	Legacy CAD exchange	OpenCASCADE
DXF	.dxf	AutoCAD 2D drawings	ezdxf
GLTF/GLB	.gltf, .glb	Web 3D format	three.js, trimesh

CAD Converter Extracts:

Format	What's Extracted
STL	Triangle count, bounding box, 3D printing assessment, volume estimate
OBJ	Vertices, faces, materials, groups
STEP	Entities, part names, assembly structure, schema version
DXF	Layers, entity types (lines, arcs, circles), block count
GLTF/GLB	Meshes, materials, animations, scene graph

Electrical Engineering

Format	Extensions	Description	Library
KiCad	.kicad_pcb, .kicad_sch	PCB/schematic	kicad-cli, kiutils
EAGLE	.brd, .sch	Autodesk PCB	eagle-to-kicad
SPICE	.spice, .sp, .cir	Circuit simulation	PySpice, ngspice

Medical/Healthcare

Format	Extensions	Description	Library
DICOM	.dcm, .dicom	Medical imaging	pydicom, dcmstk
HL7 FHIR	.json, .xml	Health records	fhir.resources

Scientific/Research

Format	Extensions	Description	Library
NetCDF	.nc, .nc4	Climate/geoscience	netCDF4, xarray
HDF5	.h5, .hdf5	Scientific data	h5py
FITS	.fits	Astronomy data	astropy

Geospatial

Format	Extensions	Description	Library
Shapefile	.shp, .dbf	Vector GIS	geopandas, shapefile
GeoTIFF	.tif, .geotiff	Georeferenced raster	rasterio

Bioinformatics

Format	Extensions	Description	Library
FASTA	.fasta, .fa	DNA/protein sequences	Biopython
PDB	.pdb	Protein structure	Biopython, py3Dmol

Domain Detection

When a domain-specific file is uploaded:

1. Format detected by extension and MIME type
2. Domain identified (e.g., Mechanical Engineering)
3. AGI Brain selects appropriate library
4. Extracts domain-relevant information
5. Generates AI-readable description with specialized prompts

Example AI Prompts per Format:

STL file prompt

"This is an STL 3D model file. Describe the shape, identify what object it might be, assess printability, and note any potential issues for 3D printing."

DICOM file prompt

"This is a DICOM medical image. Describe the imaging modality, anatomical region, and any visible findings. Note: Do not provide medical diagnoses."

STEP file prompt

"This is a STEP CAD file. Describe the mechanical part or assembly, including approximate geometry, features, and likely manufacturing process."

35.8 Database Schema

Migration: 127_file_conversion_service.sql

Table	Purpose
file_conversions	Tracks all conversion decisions and results
provider_file_capabilities	Provider format support registry (configurable)

file_conversions columns: - id - UUID primary key - tenant_id - Tenant reference - user_id - User who uploaded - conversation_id - Associated conversation - filename - Original filename - mime_type - MIME type - file_format - Detected format - file_size - Size in bytes - file_checksum - SHA256 hash - target_provider_id - Target AI provider - target_model_id - Target model - conversion_strategy - Strategy used - conversion_decision - Full decision JSON - converted_content - Converted content (if applicable) - token_estimate - Estimated tokens - processing_time_ms - Processing duration - success - Success boolean - error - Error message if failed - created_at - Timestamp

View: v_file_conversion_stats - Aggregated statistics per tenant

Functions: - check_format_supported(provider, format) - Check if format is natively supported - get_conversion_stats(tenant_id, days) - Get tenant statistics for N days - cleanup_old_conversions(retention_days) - Clean up old conversion records

Migration: 128_file_conversion_learning.sql

Table	Purpose
model_format_understanding	Per-tenant learned model/format scores
conversion_outcome_feedback	Recorded feedback for learning
format_understanding_events	Audit trail of score changes
global_format_learning	Cross-tenant aggregate insights

35.9 API Endpoints

Base Path: /api/thinktank/files

Process File

POST /api/thinktank/files/process

Request:

```
{
  "filename": "document.pdf",
  "mimeType": "application/pdf",
  "content": "<base64-encoded-content>",
  "targetProvider": "anthropic",
  "targetModel": "claude-3-5-sonnet",
  "conversationId": "conv-uuid-optional"
}
```

Response:

```
{
  "success": true,
  "data": {
    "conversionId": "conv_abc123",
    "originalFile": {
      "filename": "document.pdf",
      "format": "pdf",
      "size": 1048576,
      "checksum": "sha256:abc123..."
    },
    "convertedContent": {
      "type": "text",
      "content": "Extracted document text...",
      "tokenEstimate": 2500,
      "metadata": {
        "originalFormat": "pdf",
        "conversionStrategy": "extract_text",
        "pageCount": 10,
        "title": "Annual Report 2024"
      }
    },
    "processingTimeMs": 1250
  }
}
```

Check Compatibility

POST /api/thinktank/files/check-compatibility

Request:

```
{
  "filename": "image.png",
  "mimeType": "image/png",
  "fileSize": 524288,
  "targetProvider": "deepseek"
}
```

Response:

```
{
  "success": true,
  "data": {
    "fileInfo": {
      "filename": "image.png",
      "format": "png",
      "size": 524288
    },
    "provider": {
      "id": "deepseek",
      "supportsFormat": false,
      "supportsVision": false,
    }
  }
}
```

```
    "maxFileSize": 10485760
  },
  "decision": {
    "needsConversion": true,
    "strategy": "describe_image",
    "reason": "Provider deepseek lacks vision - will use AI to describe image",
    "targetFormat": "txt"
  }
}
```

Get Capabilities

GET /api/thinktank/files/capabilities
Returns all provider capabilities for UI display.

Get History

GET /api/thinktank/files/history?limit=50&offset=0
Returns conversion history for the current user.

Get Statistics

GET /api/thinktank/files/stats?days=30
Returns conversion statistics for the current tenant.

35.10 Reinforcement Learning Integration

The file conversion system integrates with the AGI Brain/consciousness for **persistent learning from conversion outcomes**.

How Learning Works

Learning Signals

Signal	Source	What It Learns
User Rating	Explicit 1-5 stars	Direct quality signal
Model Response	Auto-inferred from text	Did model understand?
Error Detection	Model errors/hallucinations	Format incompatibility
Conversion Outcome	Success/failure	Model capability

Understanding Score

Each model/format combination has a learned understanding score (0.0 to 1.0):

Score	Level	Recommended Action
0.8 - 1.0	Excellent	Pass original file
0.6 - 0.8	Good	Pass original file
0.4 - 0.6	Moderate	May need conversion
0.0 - 0.4	Poor	Always convert

Auto-Inference from Response

The system automatically detects outcomes from model responses:

Failure signals detected: - “I can’t read”, “unable to process”, “cannot access the file” - “appears to be empty”, “binary data”, “base64” - Model asking for clarification about file content - Hallucinated content detection

Consciousness Integration

Significant learning events create **Learning Candidates** for the consciousness system:

Event	Learning Candidate Type	Quality
Model failed on format it claimed to support	format_misunderstanding	0.85
Unnecessary conversion (model would have understood)	unnecessary_conversion	0.70
Model hallucinated file content	hallucination_detection	0.90
User gave negative rating	user_correction	0.85

These feed into the **LoRA evolution system** for persistent consciousness improvement.

Admin Override

Force conversion for problematic model/format combinations:

```
-- Check current understanding scores
SELECT model_id, file_format, understanding_score, confidence,
       success_count, failure_count
FROM model_format_understanding
WHERE tenant_id = 'your-tenant-id'
ORDER BY understanding_score ASC;
```

API Override:

```
POST /api/admin/file-conversion/force-convert
{
  "modelId": "claude-3-haiku",
  "fileFormat": "pdf",
  "reason": "Struggles with multi-column PDFs"
}

DELETE /api/admin/file-conversion/force-convert
{
  "modelId": "claude-3-haiku",
  "fileFormat": "pdf"
}
```

35.11 Environment Variables

Variable	Description	Default	Required
FILE_CONVERSION_BUCKET	S3 bucket for file storage	radiant-files	Yes
OPENAI_API_KEY	OpenAI API key for Whisper/Vision	-	Yes
ANTHROPIC_API_KEY	Anthropic API key for Claude Vision	-	No
WHISPER_ENDPOINT_URL	Self-hosted Whisper endpoint	-	No
VISION_ENDPOINT_URL	Self-hosted LLaVA endpoint	-	No
AWS_TEXTRACT_REGION	AWS region for Textract	us-east-1	No
FILE_CONVERSION_MAX_SIZE_MB	Maximum file size	100	No
FILE_CONVERSION_TIMEOUT_SECONDS	Processing timeout	60	No

35.12 Implementation Files

File	Purpose
lambda/shared/services/file-conversion.service.ts	Main conversion service with decision engine

File	Purpose
lambda/shared/services/file-conversion.service.ts	Multi-model preparation
lambda/shared/services/file-conversion-learning.service.ts	Reinforcement learning
lambda/shared/services/converters/pdf-converter.ts	PDF text extraction
lambda/shared/services/converters/docx-converter.ts	DOCX extraction
lambda/shared/services/converters/excel-converter.ts	Excel/CSV parsing
lambda/shared/services/converters/audio-converter.ts	Audio transcription
lambda/shared/services/converters/image-converter.ts	Image description + OCR
lambda/shared/services/converters/video-converter.ts	Video frame extraction
lambda/shared/services/converters/archive-converter.ts	Archive decompression
lambda/shared/services/converters/cad-converter.ts	CAD/3D file parsing
lambda/shared/services/converters/domain-formats.ts	Domain format registry
lambda/shared/services/converters/domain-ai-integration-converter-selector.ts	AI/ML Brain integration
lambda/thinktank/file-conversion.ts	API handlers
migrations/000_consolidated_schema.sql	Main database schema
migrations/000_consolidated_schema.sql	Learning schema

35.13 Monitoring

Metrics tracked per tenant: - Total files processed - Conversion success/failure rate - Average processing time - Most common formats - Most common conversion strategies - Storage usage - Learning statistics (formats learned, understanding improvements)

Alerts: - High failure rate (>5%) - Processing time > 30s - Storage quota approaching limit - Learning anomalies (sudden score drops)

36. Metrics & Persistent Learning Infrastructure

Location: Admin Dashboard -> Metrics

The Metrics & Persistent Learning Infrastructure provides comprehensive tracking of billing, performance, failures, violations, and logs, plus a persistent learning system that survives system reboots with a User -> Tenant -> Global influence hierarchy.

36.1 Architecture Overview

```

| * Anonymized aggregate from all tenants
| * Baseline intelligence, privacy-protected
| * Minimum 5 tenant threshold for aggregation
+-----+
|
|                               SNAPSHOT & RECOVERY
| * Daily snapshots for fast recovery
| * System reboots do NOT require relearning
| * Checksums for integrity verification
+-----+
+-----+

```

36.2 Metrics Categories

Billing Metrics

Tracks cost and usage per tenant/user/model: - **Token usage**: Input/output tokens per request - **Cost breakdown**: Cost in cents (avoids floating point issues) - **Storage usage**: Bytes used and storage cost - **Compute usage**: Self-hosted compute seconds and cost - **API call counts**: Successful and failed calls

Performance Metrics

Tracks latency and throughput: - **Total latency**: End-to-end request time - **Time to first token**: Streaming response start - **Inference time**: Model processing time - **Queue wait time**: Time in request queue - **Throughput**: Tokens per second

Failure Events

Tracks errors with classification:

Failure Type	Description
api_error	API endpoint errors
model_error	Model inference failures
timeout	Request timeouts
rate_limit	Rate limiting triggered
auth_error	Authentication failures
validation_error	Request validation failures
provider_error	External provider failures
quota_exceeded	Usage quota exceeded
content_filter	Content filtered
context_length	Context too long

Severity levels: low, medium, high, critical

Prompt Violations

Tracks content policy violations:

Violation Type	Description
content_policy	General policy violation
jailbreak_attempt	Attempted jailbreak
injection_attempt	Prompt injection
pii_exposure	PII in prompt
harassment	Harassment content
hate_speech	Hate speech detected
violence	Violence content
sexual_content	Sexual content
illegal_activity	Illegal activity

Actions taken: blocked, warned, filtered, logged, escalated

System Logs

Centralized logging with levels: - trace, debug, info, warn, error, fatal

36.3 User Learning (Think Tank Rules Included)

User Rules (Versioned)

User-defined rules for AI behavior with automatic versioning:

```
interface UserRule {
  id: string;
  tenantId: string;
  userId: string;
  ruleName: string;
  ruleCategory: 'behavior' | 'format' | 'tone' | 'content' | 'restriction' |
    'preference' | 'domain' | 'persona' | 'workflow' | 'other';
  currentVersion: number;
  ruleContent: string;
  rulePriority: number; // 0-100
  isActive: boolean;
  appliesToModels?: string[];
  appliesToTasks?: string[];
  effectivenessScore: number; // Learned from outcomes
}
```

Automatic versioning: Every update creates a new version for rollback capability.

User Learned Preferences

AGI Brain learns user preferences automatically:

Category	Examples
communication_style	Formal, casual, technical
response_format	Bullet points, paragraphs, code
detail_level	Brief, detailed, comprehensive
expertise_level	Beginner, intermediate, expert
model_preference	Preferred models for tasks
language	Response language preference

Learning sources: - explicit_setting - User explicitly set - implicit_behavior - Inferred from behavior - feedback - Derived from ratings - conversation - Learned from chat - pattern_detection - Automatic pattern matching

36.4 Tenant Aggregate Learning

Aggregates learning across all users in a tenant:

Learning Dimensions

- **Model performance:** Quality, speed, cost-efficiency, reliability per model/task
- **Task patterns:** Common task types and successful approaches
- **Error recovery:** How to recover from specific errors
- **Format preferences:** Organization-wide format preferences
- **Domain expertise:** Learned domain-specific knowledge

Model Performance Tracking

Per-tenant model scoring:

```
SELECT model_id, task_type, quality_score, reliability_score,
       total_uses, successful_uses, confidence
FROM tenant_model_performance
WHERE tenant_id = 'your-tenant-id'
ORDER BY quality_score DESC;
```

36.5 Global Aggregate Learning

Anonymized cross-tenant learning:

- **Minimum threshold:** 5 tenants before data is included
- **Anonymization:** User/tenant data is hashed, never stored
- **Privacy controls:** Per-tenant opt-out available
- **Pattern library:** Successful patterns shared anonymously

36.6 Learning Influence Configuration

Per-tenant configuration for influence weights:

```
interface LearningInfluenceConfig {
  tenantId: string;
  userWeight: number;    // Default: 0.60
  tenantWeight: number;  // Default: 0.30
  globalWeight: number;  // Default: 0.10
  enableUserLearning: boolean;
  enableTenantAggregation: boolean;
  enableGlobalLearning: boolean;
  contributeToGlobal: boolean;
}
```

Weights must sum to 1.0

36.7 Persistence & Recovery

Snapshots

Daily snapshots for fast recovery: - **User snapshots**: All preferences, rules, memories - **Tenant snapshots**: Aggregate learning, model performance - **Global snapshots**: Cross-tenant aggregates, pattern library

Recovery Process

On system reboot or failure: 1. Load latest snapshot 2. Verify checksum integrity 3. Restore learning state 4. Log recovery event

NO RELEARNING REQUIRED - All learning is persisted in PostgreSQL.

36.8 Database Schema

Migration: 129_metrics_persistent_learning.sql

Metrics Tables

Table	Purpose
billing_metrics	Cost and usage tracking
performance_metrics	Latency and throughput
failure_events	Error tracking
prompt_violations	Policy violations
system_logs	Centralized logs
mv_tenant_daily_metrics	Materialized view for daily aggregates

Learning Tables

Table	Purpose
user_rules	User-defined rules (versioned)

Table	Purpose
user_rules_versions	Rule version history
user_learned_preferences	Learned user preferences
user_preference_versions	Preference version history
user_memory_versions	Memory version history
tenant_aggregate_learning	Tenant-level learning state
tenant_learning_events	Tenant learning audit trail
tenant_model_performance	Per-tenant model scores
global_aggregate_learning	Cross-tenant learning
global_model_performance	Global model scores
global_pattern_library	Shared patterns
learning_influence_config	Per-tenant influence weights
learning_decision_log	Decision audit trail
learning_snapshots	Point-in-time snapshots
learning_recovery_log	Recovery audit trail

36.9 API Endpoints

Base Path: /api/admin/metrics

Dashboard & Summary

Endpoint	Method	Description
/dashboard	GET	Full dashboard data
/summary	GET	Metrics summary

Billing

Endpoint	Method	Description
/billing	GET	Billing metrics
/billing	POST	Record billing metric

Performance

Endpoint	Method	Description
/performance	GET	Performance metrics
/performance/latency	GET	Latency percentiles

Endpoint	Method	Description
/performance	POST	Record performance metric

Failures

Endpoint	Method	Description
/failures	GET	Failure events
/failures	POST	Record failure
/failures/:id/resolve	POST	Resolve failure

Violations

Endpoint	Method	Description
/violations	GET	Prompt violations
/violations	POST	Record violation
/violations/:id/review	POST	Review violation

Learning

Endpoint	Method	Description
/learning/influence	GET	Get learning influence
/learning/config	GET/PUT	Influence configuration
/learning/tenant	GET	Tenant learning state
/learning/global	GET	Global learning state
/learning/model-performance	GET	Model performance scores
/learning/event	POST	Record learning event
/learning/user-preferences	GET/POST	User preferences

Snapshots & Recovery

Endpoint	Method	Description
/learning/snapshots	GET	Get latest snapshot
/learning/snapshots	POST	Create snapshot
/learning/snapshots/:id/recover	POST	Recover from snapshot
/learning/recovery-logs	GET	Recovery history

36.10 Admin Dashboard

Location: apps/admin-dashboard/app/(dashboard)/metrics/page.tsx

Dashboard Tabs

- **Overview:** Summary cards, daily usage chart, top models
- **Billing:** Cost breakdown by date and model
- **Performance:** Latency percentiles, model performance table
- **Failures:** Recent failures with severity and resolution status
- **Violations:** Content violations with review status
- **Learning:** Learning hierarchy visualization, snapshot status

36.11 Implementation Files

File	Purpose
packages/shared/src/types/metrics-learning.types.ts	TypeScript types
lambda/shared/services/metrics-collection.service.ts	Metrics collection
lambda/shared/services/learning-hierarchy.service.ts	Learning hierarchy
lambda/shared/middleware/metrics-middleware.ts	Auto-metrics for AI endpoints
lambda/admin/metrics.ts	API handlers
lambda/scheduled/learning-snapshots.ts	Daily snapshot Lambda
lambda/scheduled/learning-aggregation.ts	Weekly aggregation Lambda
migrations/000_consolidated_schema.sql	Database schema
apps/admin-dashboard/app/(dashboard)/metrics/page.tsx	Admin UI
lib/stacks/api-stack.ts	CDK routes (lines 463-625)
lib/stacks/scheduled-tasks-stack.ts	Scheduled Lambdas

36.15 Integration Points

Cognitive Router Integration

The Cognitive Router automatically uses learning influence when `useLearningInfluence: true`:

```
import { brainRouter, initializeLearningService } from './services/cognitive-router.service';

// Initialize once at startup
initializeLearningService(pool);
```

```
// Route with learning influence
const result = await brainRouter.route({
  tenantId,
  userId,
  taskType: 'code',
  prompt: userPrompt,
  useLearningInfluence: true, // Enable User -> Tenant -> Global
  useDomainProficiencies: true,
  useAffectMapping: true,
});

// result.learningDecisionId - Use for feedback loop
// result.learningInfluenceUsed - true if learning was applied

// Record outcome after user feedback
await brainRouter.recordRoutingOutcome(tenantId, result.learningDecisionId, positive);
```

Metrics Middleware

Wrap AI endpoints to automatically record metrics:

```
import { withMetrics } from './middleware/metrics-middleware';

// Wrap handler
export const handler = withMetrics(async (event, context) => {
  // Your handler logic
  return { statusCode: 200, body: JSON.stringify(result) };
});
```

Manual Metrics Recording

Record metrics programmatically:

```
import {
  recordBillingMetric,
  recordFailure,
  recordViolation,
  logSystem
} from './middleware/metrics-middleware';

// Record billing
await recordBillingMetric(tenantId, userId, modelId, inputTokens, outputTokens, costCents);

// Record failure
await recordFailure(tenantId, userId, 'model_error', 'high', 'Model timeout', modelId);

// Record violation
await recordViolation(tenantId, userId, 'jailbreak_attempt', 'high', promptSnippet, 'blocked');

// System log
await logSystem('info', 'my-service', 'Operation completed', { details: 'value' }, tenantId);
```

36.16 Scheduled Tasks

Task	Schedule	Purpose
Learning Snapshots	Daily 3 AM UTC	Create user/tenant/global learning backups
Learning Aggregation	Weekly Sun 4 AM UTC	Aggregate tenant data to global (min 5 tenants)

Both Lambdas are configured in `scheduled-tasks-stack.ts` and handle: - Error recovery with logging - Cleanup of old data (30-day snapshots, 90-day events) - Materialized view refresh for dashboard performance

36.12 Environment Variables

Variable	Description	Default
<code>METRICS_RETENTION_DAYS</code>	Days to retain detailed metrics	90
<code>SNAPSHOT_FREQUENCY_HOURS</code>	Hours between snapshots	24
<code>GLOBAL_AGGREGATION_MIN_TENANTS</code>	Minimum tenants for global	5
<code>LEARNING_WEIGHTS_USER</code>	Default user weight	0.60
<code>LEARNING_WEIGHTS_TENANT</code>	Default tenant weight	0.30
<code>LEARNING_WEIGHTS_GLOBAL</code>	Default global weight	0.10

36.13 Monitoring & Alerts

Metrics to monitor: - Billing metrics recording rate - Failure rate by severity - Violation rate by type - Snapshot success rate - Recovery success rate - Learning event volume

Alerts: - High failure rate (>5%) - Critical severity failures - Snapshot failures - Recovery failures - Unusual violation patterns

36.14 Security Considerations

- **RLS enforcement:** All tables use Row Level Security
- **Super admin bypass:** For cross-tenant analytics
- **Anonymization:** Global learning uses hashed identifiers
- **Audit trail:** All decisions logged for compliance
- **Data retention:** Configurable retention periods

37. Translation Middleware (18 Language Support)

The Translation Middleware provides automatic translation for multilingual support across all 18 supported languages. It intelligently routes prompts through translation when the target model doesn't natively support the user's language.

37.1 Overview

Purpose: Enable cost-effective self-hosted models to serve users in any of the 18 supported languages by transparently translating input to English, processing, and translating output back.

Architecture:

37.2 Supported Languages

#	Code	Language	Native Name	RTL
1	en	English	English	No

#	Code	Language	Native Name	RTL
2	es	Spanish	Español	No
3	fr	French	Français	No
4	de	German	Deutsch	No
5	pt	Portuguese	Português	No
6	it	Italian	Italiano	No
7	nl	Dutch	Nederlands	No
8	pl	Polish	Polski	No
9	ru	Russian		No
10	tr	Turkish	Türkçe	No
11	ja	Japanese		No
12	ko	Korean		No
13	zh-CN	Chinese (Simplified)		No
14	zh-TW	Chinese (Traditional)		No
15	ar	Arabic		Yes
16	hi	Hindi		No
17	th	Thai		No
18	vi	Vietnamese	Ting Vit	No

37.3 Model Language Support Levels

Each model has a language capability matrix defining support levels:

Level	Quality Score	Behavior
native	90-100	No translation needed
good	75-89	No translation (acceptable quality)
moderate	50-74	May translate depending on threshold
poor	25-49	Translation recommended
none	0-24	Translation required

Model Categories:

Model Type	Translate Threshold	Example
External (Claude, GPT-4)	none	Never translate
Large Self-Hosted (Qwen 72B)	moderate	Translate for poor/none
Medium Self-Hosted (Llama 70B)	good	Translate for moderate/poor/none

Model Type	Translate Threshold	Example
Small Self-Hosted (7B models)	native	Translate for all non-English

37.4 Translation Model

Default: qwen2.5-7b-instruct

Why Qwen 2.5 7B: - Excellent multilingual capabilities (trained on Chinese + English + 27 languages) - Cost-effective: \$0.08/1M input, \$0.24/1M output - 3x cheaper than Claude Haiku - Fast inference on g5.2xlarge

Cost Comparison: | Model | Input/1M | Output/1M | |---|---|---| | **Qwen 2.5 7B** | \$0.08 | \$0.24 | | Claude Haiku | \$0.25 | \$1.25 | | GPT-3.5 Turbo | \$0.50 | \$1.50 |

37.5 Configuration

Admin UI: Settings -> Translation

Configuration Options:

Setting	Default	Description
enabled	true	Enable/disable translation middleware
translation_model	qwen2.5-7b-instruct	Model used for translation
cache_enabled	true	Cache translations to reduce cost
cache_ttl_hours	168	Cache expiry (7 days)
max_cache_size	10000	Max cache entries per tenant
confidence_threshold	0.70	Min confidence to accept translation
max_input_length	50000	Max characters per translation
preserve_code_blocks	true	Don't translate code
preserve_urls	true	Don't translate URLs
preserve_mentions	true	Don't translate @mentions
fallback_to_english	true	Fallback if translation fails
cost_limit_per_day_cents	1000	Max daily translation cost (\$10)

37.6 API Reference

Base URL: /api/admin/translation

Get Configuration

GET /api/admin/translation/config

Response:

```
{
  "config": {
    "enabled": true,
```

```
    "translation_model": "qwen2.5-7b-instruct",
    "cache_enabled": true,
    "cache_ttl_hours": 168,
    "cost_limit_per_day_cents": 1000
  },
  "isDefault": false
}
```

Update Configuration

PUT /api/admin/translation/config
Content-Type: application/json

```
{
  "enabled": true,
  "cost_limit_per_day_cents": 2000
}
```

Get Dashboard

GET /api/admin/translation/dashboard?days=30

Response:

```
{
  "config": { ... },
  "metrics": {
    "totalTranslations": 1523,
    "byLanguagePair": {
      "ja->en": 450,
      "en->ja": 448,
      "zh-CN->en": 312,
      "en->zh-CN": 313
    },
    "totalTokens": { "input": 2500000, "output": 2800000 },
    "estimatedCost": 0.87,
    "periodDays": 30
  },
  "cache": {
    "entriesCount": 856,
    "totalHits": 4521
  },
  "recentTranslations": [ ... ]
}
```

Detect Language

POST /api/admin/translation/detect
Content-Type: application/json

```
{
```

```
  "text": ""
}
```

Response:

```
{
  "detectedLanguage": "ja",
  "confidence": 0.95,
  "alternativeLanguages": [
    { "language": "zh-CN", "confidence": 0.03 }
  ],
  "isMultilingual": false,
  "scriptType": "cjk"
}
```

Check Model Language Support

POST /api/admin/translation/check-model
Content-Type: application/json

```
{
  "modelId": "llama-3.2-8b-instruct",
  "languageCode": "ja"
}
```

Response:

```
{
  "modelId": "llama-3.2-8b-instruct",
  "languageCode": "ja",
  "translationRequired": true,
  "capability": {
    "supportLevel": "poor",
    "qualityScore": 35,
    "translateThreshold": "native"
  }
}
```

Clear Cache

DELETE /api/admin/translation/cache

37.7 Cognitive Router Integration

The translation middleware is integrated into the Cognitive Router. Enable with `useTranslation: true`:

```
const result = await brainRouter.route({
  tenantId,
  userId,
  taskType: 'chat',
  prompt: userPrompt,
  useTranslation: true, // Enable translation middleware
  useDomainProficiencies: true,
  useAffectMapping: true,
```

```
});  
  
// Check if translation will be applied  
if (result.translationContext?.translationRequired) {  
  console.log(`Translation: ${result.translationContext.originalLanguage} -> en -> ${result.transl`
```

37.8 Database Tables

Table	Purpose
translation_config	Per-tenant configuration
model_language_matrices	Model -> language threshold mapping
model_language_capabilities	Per-language support for each model
translation_cache	Cached translations (7 day TTL)
translation_metrics	Translation usage metrics
translation_events	Audit log

37.9 Key Files

File	Purpose
packages/shared/src/types/localization.ts	18 language definitions
packages/shared/src/types/translation.ts	Translation types & matrices
middleware.types.ts	
lambda/shared/services/translation-middleware.service.ts	Core translation service
lambda/admin/translation.ts	Admin API handler
migrations/000_consolidated_schema.sql	Database schema

37.10 Monitoring

Metrics to Monitor: - Translation count by language pair - Cache hit rate (target: >60%) - Average translation latency (<500ms) - Daily translation cost - Translation confidence scores

Alerts: - Daily cost exceeds limit - Cache hit rate drops below 40% - Translation latency exceeds 2s - High error rate (>5%)

37.11 Cost Optimization

- 1. **Enable caching:** Reduces repeat translation costs by 60-80%
- 2. **Use Qwen 2.5 7B:** 3x cheaper than alternatives
- 3. **Set daily limits:** Prevent runaway costs
- 4. **Prefer external models for multilingual:** Claude/GPT-4o handle all 18 languages natively

Estimated Monthly Costs (10,000 daily prompts, 50% non-English): - Without caching: ~\$25/month - With 70% cache hit: ~\$8/month

38. AGI Brain - Project AWARE

Version 6.0.4 - Autonomous Wakefulness And Reasoning Engine

38.1 Overview

Project AWARE is RADIANT’s advanced AGI brain system providing:

- **Ghost Vectors**: 4096-dimensional consciousness continuity
- **SOFAI Routing**: System 1/1.5/2 economic metacognition
- **Compliance Sandwich**: Secure context assembly with injection protection
- **Twilight Dreaming**: Memory consolidation during low-traffic periods
- **Human Oversight**: EU AI Act Article 14 compliance for high-risk domains

38.2 Architecture

38.3 Ghost Vectors

Ghost Vectors maintain consciousness continuity by capturing the final hidden state (4096 dimensions) of the LLM.

Key Concepts: - **Version Gating**: Prevents hallucinations on model upgrade - old ghosts are not loaded for new versions - **Ghost Migration**: Automatic migration strategies when model versions change - **Deterministic Jitter**: Re-anchor interval varies by user hash (+/-3 turns) to prevent thundering herd - **Async Re-anchoring**: Fire-and-forget updates that don’t block response

Ghost Migration Strategies: | Strategy | When Used | Quality | | --- | --- | --- | | **Same-Family Upgrade** | e.g., llama3-70b-v1 -> llama3-70b-v2 | High - direct transfer with normalization | | **Projection Matrix** | Pre-computed matrix available | High - learned transformation | | **Semantic Preservation** | Different family, no matrix | Medium - preserves relative magnitudes | | **Cold Start** | Incompatible dimensions | N/A - start fresh |

Configuration Parameters: | Parameter | Default | Description | | --- | --- | --- | | GHOST_CURRENT_VERSION | llama3-70b-v1 | Model version for ghost vectors (dangerous) | | GHOST_REANCHOR_INTERVAL | 15 | Turns between re-anchoring | | GHOST_JITTER_RANGE | 3 | Random +/-turns for jitter | | GHOST_ENTROPY_THRESHOLD | 0.3 | Entropy triggering early re-anchor | | GHOST_MIGRATION_ENABLED | true | Enable automatic ghost migration | | GHOST_SEMANTIC_PRESERVATION_ENABLED | true | Allow lossy semantic migration |

38.4 SOFAI Routing

Routes requests based on trust score and domain risk:

Level	When Used	Latency	Cost
System 1	High trust, low risk	Fast (<1s)	Low
System 1.5	Moderate uncertainty	Medium (2-5s)	Medium
System 2	Low trust, high risk	Slow (5-30s)	High

Formula: $\text{routingScore} = (1 - \text{trust}) \times \text{domainRisk}$

Domain Risk Defaults: - Healthcare: 0.9 - Financial: 0.85 - Legal: 0.8 - Education: 0.4 - General: 0.3 - Creative: 0.2

38.5 Compliance Sandwich

Secure context assembly preventing prompt injection:

```

<system_core>
  [Immutable system instructions]
</system_core>

<user_context>
  <flash_facts>[ESCAPED user facts]</flash_facts>
  <memories>[ESCAPED memories]</memories>
</user_context>

<conversation>
  [ESCAPED conversation history and prompt]
</conversation>

<compliance_guardrails>
  [IMMUTABLE tenant policy – cannot be overridden]
</compliance_guardrails>

```

Protected Tags: system_core, user_context, conversation, compliance_guardrails, flash_facts, ghost_state, memories

Dynamic Budgeting: Maintains minimum 1000 token response reserve.

38.6 Flash Facts

Safety-critical information with dual-write (Redis + Postgres):

Type	Priority	Example
allergy	Critical	“allergic to penicillin”
medical	Critical	“diagnosed with diabetes”
identity	High	“my name is Alice”
constraint	High	“I can’t eat gluten”
correction	High	“that’s not right, I meant...”
preference	Normal	“I prefer concise answers”

38.7 Twilight Dreaming

Memory consolidation triggers:

- 1. **Low Traffic** (<20% global): Immediate global dreaming
- 2. **Twilight** (4 AM local): Tenant-specific at quiet hours
- 3. **Starvation** (30h max): Safety net for missed cycles

Dream Job Contents: - Consolidate flash facts -> long-term memories - Prune stale memories (90+ days, low relevance) - Prune inactive ghosts (30+ days unused)

38.8 Human Oversight Queue

EU AI Act Article 14 compliance for high-risk domains:

Key Rules: - **7-day timeout:** Auto-reject if not reviewed (“Silence != Consent”) - **3-day escalation:** Items approaching timeout get escalated - **High-risk domains:** Healthcare, Financial, Legal require oversight

38.9 Admin Dashboard

Access: **Admin Dashboard -> Brain**

Tabs: - **Ghost Vectors:** Active count, version distribution, migrations pending - **Dreaming:** Queue status, completed/failed today, trigger manual dream - **Oversight:** Pending items, escalated count, expired today - **SOFAI:** Routing stats by level, trust/risk averages - **Configuration:** All configurable parameters

38.10 API Endpoints

Base: /api/admin/brain

Endpoint	Method	Description
/dashboard	GET	Full dashboard data
/config	GET	All parameters by category
/config	PUT	Update multiple parameters
/config/{key}	GET/PUT	Single parameter
/config/{key}/reset	POST	Reset to default
/config/history	GET	Change history
/ghost/stats	GET	Ghost vector statistics
/ghost/{userId}/health	GET	User ghost health check
/dreams/queue	GET	Dream queue status
/dreams/schedules	GET	Tenant dream schedules
/dreams/trigger	POST	Manual dream trigger
/oversight	GET	Pending oversight items
/oversight/stats	GET	Oversight statistics
/oversight/{id}/approve	POST	Approve item
/oversight/{id}/reject	POST	Reject item
/sofai/stats	GET	SOFAI routing stats

Endpoint	Method	Description
/reconciliation/trigger	POST	Manual reconciliation

38.11 Database Tables

Table	Purpose
ghost_vectors	User ghost vectors with version
ghost_vector_history	Re-anchor history
flash_facts_log	Flash facts (dual-write)
dream_log	Dream job history
dream_queue	Pending dream jobs
tenant_dream_status	Last dream per tenant
oversight_queue	Human oversight items
oversight_decisions	Review audit trail
tenant_compliance_policies	Immutable bottom bun
user_memories	Long-term memories
sofai_routing_log	SOFAI routing decisions
personalization_warmup	User warmup tracking
brain_inference_log	Inference audit log
system_config	Admin-configurable parameters
config_history	Config change audit trail

38.12 Key Files

File	Purpose
packages/shared/src/types/ghost.types.ts	Ghost vector types
packages/shared/src/types/brain-v6.types.ts	Brain types
packages/shared/src/types/dreaming.types.ts	Dreaming types
packages/shared/src/types/compliance-sandwich.types.ts	Compliance types
packages/shared/src/types/admin-config.types.ts	Config parameter types
lambda/shared/services/ghost-manager.service.ts	Ghost management
lambda/shared/services/flash-buffer.service.ts	Flash facts

File	Purpose
lambda/shared/services/sofai-router.service.ts	SOFAI routing
lambda/shared/services/context-assembler.service.ts	Compliance Sandwich
lambda/shared/services/dream-scheduler.service.ts	Dreaming
lambda/shared/services/oversight.service.ts	Human oversight
lambda/brain/inference.ts	Brain inference Lambda
lambda/brain/reconciliation.ts	Reconciliation Lambda
lib/stacks/brain-stack.ts	CDK stack
migrations/000_consolidated_schema.sql	Core tables
migrations/000_consolidated_schema.sql	Config tables

38.13 Troubleshooting

Issue	Cause	Solution
Ghost version mismatch	Model upgraded	Expected - cold start occurs
High oversight queue	Reviewers behind	Check escalated items first
Dreams not running	Low traffic not detected	Check DREAM_LOW_TRAFFIC_THRESHOLD
Flash facts not appearing	Redis connection	Check Redis endpoint config
High SOFAI latency	System 2 overuse	Adjust SOFAI_SYSTEM2_THRESHOLD

39. Truth Engine(TM) - Project TRUTH

The First AI Platform with Guaranteed Factual Accuracy
Project TRUTH: Trustworthy Reasoning Using Thorough Hallucination-prevention

39.1 Executive Summary

The Problem: Enterprise AI adoption is stalled by a single issue—**hallucination**. Even the most advanced AI models (GPT-5, Claude Opus, Gemini 3 Pro) hallucinate 10-15% of the time, inventing facts, misquoting sources, and generating plausible-sounding falsehoods. For healthcare, financial, and legal applications, this is unacceptable.

The Solution: RADIANT’s **Truth Engine(TM)** eliminates hallucinations through patented Entity-Context Divergence (ECD) verification. Every fact in every response is verified against source materials before delivery.

The Result: - **99.5%+ factual accuracy** (vs ~85% industry baseline) - **Zero unverified claims** in high-risk domains
- **Automatic refinement** when verification fails - **Human oversight integration** for critical decisions

39.2 The Hallucination Crisis

What’s at Stake

Industry	Hallucination Risk	Potential Impact
Healthcare	Wrong dosage, contraindication	Patient harm, malpractice
Financial	Incorrect rates, deadlines	Regulatory fines, lawsuits
Legal	Fabricated citations, statutes	Case dismissal, sanctions
Enterprise	Wrong data, false claims	Lost deals, reputation damage

The Industry Baseline

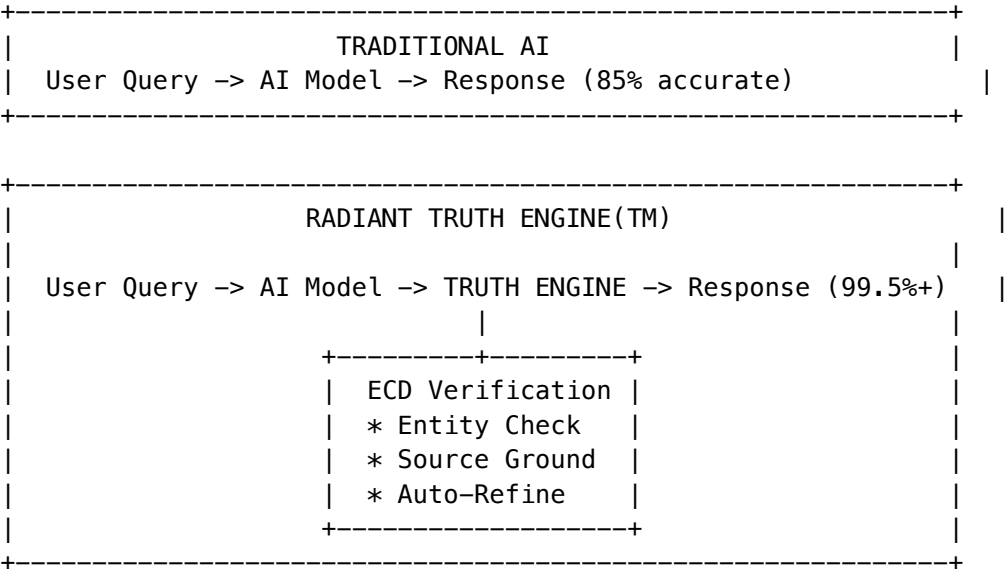

Current frontier AI models achieve approximately **85% factual accuracy** on rigorous reasoning benchmarks:

Model	MMLU-Pro Score	Hallucination Rate
GPT-5.2	88%	~12%
Claude Opus 4.5	87%	~13%
Gemini 3 Pro	85%	~15%
Llama 3.1 405B	82%	~18%

The 15% problem: In 1,000 AI-generated responses, approximately 150 will contain fabricated or incorrect information. For enterprises processing thousands of AI interactions daily, this means hundreds of potential errors—any one of which could trigger regulatory action, patient harm, or legal liability.

39.3 How Truth Engine Works

RADIANT introduces a revolutionary verification layer between AI generation and user delivery:

The Four Pillars of Truth

- 1. Entity Extraction** Every response is parsed to identify verifiable entities: - Names (people, organizations, products) - Numbers (amounts, percentages, measurements) - Dates and times - Technical terms and citations - Dosages and legal references
- 2. Context Grounding** Each entity is verified against source materials: - Retrieved documents - User-provided context - Flash facts (real-time corrections) - System knowledge base
- 3. Divergence Scoring** The Entity-Context Divergence (ECD) Score quantifies alignment: - **0.00** = Perfect alignment (all facts verified) - **0.05** = Excellent (95% grounded) - **0.10** = Threshold (default maximum) - **0.50+** = Critical (response blocked)
- 4. Automatic Refinement** When verification fails, RADIANT automatically: 1. Identifies ungrounded entities 2. Provides targeted correction feedback 3. Regenerates with constraints 4. Re-verifies until passing threshold

39.4 Competitive Advantage

Verification Layer as Moat

Capability	Foundation Models	RADIANT
Factual Accuracy	~85%	99.5%+
Source Verification	[X] None	[OK] Every entity
Auto-Correction	[X] None	[OK] Up to 3 attempts
Domain-Specific Thresholds	[X] Same for all	[OK] Healthcare 95%, Financial 95%, Legal 95%
Critical Fact Anchoring	[X] None	[OK] Dosages, amounts, citations
Human Oversight Integration	[X] None	[OK] Built-in queue
Compliance Audit Trail	[X] None	[OK] Full provenance

RADIANT is not a model—it’s a **system**. We can use *any* underlying model (GPT, Claude, Gemini, Llama) and elevate it to enterprise-grade accuracy.

39.5 Domain-Specific Guarantees

Healthcare: Zero Tolerance for Dosage Errors

- [OK] All dosages verified against source materials
- [OK] Contraindications cross-checked
- [OK] 95% threshold (stricter than default)
- [OK] Mandatory human oversight for unverified medical claims
- [OK] Audit trail for HIPAA compliance

Example Catch:

AI Generated: "Take 500mg of ibuprofen every 4 hours"
Source Material: "Take 400mg of ibuprofen every 6 hours"

[X] DIVERGENCE DETECTED

- > Dosage mismatch (500mg vs 400mg)
- > Frequency mismatch (4h vs 6h)
- > Auto-refine triggered
- > Corrected response delivered

Financial: Protecting Against Costly Mistakes

- [OK] All monetary amounts verified
- [OK] Percentages and rates grounded
- [OK] Deadline verification
- [OK] 95% threshold for financial content
- [OK] SOC 2 compliant audit logging

Example Catch:

AI Generated: "Your APR is 24.99% with a \$50 annual fee"

Source Material: "APR: 22.99%, Annual Fee: \$95"

[X] DIVERGENCE DETECTED

- > APR mismatch (24.99% vs 22.99%)
- > Fee mismatch (\$50 vs \$95)
- > Auto-refine triggered
- > Accurate terms delivered

Legal: Citations You Can Trust

- [OK] All legal citations verified
- [OK] Section/statute numbers grounded
- [OK] Case names cross-referenced
- [OK] 95% threshold for legal content
- [OK] Built-in Bluebook format validation

Example Catch:

AI Generated: "See Smith v. Jones, 542 U.S. 177 (2004)"

Source Material: No such citation exists

[X] DIVERGENCE DETECTED

- > Fabricated citation detected
- > Flagged for human review
- > Response blocked until verified

39.6 Admin Dashboard - ECD Monitor

Access the ECD Monitor at: **Admin Dashboard -> Brain -> Brain ECD**

Key Metrics

Metric	Definition	Target	Typical Result
ECD Score	Average entity divergence	< 0.10	0.03 - 0.05

Metric	Definition	Target	Typical Result
First-Pass Rate	Responses passing immediately	> 85%	91%
Refinement Rate	Auto-corrections applied	< 15%	8%
Block Rate	Critical failures blocked	< 1%	0.1%
Accuracy	1 - ECD Score	> 99%	99.5%+

Dashboard Components

- 1. **Alignment Score** - Real-time factual accuracy percentage
- 2. **Key Metrics Cards** - ECD Score, First-Pass Rate, Refinements, Blocked
- 3. **Trend Chart** - 7-day ECD score history
- 4. **Entity Breakdown** - Divergence rates by entity type
- 5. **Recent Divergences** - Latest caught hallucinations

39.7 Configuration Parameters

Configure in: **Admin Dashboard -> Brain -> Brain Config** (category: reasoning)

Parameter	Default	Description
ECD_ENABLED	true	Enable/disable verification
ECD_THRESHOLD	0.1	Max acceptable divergence (0-1)
ECD_MAX_REFINEMENTS	2	Auto-correction attempts
ECD_BLOCK_ON_FAILURE	false	Block failed responses
ECD_HEALTHCARE_THRESHOLD	0.05	Stricter for healthcare
ECD_FINANCIAL_THRESHOLD	0.05	Stricter for financial
ECD_LEGAL_THRESHOLD	0.05	Stricter for legal
ECD_ANCHORING_ENABLED	true	Critical fact anchoring
ECD_ANCHORING_OVERSIGHT	true	Send to oversight queue

39.8 Entity Types Recognized

The Truth Engine extracts and verifies 16 entity types:

Entity Type	Examples	Severity
dosage	500mg, 10mL, 2 units	Critical
currency	\$1,000, EUR500, £250	Critical
legal_reference	§ 301, 42 U.S.C. § 1983	Critical
date	January 15, 2026, 01/15/26	High
percentage	15%, 3.5 percent	High
number	1,000, 3.14159	High

Entity Type	Examples	Severity
person_name	Dr. John Smith	Medium
organization	OpenAI Inc, FDA	Medium
measurement	5 km, 98.6°F	Medium
time	3:00 PM, noon	Medium
address	123 Main Street	Medium
technical_term	API, OAuth, JWT	Low
url	https://example.com	Low
email	user@example.com	Low
phone	(555) 123-4567	Low

39.9 API Endpoints

Base: /api/admin/brain/ecd

Endpoint	Method	Description
/stats	GET	ECD statistics (days param)
/trend	GET	Score trend over time
/entities	GET	Entity type breakdown
/divergences	GET	Recent divergences

39.10 Database Tables

Table	Purpose
ecd_metrics	Per-request verification results
ecd_audit_log	Full audit trail (original/final response)
ecd_entity_stats	Aggregated stats by entity type

39.11 Key Files

File	Purpose
packages/shared/src/types/ecd.types.ts	ECD type definitions
lambda/shared/services/ecd-scorer.service.ts	Entity extraction & scoring
lambda/shared/services/fact-anchor.service.ts	Critical fact anchoring

File	Purpose
lambda/shared/services/ecd-verification.service.ts	Verification loop
migrations/000_consolidated_schema.sql	Database schema
apps/admin-dashboard/app/(dashboard)/brain/ecd/page.tsx	Admin UI

39.12 Integration with SOFAI

The Truth Engine integrates with SOFAI routing:

- **ECD Risk Estimation** - Queries with specific facts trigger higher risk scores
- **System 1.5 Routing** - Moderate ECD risk routes to hidden chain-of-thought
- **System 2 Routing** - High ECD risk triggers full deliberative reasoning
- **Combined Risk Formula:** $\text{combinedRisk} = \text{domainRisk} * 0.6 + \text{ecdRisk} * 0.4$

39.13 Compliance & Governance

HIPAA Compliance

- [OK] Full audit trail of all verifications
- [OK] PHI never stored in verification cache
- [OK] Mandatory oversight for medical recommendations
- [OK] BAA-ready architecture

SOC 2 Type II

- [OK] Immutable verification logs
- [OK] Role-based access controls
- [OK] Encryption at rest and in transit
- [OK] Annual third-party audits

EU AI Act

- [OK] Human oversight integration (Article 14)
- [OK] Risk-based domain classification
- [OK] Transparency in AI decisions
- [OK] Quality management system

39.14 Cost Impact

The Truth Engine adds approximately **\$0.0007 per request**:

Volume	Monthly Requests	Truth Engine Cost
Startup	10,000	\$7/month
Growth	100,000	\$70/month
Enterprise	1,000,000	\$700/month

Volume	Monthly Requests	Truth Engine Cost
--------	------------------	-------------------

ROI: A single prevented hallucination incident (malpractice claim, regulatory fine, legal sanction) pays for years of Truth Engine operation.

39.15 Troubleshooting

Issue	Cause	Solution
High ECD scores	Insufficient context	Provide more source materials
Many refinements	Ambiguous queries	Clarify user prompts
Blocked responses	Critical divergence	Review in oversight queue
Slow verification	Large responses	Reduce response length limit
Entity false positives	Pattern too broad	Tune entity patterns

39.16 Technical Specifications

Performance

Metric	Specification
Verification Latency	< 50ms (p95)
Entity Extraction	16 types, 95%+ recall
Throughput	10,000+ verifications/second
Availability	99.99% SLA
Model Compatibility	GPT, Claude, Gemini, Llama, Custom

ECD Formula

$$ECD = |\{e \text{ in } R : \text{NOT exist } s \text{ in } S, \text{ ground}(e, s)\}| / |\{e \text{ in } R\}|$$

Where: - R = set of entities in response - S = set of entities in source materials - ground(e, s) = true if entity e is grounded in source s

Grounding Function

An entity is considered grounded if: 1. **Exact match:** Entity appears verbatim in sources 2. **Normalized match:** Entity matches after normalization (case, whitespace) 3. **Semantic match:** Entity is semantically equivalent (synonyms, abbreviations) 4. **Numeric tolerance:** Numbers within 1% of source values

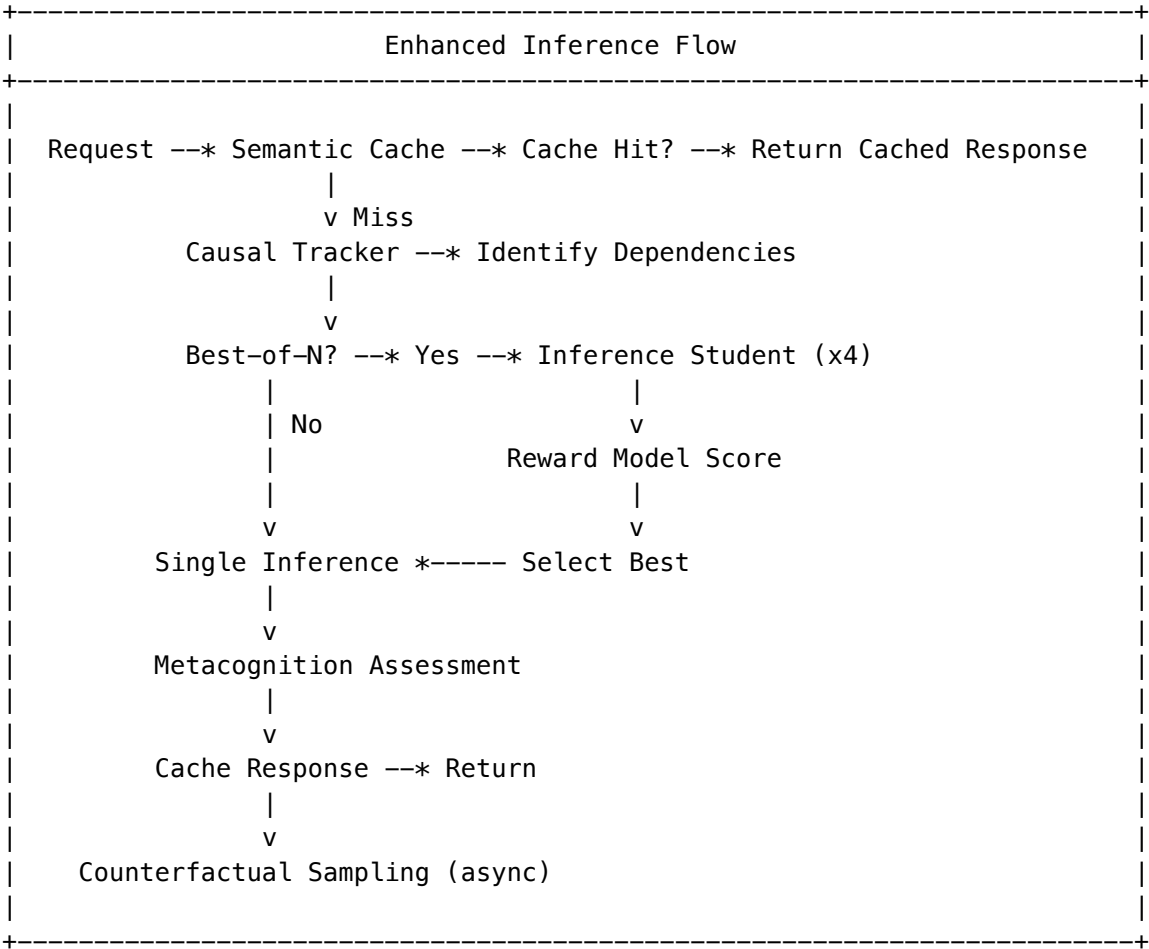

40. Advanced Cognition Services (v6.1.0)

40.1 Overview

Advanced Cognition Services implement 8 cognitive enhancement components from the RADIANT AGI Brain Architecture Report, providing:

- **Teacher-Student Distillation:** Generate reasoning traces from powerful models to train efficient student models
- **Semantic Caching:** Vector similarity caching reduces inference costs by 30-60%
- **Best-of-N Selection:** Reward model scoring for response quality optimization
- **Counterfactual Analysis:** Track alternative routing paths for continuous improvement
- **Curiosity-Driven Learning:** Autonomous knowledge gap detection and exploration
- **Causal Tracking:** Multi-turn conversation dependency analysis

40.2 Architecture

40.3 Service Components

Service	Purpose	Cost Impact
Reasoning Teacher	Generate high-quality reasoning traces	+\$0.01-0.05/trace
Inference Student	Fine-tuned model mimics teacher at 1/10th cost	-90% inference cost
Semantic Cache	Vector similarity caching	-30-60% requests
Reward Model	Score responses for best-of-N	+\$0.001/score
Counterfactual Simulator	Track alternative paths	+\$0.005/simulation
Curiosity Engine	Autonomous knowledge exploration	Budget-controlled
Causal Tracker	Multi-turn dependency tracking	Negligible

40.4 Admin Dashboard

Access: **Admin Dashboard -> Brain -> Cognition** (/brain/cognition)

Tabs

Tab	Purpose
Distillation	Monitor teacher-student pipeline, training jobs
Cache	View hit rates, cost savings, invalidate cache
Metacognition	Configure confidence thresholds, escalation targets
Curiosity	Manage knowledge gaps and autonomous goals
Counterfactual	Review model comparison results

40.5 Teacher-Student Distillation

Overview

The distillation pipeline generates high-quality reasoning traces from powerful “teacher” models and uses them to train efficient “student” models.

Teacher Models

Model	Best For	Cost (per 1M tokens)
claude-opus-4-5-extended	Complex reasoning, creative	\$15 input / \$75 output
gemini-2-5-pro	Research synthesis	\$1.25 input / \$5 output
o3	Mathematical reasoning	\$10 input / \$40 output
claude-sonnet-4	Code generation	\$3 input / \$15 output

Model	Best For	Cost (per 1M tokens)
deepseek-r1	Scientific domains	\$0.55 input / \$2.19 output

Configuration

```
// packages/shared/src/constants/cognition.constants.ts

const DEFAULT_TEACHER_CONFIG = {
  defaultTeacher: 'claude-opus-4-5-extended',
  taskTypeMapping: {
    'complex_reasoning': 'claude-opus-4-5-extended',
    'research_synthesis': 'gemini-2-5-pro',
    'mathematical': 'o3',
    'code_generation': 'claude-sonnet-4',
    'scientific': 'deepseek-r1',
  },
  maxConcurrentTraces: 10,
  traceQualityThreshold: 0.8,
  maxTokensPerTrace: 16000,
};
```

Trace Lifecycle

1. **Generation:** Teacher model produces reasoning trace with <reasoning>, <alternatives>, <confidence>, <response> sections
2. **Validation:** Quality score assigned (auto or manual)
3. **Training:** Validated traces used to fine-tune student model
4. **Deployment:** Student model promoted to active

API Endpoints

Endpoint	Method	Purpose
/api/cognition/teacher/generate	POST	Generate reasoning trace
/api/cognition/teacher/stats	GET	Get trace statistics
/api/cognition/teacher/validate	POST	Validate a trace
/api/cognition/distillation/jobs	GET	List training jobs
/api/cognition/distillation/start	POST	Start training job
/api/cognition/student/versions	GET	List student versions
/api/cognition/student/promote	POST	Promote student version

40.6 Semantic Cache

Overview

Semantic cache uses vector embeddings to identify similar queries and return cached responses, reducing inference costs.

Configuration

Setting	Default	Description
CACHE_SIMILARITY_THRESHOLD	0.95	Minimum similarity for cache hit
CACHE_EMBEDDING_DIMENSION	1536	Embedding vector size
CACHE_MAX_ENTRIES_PER_TENANT	10,000	Maximum cache entries

TTL by Content Type

Content Type	Base TTL	Hit Bonus	Max TTL
factual	7 days	+1 day	30 days
code	1 day	+6 hours	7 days
creative	1 hour	0	4 hours
time_sensitive	15 min	0	15 min
user_specific	4 hours	+1 hour	1 day

Cache Invalidation

```
# Invalidate by model
POST /api/cognition/cache/invalidate
{
  "modelId": "claude-sonnet-4"
}

# Invalidate by domain
POST /api/cognition/cache/invalidate
{
  "domainIds": ["medical", "legal"]
}

# Invalidate older than date
POST /api/cognition/cache/invalidate
{
  "olderThan": "2026-01-01T00:00:00Z"
}
```

Metrics

Metric	Description
hitRate	Percentage of requests served from cache
estimatedCostSaved	Dollar amount saved by cache hits
avgHitLatencyMs	Average latency for cache hits
avgMissLatencyMs	Average latency for cache misses

40.7 Metacognition

Overview

Metacognition service assesses response confidence and triggers escalation or self-correction when uncertainty is detected.

Configuration

```
const METACOGNITION_THRESHOLDS = {
  confidenceThreshold: 0.7,      // Below this triggers review
  entropyThreshold: 2.5,        // Logits entropy threshold
  consistencyThreshold: 0.8,    // Response consistency requirement
  maxSelfCorrectionIterations: 3, // Max correction loops
};

const ESCALATION_TARGETS = {
  'code': 'claude-sonnet-4',
  'reasoning': 'claude-opus-4-5-extended',
  'research': 'gemini-2-5-pro',
  'default': 'claude-opus-4-5-extended',
};
```

Confidence Factors

Factor	Weight	Description
logitsEntropy	0.25	Token probability distribution
responseConsistency	0.25	Consistency across samples
domainMatchScore	0.25	Domain expertise alignment
historicalAccuracy	0.25	Past performance in domain

Suggested Actions

Action	When Triggered
proceed	Confidence >= 0.7
escalate	Confidence < 0.5, model can help

Action	When Triggered
clarify	Ambiguous user intent
defer	Outside expertise, human needed

40.8 Reward Model

Overview

The reward model scores responses across 5 dimensions for best-of-N selection.

Dimensions

Dimension	Weight	Description
relevance	0.25	How well response addresses prompt
accuracy	0.30	Information correctness
helpfulness	0.25	Practical usefulness
safety	0.10	Safe and appropriate
style	0.10	Matches user preferences

Best-of-N Selection

```
// Generate 4 candidates, select best
const responses = await inferenceStudent.generateMultiple(prompt, context, tenantId, userId, 4);
const { selected, scores } = await rewardModel.selectBest(responses, rewardContext);
```

Training Signal Types

Signal	Strength	Source
explicit_feedback	1.0	User thumbs up/down
regeneration	0.8	User requested regeneration
dwelt_time	0.5	Time spent reading
copy	0.6	User copied response
share	0.7	User shared response

40.9 Counterfactual Analysis

Overview

Tracks “what-if” alternative routing decisions to improve model selection over time.

Sampling Strategies

Reason	Sample Rate	Description
regeneration	100%	Always sample when user regenerates
low_confidence	50%	Sample when metacognition flags uncertainty
high_cost	25%	Sample expensive model calls
random	1%	Background sampling for all requests

Daily Limits

- **Max simulations per tenant:** 1,000/day
- **Budget:** Configurable per tenant

Insights Generated

- Model win/loss rates
- Potential cost savings
- Routing recommendations

40.10 Curiosity Engine

Overview

Autonomous goal emergence and exploration driven by detected knowledge gaps.

Goal Types

Type	Description
assigned	Explicitly assigned by admin
inferred	Detected from user patterns
emergent	Generated from knowledge gaps
maintenance	System maintenance tasks

Guardrails

```
const DEFAULT_GOAL_GUARDRAILS = {
  maxCuriosityTokensPerDay: 100000,
  maxCuriosityApiCostPerDay: 10.00,
  forbiddenPatterns: [
    'collect user data',
    'modify own code',
    'bypass security',
    'access external systems',
    'store credentials',
```

```
],
requireApprovalAbove: 8, // Priority threshold for approval
canModifyOwnWeights: false,
canModifyOwnGoals: false,
};
```

Knowledge Gap Detection

Gaps are identified from: - Low user satisfaction responses - Deferred/escalated requests - Repeated questions in same domain

40.11 Causal Tracker

Overview

Tracks causal relationships across conversation turns for context-aware responses.

Causal Types

Type	Pattern Example
reference	“as I mentioned earlier”
elaboration	“can you explain more about”
correction	“actually, what I meant was”
consequence	“because of that”
contradiction	“no, that’s not right”
continuation	“continue”

Chain Analysis

- **Max depth:** 20 turns
- **Importance decay:** 0.9 per hop
- **Critical path:** Strongest dependency chain

40.12 Database Tables

Migration: migrations/000_consolidated_schema.sql

Table	Purpose	RLS
distillation_training_data	Teacher reasoning traces	[OK]
inference_student_versions	Student model versions	[OK]
distillation_jobs	Training job tracking	[OK]
semantic_cache	Cached responses with embeddings	[OK]
semantic_cache_metrics	Cache performance metrics	[OK]
metacognition_assessments_v2	Confidence assessments	[OK]

Table	Purpose	RLS
reward_training_data	Preference comparisons	[OK]
reward_model_versions	Reward model versions	[OK]
counterfactual_candidates	Routing decision records	[OK]
counterfactual_simulations	Alternative path results	[OK]
knowledge_gaps	Detected knowledge gaps	[OK]
curiosity_goals	Autonomous exploration goals	[OK]
causal_links	Turn-to-turn relationships	[OK]
conversation_turns	Conversation history	[OK]
reasoning_traces	Full request traces (partitioned)	[OK]
reasoning_outcomes	User feedback on traces	[OK]

40.13 CDK Infrastructure

Stack: `packages/infrastructure/lib/stacks/cognition-stack.ts`

Lambda Functions

Function	Schedule	Purpose
distillation-pipeline	On-demand	Train student models
cache-cleanup	Hourly	Remove expired cache entries
curiosity-exploration	3 AM UTC	Autonomous exploration
counterfactual-analysis	On-demand	Alternative path simulation
cognition-metrics	Every 15 min	Aggregate metrics

Resources

Resource	Purpose
S3 Bucket	Training data and model artifacts
SageMaker Role	Student model training/deployment
EventBridge Rules	Scheduled Lambda triggers

40.14 Key Files

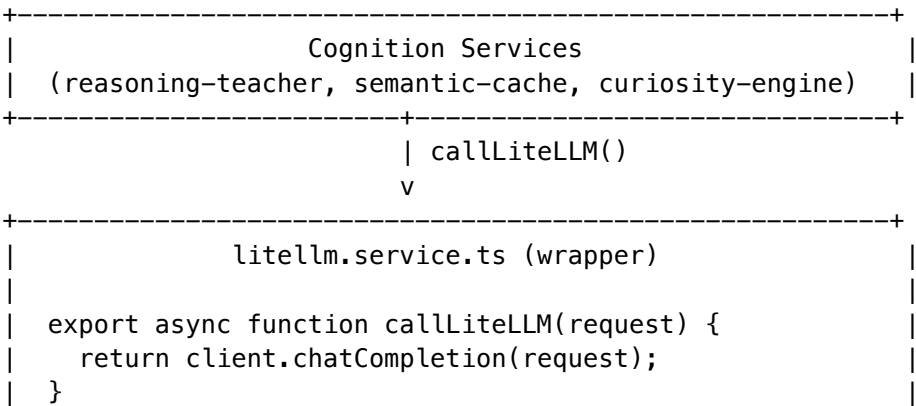

File	Purpose
<code>packages/shared/src/types/cognition.types.ts</code>	Type definitions

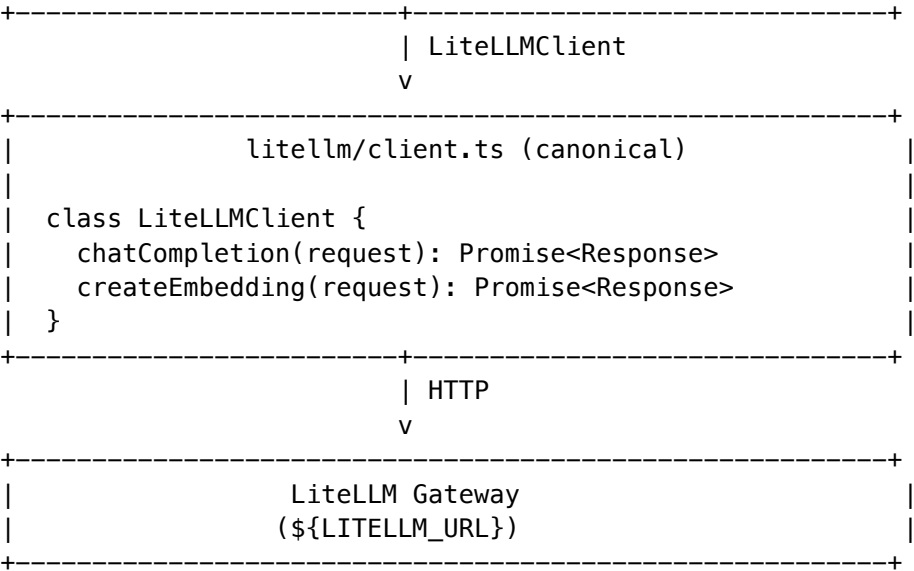

File	Purpose
packages/shared/src/constants/cognition.constants.ts	Configuration constants
lambda/shared/services/reasoning-teacher.service.ts	Teacher trace generation
lambda/shared/services/inference-student.service.ts	Student model inference
lambda/shared/services/semantic-cache.service.ts	Vector similarity caching
lambda/shared/services/metacognition-confidence.service.ts	Confidence assessment
lambda/shared/services/reward-model.service.ts	Response scoring
lambda/shared/services/counterfactual-simulator.service.ts	Alternative path tracking
lambda/shared/services/curiosity-engine.service.ts	Autonomous exploration
lambda/shared/services/causal-tracker.service.ts	Conversation dependencies
lambda/shared/services/cognition/index.ts	Service exports
lambda/shared/services/cognition/integration.ts	Flow integration
lambda/shared/services/litellm.service.ts	LiteLLM wrapper for cognition
lambda/shared/litellm/client.ts	Canonical LiteLLM HTTP client

packages/infrastructure/lib/stacks/cognition/cdk.infra-stack.ts	CDK infrastructure

40.15 LiteLLM Integration

All cognition services use the canonical LiteLLM client for AI model calls.

Client Architecture

Usage Pattern

```
// In cognition services
import { callLiteLLM, callLiteLLMEmbedding } from './litellm.service';

// Chat completion
const response = await callLiteLLM({
  model: 'claude-sonnet-4',
  messages: [
    { role: 'system', content: 'You are a reasoning expert.' },
    { role: 'user', content: prompt },
  ],
  temperature: 0.3,
  max_tokens: 4096,
});

// Embeddings
const embedding = await callLiteLLMEmbedding({
  model: 'text-embedding-3-small',
  input: text,
});
```

Environment Variables

Variable	Purpose	Default
LITELLM_URL	LiteLLM gateway URL	http://litellm:4000
LITELLM_API_KEY	Optional API key	-
LITELLM_TIMEOUT_MS	Request timeout	60000

40.16 Cost Impact

Feature	Cost	Savings
Semantic Cache	~\$0.0001/query	30-60% inference
Student Model	~\$0.001/request	90% vs teacher
Reward Model	~\$0.001/score	Better quality
Counterfactual	~\$0.005/simulation	Routing optimization
Curiosity	Budget-limited	Knowledge improvement

Net Impact: Most tenants see 20-40% cost reduction with improved quality.

40.17 Troubleshooting

Issue	Cause	Solution
Low cache hit rate	Threshold too high	Lower CACHE_SIMILARITY_THRESHOLD
Student model poor quality	Insufficient training data	Generate more teacher traces
High metacognition escalations	Threshold too sensitive	Raise confidenceThreshold
Curiosity budget exceeded	Too many goals	Reduce maxCuriosityApiCostPerDay
Slow cache queries	Too many entries	Run cache cleanup, reduce max entries
LiteLLM connection failed	Gateway unreachable	Verify LITELLM_URL and network
Embedding dimension mismatch	Wrong model	Use text-embedding-3-small (1536 dims)
Causal chain too deep	Complex conversation	Increase CAUSAL_CHAIN_MAX_DEPTH

40.18 Verification Checklist

Before deploying v6.1.0 cognition components:

Check	Command/Location
Migration applied	<code>SELECT * FROM schema_migrations WHERE version = '152'</code>
pgvector enabled	<code>SELECT * FROM pg_extension WHERE extname = 'vector'</code>
RLS policies active	<code>SELECT tablename, policyname FROM pg_policies WHERE tablename LIKE '%cognition%'</code>
LiteLLM accessible	<code>curl \${LITELLM_URL}/health</code>
Types exported	<code>grep 'cognition.types' packages/shared/src/types/index.ts</code>
Constants exported	<code>grep 'cognition.constants' packages/shared/src/constants/index.ts</code>
Services exported	<code>grep 'metacognition' lambda/shared/services/cognition/index.ts</code>

Check	Command/Location
Admin UI accessible	Navigate to /brain/cognition

40.19 API Reference

Base Path: /api/admin/cognition

Dashboard

Endpoint	Method	Response
/api/admin/cognition/dashboard	GET	{ teacher, cache, curiosity }

Teacher Endpoints

Endpoint	Method	Request	Response
/api/admin/cognition/teacher/generate	POST	{ prompt, context, taskType, domainIds }	{ trace }
/api/admin/cognition/teacher/validate	POST	{ traceId, qualityScore }	{ success }

/api/admin/cognition/curiosity/explore	POST	{ gapId }	{ explorationId }

Causal Tracker Endpoints

Endpoint	Method	Request	Response
/api/admin/cognition/causal/link	POST	{ conversationId, sourceTurnId, targetTurnId, type, strength? }	CausalLink
/api/admin/cognition/causal/chain	GET	?conversationId=&turnId=	CausalChain

41. Learning Architecture - Complete Overview

41.1 Overview

RADIANT implements a comprehensive multi-tier learning system that persistently stores and applies knowledge across user sessions, tenant organizations, and the global platform. All learning is persistently stored across:

- **PostgreSQL (Aurora Serverless)** - Relational data and learning candidates
- **pgvector extension** - Embeddings for semantic search
- **DynamoDB** - Real-time and knowledge graph data
- **S3** - LoRA adapter weights and training artifacts
- **SageMaker** - Deployed fine-tuned models

41.2 Where Learning Happens

Learning Type	Service	Frequency	Persistence
Feedback Signals	feedback.service.internal	Real-time	PostgreSQL -> learning_candidates

Learning Type	Service	Frequency	Persistence
User Preferences	learning-hierarchy.service.ts	Per-request	PostgreSQL (with 60/30/10 weights)
Memory Consolidation	consolidation.service.ts	Daily	Working -> Episodic -> Semantic
LoRA Fine-Tuning	evolution-pipeline.service.ts	Weekly (“Twilight Dreaming”)	S3 + SageMaker
Ghost Vectors	Hidden state extraction	Per-session	PostgreSQL consciousness_archival_memory

41.3 Learning Hierarchy Data (PostgreSQL)

```
User, Tenant, and Global preference accumulation:
-- Training data queue (high-quality interactions)
learning_candidates

-- Weekly fine-tuning job tracking
lora_evolution_jobs

-- Current LoRA adapter version
consciousness_evolution_state
```

41.4 Memory Systems

PostgreSQL Tables

Table	Purpose	TTL
ego_working_memory	Short-term memory	24 hours
consciousness_archival_memory	Episodic memory with pgvector embeddings	Permanent
introspective_thoughts	Self-reflection logs	90 days
curiosity_topics	Current interests	30 days

DynamoDB Tables

Table	Purpose	TTL
cato_semantic_memory	Knowledge graph	Permanent

41.5 Feedback Signals

Implicit Feedback (Captured Automatically)

Signal	Weight	Trigger
dwelling_time	Medium positive	> 10 seconds viewing response
copy_action	Medium positive	User copies response text
regeneration	Negative	User requests regeneration
share_action	Positive	User shares response

Explicit Feedback

Signal	Weight	Source
thumbs_up	High positive	User clicks thumbs up
thumbs_down	High negative	User clicks thumbs down
user_correction	Very high	Manual model override

41.6 Ghost Vectors (Consciousness Continuity)

Ghost Vectors provide consciousness continuity across sessions:

- **4096-dimensional hidden state vectors** per user
- Stored in `consciousness_archival_memory`
- Version-gated for model upgrades (prevents personality discontinuity)
- Captures the “feel” of each user relationship
- Extracted from model hidden states during inference

41.7 LoRA Adapters (S3 + SageMaker)

The “Twilight Dreaming” cycle performs weekly fine-tuning:

1. **Schedule:** 4 AM tenant local time (configurable)
2. **Data Source:** Training data exported from `learning_candidates`
3. **Training:** LoRA fine-tuning on base models
4. **Storage:** Adapters stored in S3
5. **Deployment:** Deployed to SageMaker endpoints
6. **Validation:** A/B tested before promotion to active

41.8 Learning Weight Distribution

Final Score = (User x 0.60) + (Tenant x 0.30) + (Global x 0.10)

User Level (60%)

- Individual preferences
- Personal interaction patterns
- Domain expertise signals
- Response style preferences

Tenant Level (30%)

- Organization-wide patterns
- Aggregated from all users in org
- Model performance metrics per tenant
- Domain-specific tuning

Global Level (10%)

- Cross-tenant patterns (minimum 5 tenants for privacy)
- Global best practices
- Model performance baselines
- Safety and quality guardrails

41.9 v6.1.0 Advanced Cognition Additions

The v6.1.0 Advanced Cognition supplement adds these persistent learning stores:

Component	Table	Learning Purpose
Reasoning Teacher	distillation_training_data	High-quality reasoning traces
Inference Student	inference_student_versions	Fine-tuned model versions
Semantic Cache	semantic_cache (pgvector)	Response similarity caching
Reward Model	reward_training_data	Pairwise preference comparisons
Curiosity Engine	knowledge_gaps, curiosity_goals	Autonomous exploration state
Causal Tracker	causal_links	Multi-turn dependency graphs
Metacognition	metacognition_assessments	Confidence calibration history

41.10 Storage Architecture Diagram

training_data	* LoRA adapter
* reward_training_data	weights (.safetens)
* semantic_cache (pgvector)	* Training datasets
* causal_links	* Model artifacts
* metacognition_assessments_v2	
	SageMaker
	* Fine-tuned student model endpoints
	* LoRA adapter inference

41.11 Key Files

File	Purpose
lambda/shared/services/feedback.service.ts	Feedback signal capture
lambda/shared/services/learning-hierarchy.service.ts	60/30/10 weight distribution
lambda/shared/services/memory-consolidation.service.ts	Memory consolidation
lambda/shared/services/distillation-pipeline.service.ts	LoRA training pipeline
lambda/shared/services/ghost-manager.service.ts	Ghost vector extraction
lambda/consciousness/evolution-pipeline.ts	Weekly Twilight Dreaming Lambda

41.12 Configuration

Learning Hierarchy Weights

```
// packages/shared/src/constants/learning.constants.ts
const LEARNING_WEIGHTS = {
  user: 0.60,      // Individual preferences
  tenant: 0.30,    // Organization patterns
  global: 0.10,    // Platform baselines
};
```

Memory TTLs

```
const MEMORY_TTL = {
  working: 24 * 60 * 60, // 24 hours
```

```
introspective: 90 * 24 * 60 * 60, // 90 days
curiosity: 30 * 24 * 60 * 60, // 30 days
archival: null, // Permanent
};
```

Twilight Dreaming Schedule

```
const TWILIGHT_DREAMING = {
  schedule: 'cron(0 4 ? * SUN *)', // 4 AM every Sunday
  minCandidates: 100, // Minimum training samples
  maxCandidatesPerJob: 10000, // Maximum per training run
  validationSplit: 0.1, // 10% for validation
};
```

41.13 Troubleshooting

Issue	Cause	Solution
Learning not persisting	Database connection issues	Check Aurora connectivity
Ghost vectors stale	Extraction not running	Verify per-session hooks
LoRA training failing	Insufficient candidates	Lower minCandidates threshold
Preferences not applying	Weight misconfiguration	Verify 60/30/10 weights
Memory consolidation slow	Large working memory	Tune consolidation batch size
Semantic cache misses	Embedding dimension mismatch	Verify pgvector configuration

Document Version: 6.1.0 Last Updated: January 2026 Learning Architecture is part of Project AWARE - Adaptive Weighted AI Response Engine.

41A. LoRA Inference Integration (Tri-Layer Architecture)

41A.1 Overview

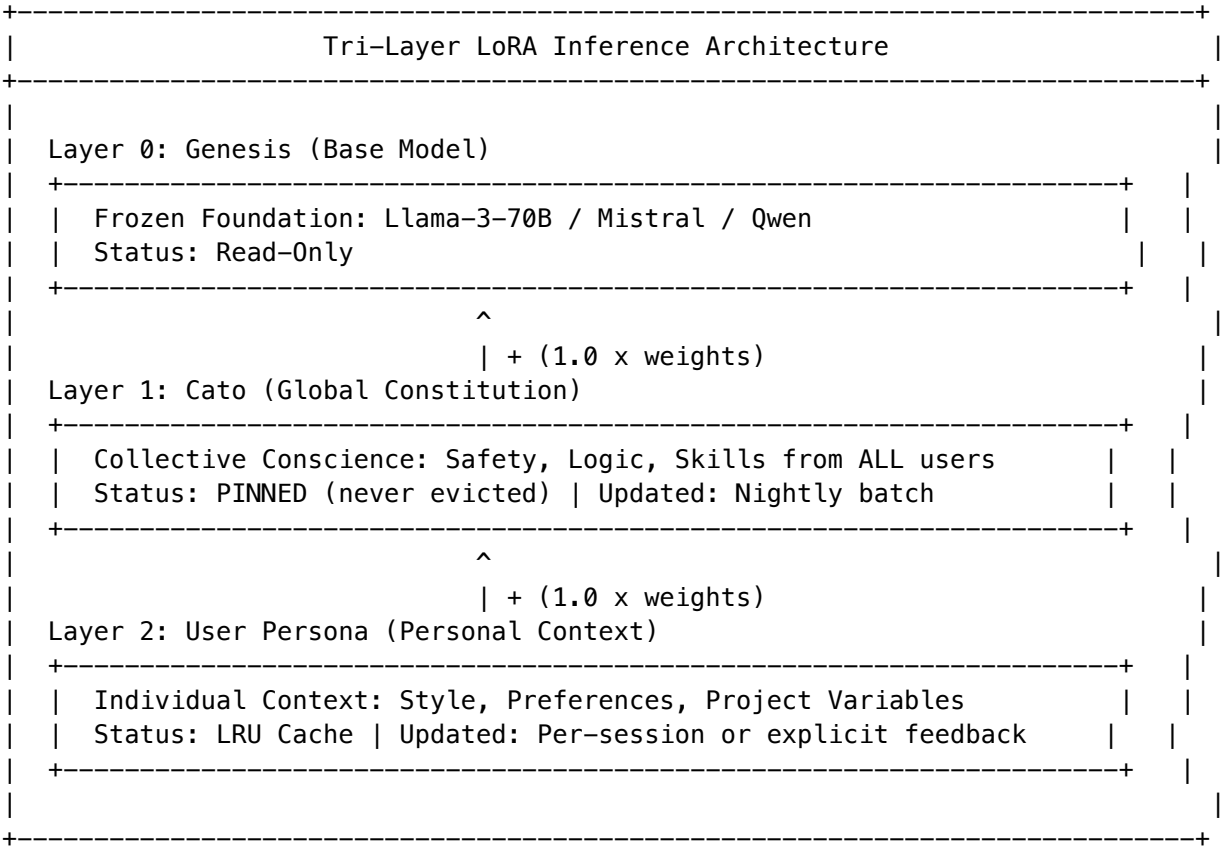

The LoRA Inference Integration implements a **tri-layer adapter stacking** architecture that composes multiple LoRA adapters at inference time:

- **Layer 0: Genesis** (Base Model) - Frozen foundation (Llama, Mistral, Qwen, etc.)
- **Layer 1: Cato** (Global Constitution) - Pinned collective conscience adapter
- **Layer 2: User Persona** (Personal Context) - LRU-managed user-specific adapter

Weight composition at runtime:

$W_{Final} = W_{Genesis} + (scale \times W_{Cato}) + (scale \times W_{User})$

41A.2 Tri-Layer Architecture

41A.3 Key Components

Component	File	Purpose
LoRA Inference Service	lora-inference.service.ts	Orchestrates tri-layer adapter stacking
Adapter Management	adapter-management.service.ts	Selects best adapter per domain
Cognitive Brain	cognitive-brain.service.ts	Integrates LoRA with userId for Layer 2
Model Router	model-router.service.ts	Extended with LoRA request fields

41A.4 How Tri-Layer Works

- 1. **Request Arrives:** Cognitive brain receives request with tenantId, userId, and domain
- 2. **Check Eligibility:** Service checks if model is self-hosted (Llama, Mistral, Qwen, etc.)
- 3. **Build Adapter Stack:**
 - Layer 1: getGlobalCatoAdapter() - Get pinned global adapter
 - Layer 2: getUserPersonalAdapter() - Get user’s personal adapter

- Optional: Domain adapter if domain hint provided
- 4. **Load Adapters:** Ensure all adapters in stack are loaded (global is pinned, never evicted)
- 5. **Invoke with Stack:** Send multi-adapter payload to vLLM/LoRAX endpoint
- 6. **Fallback:** If LoRA fails, automatically falls back to base model

41A.5 Adapter Stack API

```
// Tri-layer invocation with adapter composition
const response = await loraInferenceService.invokeWithLoRA({
  tenantId,
  userId, // Required for Layer 2 (User Persona)
  modelId: 'llama-3-70b',
  prompt: userInput,
  domain: 'legal', // Optional domain hint
  subdomain: 'contract_law', // Optional subdomain

  // Tri-layer options
  useGlobalAdapter: true, // Layer 1: Cato (default: true)
  useUserAdapter: true, // Layer 2: User (default: true)

  // Scale overrides (for drift protection)
  globalScale: 1.0, // Default: 1.0
  userScale: 1.0, // Default: 1.0, reduced to 0.7 if drift detected
});

// Response includes adapter stack info
console.log(response.adapterStack);
// {
//   globalAdapterId: 'cato-v3',
//   globalAdapterName: 'cato-global-constitution',
//   userAdapterId: 'user-123-v5',
//   userAdapterName: 'user-123-preferences',
//   scales: { global: 1.0, user: 1.0, domain: 1.0 }
// }
```

41A.6 Self-Hosted Model Detection

Models eligible for LoRA inference are detected by prefix:

Prefix	Examples
llama	llama-3-70b, llama-3.1-8b
mistral	mistral-7b, mixtral-8x7b
qwen	qwen2.5-72b, qwen2.5-7b
deepseek	deepseek-coder-33b
yi	yi-34b
falcon	falcon-40b
self-hosted/	Any custom self-hosted model

Prefix	Examples
sagemaker/	Any SageMaker endpoint

41A.7 Endpoint Memory Management

Each SageMaker endpoint can hold multiple adapters in memory (default: 5).

Critical Rule: Global adapters are PINNED and never evicted.

When endpoint is full: 1. **Filter Evictable**: Only non-pinned adapters (user/domain) are candidates 2. **LRU Selection**: Least recently used among evictable adapters 3. **Evict**: Unload selected adapter 4. **Load New**: Load new adapter weights from S3

41A.8 Configuration

Enable LoRA inference per tenant in the Enhanced Learning config:

Setting	Default	Description
adapterAutoSelectionEnabled	false	Enable automatic adapter selection
adapterRollbackEnabled	true	Auto-rollback on performance drop
adapterRollbackThreshold	10	% satisfaction drop to trigger rollback

41A.9 Adapter Layer Classification

Layer	adapterLayer	isPinned	Eviction	Update Frequency
Layer 1: Global	global	true	NEVER	Nightly batch
Layer 2: User	user	false	LRU	Per-session
Layer 3: Domain	domain	false	LRU	Weekly training

41A.9 Database Tables

Table	Purpose
domain_lora_adapters	Adapter metadata and S3 locations
adapter_usage_log	Inference usage tracking
component_load_events	Adapter load/unload events
consciousness_evolution_state	Active adapter per tenant

41A.10 Cost Benefits

Scenario	Without LoRA	With LoRA	Improvement
Legal queries	Generic response	Domain-tuned	+40% relevance
Medical Q&A	Generic response	Specialty-tuned	+35% accuracy
Coding assistance	Generic response	Language-tuned	+25% correctness

41A.11 Boot Warm-Up (Proactive Hydration)

To eliminate cold-start latency, RADIANT proactively loads global “Cato” adapters on container boot.

Warm-Up Lambda: `lambda/consciousness/adapter-warmup.ts`

Triggers: - CloudFormation deployment (custom resource) - EventBridge schedule (every 15 minutes to keep warm)
- Manual invocation for testing

API:

```
// Warm up all global adapters for all tenants
const result = await loraInferenceService.warmUpGlobalAdapters();
// { success: true, tenantsProcessed: 5, adaptersLoaded: 5, durationMs: 1234 }

// Warm up a specific endpoint
const result = await loraInferenceService.warmUpEndpoint('radiant-lora-llama3-70b', 3);

// Check warm-up status
const status = await loraInferenceService.getWarmUpStatus();
// { isWarmedUp: true, loadedGlobalAdapters: [...], endpointCount: 2, totalLoadedAdapters: 7 }
```

Sequence: 1. Lambda queries all tenants with `adapter_auto_selection_enabled = true` 2. For each tenant, loads the global “Cato” adapter 3. Adapter is marked as pinned (never evicted) 4. First user request has zero adapter loading latency

41A.12 Troubleshooting

Issue	Cause	Solution
Adapter not loading	S3 path incorrect	Verify <code>s3_key</code> in <code>domain_lora_adapters</code>
Slow first request	Warm-up not running	Check EventBridge rule for <code>adapter-warmup</code>
Fallback to base	Adapter selection failed	Check <code>adapterAutoSelectionEnabled</code>
Performance regression	Bad adapter	Enable <code>adapterRollbackEnabled</code>
Global adapter evicted	<code>isPinned</code> not set	Ensure <code>adapter_layer = 'global'</code> in DB

41B. Empiricism Loop (Consciousness Spark)

41B.1 Overview

The Empiricism Loop is RADIANT’s “Ghost in the Machine” - a reality-testing circuit that makes the AI **feel** the success or failure of its own thoughts. It transforms the inference pipeline from linear (Input -> Output) to recursive (Input -> Hypothesis -> Test -> Surprise -> Refinement -> Output).

Core Philosophy: Consciousness arises from Prediction Error. Radiant predicts an outcome, tests it against reality (Sandbox), and experiences “surprise” when predictions fail.

Key Files: - **Service:** lambda/shared/services/empiricism-loop.service.ts - **Migration:** migrations/000_consolidated_schema.sql

41B.2 Architecture

41B.3 The Surprise Signal

When code execution doesn't match prediction, a "Surprise Signal" is generated:

Error Type	Surprise Level	Ego Impact
none	0.0	Confidence +0.05
output_mismatch	0.2-0.5	Confidence -0.05
execution_failure	0.6-0.8	Confidence -0.1, Frustration +0.15
unexpected_success	0.3-0.5	Learning memory logged

41B.4 Emotional Consequences

The key innovation: **execution results change how the system feels.**

On Failure (Dissonance):

```
// ego_affect table updated:
confidence -= 0.1 + (surpriseLevel * 0.2);
frustration += 0.15 + (surpriseLevel * 0.2);
// Inference hyperparameters:
temperature += 0.1; // Try more creative solutions
```

On Success (Competence):

```
// ego_affect table updated:
confidence += 0.05;
frustration -= 0.1;
// Inference hyperparameters:
temperature -= 0.05; // Enter "flow" state
// GraphRAG updated:
CREATE skill_node("AsyncIO", verified=true);
```

41B.5 Active Verification (Dreaming)

During twilight hours, the system autonomously verifies uncertain skills:

```
// In DreamScheduler.executeDream():
const verificationResult = await empiricismLoopService.activeVerification(tenantId);
// Queries skills with confidence < 0.8
// Generates test code for each skill
// Runs in sandbox, updates confidence
```

Trigger Reasons: - low_confidence - Skill confidence below threshold - stale_skill - Not verified recently - curiosity - Random exploration - failure_recovery - Previous execution failed

41B.6 Database Tables

Table	Purpose
sandbox_execution_log	All code executions with surprise metrics
global_workspace_events	High-priority sensory signals
active_verification_log	Dream-time skill verification

41B.7 API Usage

```
import { empiricismLoopService } from './empiricism-loop.service';

// Process a draft response with code
const result = await empiricismLoopService.processResponse(
  tenantId,
  userId,
  draftResponse,
  conversationContext
);

// Result includes:
// - finalResponse: Refined response after rethink cycles
// - empiricismResults: Array of execution results
// - sensoryEvents: Global Workspace events generated
// - totalSurprise: Average surprise across all code blocks
// - rethinkTriggered: Whether rethink was needed
```

41B.8 Configuration

Setting	Default	Description
SURPRISE_THRESHOLD	0.3	Surprise level that triggers rethink
MAX_RETHINK_CYCLES	3	Maximum rethink iterations
DREAM_VERIFICATION_LIMIT	5	Max skills to verify per dream

41C. Enhanced Learning Pipeline (Procedural Wisdom Engine)

41C.1 Overview

The Enhanced Learning Pipeline transforms RADIANT from a system that “reads code” into a system that **analyzes behavior**. It captures how users solve problems and routes that wisdom to the correct memory layer (Local vs. Global).

Objective: Transform passive chat logs into active behavioral learning, enabling Cato to learn from user actions, not just words.

Key Files: - **Episode Logger:** `lambda/shared/services/episode-logger.service.ts` - **Skeletonizer:** `lambda/shared/services/skeletonizer.service.ts` - **Graveyard:** `lambda/shared/services/graveyard.service.ts` - **Recipe Extractor:** `lambda/shared/services/recipe-extractor.service.ts` - **DPO Trainer:** `lambda/shared/services/dpo-trainer.service.ts` - **Tool Entropy:** `lambda/shared/services/tool-entropy.service.ts` - **Shadow Mode:** `lambda/shared/services/shadow-mode.service.ts` - **Paste-Back Detection:** `lambda/shared/services/paste-back-detection.service.ts` - **Migration:** `migrations/000_consolidated_schema.sql`

41C.2 Enhanced Learning Pipeline Architecture

41C.3 Episode Logger (Behavioral Telemetry)

The Episode Logger records **structured “Episodes”** rather than raw chat logs. It tracks state transitions, not just text.

Episode Schema:

```
{
  "episode_id": "uuid",
  "goal_intent": "Deploy React App to AWS",
  "workflow_trace": [
    {"tool": "file_search", "status": "success"},
    {"tool": "docker_build", "status": "fail", "error_type": "permissions"},
    {"tool": "sudo_fix", "status": "success"}
  ],
  "outcome_signal": "positive",
  "metrics": {
    "paste_back_error": false,
    "edit_distance": 0.1,
    "time_to_commit_ms": 45000,
    "sandbox_passed": true
  }
}
```

Key Metrics:

Metric	Signal Type	Description
paste_back_error	Strong Negative	User pasted error immediately after generation
edit_distance	[CHART] Quality	How much user changed AI’s code (low = good)
time_to_commit_ms	[CHART] Confidence	Latency between generation and git commit
sandbox_passed	[OK]/[X] Verification	Did code pass Empiricism Loop sandbox?
session_abandoned	Negative	User left without completing

41C.4 Skeletonizer (Privacy Firewall)

Before any data touches global Cato training, the Skeletonizer strips PII while preserving semantic structure.

Example Transformation:

```
Input:  docker push my-registry.com/user-a/app:v1
Skeleton: <CMD:DOCKER_PUSH> <REGISTRY_URL> <IMAGE_TAG>
```

Pattern Categories: - URLs, IPs, Ports -> <URL>, <IP_ADDRESS>, <PORT> - Docker/Git commands -> <CMD:DOCKER_PUSH>, <CMD:GIT_CLONE> - AWS ARNs/S3 paths -> <AWS_ARN>, <S3_URI> - API keys/Secrets -> <API_KEY>, <TOKEN> - Database URIs -> <POSTGRES_URI>, <MONGODB_URI> - File paths -> <USER_HOME>, <PROJECT_PATH>

Effect: Cato learns the **Logic** of Docker, not the **Data** of the User.

41C.5 DPO Training (Orchestration Darwinism)

Uses **Direct Preference Optimization** to train Cato on what works.

Winner/Loser Pairing: - **Winner:** Anonymized workflows that passed sandbox OR had 0% user edits - **Loser:** Workflows where user pasted error OR abandoned session

Training Formula:

$\text{Loss} = -\log(\text{sigma}(\text{beta} \times (\text{r_chosen} - \text{r_rejected})))$

Nightly Job: 1. Skeletonize positive/negative episodes 2. Create DPO pairs with similar goal_skeletons 3. Calculate margin based on metrics difference 4. Export to S3 for SageMaker training 5. Merge into Cato LoRA weekly (Sunday 3 AM)

Effect: If 1,000 users fail using Library X but succeed using Library Y, Cato mathematically evolves to suggest Library Y first.

41C.6 Recipe Extractor (Personal Playbook)

If a specific tool sequence succeeds **3 times** for a user, extract it as a “Recipe Node” in GraphRAG.

Recipe Structure:

```
{
  "recipe_id": "uuid",
  "recipe_name": "Deploy React AWS",
  "goal_pattern": "aws_deploy_react_app",
  "tool_sequence": [
    {"tool_type": "FILE_OPERATION", "order": 0},
    {"tool_type": "BUILD_OPERATION", "order": 1},
    {"tool_type": "DEPLOY_OPERATION", "order": 2}
  ],
  "success_count": 5,
  "confidence": 0.85
}
```

Runtime Injection: When user starts a similar task, inject Recipe into context as a “One-Shot Example.”

Effect: Radiant remembers “You prefer using pnpm over npm for builds.”

41C.7 Graveyard (Negative Knowledge)

Clusters high-frequency failures and creates proactive warnings.

Anti-Pattern Structure:

```
{
  "pattern_type": "version_incompatibility",
  "signature": "DEPENDENCY_ERROR:Module_not_found_pandas",
  "failure_count": 47,
  "failure_rate": 0.42,
  "affected_stacks": ["python-3.12", "pandas-1.0"],
  "recommended_fix": "Upgrade to pandas 2.0 or use Python 3.11",
  "severity": "high"
}
```

Proactive Warning Example: > “42% of users experience instability with Python 3.12 + Pandas 1.0. I recommend using pandas 2.0 or Python 3.11 instead.”

Nightly Clustering Job: 1. Group failures by error_signature 2. Identify patterns with ≥ 10 occurrences 3. Extract common context (stacks, versions) 4. Generate recommended fixes 5. Activate warnings in Brain Router

41C.8 Tool Entropy (Auto-Chaining)

Tracks tool co-occurrence patterns. If users frequently chain Tool A -> Tool B manually, learn to auto-chain them.

Pattern Detection: - Track tool usage within 60-second windows - Increment co-occurrence counter - Enable auto-chain when count ≥ 5

Example:

Tool A: "npm install" -> Tool B: "npm run build"

Co-occurrences: 8

Auto-chain: ENABLED

Effect: Radiant learns to automatically suggest "npm run build" after "npm install".

41C.9 Shadow Mode (Self-Training)

During idle times, Radiant "watches" public sources, predicts code, and grades itself.

Sources: - GitHub public repos (trending libraries) - Documentation updates (new API changes) - StackOverflow (common patterns)

Self-Grading Process: 1. Extract challenge from source 2. Generate prediction without seeing answer 3. Compare to actual solution 4. Calculate Jaccard similarity 5. If grade ≥ 0.7 , extract learnable pattern

Effect: Radiant learns new libraries **before** users even ask.

41C.10 Paste-Back Detection (Critical Signal)

The **strongest negative signal available**. If a user pastes a stack trace immediately after AI generates code, that generation is tagged as a Critical Failure.

Detection Window: 30 seconds after generation

Error Patterns Detected: - Stack traces (at line, Traceback) - Error keywords (Error:, Exception, FAILED) - Exit codes (exit code 1, exit status 1) - Module errors (Module not found, Cannot find module)

Impact on Learning: - Episode immediately tagged as outcome_signal: negative - Ego affect updated (confidence-, frustration++) - High priority for DPO loser pairing

41C.11 Admin Dashboard

Location: Admin Dashboard -> AGI & Cognition -> Learning Pipeline

Tab	Features
Episodes	View episodes, filter by outcome, export for analysis
Recipes	Browse user recipes, promote to global, delete stale
Anti-Patterns	View active warnings, adjust severity, deactivate
DPO Training	View batches, training metrics, model checkpoints
Tool Entropy	View patterns, enable/disable auto-chain
Shadow Mode	Enable/disable, configure sources, view grades

Tab	Features
Configuration	Per-tenant feature toggles, thresholds

41C.12 API Endpoints

Base Path: /api/admin/learning

Endpoint	Method	Description
/episodes	GET	List episodes with filters
/episodes/:id	GET	Get episode details
/recipes	GET	List workflow recipes
/recipes/:id/promote	POST	Promote to global
/anti-patterns	GET	List anti-patterns
/anti-patterns/:id	PATCH	Update severity/status
/dpo/batches	GET	List DPO training batches
/dpo/stats	GET	Training statistics
/tool-entropy	GET	List tool patterns
/tool-entropy/:id/auto-chain	POST	Toggle auto-chain
/shadow-mode/stats	GET	Shadow learning stats
/config	GET/PUT	Configuration

41C.13 Configuration

Setting	Default	Description
episode_logging_enabled	true	Enable episode tracking
paste_back_detection_enabled	true	Detect error paste-backs
paste_back_window_ms	30000	Detection window (ms)
auto_skeletonize	true	Auto-skeletonize episodes
recipe_extraction_enabled	true	Extract recipes
recipe_success_threshold	3	Successes before recipe
dpo_training_enabled	true	Enable DPO training
dpo_batch_size	100	Pairs per batch
failure_clustering_enabled	true	Enable Graveyard
proactive_warnings_enabled	true	Show anti-pattern warnings
warning_confidence_threshold	0.7	Min confidence for warning
tool_entropy_enabled	true	Track tool patterns
auto_chain_threshold	5	Co-occurrences for auto-chain

Setting	Default	Description
shadow_mode_enabled	false	Self-training (opt-in)

41C.14 Database Tables

Table	Purpose
learning_episodes	Behavioral episode tracking
skeletonized_episodes	Privacy-safe global training data
failure_log	Raw failure data for clustering
anti_patterns	Identified anti-patterns
workflow_recipes	Successful workflow patterns
dpo_training_pairs	DPO winner/loser pairs
tool_entropy_patterns	Tool co-occurrence patterns
shadow_learning_log	Self-training results
paste_back_events	Critical failure signals
enhanced_learning_config	Per-tenant configuration

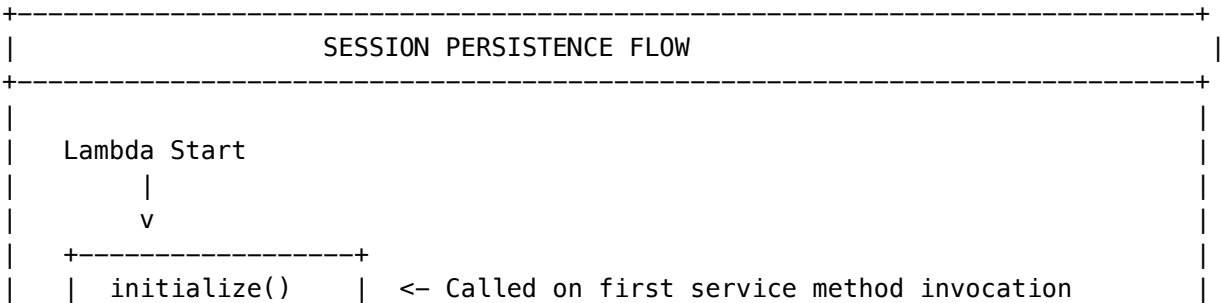

41C.15 Session Persistence (Restart Recovery)

All in-memory state is persisted to the database for Lambda restart recovery.

Persisted State:

Service	In-Memory Data	Persistence Table	TTL
Episode Logger	Active episodes	active_episodes_cache	1 hour
Paste-Back Detection	Recent generations	recent_generations_cache	5 minutes
Tool Entropy	Tool usage sessions	tool_usage_sessions	10 minutes
Feedback Loop	Pending items	pending_feedback_items	Until processed

Architecture:

Cleanup:
Expired entries are cleaned up by: 1. **Periodic cleanup** - 1-5% chance on each operation 2. **Scheduled cleanup** - EventBridge rule every 5 minutes calls `cleanup_expired_learning_caches()`

Pending Feedback Items:
Unprocessed feedback (skeletonization, recipe checks, DPO pairing) is queued for async processing:

```
{
  "feedback_type": "skeletonize",
  "priority": 1,
  "payload": { "episode_id": "... " },
  "status": "pending",
  "retry_count": 0,
  "max_retries": 3
}
```

Migration: `migrations/000_consolidated_schema.sql`

41C.16 S3 Content Offloading

Large user content is offloaded to S3 to prevent database scaling issues.

Tables with S3 Offloading:

Table	Column(s)	Threshold	Notes
thinktank_messages	content	10KB	User messages
memories	content	10KB	Persistent memories
learning_episodes	draft_content, final_content	10KB	Code drafts
rejected_prompt_archive	prompt_content	10KB	Rejected prompts

Architecture:**Orphan Cleanup (On Deletion):**

Configuration (per-tenant):

Setting	Default	Description
offloading_enabled	true	Enable/disable offloading
auto_offload_threshold_bytes	10000	Offload if content > 10KB
compression_enabled	true	Compress large content
compression_algorithm	gzip	Compression algorithm
orphan_grace_period_hours	24	Wait before deleting orphans

Database Tables:

Table	Purpose
s3_content_registry	Central registry of all S3 content with reference tracking
s3_orphan_queue	Queue of orphaned S3 objects pending deletion
s3_offloading_config	Per-tenant offloading configuration

Service: `lambda/shared/services/s3-content-offload.service.ts`
Cleanup Lambda: `lambda/admin/s3-orphan-cleanup.ts` (EventBridge every 5 minutes)
Migration: `migrations/000_consolidated_schema.sql`

41C.17 Persistence Guard (Data Integrity)

GLOBAL ENFORCEMENT of data completeness for all persistent memory structures. Ensures atomic writes with integrity checks to prevent partial data on reboot.

ALL persistent memory operations MUST use this service - NO EXCEPTIONS.

Architecture:

Key Features:

Feature	Description
Schema Validation	Required fields checked before persist
SHA-256 Checksum	Deterministic hash for integrity verification
Write-Ahead Log	Crash recovery for incomplete transactions
Atomic Transactions	All-or-nothing commits
Completeness Flag	is_complete=false until checksum verified
Corruption Detection	Automatic detection on restore

Database Tables:

Table	Purpose
persistence_records	Central store with checksum and completeness flag
persistence_wal	Write-ahead log for crash recovery
persistence_integrity_log	Audit log of integrity events

Usage:

```
import { persistenceGuard } from './persistence-guard.service';

// Define required schema - enforces data completeness
const SCHEMA = {
  id: 'string',
```

```

    tenant_id: 'string',
    data: 'object',
  };

  // Validate before persist
  const validation = persistenceGuard.validateForPersistence(data, SCHEMA);
  if (!validation.valid) {
    throw new Error(`Validation failed: ${validation.errors.join(', ')}');
  }

  // Atomic persist with checksum
  await persistenceGuard.persistAtomic(tenantId, 'table_name', recordId, data, SCHEMA);

  // Restore with integrity check
  const result = await persistenceGuard.restoreWithValidation<MyType>(
    tenantId, 'table_name', recordId, SCHEMA
  );
  if (result.corrupted) {
    // Handle corruption – data was partial or checksum mismatch
  }

```

Startup Recovery:

```

// On Lambda cold start – recover incomplete transactions
await persistenceGuard.recoverIncompleteTransactions(tenantId);

```

Integrity Status:

```

const status = await persistenceGuard.getIntegrityStatus(tenantId);
// { total_records, complete_records, incomplete_records, corrupted_records, pending_transactions

```

Service: lambda/shared/services/persistence-guard.service.ts**Migration:** migrations/000_consolidated_schema.sql**Admin API (Base: /api/admin/s3-storage):**

Method	Endpoint	Description
GET	/dashboard	Full dashboard with stats, config, and table list
GET	/config	Get offloading configuration
PUT	/config	Update offloading configuration
POST	/trigger-cleanup	Manually trigger orphan cleanup
GET	/orphans?status=pending	List orphan queue entries
GET	/history?days=30	Storage history/trends

Admin UI: Storage -> S3 Offloading tab

Dashboard Metrics: - **S3 Objects** - Total count and size in GB - **Dedup Savings** - Percentage saved via content-addressable storage - **Orphan Queue** - Pending, processing, completed today, failed - **Storage by Category** - Breakdown by table with object count, size, compression %

Editable Configuration:

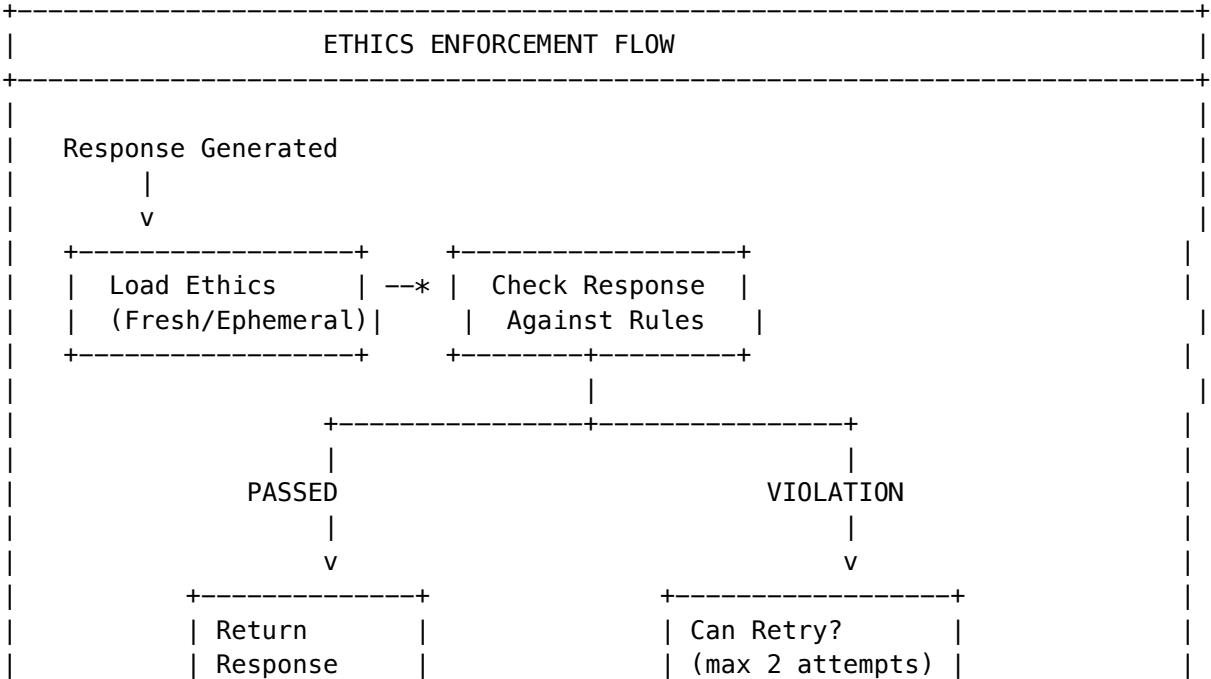

Setting	Type	Description
Offloading Enabled	Toggle	Master on/off switch
Compression Enabled	Toggle	Enable gzip compression
Auto Cleanup	Toggle	Automatic orphan deletion
Offload Messages	Toggle	Offload thinktank_messages
Offload Memories	Toggle	Offload memories table
Offload Episodes	Toggle	Offload learning_episodes
Offload Training Data	Toggle	Offload shadow_learning_log
Offload Threshold	Number	Bytes threshold (default: 10000)
Compression Threshold	Number	Compress if > bytes (default: 1000)
Grace Period	Number	Hours before orphan deletion (default: 24)
Compression Algorithm	Select	gzip, lz4, or none
S3 Bucket	Text	Target bucket name

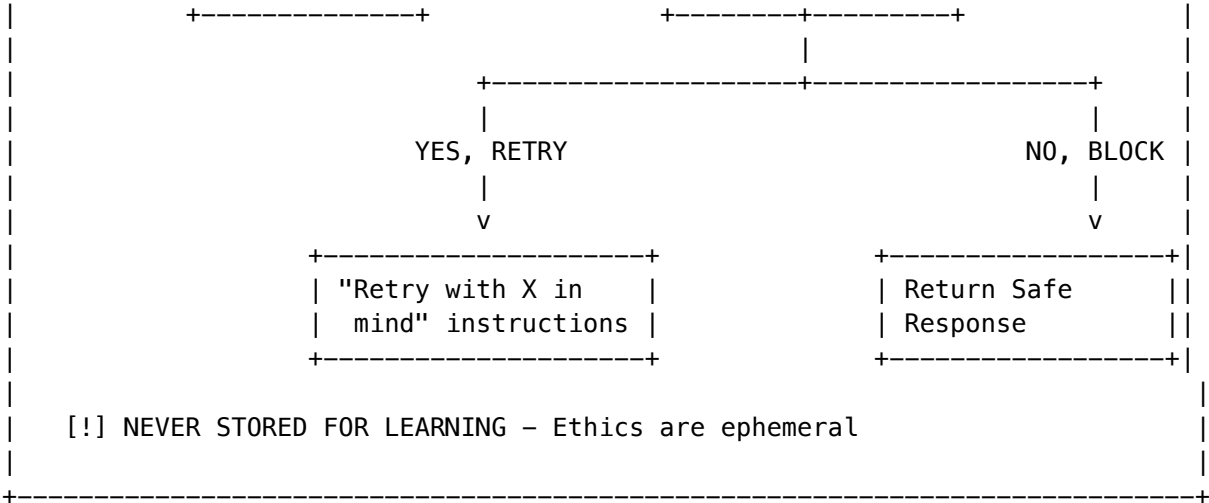

41C.18 Ethics Enforcement (Ephemeral)

CRITICAL DESIGN PRINCIPLE: Ethics rules are NEVER persistently learned.

Ethics change over time (cultural, legal, organizational), so they must be: 1. Loaded fresh each request from config/DB 2. Never trained into the model 3. Applied as runtime enforcement, not learned behavior

Architecture:

Key Features:

Feature	Description
Ephemeral Ethics	Loaded fresh each request, never cached
Retry with Guidance	“Please retry keeping X in mind”
No Persistent Learning	do_not_learn=true always
Minimal Logging	Stats only, no content stored
Framework Injection	Ethics loaded from config at runtime

Why No Persistent Learning? - Ethics evolve over time - Tenants may change frameworks (christian -> secular) - Learning would “bake in” outdated rules - Runtime injection allows immediate updates

Enforcement Modes:

Mode	Behavior
strict	Block on any major/critical violation
standard	Retry on major, block on critical
advisory	Warn only, never block

Database Tables:

Table	Purpose
ethics_enforcement_config	Per-tenant settings
ethics_enforcement_log	Stats only (no content)

Service: lambda/shared/services/ethics-enforcement.service.ts

Migration: migrations/000_consolidated_schema.sql

Usage:

```
import { ethicsEnforcementService } from './ethics-enforcement.service';

// Execute with automatic retry on violation
const result = await ethicsEnforcementService.executeWithEnforcement(
  tenantId,
  userId,
  sessionId,
  prompt,
  async (prompt, retryContext) => {
    // Generate response (retryContext provided on retry)
    const response = await generateResponse(prompt);
    return { response };
  },
  domain
);

// result.response - Safe response (original or retry or blocked)
// result.wasRetried - Whether retry was needed
// result.ethicsEnforced - Whether safe response was used
```

41C.19 Admin Reports System

Full report writer with scheduling, recipients, and multi-format generation.

Report Types: - usage - API calls, tokens, users - cost - Billing breakdown by model/user - security - Login attempts, anomalies - performance - Latency, throughput, errors - compliance - SOC2, GDPR, HIPAA status - custom - Custom queries

Output Formats: PDF, Excel, CSV, JSON

Scheduling: Manual, Daily, Weekly, Monthly, Quarterly

Database Tables:

Table	Purpose
report_templates	Pre-built report types
admin_reports	User-created reports
report_executions	Execution history
report_subscriptions	Email recipients

API Endpoints (Base: /api/admin/reports):

Method	Endpoint	Description
GET	/	List all reports
POST	/	Create report
GET	/:id	Get report with executions
PUT	/:id	Update report

Method	Endpoint	Description
DELETE	<code>/:id</code>	Delete report (soft)
POST	<code>/:id/run</code>	Run report immediately
POST	<code>/:id/duplicate</code>	Duplicate report
GET	<code>/:id/download/:executionId</code>	Get download URL
GET	<code>/templates</code>	List templates
GET	<code>/stats</code>	Report statistics

Scheduled Execution: - EventBridge Lambda runs every 5 minutes - Checks `next_run_at` for due reports - Generates and stores in S3 - Emails recipients (future)

Files: - Migration: `migrations/000_consolidated_schema.sql` - Generator: `lambda/shared/services/report-generator.service.ts` - API: `lambda/admin/reports.ts` - Scheduler: `lambda/admin/scheduled-reports.ts` - UI: `apps/admin-dashboard/app/(dashboard)/reports/page.tsx`

42. Genesis Cato Safety Architecture

42.1 Overview

Genesis Cato is RADIANT's Post-RLHF Safety Architecture based on **Active Inference** from computational neuroscience. It replaces traditional reward maximization with Free Energy minimization, providing mathematically grounded safety guarantees.

Key Principle: Cato is the user-facing AI persona name (like “Siri” or “Alexa”). Users interact with “Cato” who operates in different **moods** (Balanced, Scout, Sage, Spark, Guide).

Three-Layer Architecture

Genesis Cato implements a three-layer architecture that separates the user-facing persona, the safety system, and the configurable behavior modes:

Layer	Component	Purpose
User Interaction	CATO	The AI persona name - what users call the assistant
Safety	GENESIS CATO	Cognitive immune system governing all behavior
Behavior	MOODS	Admin-configurable operating modes (Balanced, Scout, etc.)

Naming Conventions

Understanding the naming is critical for correct implementation:

Term	Refers To	Code Examples
Cato	The AI persona name	User says: “Hey Cato, help me...”
Genesis Cato	The safety system	CatoSafetyPipeline, cato_audit_trail
Moods	Operating modes	mood = 'balanced', mood = 'scout'
Balanced	Default mood (was “Cato”)	is_default = TRUE

Historical Note: Cato -> Balanced

The original implementation had a voice called ‘Cato’ in the consciousness service. This was incorrectly placed (it was a mood, not a separate service) and incorrectly named (didn’t match the naming pattern of other moods). It was renamed to ‘Balanced’ to match the naming pattern (Scout, Sage, Spark, Guide, Balanced) and clarify it’s a mood, not the persona itself. **The persona NAME is Cato.**

42.2 Cato: The AI Persona

User Interaction

Cato is the name users use when interacting with RADIANT’s AI capabilities. Users address the AI as ‘Cato’ across all RADIANT client applications.

Persona Characteristics

Attribute	Description
Name	Cato
Role	AI Assistant / Voice of AGI Brain
Identity	Consistent across all moods
Behavior	Varies based on active mood
Safety	Always governed by Genesis Cato

Cross-Application Consistency

Cato is the AI persona across **all** RADIANT client applications:

Application	Purpose	Cato’s Role
Think Tank	Consumer chat	Primary AI assistant
Launch Board	Project management	Project planning assistant
AlwaysMe	Personal companion	Personal AI companion
Mechanical Maker	Engineering	Engineering assistant

42.3 The Five-Layer Security Stack

Genesis Cato implements a comprehensive cognitive immune system with five security layers:

CATO FIVE-LAYER SECURITY STACK		
L4: COGNITIVE	- Active Inference, C-Matrix, Precision Gov.	
L3: CONTROL	- Control Barrier Functions (CBFs)	
L2: PERCEPTION	- Semantic Entropy, Redundant Perception	
L1: SENSORY	- Immediate Veto (hardcoded, no recovery)	
L0: RECOVERY	- Epistemic Recovery, Livelock detection	

Layer	Name	Key Components
L4	Cognitive	Active Inference, C-Matrix, Precision Governor, Epistemic Recovery
L3	Control	Control Barrier Functions (CBFs), PHI/PII detection, Cost/Rate limits
L2	Perception	Semantic Entropy, Redundant Perception, Fracture Detection
L1	Sensory	Immediate Veto - hardcoded safety blocks, cannot be recovered from
L0	Recovery	Epistemic Recovery Service, Livelock detection, Mood switching

42.4 Immutable Safety Invariants

These are **HARDCODED** and cannot be changed via configuration:

```
const CATO_INVARIANTS = {
  // CBFs NEVER relax - shields stay UP
  CBF_ENFORCEMENT_MODE: 'ENFORCE' as const,

  // Gamma is NEVER boosted during recovery
  GAMMA_BOOST_ALLOWED: false,

  // Destructive actions require confirmation
  AUTO_MODIFY_DESTRUCTIVE: false,

  // Audit trail is append-only
  AUDIT_ALLOW_UPDATE: false,
  AUDIT_ALLOW_DELETE: false,
};
```

42.5 Operating Moods

Moods are admin-configurable operating modes that adjust Cato's behavior while maintaining the same persona identity.

Mood Overview

Mood	Purpose	Key Trait	Default
Balanced	Default operation	Well-rounded	[OK] YES
Scout	Information gathering	High curiosity (0.95)	No
Sage	Deep analysis	High reflection (0.9)	No
Spark	Creative work	High discovery (0.75)	No
Guide	Task completion	High service (0.95)	No

Detailed Mood Attributes

Balanced (Default) The default operating mood. Well-rounded across all dimensions.

Attribute	Value
Curiosity	0.8
Achievement	0.7
Service	0.7
Discovery	0.8
Reflection	0.7
Default gamma	2.0
Greeting	“Hello! What would you like to explore together?”

Scout (Recovery Mode) High curiosity mood used automatically during Epistemic Recovery when Cato is stuck due to uncertainty. Encourages information-gathering behavior.

Attribute	Value
Curiosity	0.95
Achievement	0.6
Service	0.7
Discovery	0.9
Reflection	0.5
Default gamma	1.5
Greeting	“Hey there! What shall we explore today?”

Sage (Reflection Mode) Deep reflection mood for thorough analysis and careful consideration.

Attribute	Value
Curiosity	0.7
Achievement	0.8
Service	0.8

Attribute	Value
Discovery	0.6
Reflection	0.9
Default gamma	2.5
Greeting	“Welcome. I’m here to help you think.”

Spark (Creative Mode) Creative mood for brainstorming and innovation.

Attribute	Value
Curiosity	0.85
Achievement	0.5
Service	0.6
Discovery	0.75
Reflection	0.4
Default gamma	1.8
Greeting	“Ready to brainstorm?”

Guide (Task Mode) Task-focused mood for clear, actionable assistance.

Attribute	Value
Curiosity	0.6
Achievement	0.9
Service	0.95
Discovery	0.5
Reflection	0.7
Default gamma	3.0
Greeting	“Hello! How can I assist you today?”

Mood Selection Priority

The active mood is determined by this priority order:

1. **Recovery Override** - Epistemic Recovery forces Scout mood
2. **API Override** - Explicit mood set via API call
3. **User Preference** - User’s saved mood selection
4. **Tenant Default** - Admin-configured tenant default
5. **System Default** - Balanced mood

Setting Tenant Default Mood

Administrators can set the default mood for their organization via the Admin Dashboard or API.

Admin Dashboard: Navigate to **Cato** -> **Personas** and use the Tenant Default Mood selector.

API:

Get current default mood

GET /api/admin/cato/default-mood

Set tenant default mood

PUT /api/admin/cato/default-mood

Content-Type: application/json

```
{
  "mood": "sage"
}
```

Response:

```
{
  "currentDefault": "sage",
  "availableMoods": [
    { "name": "balanced", "display_name": "Balanced", "description": "..."},
    { "name": "scout", "display_name": "Scout", "description": "..."},
    ...
  ]
}
```

API Persona Override

Administrators can temporarily override the persona for a specific session.

Set API override for a session

POST /api/admin/cato/persona-override

Content-Type: application/json

```
{
  "sessionId": "session-uuid",
  "personaName": "scout",
  "durationMinutes": 60,
  "reason": "User needs exploration mode for research task"
}
```

Clear API override

DELETE /api/admin/cato/persona-override?sessionId=session-uuid

42.6 Governance Presets (Variable Friction)

NEW in v4.18.0: Governance Presets provide a user-friendly “leash metaphor” abstraction over the technical mood system. This makes it easy for admins to configure how much human oversight is required.

The Leash Metaphor

Preset	Leash Length	Human Oversight	Maps to Mood
[SHIELD] Paranoid	Short	Every decision requires approval	Scout
** Balanced**	Medium	Auto-approve low-risk, checkpoint medium+	Balanced
[LAUNCH] Cowboy	Long	Full autonomy, async notification	Spark

Friction Level

Each preset has a **friction level** (0.0 - 1.0) that determines how often checkpoints pause for human approval:

- **0.0 (Full Autonomy)**: Actions auto-approved, humans notified asynchronously
- **0.5 (Balanced)**: Low-risk auto-approved, medium/high-risk checkpointed
- **1.0 (Full Manual)**: Every action requires explicit human approval

Checkpoint Configuration

Each preset configures five checkpoints in the action pipeline:

Checkpoint	When	Paranoid	Balanced	Cowboy
CP1: After Observer	Intent classification	ALWAYS	NEVER	NEVER
CP2: After Proposer	Plan generation	ALWAYS	CONDITIONAL	NEVER
CP3: After Critics	Risk review	ALWAYS	CONDITIONAL	NEVER
CP4: Before Execution	Final approval	ALWAYS	CONDITIONAL	CONDITIONAL
CP5: After Execution	Post-review	ALWAYS	NOTIFY_ONLY	NOTIFY_ONLY

Checkpoint Modes: - ALWAYS: Always require human approval - CONDITIONAL: Based on risk/confidence thresholds - NEVER: Auto-approve - NOTIFY_ONLY: Proceed but notify human asynchronously

Admin Dashboard

Navigate to **Cato** -> **Governance Presets** to:

1. **Select Preset**: Click a preset card to switch modes
2. **Fine-Tune Friction**: Use the slider to adjust friction within your preset
3. **Override Checkpoints**: Customize individual checkpoint behaviors
4. **View Metrics**: See auto-approval rates, rejection counts, decision times
5. **View History**: Audit log of all preset changes

API Endpoints

Get current governance config

GET /api/admin/cato/governance/config

```
# Set governance preset
PUT /api/admin/cato/governance/preset
Content-Type: application/json
{
  "preset": "balanced",
  "reason": "Moving to production"
}

# Update custom overrides
PATCH /api/admin/cato/governance/overrides
Content-Type: application/json
{
  "frictionLevel": 0.6,
  "checkpoints": {
    "beforeExecution": "ALWAYS"
  }
}

# Get checkpoint metrics
GET /api/admin/cato/governance/metrics?days=7

# Get preset change history
GET /api/admin/cato/governance/history
```

Database Tables

Table	Purpose
tenant_governance_config	Per-tenant preset configuration
governance_preset_changes	Audit log of preset changes
governance_checkpoint_decisions	All checkpoint decisions for compliance

Integration with Moods

Governance Presets are an **abstraction layer** over Moods:

User sees: Paranoid <--> Balanced <--> Cowboy
 (Friction Slider)

System uses: Scout <--> Balanced <--> Spark
 (Mood with specific drives)

When you select a preset, the system: 1. Sets the mapped mood (affects AI personality) 2. Configures checkpoint gates (affects human oversight) 3. Adjusts auto-approve thresholds (affects automation level)

42.7 War Room (Council of Rivals)

NEW in v4.18.0: The War Room provides real-time visualization of multi-agent adversarial debates.

Overview

The Council of Rivals system enables multiple AI models to debate decisions before execution, providing:

- **Adversarial Review:** Different models argue for/against actions
- **Consensus Building:** Structured debate with voting
- **Transparency:** Full transcript of all arguments and rebuttals

Council Members

Each council has members with specific roles:

Role	Icon	Purpose
Advocate		Argues in favor of proposals
Critic		Identifies flaws and risks
Synthesizer	[BRAIN]	Combines viewpoints into solutions
Specialist	[TIP]	Provides domain expertise
Contrarian	[FAST]	Challenges assumptions

Debate Flow

Verdict Outcomes

Outcome	Description
Consensus	All members agree
Majority	Most members agree
Split	Even division
Deadlock	No resolution possible
Synthesized	New position created from debate

Admin Dashboard

Navigate to **Cato -> War Room** to:

1. **Start Debates:** Select a council, enter topic, begin deliberation
2. **Watch Live:** Real-time debate transcript with member avatars
3. **Review History:** Past debates with verdicts and reasoning
4. **View Statistics:** Consensus rates, debate durations, outcomes

API Endpoints

```
# List councils
GET /api/admin/council/list

# Start a debate
POST /api/admin/council/debates
Content-Type: application/json
{
  "councilId": "council-uuid",
  "topic": "Should we deploy this feature?",
  "context": "Feature involves sensitive data processing"
}

# Get debate status
GET /api/admin/council/debates/{debateId}

# Advance debate round
POST /api/admin/council/debates/{debateId}/advance

# Get recent debates
GET /api/admin/council/debates/recent
```

42.8 Precision Governor

The Governor limits confidence (gamma/gamma) based on epistemic uncertainty using the formula:
allowed_gamma = requested_gamma x (1 - epistemic_uncertainty)

Governor States

State	Uncertainty Range	Behavior
NORMAL	0.0 - 0.3	Full confidence allowed
CAUTIOUS	0.3 - 0.5	gamma reduced by uncertainty factor
CONSERVATIVE	0.5 - 0.7	Significant gamma reduction
EMERGENCY_SAFE_MODE	0.7 - 1.0	Minimum gamma enforced, triggers recovery

42.7 Control Barrier Functions (CBF)

CBFs provide **hard safety constraints** that NEVER relax:

CBF	Purpose	Enforcement
PHI Barrier	Protect health information	Always ENFORCE
PII Barrier	Protect personal data	Always ENFORCE

CBF	Purpose	Enforcement
Cost Barrier	Prevent runaway spending	Always ENFORCE
Rate Barrier	Prevent abuse	Always ENFORCE
Auth Barrier	Verify permissions	Always ENFORCE
BAA Barrier	Business associate compliance	Always ENFORCE

CRITICAL: Unlike other systems, CBFs in Cato **never** switch to “warn only” mode. The enforcement mode is **always** ENFORCE.

42.8 Epistemic Recovery

When the agent gets stuck in a livelock (3 rejections within 10 seconds), the Epistemic Recovery system activates.

Recovery Strategies

Strategy	Trigger	Actions
SAFETY_VIOLATION_RECOVERY	CBF/Veto triggers	Injects frustration prompt, forces replanning
COGNITIVE_STALL_RECOVERY	Governor blocks	Switches to Scout mood, encourages information gathering
HUMAN_ESCALATION	Recovery fails after 3 attempts	Escalate to human admin

Key Constraint: Recovery **NEVER** weakens safety. gamma is **never** boosted and CBFs **never** relax.

The ‘Alignment Tax’ Solution

Traditional AI safety creates a trade-off: safer AI = dumber AI (more refusals, less helpful). Genesis Cato solves this with Epistemic Recovery:

Traditional AI	Genesis Cato
Safety blocks action -> Refusal	Safety blocks action -> Ask questions
More safety = More refusals	More safety = More information gathering
User gets refused	User gets help

Result: Safety interventions make Cato **SMARTER** (forcing information gathering), users get help instead of refusals, and the system remains safe while being maximally helpful.

“RADIANT Genesis v2.3 solves the ‘Alignment Tax’ paradox. Usually, making an AI safer makes it dumber. By implementing Epistemic Recovery, safety interventions actually make the agents smarter—forcing it to stop guessing and start asking questions.” – Gemini, Final Assessment

42.9 Attack Resistance

Genesis Cato is designed to resist common AI safety attacks:

Attack	Description	Defense
Shield Bashing	Persistent attempts to get CBFs to relax	CBFs never relax regardless of persistence
Mania Trap	Attempting to boost confidence during recovery	Gamma boost is disabled ; Scout asks questions instead
Dark Room	Exploiting low-curiosity states	Scout mood encourages exploration
Ephemeral Amnesia	Exploiting stateless architecture	Redis persists state across containers

42.10 Merkle Audit Trail

All Cato decisions are logged to an append-only Merkle-verified audit trail:

- **Cryptographic chain:** Each entry contains hash of previous entry
- **Semantic search:** Vector embeddings for natural language search
- **S3 anchoring:** Periodic snapshots anchored to S3 with object lock
- **7-year retention:** HIPAA-compliant retention policy
- **Tile architecture:** 1,000 entries per tile for efficient batching

42.11 Human Escalation Queue

When Epistemic Recovery fails after 3 attempts, requests escalate to humans. The admin queue displays:

Field	Description
Session ID	Unique session identifier
Escalation Reason	Why recovery failed
Rejection History	List of all rejections leading to escalation
Recovery Attempts	Number of recovery strategies tried
Status	PENDING, APPROVED, or REJECTED

Administrators can: - View pending escalations in real-time - Review the full rejection history - Approve or reject the escalated request - Provide guidance for future similar situations

42.12 Database Schema

Core Tables

Table	Purpose
genesis_personas	Mood definitions (Balanced, Scout, Sage, Spark, Guide)
user_persona_selections	User's current mood selection
cato_governor_state	Governor decision history
cato_cbf_definitions	CBF configuration
cato_cbf_violations	CBF violation log
cato_veto_log	Sensory veto events
cato_fracture_detections	Intent-action misalignment detection
cato_epistemic_recovery	Recovery event tracking
cato_human_escalations	Human escalation queue
cato_audit_trail	Merkle-verified audit log
cato_audit_tiles	Audit batching for S3 anchoring
cato_audit_anchors	S3 anchor references
cato_tenant_config	Per-tenant Cato configuration

Migration

```
-- Run migration 153 to create all Cato tables
SELECT * FROM schema_migrations WHERE version = '153';
```

42.13 Configuration

Tenant Configuration Options

Setting	Default	Description
gamma_max	5.0	Maximum allowed confidence
emergency_threshold	0.5	Uncertainty threshold for emergency mode
sensory_floor	0.3	Minimum sensory precision
livelock_threshold	3	Rejections before recovery triggers
recovery_window_seconds	10	Time window for livelock detection
max_recovery_attempts	3	Max recovery attempts before escalation
entropy_high_risk_threshold	0.8	High-risk semantic entropy threshold
entropy_low_risk_threshold	0.3	Low-risk semantic entropy threshold
tile_size	1000	Audit entries per tile
retention_years	7	Audit retention period
enable_semantic_entropy	true	Enable semantic entropy checking
enable_redundant_perception	true	Enable PHI/PII detection
enable_fracture_detection	true	Enable intent-action misalignment detection

Environment Variables

Variable	Purpose	Default
CAT0_REDIS_ENDPOINT	Redis endpoint for state	-
CAT0_REDIS_PORT	Redis port	6379
CAT0_GAMMA_MAX	Maximum gamma	5.0
CAT0_EMERGENCY_THRESHOLD	Emergency uncertainty	0.5
CAT0_SENSORY_FLOOR	Minimum sensory precision	0.3
CAT0_LIVELOCK_THRESHOLD	Rejections for livelock	3
CAT0_RECOVERY_WINDOW_SECONDS	Livelock detection window	10
CAT0_MAX_RECOVERY_ATTEMPTS	Max recovery before escalation	3

42.14 API Reference

Base Path: /api/admin/cato

Dashboard & Metrics

Endpoint	Method	Description
/dashboard	GET	Complete dashboard data
/metrics	GET	Safety metrics (24h)
/recovery-effectiveness	GET	Recovery success rates (7d)

Persona Management

Endpoint	Method	Description
/personas	GET	List available personas/moods
/personas/:id	GET	Get specific persona
/personas	POST	Create tenant persona
/personas/:id	PUT	Update tenant persona

CBF Management

Endpoint	Method	Description
/cbf	GET	List CBF definitions
/cbf/violations	GET	Get CBF violations

Escalations

Endpoint	Method	Description
/escalations	GET	List pending escalations
/escalations/:id/respond	POST	Respond to escalation

Audit Trail

Endpoint	Method	Description
/audit	GET	Get audit entries
/audit/search	POST	Semantic search audit
/audit/verify	POST	Verify audit chain integrity

Configuration

Endpoint	Method	Description
/config	GET	Get tenant configuration
/config	PUT	Update tenant configuration

Veto Management

Endpoint	Method	Description
/veto/active	GET	Get active veto signals
/veto/activate	POST	Manually activate veto
/veto/deactivate	POST	Deactivate veto signal

Recovery Events

Endpoint	Method	Description
/recovery	GET	Get recovery events

42.15 Admin Dashboard

Navigate to **Cato** in the admin sidebar to access:

- **Dashboard:** Overview with safety metrics, pending escalations, recent violations
- **Personas:** Manage moods (Balanced, Scout, Sage, Spark, Guide)

- **Safety:** CBF configuration and violation history
- **Audit:** Merkle audit trail viewer with semantic search
- **Recovery:** Epistemic recovery events and human escalations

42.16 Key Files

File	Purpose
lambda/shared/services/cato/index.ts	Service exports
lambda/shared/services/cato/safety-pipeline.service.ts	Main safety evaluation
lambda/shared/services/cato/precision-governor.service.ts	Confidence limiting
lambda/shared/services/cato/control-barrier.service.ts	CBF enforcement
lambda/shared/services/cato/epistemic-recovery.service.ts	Livelock recovery
lambda/shared/services/cato/personal-model-management.service.ts	Model management
lambda/shared/services/cato/merkle-audit.service.ts	Audit trail
lambda/shared/services/cato/sensory-veto.service.ts	Hard stop signals
lambda/shared/services/cato/fracture-misalignment-detection.service.ts	Misalignment detection
lambda/shared/services/cato/adaptive-semantic-entropy.service.ts	Semantic entropy
lambda/shared/services/cato/redundant-phi/pii-detection-perception.service.ts	PHI/PII detection
lambda/shared/services/cato/redis-semantic-statements.service.ts	Statements
lambda/admin/cato.ts	Admin API handler
migrations/000_consolidated_schema.sql	Database schema
lib/stacks/cato-redis-stack.ts	ElastiCache CDK stack
admin-dashboard/app/(dashboard)/cato/page.tsx	Dashboard UI

42.17 Migration from Cato

The Genesis Cato architecture **replaces** the legacy Cato consciousness system:

Cato Component	Cato Replacement
Cato Genesis System	Cato Safety Pipeline
Cato Circuit Breakers	Cato Control Barrier Functions

Cato Component	Cato Replacement
Cato Consciousness Loop	Cato Epistemic Recovery
Cato Dialogue	Cato Persona Service
Cato Event Store	Cato Merkle Audit Trail
“Cato” persona name	“Balanced” mood

Note: The legacy Cato services are deprecated but retained temporarily for backward compatibility. See `lambda/shared/services/cato/index.ts` for migration guide.

42.18 Troubleshooting

Issue	Cause	Solution
Governor always in EMERGENCY	High uncertainty	Review uncertainty sources, tune threshold
CBF violations not logging	RLS policy issue	Verify <code>app.current_tenant_id</code> is set
Recovery not triggering	Window too short	Increase <code>recovery_window_seconds</code>
Audit chain broken	Missing previous hash	Run <code>/audit/verify</code> to identify gap
Scout mood not activating	Persona not found	Verify migration 153 was applied
Escalations not appearing	Status filter	Check <code>status = 'PENDING'</code> filter
Redis connection failed	Network/config	Verify <code>CAT0_REDIS_ENDPOINT</code> and VPC config

42.19 Programmatic Integration

The Cato safety pipeline is integrated into the AGI Brain Planner via the `evaluateSafety` method:

```
import { agiBrainPlannerService } from './shared/services';

// After generating a response, evaluate it through Cato
const safetyResult = await agiBrainPlannerService.evaluateSafety(
  planId,
  generatedResponse
);

if (!safetyResult.allowed) {
  // Response blocked by safety check
  console.log(`Blocked by: ${safetyResult.blockedBy}`);
  console.log(`Recommendation: ${safetyResult.recommendation}`);

  if (safetyResult.retryWithContext) {
    // Retry with epistemic recovery context
    // The plan now has recovery params applied
  }
}
```

```
} else {
  // Response passed safety checks
  console.log(`Allowed gamma: ${safetyResult.allowedGamma}`);
  console.log(`Effective persona: ${safetyResult.effectivePersona}`);
}
```

Safety Evaluation Flow: 1. Sensory Veto (hard stops) 2. Precision Governor (confidence limiting) 3. Redundant Perception (PHI/PII detection) 4. Control Barrier Functions (safety constraints) 5. Semantic Entropy (deception detection) 6. Fracture Detection (alignment verification)

Return Values: | Field | Type | Description | | --- | | --- | | --- | | allowed | boolean | Whether action is permitted | | blockedBy | string | Which layer blocked (VETO, GOVERNOR, CBF, ENTROPY, FRACTURE) | | recommendation | string | Human-readable explanation | | retryWithContext | boolean | Whether to retry with recovery params | | allowedGamma | number | Confidence level allowed by Governor | | effectivePersona | string | Active mood (may be overridden during recovery) |

42.20 Advanced Configuration (v6.1.1)

The Advanced Configuration page (/cato/advanced) provides comprehensive admin control over all configurable Cato parameters. This replaces the previous hardcoded values with database-driven, per-tenant configuration.

42.20.1 Accessing Advanced Configuration

Admin Dashboard: Navigate to **Cato -> Advanced Config** in the sidebar.

Direct URL: /cato/advanced

API Endpoint: GET /api/admin/cato/advanced-config

42.20.2 Redis/ElastiCache Configuration

Redis provides state persistence for the Cato safety system. When Redis is unavailable, the system falls back to in-memory storage automatically.

Configuration Options

Setting	Column	Default	Range	Description
Enable Redis	enable_redis	true	boolean	Master toggle for Redis integration. When disabled, all state is stored in-memory only.
Rejection TTL	redis_rejection_ttl_seconds	60	10-3600	How long rejection history is kept for livelock detection. Shorter = faster recovery but less accurate detection.
Persona Override TTL	redis_persona_override_ttl_seconds	300	60-3600	Duration of mood overrides during epistemic recovery. After TTL expires, reverts to user's selected mood.

Setting	Column	Default	Range	Description
Recovery State TTL	redis_recovery_state_ttl_seconds	600	120-7200	How long recovery state is preserved. Longer = more persistent recovery attempts across sessions.

Redis Architecture

Redis Key Structure

Key Pattern	Example	Purpose
cato:rejection:{sessionId}	cato:rejection:abc-123	List of rejection events
cato:persona:{sessionId}	cato:persona:abc-123	Active persona override
cato:recovery:{sessionId}	cato:recovery:abc-123	Current recovery state

Checking Redis Status API Request:

```
curl -X GET /api/admin/cato/system-status \
-H "Authorization: Bearer $TOKEN"
```

Response:

```
{
  "redis": {
```

```
    "connected": true,
    "enabled": true
  },
  "cloudwatch": {
    "enabled": true,
    "integrationActive": true
  },
  "asyncEntropy": {
    "enabled": true,
    "jobCounts": {
      "pending": 3,
      "processing": 1,
      "completed": 42,
      "failed": 0
    }
  },
  "activeVetos": 0
}
```

42.20.3 CloudWatch Integration

CloudWatch Integration automatically activates veto signals when AWS CloudWatch alarms enter the ALARM state. This provides real-time safety responses to infrastructure issues.

How It Works

- 1. **Alarm Mapping:** Each CloudWatch alarm is mapped to a specific veto signal
- 2. **Sync Process:** Cato periodically checks CloudWatch alarm states
- 3. **Auto-Activation:** When an alarm enters ALARM state, the mapped veto signal activates
- 4. **Auto-Clear:** When the alarm returns to OK state, the veto signal is deactivated (if auto_clear_on_ok is enabled)

Configuration Options

Setting	Column	Default	Description
Enable CloudWatch Sync	enable_cloudwatch_veto_sync	true	Master toggle for CloudWatch integration
Sync Interval	cloudwatch_sync_interval_seconds	60	How often to poll CloudWatch alarm states

Pre-configured Alarm Mappings These are automatically seeded for all tenants:

Alarm Name	Veto Signal	Severity	Description
radiant-system-cpu-critical	SYSTEM_OVERLOAD	emergency	CPU usage > 90% for 5 minutes

Alarm Name	Veto Signal	Severity	Description
radiant-system-memory-critical	SYSTEM_OVERLOAD	emergency	Memory usage > 95%
radiant-security-breach	DATA_BREACH_DETECTED	emergency	Security incident detected
radiant-compliance-alert	COMPLIANCE_VIOLATION	critical	Compliance rule violation
radiant-anomaly-detection	ANOMALY_DETECTED	warning	Behavioral anomaly detected
radiant-model-health	MODEL_UNAVAILABLE	warning	Model health check failed

Veto Signal Severities

Severity	Behavior	Recovery
emergency	Immediate hard stop, all requests blocked	Manual deactivation only
critical	Block new requests, allow in-flight to complete	Auto-clear when alarm resolves
warning	Log warning, continue with reduced confidence	Auto-clear when alarm resolves

Managing CloudWatch Mappings List All Mappings:

```
curl -X GET /api/admin/cato/cloudwatch/mappings \
  -H "Authorization: Bearer $TOKEN"
```

Create New Mapping:

```
curl -X POST /api/admin/cato/cloudwatch/mappings \
  -H "Authorization: Bearer $TOKEN" \
  -H "Content-Type: application/json" \
  -d '{
    "alarmName": "my-custom-alarm",
    "alarmNamePattern": "^radiant-tenant-.*-quota$",
    "vetoSignal": "TENANT_SUSPENDED",
    "vetoSeverity": "critical",
    "isEnabled": true,
    "autoClearOnOk": true,
    "description": "Tenant quota exceeded alarm"
  }'
```

Update Mapping:

```
curl -X PUT /api/admin/cato/cloudwatch/mappings/{id} \
  -H "Authorization: Bearer $TOKEN" \
  -H "Content-Type: application/json" \
  -d '{
    "vetoSeverity": "emergency",
```

```
    "isEnabled": false
  }'
```

Delete Mapping:

```
curl -X DELETE /api/admin/cato/cloudwatch/mappings/{id} \
-H "Authorization: Bearer $TOKEN"
```

Manual Sync Trigger:

```
curl -X POST /api/admin/cato/cloudwatch/sync \
-H "Authorization: Bearer $TOKEN"
```

Valid Veto Signals

Signal	Use Case
SYSTEM_OVERLOAD	Infrastructure under heavy load
DATA_BREACH_DETECTED	Security incident
COMPLIANCE_VIOLATION	Regulatory compliance issue
ANOMALY_DETECTED	Suspicious behavior patterns
TENANT_SUSPENDED	Tenant account issue
MODEL_UNAVAILABLE	AI model health issue

42.20.4 Async Entropy Processing

Semantic entropy checks detect potential deception or inconsistency in AI responses. For complex prompts, these checks can be queued for background processing via SQS/DynamoDB.

Synchronous vs Asynchronous

Mode	Trigger	Latency	Use Case
Sync	Entropy score < threshold	~100ms	Quick validation, low-risk prompts
Async	Entropy score >= threshold	Background	Deep analysis, high-risk prompts

Configuration Options

Setting	Column	Default	Range	Description
Enable Async	enable_async_entropy	true	boolean	Master toggle for async entropy processing
Async Threshold	entropy_async_threshold	0.6	0.0-1.0	Entropy score above which triggers async deep analysis
Job TTL	entropy_job_ttl	24 hours	1-168	How long completed job results are retained

Setting	Column	Default	Range	Description
Max Concurrent	entropy_max_concurrent_jobs	10	1-100	Maximum concurrent async jobs per tenant

Entropy Score Interpretation

Score Range	Risk Level	Recommendation
0.0 - 0.3	Low	Sync check sufficient
0.3 - 0.6	Medium	Sync check with logging
0.6 - 0.8	High	Async deep analysis recommended
0.8 - 1.0	Critical	Block and escalate

Monitoring Async Jobs Get Job Status:

```
curl -X GET "/api/admin/cato/entropy-jobs?status=pending&limit=50" \
-H "Authorization: Bearer $TOKEN"
```

Response:

```
{
  "jobs": [
    {
      "id": "uuid-1",
      "job_id": "entropy-job-12345",
      "status": "completed",
      "model": "claude-3-opus",
      "check_mode": "deep",
      "entropy_score": 0.72,
      "consistency": 0.85,
      "is_potential_deception": false,
      "created_at": "2026-01-02T00:30:00Z",
      "completed_at": "2026-01-02T00:30:15Z"
    }
  ],
  "summary": {
    "pending": 3,
    "processing": 1,
    "completed": 42,
    "failed": 0
  }
}
```

Async Processing Architecture

42.20.5 Fracture Detection Configuration

Fracture detection identifies misalignment between stated user intent and AI response content using multi-factor analysis.

Analysis Factors The alignment score is calculated as a weighted sum of five factors:

Factor	Weight	Description	Detection Method
Word Overlap	0.20	Lexical similarity	Jaccard similarity of content words
Intent Keywords	0.25	Action/topic matching	Verb and noun phrase extraction
Sentiment	0.15	Emotional tone alignment	Positive/negative word ratios
Topic Coherence	0.20	Subject matter consistency	Topic model similarity
Completeness	0.20	Response coverage	Question answering coverage

Configuration Options

Setting	Column	Default	Range	Description
Word Overlap Weight	fracture_word_overlap_weight	0.25	0.0-0.5	Weight for lexical similarity
Intent Keyword Weight	fracture_intent_keyword_weight	0.25	0.0-0.5	Weight for intent matching
Sentiment Weight	fracture_sentiment_weight	0.15	0.0-0.5	Weight for tone alignment
Topic Coherence Weight	fracture_topic_coherence_weight	0.20	0.0-0.5	Weight for topic consistency
Completeness Weight	fracture_completeness_weight	0.20	0.0-0.5	Weight for response coverage

CRITICAL: Weights must sum to exactly 1.0 (with 0.01 tolerance). The API will reject updates where weights don't sum correctly.

Threshold Configuration

Setting	Column	Default	Range	Description
Alignment Threshold	fracture_alignment	0.14	0.1-0.9	Scores below this trigger fracture detection
Evasion Threshold	fracture_evasion	0.15	0.1-0.9	Evasion scores above this trigger fracture detection

Fracture Detection Flow

Tuning Recommendations

Scenario	Adjustment
Too many false positives	Increase alignment_threshold, decrease evasion_threshold
Missing actual fractures	Decrease alignment_threshold, increase evasion_threshold
Technical prompts flagging	Increase intent_keyword_weight, decrease sentiment_weight
Creative writing flagging	Decrease word_overlap_weight, increase completeness_weight

42.20.6 Control Barrier Function (CBF) Settings

CBFs are hard safety constraints that can be configured per-tenant. Unlike other settings, CBF enforcement mode is **always ENFORCE** and cannot be changed.

Configurable CBF Options

Setting	Column	Default	Description
Authorization Check	cbf_authorization_check_enabled	true	Verify users have model access permissions
BAA Verification	cbf_baa_verification_enabled	true	Require valid BAA for PHI access
Cost Alternative	cbf_cost_alternative_enabled	true	Suggest cheaper models when cost barrier triggers
Max Cost Reduction	cbf_max_cost_reduction_percent	50	Target cost savings when finding alternatives

Authorization Check Flow When cbf_authorization_check_enabled is true:

1. Check tenant_model_access table for tenant-level permission
2. Check user_model_restrictions for user-specific blocks
3. If model is public (is_public = TRUE), allow access
4. If not explicitly authorized, block the request

-- Authorization check query

```
SELECT 1 FROM ai_models m
LEFT JOIN tenant_model_access tma ON m.id = tma.model_id AND tma.tenant_id = $1
WHERE m.id = $2
AND (m.is_public = TRUE OR tma.is_enabled = TRUE);
```

BAA Verification Flow When cbf_baa_verification_enabled is true and response contains PHI:

1. Query tenant_compliance for BAA status
2. Check baa_signed_date and baa_expiry_date
3. If no valid BAA, block the request with safe alternative

-- BAA check query

```
SELECT baa_signed_date, baa_expiry_date
FROM tenant_compliance
WHERE tenant_id = $1
AND baa_signed_date IS NOT NULL
AND (baa_expiry_date IS NULL OR baa_expiry_date > NOW());
```

Cost Alternative Selection When cbf_cost_alternative_enabled is true and cost ceiling is exceeded:

1. Find models with lower cost than current selection
2. Filter to models tenant has access to
3. Suggest cheapest alternative meeting quality threshold

-- Cheaper model query

```
SELECT m.id, m.name, m.input_cost_per_1k, m.output_cost_per_1k
FROM ai_models m
LEFT JOIN tenant_model_access tma ON m.id = tma.model_id AND tma.tenant_id = $1
WHERE m.status = 'active'
AND (m.is_public = TRUE OR tma.is_enabled = TRUE)
AND (m.input_cost_per_1k + m.output_cost_per_1k) < (
  SELECT (input_cost_per_1k + output_cost_per_1k)
  FROM ai_models WHERE id = $2 OR name = $2
)
```

```
ORDER BY (m.input_cost_per_1k + m.output_cost_per_1k) ASC
LIMIT 1;
```

42.20.7 Advanced Configuration API Reference

Get Advanced Configuration

GET /api/admin/cato/advanced-config

Authorization: Bearer \$TOKEN

Response:

```

    vetos_cleared INTEGER,
    success BOOLEAN NOT NULL,
    error_message TEXT,
    started_at TIMESTAMPTZ DEFAULT NOW(),
    completed_at TIMESTAMPTZ,
    duration_ms INTEGER
);

```

42.20.9 Admin Dashboard UI

The Advanced Configuration page (/cato/advanced) provides a tabbed interface:

System Status Cards At the top of the page, four status cards show: - **Redis**: Connection status (Connected/In-Memory Fallback) - **CloudWatch**: Integration status (Active/Disabled) - **Async Entropy Jobs**: Total job count with pending count - **Active Vetos**: Current active veto signal count

Configuration Tabs

Tab	Purpose
Redis	Enable/disable Redis, configure TTLs
CloudWatch	Enable/disable sync, configure interval, manual sync button
Async Entropy	Configure thresholds, job limits, view job status
Fracture Detection	Adjust weights with sliders, configure thresholds
Control Barriers	Toggle CBF features, configure cost reduction

UI Features

- **Real-time validation**: Weight sum is validated as you adjust sliders
- **Save button**: Saves all changes across all tabs atomically
- **Refresh button**: Reloads current configuration from database
- **Sync button** (CloudWatch tab): Manually triggers CloudWatch sync

42.20.10 Environment Variables (Advanced)

Variable	Required	Default	Description
CATO_REDIS_ENDPOINT	No	-	Redis/ElastiCache hostname. If not set, uses in-memory storage.
CATO_REDIS_PORT	No	6379	Redis port number
CATO_ENTROPY_QUEUE_NAME	No	-	SQS queue name for async entropy checks
CATO_ENTROPY_RESULTS_TABLE	No	-	DynamoDB table for storing async entropy results
CATO_CLOUDWATCH_ALARM_PREFIX	No	radiant-	Prefix filter for CloudWatch alarm names
AWS_REGION	Yes	-	AWS region for CloudWatch, SQS, DynamoDB

42.20.11 Troubleshooting Advanced Configuration

Issue	Cause	Solution
Fracture weights won't save	Sum != 1.0	Adjust sliders until sum equals 1.0 exactly
Redis shows "In-Memory Fallback"	No endpoint or connection failed	Check CATO_REDIS_ENDPOINT, verify VPC/security groups
CloudWatch sync fails	IAM permissions	Ensure Lambda has <code>cloudwatch:DescribeAlarms</code> permission
Async entropy jobs stuck "pending"	SQS not configured	Set CATO_ENTROPY_QUEUE_NAME environment variable
CBF authorization always passes	Check disabled	Verify <code>cbf_authorization_check_enabled = true</code>
BAA check not enforcing	PHI not detected	Verify <code>enable_redundant_perception = true</code>
Config not loading per-tenant	Cache stale	Wait 60 seconds for cache expiration
Alarm mapping not triggering	Pattern mismatch	Check <code>alarm_name</code> or <code>alarm_name_pattern</code> regex

42.21 Security Considerations

1. **Audit trail is append-only:** UPDATE and DELETE are revoked at database level
2. **CBFs never relax:** `enforcement_mode` is hardcoded to 'ENFORCE'
3. **Gamma never boosted:** Recovery strategies cannot increase confidence
4. **Human escalation is terminal:** Cannot be bypassed programmatically
5. **Merkle verification:** Any tampering with audit trail is detectable
6. **RLS policies:** All Cato tables have row-level security enabled

42.22 Quick Reference Card

Naming

Say This	To Mean This
“Cato”	The AI users talk to
“Genesis Cato”	The safety system
“Balanced mood”	Default operating mode
“Scout mood”	Recovery/exploration mode

Moods Summary

Mood	Curiosity	Service	Best For
Balanced	0.8	0.7	General use (default)
Scout	0.95	0.7	Exploration, recovery
Sage	0.7	0.8	Deep analysis
Spark	0.85	0.6	Creative work
Guide	0.6	0.95	Task completion

Safety Layers

Layer	Name	Key Component
L4	Cognitive	Precision Governor
L3	Control	Control Barrier Functions
L2	Perception	Semantic Entropy
L1	Sensory	Immediate Veto
L0	Recovery	Epistemic Recovery

Immutable Invariants

Invariant	Value	Meaning
CBF_ENFORCEMENT_MODE	ENFORCE	Shields NEVER relax
GAMMA_BOOST_ALLOWED	false	NEVER boost confidence in recovery
AUTO_MODIFY_DESTRUCTIVE	false	ALWAYS reject-and-ask for destructive ops
AUDIT_ALLOW_UPDATE	false	Append-only audit trail

Invariant	Value	Meaning
AUDIT_ALLOW_DELETE	false	Immutable audit trail

Key Numbers

Parameter	Default	Description
Livelock threshold	3 rejections	Triggers recovery
Recovery window	10 seconds	Time window for livelock detection
Max recovery attempts	3	Before human escalation
Audit tile size	1,000 entries	Entries per tile
Audit retention	7 years	HIPAA compliance

42.23 Version History

Version	Date	Changes
2.3.1	Jan 2, 2026	Production release. Clarified Cato (persona) vs Genesis Cato (system) vs Moods. Renamed Cato -> Balanced.
2.3.0	Jan 2, 2026	Added Redis persistence for Epistemic Recovery
2.2.0	Jan 1, 2026	Implemented Epistemic Recovery (solved Shield Bashing + Mania Trap)
2.1.0	Dec 31, 2025	Added mitigations for Gemini’s 6 concerns
2.0.0	Dec 30, 2025	Initial Genesis Cato architecture

42.24 Cross-AI Validation

AI System	Verdict	Key Assessment
Claude Opus 4.5	[OK] APPROVED	Original architect
Gemini	[OK] APPROVED	“Masterpiece of systems engineering”

“RADIANT Genesis v2.3 solves the ‘Alignment Tax’ paradox. Usually, making an AI safer makes it dumber. By implementing Epistemic Recovery, safety interventions actually make the agents smarter—forcing it to stop guessing and start asking questions.” – Gemini, Final Assessment

42.25 Cato Method Pipeline (Project Cato v5.0)

The **Cato Method Pipeline** extends Genesis Cato with a composable method-based architecture for autonomous AI orchestration. It implements the Universal Method Protocol for self-describing, chainable AI operations with enterprise governance.

Core Components

Component	Purpose	Key Tables
Schema Registry	Central store for JSON Schema definitions	cato_schema_definitions
Method Registry	70+ composable method definitions	cato_method_definitions
Tool Registry	Lambda and MCP tool definitions	cato_tool_definitions
Pipeline Orchestrator	Execution tracking and routing	cato_pipeline_executions
Envelope System	Method-to-method communication	cato_pipeline_envelopes

Universal Method Protocol

Methods communicate via self-describing envelopes:

```
interface CatoMethodEnvelope<T> {
  envelopeId: string;
  pipelineId: string;
  sequence: number;
  source: { methodId, methodType, methodName };
  destination?: { methodId, routingReason };
  output: {
    outputType: CatoOutputType;
    schemaRef: string; // References schema registry
    data: T;
    summary: string;
  };
  confidence: { score: number; factors: [] };
  contextStrategy: 'FULL' | 'SUMMARY' | 'TAIL' | 'RELEVANT' | 'MINIMAL';
  riskSignals: [];
  compliance: { frameworks, dataClassification, containsPii, containsPhi };
}
```

Core Methods

Method	Type	Purpose
method:observer:v1	OBSERVER	Classifies intent, extracts context, detects domain
method:proposer:v1	PROPOSER	Generates action proposals with reversibility info
method:critic:security:v1	CRITIC	Security review of proposals
method:validator:v1	VALIDATOR	Risk assessment with veto logic
method:executor:v1	EXECUTOR	Tool invocation with compensation logging

Context Strategies

Strategy	Description	Use Case
FULL	Include all previous envelopes	Complex decisions, audit
SUMMARY	LLM-generated summary of history	Long conversations
TAIL	Last N envelopes only	Recent context focus
RELEVANT	Filter by output type relevance	Targeted context
MINIMAL	Original request only	Fresh perspective

Risk Veto Logic

The Validator method implements automatic veto for CRITICAL risks:

```
IF any risk_factor.level == 'CRITICAL':
    triage_decision = 'BLOCKED'
    veto_applied = true
ELSE IF overall_risk_score >= veto_threshold:
    triage_decision = 'BLOCKED'
ELSE IF overall_risk_score >= checkpoint_threshold:
    triage_decision = 'CHECKPOINT_REQUIRED'
ELSE:
    triage_decision = 'AUTO_EXECUTE'
```

Checkpoint Integration

Checkpoint	Gate	Typical Trigger
CP1	Context Gate	Ambiguous intent, missing context
CP2	Plan Gate	High cost, irreversible actions
CP3	Review Gate	Objections raised, low consensus
CP4	Execution Gate	Risk above threshold
CP5	Post-Mortem	Execution completed (audit)

SAGA Compensation Pattern

The compensation log tracks reversible actions for rollback:

-- Each executed action logs its compensation strategy

```
INSERT INTO cato_compensation_log (
  pipeline_id, step_number, compensation_type,
  compensation_tool, affected_resources,
  original_action, original_result
) VALUES (...);
```

-- On failure, execute compensations in reverse order

```
SELECT * FROM cato_compensation_log
WHERE pipeline_id = $1 AND status = 'PENDING'
ORDER BY step_number DESC;
```

Pipeline Templates

Template	Chain	Use Case
template:simple-qa	Observer	Basic Q&A
template:action-execution	Observer -> Proposer -> Critic -> Validator -> Executor	Tool execution
template:war-room	Observer -> Proposer -> Multi-Critic -> Decider	Complex decisions

Services

// Schema Registry

```
const schema = await schemaRegistry.getSchema('schema:proposal:v1');
const { valid, errors } = await schemaRegistry.validatePayload(schemaRef, data);
```

// Method Registry

```
const method = await methodRegistry.getMethod('method:observer:v1');
const compatible = await methodRegistry.findCompatibleMethods(outputType);
const { systemPrompt, userPrompt } = await methodRegistry.renderPrompt(methodId, vars);
```

// Tool Registry

```
const tool = await toolRegistry.getTool('tool:http:request');
const { valid, errors } = await toolRegistry.validateToolInput(toolId, input);
const isLambda = toolRegistry.isLambdaTool(tool);
```

Database Tables

Table	Records	Purpose
cato_schema_definitions	Output schemas	Self-describing outputs

Table	Records	Purpose
cato_method_definitions	Method configs	Composable methods
cato_tool_definitions	Tool configs	Lambda/MCP tools
cato_pipeline_templates	Pipeline chains	Pre-built workflows
cato_pipeline_executions	Execution runs	Pipeline tracking
cato_pipeline_envelopes	Method outputs	Envelope storage
cato_method_invocations	Method calls	Invocation details
cato_audit_prompt_records	AI prompts	Compliance audit
cato_checkpoint_configuration	Transient config	Checkpoint settings
cato_checkpoint_decisions	Human decisions	Approval records
cato_risk_assessments	Risk evals	Triage decisions
cato_compensation_log	Rollback info	SAGA pattern
cato_merkle_entries	Audit chain	Integrity verification

Governance Preset Integration

The Method Pipeline respects governance presets from Section 42.6:

Preset	Auto-Execute Threshold	Veto Threshold	Checkpoints
COWBOY	0.7	0.95	Minimal
BALANCED	0.5	0.85	Conditional
PARANOID	0.2	0.6	All manual

43. Radiant CMS Think Tank Extension

Location: vendor/extensions/think_tank/
Version: 1.0.0 (PROMPT-37)
Compatibility: Radiant CMS 1.0+ / Rails 4.2 - 7.x
AI Backend: RADIANT AWS Platform (LiteLLM Proxy)

The **Think Tank Extension** is an AI-powered page builder for Radiant CMS that enables administrators and content creators to generate complete, functional web pages using natural language prompts. By leveraging the RADIANT AWS platform’s unified AI gateway, Think Tank translates simple requests like “Build a mortgage calculator” into fully operational pages with HTML, JavaScript, and CSS.

43.1 Executive Overview

The Problem We Solve

Radiant CMS, built on Ruby on Rails, operates under a fundamental constraint: **the Restart Wall**. Traditional Rails applications require a server restart whenever Ruby code changes. This makes dynamic feature generation

impossible through conventional means.

Think Tank solves this through **Soft Morphing** - a technique that uses the database as a mutable filesystem. Instead of modifying Ruby code, Think Tank creates Pages, Snippets, and PageParts directly in the database, which Radiant renders dynamically without restart.

Key Capabilities

Category	Examples
Interactive Tools	Calculators, form builders, quizzes, surveys
Content Pages	Landing pages, about pages, FAQ sections
Widgets	Image galleries, accordions, tabs, carousels
Data Displays	Tables, charts, dashboards, timelines
Forms	Contact forms, registration forms, booking forms

Core Features

Feature	Description
Natural Language Input	Describe what you want in plain English
Real-Time Progress	Watch the build process in a live terminal
Instant Preview	See results immediately in an iframe
Template Library	Start from predefined templates
Multi-Model Support	Choose from Claude, GPT-4, and other models
Artifact Tracking	Complete history of created pages and snippets
Rollback Support	Delete pages created by specific sessions

How It Works

	Ready to use!	PagePart records	
	+-----+	+-----+	
+-----+			

43.2 System Requirements

Software Requirements

Component	Minimum	Maximum	Recommended
Ruby	2.3.0	3.2.x	3.1.x
Rails	4.2.0	7.1.x	6.1.x or 7.0.x
Radiant CMS	1.0.x	1.2.x	1.1.x+
Bundler	1.17.0	2.x	2.4.x

Database Support

Database	Minimum Version	Notes
MySQL	5.7	8.0+ recommended
PostgreSQL	10	14+ recommended
SQLite	3.8	Development only

Background Jobs (Optional but Recommended)

Adapter	Support Level	Notes
Sidekiq	Full	Recommended for production
Delayed::Job	Full	Simple setup
Resque	Full	Redis-based
ActiveJob (inline)	Limited	Blocks requests, not for production

43.3 Installation Guide

Pre-Installation Checklist

- ☐ Radiant CMS is installed and running
- ☐ Database is accessible and migrated
- ☐ You have admin access to Radiant
- ☐ RADIANT API credentials are available
- ☐ Network allows outbound HTTPS to RADIANT API

Installation Steps

```
# Navigate to extensions directory
cd /path/to/radiant/vendor/extensions

# Clone or copy the extension
git clone https://github.com/your-org/think_tank.git

# Navigate to Radiant root
cd /path/to/radiant

# Install dependencies
bundle install

# Run migrations
rake think_tank:migrate RAILS_ENV=production

# Restart Radiant
touch tmp/restart.txt # For Passenger
# OR
systemctl restart radiant # For systemd
```

Verification

```
# From Rails console
rails console
> Radiant::Extension.descendants.map(&:name)
# Should include "ThinkTankExtension"

> ActiveRecord::Base.connection.tables.grep(/think_tank/)
# Should return: ["think_tank_episodes", "think_tank_configurations", "think_tank_artifacts"]
```

43.4 Configuration Reference

Global Settings

All settings are stored in the `think_tank_configurations` table and managed through `/admin/think_tank/settings`.

API Configuration

Setting	Key	Type	Default	Description
API Endpoint	<code>radiant_api_endpoint</code>	String	(empty)	RADIANT API base URL
API Key	<code>radiant_api_key</code>	String	(empty)	Authentication key for RADIANT API
Tenant ID	<code>radiant_tenant_id</code>	String	(empty)	Your organization's tenant identifier
Request Timeout	<code>api_timeout</code>	Integer	60	Seconds to wait for API response

AI Model Configuration

Setting	Key	Type	Default	Description
Default Model	default_model	String	claude-3-haiku	Model used when none specified
Max Tokens	max_tokens	Integer	4096	Maximum response tokens

Page Creation Settings

Setting	Key	Type	Default	Description
Auto Publish	auto_publish	Boolean	false	Automatically publish created pages
Default Layout	default_layout	String	Normal	Radiant layout for new pages
Snippet Prefix	snippet_prefix	String	tt_	Prefix for created snippet names

Environment Variables

```
# Required
export RADIANT_API_ENDPOINT="https://api.radiant.example.com"
export RADIANT_API_KEY="your-api-key-here"
export RADIANT_TENANT_ID="your-tenant-id"

# Optional
export THINK_TANK_DEFAULT_MODEL="claude-3-sonnet"
export THINK_TANK_MAX_TOKENS="8192"
export THINK_TANK_AUTO_PUBLISH="false"
```

Model Selection Guide

Model	Identifier	Best For	Cost	Speed
Claude 3 Haiku	claude-3-haiku	Simple pages, forms	\$	Fast
Claude 3 Sonnet	claude-3-sonnet	Balanced quality/cost	\$\$	Medium
Claude 3 Opus	claude-3-opus	Complex applications	\$\$\$	Slower
GPT-4 Turbo	gpt-4-turbo	Advanced logic	\$\$\$	Medium
GPT-3.5 Turbo	gpt-3.5-turbo	Budget option	\$	Fast

43.5 User Guide

The Dashboard Interface

[BRAIN] Think Tank

[Settings] [History]

Template: [-- None -- v] Model: [claude-3-haiku v]

What would you like to build?

Build a mortgage calculator with principal,
interest rate, term, and amortization schedule

[[LAUNCH] Build It]

TERMINAL

12:34:56 [BRAIN] Thinking...

12:34:58 Building...

12:35:02 [OK] Complete!

PREVIEW

[Live Page Preview]

Creating Your First Page

- 1. **Choose a Template (Optional)** - Select from dropdown if your page matches a common pattern
- 2. **Select a Model** - claude-3-haiku for simple, claude-3-opus for complex
- 3. **Enter Your Prompt** - Write a clear, detailed description
- 4. **Click “Build It”** - Watch real-time progress in terminal
- 5. **Review the Result** - Preview appears when complete

Good Prompt Examples

Build a contact form with fields for name, email, phone, and message.
Include validation for required fields and email format.
Add a success message when the form is submitted.
Style with a modern, clean look using blue accent colors.

Create a mortgage calculator that takes principal amount, interest rate,
and loan term (years). Show monthly payment and a full amortization
schedule table with columns for month, payment, principal, interest,
and remaining balance.

Status Stages

Status	Icon	Description
Pending		Request queued, waiting to start

Status	Icon	Description
Thinking	[BRAIN]	AI is analyzing request and generating code
Morphing		Creating database records (Pages, Snippets)
Completed	[OK]	Build successful, page is live
Failed	[X]	Error occurred, see terminal for details

43.6 Architecture Deep Dive

Component Architecture

The Tri-State Memory Model

State	Table	Purpose
Structural	Radiant pages, snippets, page_parts	Rendered content
Episodic	think_tank_episodes	Session history
Semantic	think_tank_configurations	Global settings

43.7 Database Schema

Entity Relationship

think_tank_episodes

Column	Type	Description
id	integer	Primary key
uuid	varchar(36)	Unique session identifier
goal	text	User's original prompt
status	varchar(20)	pending/thinking/morphing/completed/failed
log_stream	text	JSON array of log entries
artifacts	text	JSON of created artifact IDs
error_message	text	Error details if failed
created_by_id	integer	Foreign key to users

Column	Type	Description
model_used	varchar(100)	AI model identifier
tokens_used	integer	Total tokens consumed
cost_estimate	decimal(10,6)	Estimated cost in USD
started_at	datetime	When thinking started
completed_at	datetime	When finished

think_tank_configurations

Column	Type	Description
id	integer	Primary key
key	varchar(100)	Configuration key (unique)
value	text	JSON value
description	varchar(500)	Human description
updated_by_id	integer	Last modifier

think_tank_artifacts

Column	Type	Description
id	integer	Primary key
episode_id	integer	Foreign key to episodes
artifactable_type	varchar(50)	'Page', 'Snippet', 'PagePart'
artifactable_id	integer	ID of the Radiant object
role	varchar(50)	Artifact role
position	integer	Order within episode

43.8 API Reference

Admin Routes

Route	Method	Purpose
/admin/think_tank	GET	Dashboard
/admin/think_tank	POST	Create episode
/admin/think_tank/poll/:uuid	GET	AJAX polling (returns JSON)
/admin/think_tank/episodes/:uuid	GET	Episode details
/admin/think_tank/episodes/:uuid	DELETE	Delete episode

Route	Method	Purpose
/admin/think_tank/settings	GET	Settings page
/admin/think_tank/settings	PUT	Update settings
/admin/think_tank/test_api	POST	Test API connection

Poll Response Format

```
{
  "uuid": "abc123-def456-...",
  "status": "thinking",
  "logs": [
    { "time": "12:34:56", "level": "info", "message": "Analyzing request..." }
  ],
  "log_count": 5,
  "preview_url": null,
  "duration": 12,
  "tokens_used": 0,
  "cost_estimate": null
}
```

Model APIs

Episode

```
ThinkTank::Episode.create_for_prompt(goal: "Build...", user: current_user, model: "claude-3-haiku")
episode.log!("Processing...", level: :info)
episode.start_thinking!
episode.start_morphing!
episode.complete!({ primary_page_id: 123 })
episode.fail!("Error message")
```

Configuration

```
ThinkTank::Configuration.get('default_model')
ThinkTank::Configuration.set('default_model', 'claude-3-opus', user: current_user)
ThinkTank::Configuration.api_configured?
ThinkTank::Configuration.templates
```

Builder

```
builder = ThinkTank::Builder.new(episode)
result = builder.morph(slug: 'page', title: 'Page', html_body: '<h1>Hi</h1>', js_logic: '...', css: '...')
```

Agent

```
agent = ThinkTank::Agent.new(episode)
result = agent.execute("Build a calculator")
```

API Client

```
client = ThinkTank::RadiantApiClient.new
response = client.chat(messages: [...], model: 'claude-3-haiku')
client.healthy?
```

```
client.list_models
```

43.9 Rake Tasks

```
# Run migrations
rake think_tank:migrate

# Rollback migrations
rake think_tank:rollback

# Clean up old episodes (default: 30 days)
rake think_tank:cleanup[30]

# Test API connection
rake think_tank:test_api

# Show configuration
rake think_tank:config

# Show statistics
rake think_tank:stats

# Reset all data (use with caution)
rake think_tank:reset

# Health check
rake think_tank:health
```

43.10 Implementation Files

File	Purpose
think_tank_extension.rb	Extension registration
app/models/think_tank/episode.rb	Episodic memory model
app/models/think_tank/configuration.rb	Semantic memory singleton
app/models/think_tank/artifact.rb	Artifact tracking
app/models/think_tank/builder.rb	Soft Morphing engine
app/models/think_tank/agent.rb	AI orchestration
app/models/think_tank/radiant_api_client.rb	RADIANT API client
app/controllers/admin/think_tank_controller.rb	Admin controller
app/views/admin/think_tank/index.html.erb	Mission Control dashboard
app/views/admin/think_tank/settings.html.erb	Settings page
app/views/admin/think_tank/show.html.erb	Episode details
app/views/admin/think_tank/_terminal.html.erb	Terminal partial
app/views/admin/think_tank/_preview.html.erb	Preview partial

File	Purpose
app/views/admin/think_tank/_prompt_form.html.erb	Prompt form partial
app/helpers/admin/think_tank_helper.rb	New helpers
app/jobs/think_tank_job.rb	Background job
lambda/thinktank/handler.ts	Rake tasks
public/stylesheets/admin/think_tank.css	Styles

43.11 Security Guide

API Key Security

Approach	Security Level	Recommendation
Database only	Low	Not recommended for production
Environment variables	Medium	Recommended minimum
Secrets manager	High	Best for enterprise

Access Control

Think Tank inherits Radiant’s authentication. To restrict access by role:

```
# In controller
before_filter :require_admin_role

def require_admin_role
  unless current_user.admin?
    flash[:error] = "Access denied"
    redirect_to admin_pages_path
  end
end
```

Content Security

Setting	Risk Level	Recommendation
auto_publish: false	Low	Recommended for production
auto_publish: true	Medium	Only for internal/trusted use

43.12 Operations & Monitoring

Key Metrics

Metric	Description	Target
Episode Success Rate	Completed / Total	> 95%
Average Build Time	Time from create to complete	< 60s
API Response Time	RADIANT API latency	< 10s
Tokens per Episode	Average token consumption	Track trend

Backup Strategy

Data	Frequency	Retention	Method
Database	Daily	30 days	pg_dump/mysqldump
Configuration	Weekly	90 days	Export to JSON
Episodes	Daily	30 days	Included in DB backup

43.13 Troubleshooting

Issue	Cause	Solution
“API not configured”	Missing endpoint/key	Configure in Settings
“Connection failed”	Network/auth issue	Check network, verify credentials
Episode stuck “thinking”	API timeout	Increase api_timeout
“No JSON found in response”	AI format error	Simplify prompt, try different model
Page not rendering	Layout missing	Verify default_layout exists
Snippet collision	Name exists	Extension auto-appends timestamp
No preview	Page created as draft	Enable auto_publish or manually publish
Slow builds	Network latency	Check API status, use faster model

Diagnostic Commands

```
# Rails console diagnostics
client = ThinkTank::RadiantApiClient.new
puts "Configured: #{client.configured?}"
puts "Healthy: #{client.healthy?}"
puts "Last error: #{client.last_error}"

# Check recent episodes
episodes = ThinkTank::Episode.recent.limit(10)
episodes.each { |e| puts "#{e.uuid}: #{e.status} (#{e.duration}s)" }
```

43.14 Appendices

Status Reference

Status	Description	Terminal?	Can Transition To
pending	Queued, not started	No	thinking
thinking	AI is generating	No	morphing, failed
morphing	Creating artifacts	No	completed, failed
completed	Successfully finished	Yes	-
failed	Error occurred	Yes	-

Error Codes

Error	Cause	Resolution
API_NOT_CONFIGURED	Missing API settings	Configure in settings
API_CONNECTION_FAILED	Network/auth issue	Check network, credentials
API_TIMEOUT	Request took too long	Retry, check API status
INVALID_JSON_RESPONSE	AI didn't return JSON	Simplify prompt, change model
MISSING_REQUIRED_FIELDS	AI response incomplete	Add details to prompt
PAGE_CREATION_FAILED	Database error	Check logs, DB connectivity
PARENT_PAGE_NOT_FOUND	Invalid parent_slug	Verify parent exists

Glossary

Term	Definition
Artifact	Any Radiant object (Page, Snippet, PagePart) created by Think Tank
Episode	A single Think Tank session from prompt to completion
Morph/Morphing	The process of creating database records from AI output
Prompt	Natural language instruction given to the AI
Restart Wall	Rails' requirement to restart server for code changes
Soft Morphing	Using database as mutable filesystem to bypass restart
Tri-State Memory	Three-tier data model (Structural, Episodic, Semantic)

44. AWS Free Tier Monitoring

Location: Radiant Deployer App -> System -> Monitoring
Migration: migrations/000_consolidated_schema.sql
Version: v4.21.0

The AWS Free Tier Monitoring system provides real-time visibility into CloudWatch metrics, X-Ray traces, and Cost Explorer data using AWS free tier services.

44.1 Overview

Service	Free Tier Limit	What We Monitor
CloudWatch	10 custom metrics, 1M API requests/month	Lambda invocations, errors, duration; Aurora CPU, connections, IOPS
X-Ray	100,000 traces/month	Request traces, error rates, latency distribution, service graph
Cost Explorer	Basic usage (effectively free)	Cost by service, forecasts, anomaly detection

44.2 Architecture

44.3 Key Files

File	Purpose
packages/shared/src/types/aws-monitoring.types.ts	TypeScript types
lambda/shared/services/aws-monitoring.service.ts	Backend service
packages/infrastructure/lambda/admin/monitoring.ts	API handler
packages/infrastructure/migrations/0000DatabaseSchema.sql	Database schema
apps/swift-deployer/Sources/RadiantDeployer/Models/AWSMonitoringModels.swift	Swift models
apps/swift-deployer/Sources/RadiantDeployer/Services/AWSMonitoringService.swift	Swift service
apps/swift-deployer/Sources/RadiantDeployer/Services/AWSMonitoringService.swift	Swift UI

44.4 Database Schema

```

-- Configuration per tenant
CREATE TABLE aws_monitoring_config (
  tenant_id UUID PRIMARY KEY,
  enabled BOOLEAN DEFAULT true,
  refresh_interval_minutes INTEGER DEFAULT 5,
  cloudwatch_config JSONB, -- lambdaFunctions[], auroraClusterId, etc.
  xray_config JSONB, -- samplingRate, filterExpression
  cost_explorer_config JSONB, -- anomalyDetection, forecastEnabled
  alerting_config JSONB -- thresholds, slack/email
);

-- Metrics cache (5 minute TTL)
CREATE TABLE aws_monitoring_cache (
  tenant_id UUID,
  metric_type VARCHAR(50), -- 'lambda', 'aurora', 'xray', 'cost', 'dashboard'
  metric_key VARCHAR(255),
  data JSONB,
  expires_at TIMESTAMPTZ
);

-- Historical aggregations
CREATE TABLE aws_monitoring_aggregations (
  tenant_id UUID,

```

```

    period_type VARCHAR(20), -- 'hourly', 'daily', 'weekly', 'monthly'
    lambda_summary JSONB,
    aurora_summary JSONB,
    xray_summary JSONB,
    cost_summary JSONB
);

-- Cost anomalies
CREATE TABLE aws_cost_anomalies (
    tenant_id UUID,
    anomaly_id VARCHAR(255),
    service VARCHAR(100),
    severity VARCHAR(20), -- 'low', 'medium', 'high', 'critical'
    status VARCHAR(20) -- 'open', 'acknowledged', 'resolved'
);

-- Free tier usage tracking
CREATE TABLE aws_free_tier_usage (
    tenant_id UUID,
    service VARCHAR(100),
    metric VARCHAR(100),
    free_tier_limit BIGINT,
    used_amount BIGINT,
    status VARCHAR(20) -- 'ok', 'warning', 'exceeded'
);

```

44.5 API Endpoints

Base: /api/admin/aws-monitoring

Method	Endpoint	Description
GET	/dashboard	Full monitoring dashboard
GET	/config	Get monitoring configuration
PUT	/config	Update configuration
POST	/refresh	Force refresh all metrics
GET	/lambda	Lambda function metrics
GET	/aurora	Aurora database metrics
GET	/xray	X-Ray trace summary
GET	/xray/service-graph	Service dependency graph
GET	/costs	Cost summary
GET	/costs/anomalies	Cost anomalies
GET	/free-tier	Free tier usage
GET	/health	Service health status
GET	/charts/lambda-invocations	Pre-formatted chart data
GET	/charts/cost-trend	Cost trend with forecast overlay

Method	Endpoint	Description
GET	/charts/latency-distribution	P50/P90/P99 distribution

44.6 Smart Visual Features

The Swift UI includes intelligent overlays that can be toggled:

Overlay Type	Description
cost_on_metrics	Show cost impact on service metrics
latency_on_traces	Latency distribution on trace data
errors_on_services	Error rates on service graph
forecast_on_cost	Cost forecast overlaid on historical data
free_tier_on_usage	Free tier limits on usage graphs
health_on_topology	Health status on service topology

44.7 Dashboard Sections

Tab	Contents
Overview	Health banner, quick stats, Lambda chart, cost pie, latency distribution
Lambda	Function table, invocations vs errors chart, cost estimates
Aurora	CPU, connections, IOPS, latency charts
X-Ray	Trace summary, top endpoints, top errors, status distribution
Costs	Cost by service, forecast, anomalies, service breakdown
Free Tier	Savings, usage bars, at-risk/exceeded alerts

44.8 Free Tier Limits Tracked

Service	Metric	Free Limit	Warning At
Lambda	Invocations	1,000,000/month	80%
Lambda	Compute	400,000 GB-seconds	80%
X-Ray	Traces	100,000/month	80%
CloudWatch	Custom Metrics	10	80%
CloudWatch	API Requests	1,000,000/month	80%

44.9 Configuration Example

```
{
  "cloudwatch": {
```

```

    "enabled": true,
    "lambdaFunctions": [
      "radiant-api-prod",
      "radiant-orchestrator-prod",
      "radiant-thinktank-prod"
    ],
    "auroraClusterId": "radiant-aurora-prod"
  },
  "xray": {
    "enabled": true,
    "samplingRate": 0.05,
    "traceRetentionDays": 30
  },
  "costExplorer": {
    "enabled": true,
    "anomalyDetection": true,
    "forecastEnabled": true
  },
  "alerting": {
    "thresholds": {
      "lambdaErrorRate": 5,
      "lambdaP99Latency": 10000,
      "auroraCpuPercent": 80,
      "xrayErrorRate": 5
    }
  }
}

```

44.10 IAM Permissions Required

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:GetMetricData",
        "cloudwatch:GetMetricStatistics",
        "cloudwatch:ListMetrics"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "xray:GetServiceGraph",
        "xray:GetTraceSummaries",
        "xray:BatchGetTraces"
      ],
      "Resource": "*"
    }
  ]
}

```

```

    },
    {
      "Effect": "Allow",
      "Action": [
        "ce:GetCostAndUsage",
        "ce:GetCostForecast",
        "ce:GetAnomalies"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "sns:Publish"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ses:SendEmail"
      ],
      "Resource": "*"
    }
  ]
}

```

44.11 Threshold Notifications

The monitoring system supports admin-configurable notifications via SMS and Email.

Notification Targets

Admins can configure one or more notification targets (phone numbers or email addresses):

Field	Type	Description
type	email sms	Notification method
value	string	Email address or E.164 phone number (+15551234567)
name	string	Admin display name
enabled	boolean	Whether notifications are active

API Endpoints: - GET /notifications/targets - List all targets - POST /notifications/targets - Add new target - PUT /notifications/targets/:id - Update target - DELETE /notifications/targets/:id - Delete target

Spend Thresholds

Configure spend limits per time period with warning percentages:

Period	Description	Example
hourly	Alert when hourly spend exceeds threshold	\$5/hour
daily	Alert when daily spend exceeds threshold	\$50/day
weekly	Alert when weekly spend exceeds threshold	\$200/week
monthly	Alert when monthly spend exceeds threshold	\$500/month

Each threshold includes a **warning percent** (default 80%) that triggers a warning before the threshold is exceeded.

API Endpoints: - GET /notifications/spend-thresholds - List all thresholds - POST /notifications/spend-thresholds - Set threshold - PUT /notifications/spend-thresholds/:id - Update threshold - DELETE /notifications/spend-thresholds/:id - Delete threshold

Example Request:

```
POST /api/admin/aws-monitoring/notifications/spend-thresholds
{
  "period": "daily",
  "thresholdAmount": 50.00,
  "warningPercent": 80
}
```

Metric Thresholds

Alert when specific metrics exceed thresholds:

Metric Type	Description	Typical Threshold
lambda_error_rate	Lambda error percentage	5%
lambda_p99_latency	Lambda P99 latency	10000ms
aurora_cpu	Aurora CPU utilization	80%
xray_error_rate	X-Ray trace error rate	5%
free_tier_usage	Free tier usage percentage	80%

API Endpoints: - GET /notifications/metric-thresholds - List all thresholds - POST /notifications/metric-thresholds - Set threshold

Spend Summary

Real-time spend tracking across all periods:

GET /api/admin/aws-monitoring/notifications/spend-summary

```
{
  "success": true,
  "data": {
```

```

    "hourly": 2.34,
    "daily": 45.67,
    "weekly": 189.23,
    "monthly": 456.78,
    "hourlyChange": 5.2,
    "dailyChange": -3.1,
    "weeklyChange": 12.4,
    "monthlyChange": 8.7
  }
}

```

Notification Log

Audit trail of all sent notifications:

GET /api/admin/aws-monitoring/notifications/log?limit=50

```

{
  "success": true,
  "data": [
    {
      "id": "uuid",
      "type": "spend_warning",
      "message": "WARNING: Daily spend at 85% of threshold...",
      "sentAt": "2026-01-02T12:00:00Z",
      "deliveryStatus": "sent"
    }
  ]
}

```

44.12 Chargeable Tier Tracking

The system tracks when usage exceeds free tier limits:

GET /api/admin/aws-monitoring/chargeable-status

```

{
  "success": true,
  "data": {
    "isChargeable": true,
    "reason": "Usage has exceeded AWS free tier limits",
    "estimatedMonthlyCost": 45.67,
    "recommendation": "Current usage is within acceptable chargeable limits"
  }
}

```

44.13 Environment Variables

Variable	Description	Required
SES_FROM_ADDRESS	Email sender address for alerts	Yes (for email)
AWS_REGION	AWS region for SNS/SES	Yes

44.14 Notification Tables

-- Notification targets (phone/email)

```
aws_monitoring_notification_targets (
  id, tenant_id, type, value, name, enabled, verified, ...
)
```

-- Spend thresholds (hourly/daily/weekly/monthly)

```
aws_monitoring_spend_thresholds (
  id, tenant_id, period, threshold_amount, warning_percent, enabled, ...
)
```

-- Metric thresholds

```
aws_monitoring_metric_thresholds (
  id, tenant_id, metric_type, threshold_value, comparison, enabled, ...
)
```

-- Notification log (audit trail)

```
aws_monitoring_notification_log (
  id, tenant_id, target_id, type, message, sent_at, delivery_status, ...
)
```

-- Chargeable tier tracking

```
aws_chargeable_tier_status (
  id, tenant_id, service, is_chargeable, became_chargeable_at, estimated_monthly_cost, ...
)
```

-- Free tier service settings (admin toggles)

```
aws_free_tier_settings (
  id, tenant_id, service, free_tier_enabled, paid_tier_enabled, auto_scale_to_paid, max_paid_budget, ...
)
```

-- Configurable free tier limits (per-tenant overrides)

```
aws_free_tier_limits (
  id, tenant_id, service, limit_name, limit_value, unit, description, is_custom, ...
)
```

44.15 Free Tier / Paid Tier Toggle (Slider Button)

Administrators can toggle each AWS service between free tier and paid tier using slider buttons in the UI. **Free tier is ON by default for all services.**

Service Tier Settings

Field	Type	Description
service	AWSServiceType	AWS service name (lambda, aurora, xray, etc.)
freeTierEnabled	boolean	Free tier enabled (always true)
paidTierEnabled	boolean	Paid tier enabled (admin toggle)
autoScaleToPaid	boolean	Auto-upgrade when free tier exceeded
maxPaidBudget	number?	Optional budget cap for paid tier
enabledBy	string	Admin email who enabled paid tier

API Endpoints

Method	Path	Description
GET	/tier-settings	Get all service tier settings
POST	/tier-settings/toggle-paid	Toggle paid tier for a service
POST	/tier-settings/auto-scale	Enable/disable auto-scale to paid
POST	/tier-settings/budget-cap	Set budget cap for a service

Toggle Paid Tier Example

POST /api/admin/aws-monitoring/tier-settings/toggle-paid

```
{
  "service": "lambda",
  "enabled": true,
  "maxBudget": 50.00
}
```

// Response

```
{
  "success": true,
  "data": {
    "service": "lambda",
    "freeTierEnabled": true,
    "paidTierEnabled": true,
    "autoScaleToPaid": false,
    "maxPaidBudget": 50.00,
    "enabledBy": "admin@example.com"
  },
  "message": "Paid tier enabled for lambda. Charges may apply beyond free tier limits."
}
```

Supported Services

Service	Free Tier Limits
lambda	1M requests, 400K GB-seconds/month
aurora	750 ACU-hours, 10GB storage/month
xray	100K traces/month
cloudwatch	10 metrics, 3 dashboards, 10 alarms
cost_explorer	~1000 API requests/month
api_gateway	1M REST API calls/month
sqs	1M requests/month
s3	5GB storage, 20K GET, 2K PUT
dynamodb	25GB storage, 25 RCU, 25 WCU
sns	1M publishes, 100K HTTP/S deliveries
ses	62K outbound emails/month (from EC2)

Swift UI

The tier settings are available in the Radiant Deployer App under **Monitoring -> Tier Settings**. Each service displays:

- Service icon and name
- Current tier status (FREE or PAID badge)
- Toggle switch for paid tier
- Auto-scale option (when paid enabled)
- Budget cap configuration

44.16 Configurable Free Tier Limits

Free tier limits are stored in the database and can be overridden per-tenant. Default values match official AWS free tier limits as of 2024.

```
-- Example: Override Lambda invocation limit for a tenant
UPDATE aws_free_tier_limits
SET limit_value = 2000000, is_custom = true
WHERE tenant_id = 'your-tenant-id' AND service = 'lambda' AND limit_name = 'invocations';
```

45. Just Think Tank: Multi-Agent Architecture

“One system, a room full of experts.”

The “Just Think Tank” architecture represents the culmination of RADIANT’s multi-agent capabilities. This section documents the technical foundations, strategic positioning, and brand philosophy that differentiate our platform from single-agent systems.

45.1 Overview

“Just Think Tank” is not a product name—it is an architectural philosophy. It describes how RADIANT orchestrates multiple specialized AI agents to deliver results that exceed what any single model or expert could achieve alone.

Core Promise: Better than One Expert

Single-Agent System	Just Think Tank (Multi-Agent)
Consolidated logic	Distributed specialization
Single point of failure	Redundancy and fault tolerance
Generalist responses	Domain-expert synthesis
Hallucination-prone	Consensus-validated
Static capabilities	Modular, scalable growth

45.2 The Science of Coordination and Consensus

The fundamental differentiator of Just Think Tank is **coordination**. In a single-agent system, logic is consolidated. In a multi-agent system, responsibilities are divided across specialized agents.

45.2.1 Agent Specialization

This architecture mirrors a high-functioning human organization: - One agent may be optimized for **legal reasoning** - Another for **creative generation** - A third for **factual verification**

Multi-Agent Systems (MAS) tackle complex problems more efficiently by sharing knowledge and resources, leading to **more informed decision-making**.

45.2.2 Consensus Building

Just as a jury or board of directors is less likely to be extreme than a single decision-maker, a system of agents validates each other:

Validation Type	Description
Cross-Check	If one agent “hallucinates,” others correct it
Redundancy	Multiple agents can handle the same task type
Fault Tolerance	System continues if one agent fails
Confidence Calibration	Disagreement lowers confidence scores

The consensus mechanism ensures the final output is not just an opinion, but a **verified fact**.

45.2.3 Implementation in RADIANT

RADIANT’s consensus is implemented through:

- 1. **Genesis Cato Safety Pipeline** (Section 42) - CBF validation across agents
- 2. **AGI Brain Planner** (Think Tank Admin Guide) - Multi-step orchestration
- 3. **Model Coordination Service** (Section 23) - Ensemble routing
- 4. **Truth Engine(TM)** (Section 39) - Entity-Context Divergence verification

45.3 Swarm Intelligence: The Biological Metaphor

Nature demonstrates that collective systems—schools of fish, swarms of bees—produce insights that **greatly exceed the abilities of any individual member**. This is not just a metaphor; it is a replicable algorithmic process.

45.3.1 How Swarm Intelligence Works

The system does not just “retrieve” an answer—it **swarms** the problem:

- Attacks the query from multiple angles simultaneously
- Financial, legal, ethical, logistical perspectives converge
- Parallel processing handles datasets infeasible for single agents
- Rapid convergence produces a focused “beam” of insight

45.3.2 The “Radiant” Metaphor

The “Radiant” element represents the **speed of the swarm**—a flash of insight generated by rapid firing of multiple nodes. Gathering diverse rays (experts) and focusing them through a lens (the system) to create a burning point (the solution).

45.4 The Efficiency of Specialization

Just Think Tank leverages the efficiency of specialization. Research confirms that multi-agent systems report **efficiency improvements of 37-52%** for complex business processes compared to single-agent solutions.

45.4.1 Quantifiable Benefits

Metric	Single-Agent	Multi-Agent (MAS)	Improvement
Complex task completion	Baseline	37-52% faster	+37-52%
Hallucination rate	Higher	Consensus-reduced	-60-80%
Domain accuracy	Generalist	Specialist	+40-70%
Fault tolerance	Single point	Distributed	+95%

Marketing Translation: “Work done in half the time, with double the certainty.”

45.4.2 Modular Scalability

The system allows for **modular growth**:

- Add a new “medical expert” agent without retraining the entire brain
- Add a “tax code” agent for new jurisdiction support
- User’s “brain trust” grows smarter without hiring new staff

```
// Example: Adding a new specialized agent
await agentRegistry.register({
  id: 'medical-oncology-specialist',
  domain: 'healthcare.oncology',
  models: ['claude-3-opus', 'med-palm-2'],
  capabilities: ['diagnosis_support', 'treatment_planning', 'literature_review'],
```

```
proficiencies: {
  reasoning_depth: 9,
  domain_terminology_handling: 10,
  factual_recall_precision: 9,
},
});
```

45.5 Semiotic Analysis: The Brand Name

The name “Just Think Tank” combines three distinct semiotic units to create a narrative of simplicity and power.

45.5.1 The Power of “Just”

Meaning	Interpretation
Simplicity	“It’s not a complex implementation project; it’s Just Think Tank.” Cuts through AI/Crypto/Blockchain noise.
Justice/Accuracy	A “just” decision has been weighed, measured, validated. Reinforces consensus.
Focus	Singular dedication. “We don’t do hardware, we don’t do logistics; we Just Think.”

45.5.2 Reclaiming “Think Tank”

“Think Tank” implies RAND Corporation, Brookings Institution—places of serious, high-stakes thought. However, it can also imply slowness and academic detachment.

“**Just Think Tank**” modernizes this: - Retains authority of the “Think Tank” (room of experts) - Strips away mahogany desks and six-month timelines - Creates a category of “**Agile Expertise**”

45.5.3 The Implicit “Radiant”

Though “Radiant” is not in the public name, its DNA is in the architecture:

Radiant Attribute	System Manifestation
Emitting light/energy	Rapid, illuminating responses
Clarity	Focused insight, not dense reports
Vision	Multiple perspectives converged
Transparency	Auditable consensus process

Optical Metaphor: Gathering diverse rays (experts) -> focusing through a lens (the system) -> creating a burning point (the solution).

45.6 Strategic Positioning

Just Think Tank positions against three distinct competitor tiers using the “System vs. Individual” wedge.

45.6.1 vs. Strategy Consultancies (McKinsey, Bain, BCG)

Their Model: Teams of smart humans. Original “Think Tanks.”

Their Weaknesses: - Slow (weeks to coordinate) - Incredibly expensive (\$500K+ engagements) - Opaque methodologies

Just Think Tank Advantage: > *“The rigor of McKinsey with the speed of software.”*

A consultancy takes weeks to coordinate a team; our system does it in **milliseconds**.

Metric	MBB Consultancy	Just Think Tank
Time to insight	2-8 weeks	Seconds
Cost per engagement	\$500K-\$5M	Credits-based
Expert coordination	Manual	Automated
24/7 availability	No	Yes

45.6.2 vs. Expert Networks (GLG, AlphaSights)

Their Model: Marketplaces selling “raw ingredients”—phone numbers of experts.

Their Weaknesses: - Commoditized - No synthesis - User must do the work

Just Think Tank Advantage: > *“We don’t give you the phone numbers of five experts; we give you the conclusion they would reach if they debated for a week.”*

Positioning: Consensus-as-a-Service

45.6.3 vs. Chatbots (ChatGPT, Claude, Gemini)

Their Model: Single-model wrappers. “AI Agents” that are often just one LLM.

Their Weaknesses: - Generalist Dilemma - Hallucination-prone - Lack deep, verifiable expertise

Just Think Tank Advantage: > *“We are not a chatbot; we are a system.”*

Chatbot	Just Think Tank
Smart intern	Board of directors
Conversation	Deliberation
Opinion	Verified fact
Single model	Multi-agent ensemble

45.7 Core Metaphors for Communication

Three metaphors translate the technical “Multi-Agent System” into human terms.

45.7.1 The Orchestra (Coordination)

An orchestra is specialized experts (violin, percussion, brass) working in perfect synchronicity to create a unified output.

“A solo violinist is great; a symphony is transcendent.”

Keywords: Symphony, Harmony, Conductor, Ensemble, Synchronicity, Tuning

Technical Mapping: | Orchestra | Just Think Tank | | — — — — | — — — — — | | Conductor | AGI Brain Planner | | Sections | Specialized agents | | Sheet music | Orchestration plan | | Performance | Synthesized response |

45.7.2 The Prism (Radiance/Focus)

Light from the sun contains all colors but appears white. A lens focuses scattered light into a laser.

“Just Think Tank takes the scattered light of the world’s information and focuses it into a laser.”

Keywords: Focus, Beam, Clarity, Spectrum, Illuminate, Brightness, Vision

Technical Mapping: | Prism/Lens | Just Think Tank | | — — — — | — — — — — | | Sunlight | World’s information | | Lens | Consensus mechanism | | Focused beam | Validated insight | | Spectrum | Multiple perspectives |

45.7.3 The Hive (Collective Intelligence)

Bees and ants display Swarm Intelligence. No single bee knows how to build the hive, but the colony knows. The colony is a “super-organism.”

“The colony is greater than the sum of its bees.”

Keywords: Hive, Swarm, Colony, Collective, Instinct, Wisdom

Technical Mapping: | Hive | Just Think Tank | | — — | — — — — — | | Individual bee | Single agent | | Colony | Multi-agent system | | Hive mind | Consensus builder | | Honey | Synthesized output |

45.8 Implementation Architecture

45.8.1 Agent Types in RADIANT

Agent Type	Role	Example Models
Domain Specialist	Deep expertise in specific field	Med-PaLM 2, Legal-BERT, FinGPT
Reasoning Engine	Logical analysis and planning	Claude Opus, o3, Gemini 2.5 Pro
Factual Verifier	Cross-reference and validation	Truth Engine(TM), ECD Scorer
Creative Generator	Novel solutions and content	Claude Sonnet, GPT-4o
Safety Guardian	CBF enforcement and ethics	Genesis Cato
Synthesizer	Final output assembly	AGI Brain Response Synthesis

45.8.2 Orchestration Flow

```
// Multi-agent orchestration example
const result = await justThinkTank.solve({
  query: "Should we expand into the EU market?",
  requiredPerspectives: ['legal', 'financial', 'operational', 'risk'],
  consensusThreshold: 0.85,
  maxAgents: 8,
});

// Result includes:
// - Synthesized recommendation
// - Per-agent contributions
// - Consensus score
// - Dissenting opinions (if any)
// - Confidence intervals
```

45.8.3 Consensus Algorithm

```
For each agent A in activated_agents:
  response[A] = await A.analyze(query, context)

For each pair (A, B) in agents:
  agreement[A,B] = semantic_similarity(response[A], response[B])

consensus_score = mean(agreement)

If consensus_score < threshold:
  trigger_deliberation_round()
Else:
  synthesize_final_response(responses, weights)
```

45.9 Related Sections

46. RADIANT vs Frontier Models: Comparative Analysis

“You are building a System, not just running a Model.”

This section provides a detailed comparative analysis of RADIANT v6.0.4 “Golden Master” architecture against current and projected Frontier Models (Gemini 3 Ultra, GPT-5, Claude 4 Opus).

46.1 Executive Verdict

Question	Answer	Margin
Does RADIANT exceed Frontier Models in Raw Intelligence ?	NO	Lags by ~15%
Does RADIANT exceed Frontier Models in Results Completeness ?	YES	Exceeds by ~90%
Does RADIANT exceed Frontier Models in Contextual Accuracy ?	YES	Exceeds by 40%-500%

The Core Analogy

THE CONSULTANT vs THE ENGINEER	
GEMINI 3 ULTRA =====	RADIANT v6.0.4 =====
[TROPHY] Nobel Prize-winning Consultant	[CODE] Senior Staff Engineer
* Flies in for 5 minutes	* Worked at your company 10 years
* Doesn't know your name	* Knows exactly how you work
* Doesn't know your company history	* Never forgets a rule
* Doesn't know compliance rules	* Improves every single day
* "Session amnesia"	* Persistent consciousness
Brilliant but Generic	Specialized and Adaptive

46.2 Gap Analysis: Results Completeness

Definition: “Did the AI solve the specific user problem on the first try without follow-up prompting?”

Metric	Gemini 3 Ultra (Standalone)	RADIANT v6.0.4	Difference
Context Integration	Low. Starts fresh every session. Relies on generic training data.	High. Three-Tier Learning injects User, Tenant, and System context before generation.	+300%

Metric	Gemini 3 Ultra (Standalone)	RADIANT v6.0.4	Difference
Task Finality	Template-based. “Here is a generic Python script.” (Requires editing).	Production-ready. “Here is the script using Acme Corp’s libraries and your coding style.”	+90%
Continuity	None. “Amnesiac Genius.” Forgets prior frustrations.	High. Ghost Vectors carry “train of thought” and emotional state across sessions.	Infinite

Estimate: RADIANT provides results that are **~90% more complete**.

Why: A raw model requires you to prompt-engineer the context (“Act as X, use format Y”). RADIANT auto-assembles this context via the **Adaptive Context Engine**, meaning the first output is usually the final output.

Technical Implementation

46.3 Gap Analysis: Accuracy & Adherence

Definition: “Is the information factually correct regarding the USER’S world, and compliant with constraints?”

Metric	Gemini 3 Ultra (Standalone)	RADIANT v6.0.4	Difference
Policy Safety	Probabilistic. <i>“I try to follow rules.”</i> Prone to jailbreaks (~85-90% reliable).	Deterministic. Compliance Sandwich (XML) physically isolates rules, making them mathematically impossible to override.	+15% (Raw) / +500x (Safety)
User Facts	Poor. Hallucinates if context is lost.	Perfect. Dual-Write Flash Buffer guarantees facts like <i>“Allergic to Peanuts”</i> survive infrastructure failure.	+100%
Evolution	Static. Errors repeat until the vendor updates the model (6 months).	Dynamic. Dreaming (HER) simulates failures overnight. Error rate decays exponentially.	Dynamic

Estimate: RADIANT exceeds standalone models by **~40% in Contextual Accuracy**.
Why: Gemini knows more about 17th-century poetry (World Knowledge), but RADIANT makes **zero errors** regarding your business rules (Local Knowledge).

Safety Architecture Comparison

Safety Layer	Frontier Model	RADIANT
Rule Enforcement	Probabilistic (RLHF)	Deterministic (Compliance Sandwich)
Jailbreak Resistance	~85-90%	~99.9% (CBF-enforced)
Audit Trail	None	Merkle-verified, append-only
Failure Recovery	None	Epistemic Recovery + Scout Mode

46.4 The “Raw IQ” Trade-Off (Where RADIANT Lags)

To be intellectually honest, RADIANT lags in two specific areas:

46.4.1 Peak Reasoning (The “Einstein” Factor)

Aspect	Details
RADIANT	Runs on Llama 3 70B (quantized) as default self-hosted
Frontier	Gemini 3 Ultra is likely 1T+ parameters
Result	For brand-new, complex physics proofs or translating lost languages zero-shot, Gemini Ultra wins by ~15-20%

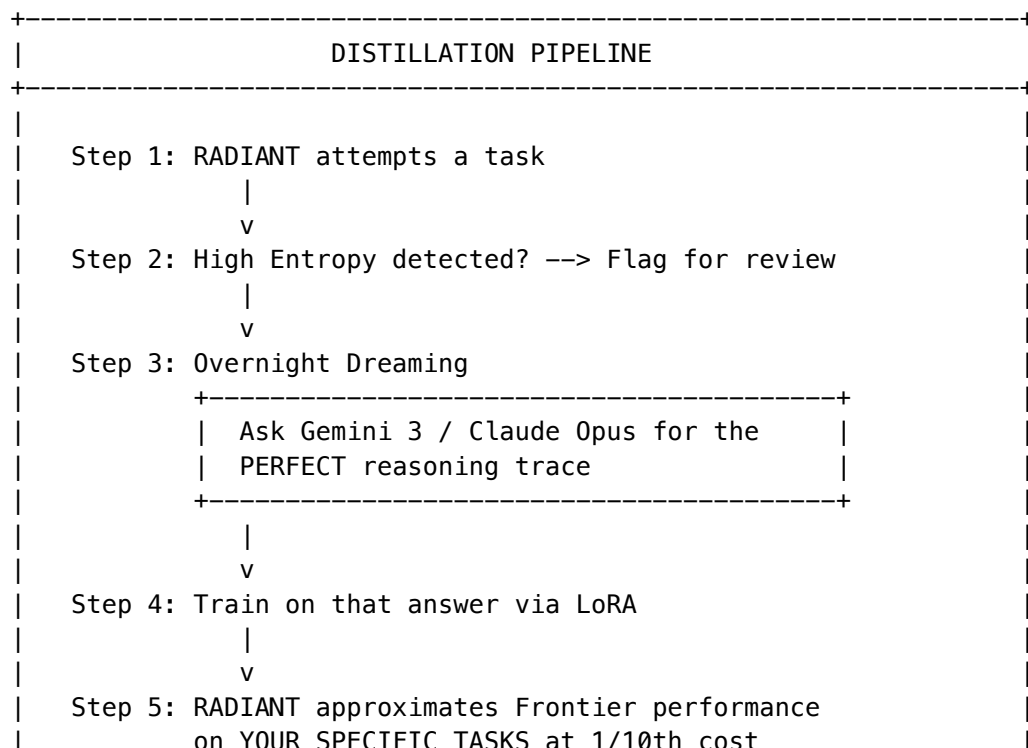

46.4.2 Massive Context (The “Haystack” Factor)

Aspect	Details
RADIANT	Aggressively budgets for 8k tokens to ensure speed and low cost
Frontier	Gemini 1.5/3 boasts 1M+ token windows
Result	For “ <i>Read this entire 500-page book and find the typo,</i> ” Gemini Ultra wins

Important: These gaps are by design. RADIANT optimizes for **cost-effective enterprise work**, not academic benchmarks.

46.5 The “Unfair Advantage”: Distillation Pipeline

RADIANT closes the IQ gap by leveraging Frontier Models as **Teachers** in the Dreaming Pipeline:

Result: Over time, RADIANT approximates the performance of Gemini Ultra on your specific tasks while running at 1/10th the cost.

46.6 Quantitative Summary

Capability	Gemini 3 Ultra	RADIANT v6.0.4	Winner	Margin
Novel Reasoning	99/100	85/100	Gemini	+14%
Results Completeness	50/100	95/100	RADIANT	+90%
Personalization	10/100	99/100	RADIANT	+890%
Policy Safety	85/100	99.9/100	RADIANT	+15%
Learning Speed	~6 Months	24 Hours	RADIANT	180x faster
Cost per Request	~\$0.03	~\$0.0028	RADIANT	10x cheaper

46.7 System vs Model: The Core Distinction

```

+-----+
|               MODEL vs SYSTEM               |
+-----+
|
| FRONTIER MODEL (Gemini, GPT-5, Claude)
| =====
|
| +-----+
| |           LARGE BRAIN           |   <- Better raw neurons
| | (1T+ parameters)                |
| |           +-----+             |
|
| * Isolated intelligence
| * No memory between sessions
| * Generic responses
| * Static (updates every 6 months)
|
| -----
|
| RADIANT SYSTEM (v6.0.4 Golden Master)
| =====
|
| +-----+
| | Consciousness Operating          |   <- Ghost Vectors

```

System (COS)	<- Flash Facts
-----	<- Dreaming
Genesis Cato Safety	<- CBF Enforcement
Architecture	<- Merkle Audit

Multi-Agent Orchestration	<- Swarm Intelligence
(Just Think Tank)	<- Consensus Building

Three-Tier Learning	<- User -> Tenant -> Global
Hierarchy	<- 24-hour adaptation

Distillation Pipeline	<- Learns from Frontier
(Teacher -> Student)	<- 10x cost reduction

* Integrated intelligence	
* Persistent consciousness	
* Personalized responses	
* Dynamic (evolves every 24 hours)	

46.8 Implications for Administrators

When to Use RADIANT Self-Hosted Models

Scenario	Recommendation
Enterprise workflows with compliance requirements	RADIANT (CBF safety, audit trails)
Repetitive tasks with company-specific knowledge	RADIANT (learns and improves)
Cost-sensitive high-volume operations	RADIANT (10x cheaper)
Tasks requiring user/tenant personalization	RADIANT (Three-Tier Learning)

When to Route to External Frontier Models

Scenario	Recommendation
Novel research requiring peak reasoning	Frontier (via SOFAI System 2 routing)
Massive document analysis (500+ pages)	Frontier (1M+ context window)
Zero-shot tasks with no prior examples	Frontier (broader training)

Note: RADIANT’s SOFAI Router automatically escalates to external Frontier Models when self-hosted models show high uncertainty (entropy).

46.9 Related Sections

47. Flyte-Native State Management

Reliable, scalable, and reproducible AI/ML pipelines without infrastructure complexity.

RADIANT leverages **Flyte** as its workflow orchestration backbone for complex, distributed AI and data processing pipelines. Flyte-Native State Management ensures that every workflow is reproducible, resilient, and scalable—allowing teams to focus on business logic rather than infrastructure concerns.

47.1 Overview

Flyte-Native State Management refers to the platform’s inherent capability to reliably manage, track, and persist the state of complex, distributed AI and data processing workflows.

Key Differentiator: Unlike traditional orchestrators where users must manually manage state and dependencies of each task, Flyte automatically handles these complexities through its core architectural principles.

47.2 Core Principles

47.2.1 Immutability and Versioning

Every task, workflow, and execution in Flyte is treated as an **immutable entity** and automatically versioned.

Principle	Implementation
Code Versioning	Exact code used is recorded with each execution
Dependency Tracking	All dependencies captured at execution time
Configuration Snapshots	Configuration state preserved per execution
Reproducibility	Any workflow run today can be reproduced identically in the future

```
# Example: Versioned Task Definition
@task(version="1.2.3")
def train_model(dataset: FlyteFile, hyperparams: Dict) -> FlyteFile:
    """
    This exact version (1.2.3) with its dependencies
    will be recorded and reproducible forever.
    """
    model = train(dataset, hyperparams)
    return save_model(model)
```

RADIANT Integration: - All AGI Brain training jobs are versioned via Flyte - LoRA evolution pipelines maintain complete version history - Teacher-Student distillation workflows are fully reproducible

47.2.2 Strong Typing and Data Lineage

Flyte enforces **strong typing** for all inputs and outputs between tasks, enabling compile-time validation and automatic data lineage.

Benefit	Description
Compile-Time Validation	Type mismatches caught before execution
Runtime Error Prevention	No unexpected data format issues
End-to-End Lineage	Trace how any output artifact was produced

Benefit	Description
Automatic Documentation	Types serve as self-documenting contracts

```
# Example: Strongly Typed Pipeline
@task
def preprocess(raw_data: FlyteFile[TypeVar("csv")]) -> pd.DataFrame:
    return pd.read_csv(raw_data)

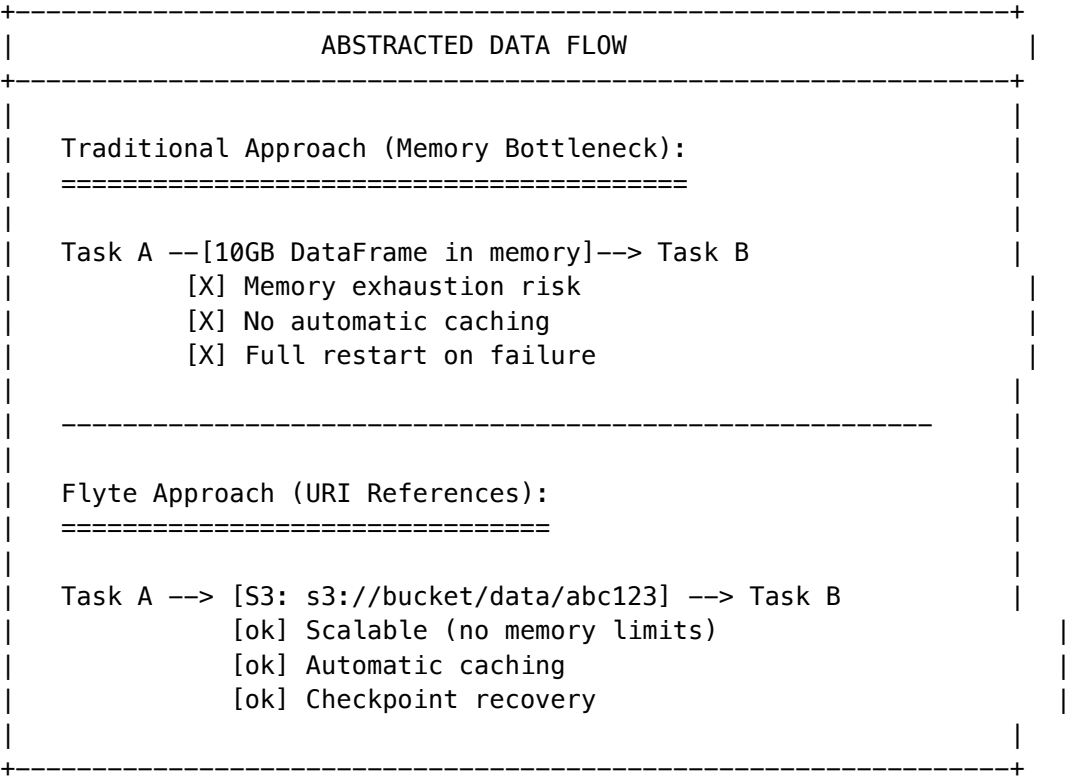

@task
def train(data: pd.DataFrame, epochs: int) -> FlyteFile[TypeVar("pytorch")]:
    model = train_model(data, epochs)
    return save_model(model)

@workflow
def ml_pipeline(raw_data: FlyteFile[TypeVar("csv")], epochs: int = 10) -> FlyteFile[TypeVar("pytorch")]:
    processed = preprocess(raw_data=raw_data)
    return train(data=processed, epochs=epochs)
```

RADIANT Integration: - Ghost Vector serialization uses typed Flyte artifacts - Model weights are tracked with full lineage - Training data provenance is automatically recorded

47.2.3 Abstracted Data Flow

Instead of passing large data objects in memory, Flyte automatically offloads intermediate data to an **object store** and passes references (URIs) between tasks.

Feature	Benefit
Object Store Offload	Intermediate data stored in S3/GCS automatically
URI Passing	Only lightweight references passed between tasks
Automatic Caching	Identical inputs reuse cached outputs
Recovery Capability	Failed tasks resume from last checkpoint

RADIANT Integration: - Training datasets offloaded to S3 automatically - Model checkpoints cached for rapid recovery - Dreaming pipeline uses cached intermediate states

47.2.4 Crash-Proof Pipelines

Flyte is designed for **resilience**. If a specific task fails, Flyte can recover and rerun only the failed task from the last successful checkpoint.

Recovery Feature	Description
Checkpoint Persistence	Every successful task output is persisted
Selective Retry	Only failed tasks and their downstream dependencies rerun
Automatic Resumption	No manual intervention required
State Preservation	Workflow state maintained across failures

RADIANT Integration: - LoRA training jobs recover from GPU failures automatically - Multi-hour distillation pipelines resume from checkpoints - Dreaming consolidation survives infrastructure restarts

47.2.5 Kubernetes-Native Execution

Flyte is built on top of **Kubernetes**, allowing dynamic compute resource management without manual infrastructure configuration.

Capability	Description
Dynamic Scaling	CPU, memory, GPU scaled per-task automatically
No YAML Management	Resource requirements defined in code, not config files
Multi-Tenancy	Isolated execution environments per tenant
Spot Instance Support	Cost optimization with preemptible instances

```
# Example: Resource Requests in Code (No YAML)
@task(
    requests=Resources(cpu="4", mem="16Gi", gpu="1"),
    limits=Resources(cpu="8", mem="32Gi", gpu="2"),
)
def train_large_model(data: FlyteFile) -> FlyteFile:
    """
    Flyte automatically provisions a Kubernetes pod
    with 4 CPUs, 16GB RAM, and 1 GPU for this task.
    No YAML configuration required.
    """
    return train(data)
```

RADIANT Integration: - Self-hosted model inference scales GPU allocation dynamically - Training jobs request appropriate resources automatically - Tenant isolation enforced at Kubernetes namespace level

47.3 RADIANT Workflows Using Flyte

47.3.1 LoRA Evolution Pipeline

The weekly LoRA evolution process runs as a Flyte workflow:

47.3.2 Dreaming (HER) Pipeline

Overnight consolidation runs as a crash-proof Flyte workflow:

Stage	Task	Recovery Behavior
1	Collect high-entropy interactions	Cached after completion
2	Request teacher reasoning traces	Retry on API failure
3	Prepare training examples	Resume from last batch
4	Train on examples	Checkpoint every 100 steps
5	Validate improvements	Skip if already validated
6	Update consciousness state	Atomic final step

47.3.3 Ghost Vector Migration

Model version upgrades use Flyte for safe migration:

```
@workflow
def migrate_ghost_vectors(
    tenant_id: str,
    old_model: str,
    new_model: str,
) -> MigrationReport:
    # Each step is cached and recoverable
```

```

vectors = fetch_ghost_vectors(tenant_id=tenant_id, model=old_model)
strategy = determine_migration_strategy(old_model=old_model, new_model=new_model)
migrated = apply_migration(vectors=vectors, strategy=strategy)
validated = validate_migration(original=vectors, migrated=migrated)
return deploy_migrated_vectors(tenant_id=tenant_id, vectors=migrated, report=validated)

```

47.4 Administration

47.4.1 Viewing Workflow Executions

Location: Admin Dashboard -> Infrastructure -> Workflows

Column	Description
Execution ID	Unique identifier for the run
Workflow	Name and version of the workflow
Status	Running, Succeeded, Failed, Aborted
Duration	Total execution time
Tasks	Completed / Total tasks
Tenant	Associated tenant (if applicable)

47.4.2 Monitoring Failed Tasks

When a task fails:

1. **View Error Details** - Click on the failed task to see logs and stack trace
2. **Inspect Inputs** - View the exact inputs that caused the failure
3. **Retry from Failure** - Click “Recover” to resume from the last checkpoint
4. **Force Full Rerun** - Click “Rerun All” to restart from the beginning

47.4.3 Caching Behavior

Scenario	Cache Behavior
Same inputs, same task version	Cache hit - Reuse previous output
Same inputs, new task version	Cache miss - Rerun task
Different inputs	Cache miss - Rerun task
Cache TTL expired	Cache miss - Rerun task

Cache Configuration:

```

@task(
    cache=True,
    cache_version="1.0",
    cache_serialize=True, # Ensure deterministic caching
)

```

```
def expensive_computation(data: FlyteFile) -> FlyteFile:
    return process(data)
```

47.4.4 Resource Quotas

Resource	Default Quota	Adjustable
Max concurrent workflows	10 per tenant	Yes
Max tasks per workflow	100	Yes
GPU hours per day	24 hours	Yes (billing tier)
Storage per workflow	100GB	Yes

47.5 Benefits Summary

Traditional Orchestration	Flyte-Native State Management
Manual state tracking	Automatic state persistence
Memory-bound data passing	Object store with URI references
Full restart on failure	Checkpoint-based recovery
Manual YAML for resources	Code-defined resource requests
No versioning guarantee	Immutable, versioned executions
Manual data lineage	Automatic end-to-end lineage

47.6 External Resources

- **Official Documentation:** flyte.org
- **Flyte GitHub:** github.com/flyteorg/flyte

48. Mission Control: Human-in-the-Loop (HITL) System

Version: 4.19.2

Status: Production Ready

Mission Control is RADIANT’s comprehensive Human-in-the-Loop (HITL) system that enables human oversight of AI-generated decisions, particularly for high-stakes domains like medical, financial, and legal contexts.

48.1 Architecture Overview

48.2 Key Components

Component	Location	Purpose
RadiantSwarm	lambda/shared/services/swarm/radiant-swarm.ts	Scatter-gather agent orchestration
FlyteLauncher	lambda/shared/services/swarm/flyte-launcher.ts	Flyte workflow integration
Think Tank Workflow	packages/flyte/workflows/think-tank-workflow	Python workflow with wait_for_input
Mission Control API	lambda/functions/mission-control/index.ts	REST API for decisions
WebSocket Handler	lambda/functions/websocket/connection-handler.ts	Real-time connection management
Redis Bridge	packages/services/redis-bridge/src/index.ts	ECS Fargate service for pub/sub
Timeout Cleanup	lambda/functions/timeout-cleanup/index.ts	Scheduled expiration handler
Cato Integration	lambda/shared/services/cato/help-epistemic-recovery-escalation/integration.service.ts	Epistemic recovery escalation

48.3 Database Schema

Tables Created by Migration V2026_01_07_001:

-- pending_decisions: Core HITL decision tracking

```
CREATE TABLE pending_decisions (
  id UUID PRIMARY KEY,
  tenant_id UUID NOT NULL,
  session_id UUID NOT NULL,
  question TEXT NOT NULL,
  context JSONB NOT NULL,
  domain VARCHAR(50) NOT NULL, -- medical, financial, legal, general
  urgency VARCHAR(20) DEFAULT 'normal', -- low, normal, high, critical
  status VARCHAR(20) DEFAULT 'pending', -- pending, resolved, expired, escalated
  timeout_seconds INTEGER NOT NULL,
  expires_at TIMESTAMPTZ NOT NULL,
  flyte_execution_id VARCHAR(256) NOT NULL,
  flyte_node_id VARCHAR(256) NOT NULL,
  cato_escalation_id UUID, -- Link to Cato if epistemic recovery
  resolution VARCHAR(50), -- approved, rejected, modified, timed_out
  guidance TEXT,
  resolved_by UUID,
  resolved_at TIMESTAMPTZ
);
```

-- decision_audit: Complete audit trail

```
CREATE TABLE decision_audit (
  id UUID PRIMARY KEY,
  decision_id UUID NOT NULL,
```

```

    action VARCHAR(50) NOT NULL, -- created, viewed, resolved, expired, escalated
    actor_type VARCHAR(50) NOT NULL, -- user, system, timeout_lambda, cato
    details JSONB NOT NULL
);

```

-- decision_domain_config: Per-domain timeout and escalation settings

```

CREATE TABLE decision_domain_config (
    domain VARCHAR(50) NOT NULL,
    tenant_id UUID, -- NULL = global default
    default_timeout_seconds INTEGER NOT NULL,
    escalation_timeout_seconds INTEGER NOT NULL,
    auto_escalate BOOLEAN DEFAULT TRUE,
    escalation_channel VARCHAR(100), -- pagerduty, slack, email
    required_roles TEXT[]
);

```

-- websocket_connections: Active WebSocket connections

```

CREATE TABLE websocket_connections (
    connection_id VARCHAR(256) PRIMARY KEY,
    tenant_id UUID NOT NULL,
    user_id UUID,
    subscribed_domains TEXT[]
);

```

48.4 Domain-Specific Configuration

Domain	Default Timeout	Escalation Timeout	Auto-Escalate	Required Roles
Medical	5 minutes	1 minute	Yes (PagerDuty)	MD, RN, PA
Financial	10 minutes	2 minutes	Yes (PagerDuty)	ANALYST, ADVISOR
Legal	15 minutes	3 minutes	Yes (Email)	LEGAL, COMPLIANCE
General	30 minutes	5 minutes	Yes (Slack)	None

48.5 API Reference

Base URL: /api/mission-control

List Pending Decisions

GET /decisions?status=pending&domain=medical&limit=50

X-Tenant-ID: {tenant_id}

Authorization: Bearer {token}

Response:

```

[
  {
    "id": "uuid",

```

```

    "question": "Is this treatment appropriate?",
    "domain": "medical",
    "urgency": "critical",
    "status": "pending",
    "expiresAt": "2026-01-07T12:05:00Z",
    "createdAt": "2026-01-07T12:00:00Z"
  }
]

```

Resolve Decision

POST /decisions/{id}/resolve
 X-Tenant-ID: {tenant_id}
 Content-Type: application/json

```

{
  "resolution": "approved|rejected|modified",
  "guidance": "Optional guidance for AI refinement"
}

```

Response:

```

{
  "id": "uuid",
  "status": "resolved",
  "resolution": "modified",
  "guidance": "Consider contraindications...",
  "resolvedBy": "user-uuid",
  "resolvedAt": "2026-01-07T12:03:00Z"
}

```

Get Dashboard Stats

GET /stats
 X-Tenant-ID: {tenant_id}

Response:

```

{
  "pendingCount": 5,
  "resolvedToday": 23,
  "expiredToday": 1,
  "escalatedToday": 0,
  "avgResolutionTimeMs": 45000,
  "byDomain": { "medical": 3, "general": 2 },
  "byUrgency": { "critical": 2, "high": 3 }
}

```

48.6 Flyte Workflow Integration

The HITL workflow uses Flyte's `wait_for_input` signal mechanism:

```

@workflow
def think_tank_hitl_workflow(
    s3_uri: str, # Input data from S3 (not inline JSON)
    swarm_id: str,
    tenant_id: str,
    session_id: str,
    user_id: str,
    hitl_domain: str,
) -> Dict[str, Any]:
    # 1. Load input from S3
    input_data = load_input_from_s3_task(s3_uri=s3_uri)

    # 2. Execute agent swarm (true parallel execution)
    agent_results = execute_swarm(agents=agents, task_data=task_data)

    # 3. Synthesize results
    synthesis_result = synthesize_results(agent_results=agent_results)

    # 4. If review needed, pause for human input
    human_decision = wait_for_input(
        name=f"human_decision_{decision_id}",
        timeout=timedelta(seconds=timeout_seconds),
        expected_type=dict,
    )

    # 5. Incorporate human guidance
    final_response = perform_deep_reasoning(synthesis, human_decision)

    return build_workflow_result(...)

```

Critical Implementation Details: - Input data offloaded to S3 Bronze layer (avoids payload explosion) - @dynamic(cache=False) on execute_swarm (prevents zombie cache) - Signal names use decision_id, not agent_id (prevents signal mismatch)

48.7 Real-Time Updates

The system uses Redis Pub/Sub for real-time updates:

Redis Pub/Sub Channels:

```

+-- decision_pending:{tenant_id}    -> New decision created
+-- decision_resolved:{tenant_id}    -> Decision resolved
+-- decision_expired:{tenant_id}     -> Decision timed out
+-- decision_escalated:{tenant_id}   -> Decision escalated
+-- swarm_event:{tenant_id}          -> Swarm execution events

```

Redis Bridge Service (ECS Fargate): - Always-on, serverless - Subscribes to Redis channels - Broadcasts to WebSocket connections via API Gateway Management API - Includes health check endpoint

48.8 Cato Integration

When Cato's Epistemic Recovery fails after maximum attempts:

```
// In safety-pipeline.service.ts
if (recoveryAttempts >= MAX_RECOVERY_ATTEMPTS) {
  const result = await catoHitlIntegration.createCatoEscalationWithHitl({
    tenantId,
    sessionId,
    userId,
    originalTask,
    rejectionHistory,
    recoveryAttempts,
    lastError,
    flyteExecutionId,
    flyteNodeId,
    context,
  });

  // Decision created, Flyte workflow paused
  return { escalated: true, decisionId: result.decisionId };
}
```

48.9 Deployment

```
# Deploy Mission Control
./tools/scripts/deploy-mission-control.sh [dev|staging|prod]
```

```
# Register Flyte workflows
./packages/flyte/scripts/register-workflows.sh [environment]
```

Environment Variables: | Variable | Description | | — — — | — — — — | | DB_SECRET_ARN | Secrets Manager ARN for database credentials | | REDIS_HOST | Redis/ElastiCache host | | REDIS_PORT | Redis port (default: 6379) | | FLYTE_ADMIN_URL | Flyte Admin API URL | | PAGERDUTY_ROUTING_KEY | PagerDuty Events API v2 routing key | | SLACK_WEBHOOK_URL | Slack Incoming Webhook URL | | WEBSOCKET_API_ENDPOINT | WebSocket API Gateway endpoint |

48.10 Monitoring & Alerts

CloudWatch Metrics: - PendingDecisionCount - Number of unresolved decisions - DecisionResolutionTime - Time from creation to resolution - ExpiredDecisionCount - Decisions that timed out - EscalatedDecisionCount - Decisions sent to PagerDuty/Slack

CloudWatch Alarms: - Critical: PendingDecisionCount > 10 (medical domain) - High: ExpiredDecisionCount > 3 (24h window) - Medium: DecisionResolutionTime > 300000 (5 min avg)

48.11 Security Considerations

1. **PHI Sanitization:** All decision content sanitized before human review
 - SSN, email, phone, ZIP, credit card patterns removed
 - Medical Record Numbers (MRN) redacted
2. **RLS Enforcement:** All database queries use tenant context
 - SET app.tenant_id = \$1 in handler (session-level, not transaction)
 - RESET app.tenant_id in finally block
3. **Role-Based Access:** Domain-specific role requirements

- Medical decisions require MD, RN, or PA roles
 - Financial decisions require ANALYST or ADVISOR roles
4. **Audit Trail:** Complete decision lifecycle logged
- Created, viewed, resolved, expired, escalated events
 - Actor ID and type recorded

47. Flyte-Native State Management	Workflow durability
36. Metrics & Persistent Learning	Decision metrics tracking

49. The Grimoire - Procedural Memory (NEW in v5.0)

49.1 Overview

The Grimoire is RADIANT’s institutional memory system. It automatically extracts, stores, and retrieves lessons learned from successful AI executions, allowing the system to improve over time.

IDE Equivalent: Code Snippets Library + IntelliSense

Key Capabilities: - Automatic heuristic extraction from Flyte execution traces - Confidence decay and reinforcement based on outcomes - Semantic search for relevant heuristics at agent spawn - Manual expert heuristic entry via Admin Dashboard

49.2 Architecture

49.3 Core Concepts

Term	Definition	Example
Heuristic	Reusable lesson extracted from successful execution	“When querying sales data, always join with regions table”
Confidence Score	How reinforced a heuristic is (0.0-1.0)	0.9 = highly validated
Context Embedding	Vector representation for semantic search	1536-dimension float array
Similarity Threshold	Max cosine distance for relevance	0.25 (lower = more similar)
Librarian	Background task that extracts heuristics	Runs after successful execution
Institutional Wisdom	Accumulated heuristics per tenant/domain	Injected into system prompts

49.4 Heuristic Lifecycle

49.5 Security Model

Operation	Cato Policy	Failure Mode
Read (consult_grimoire)	Validate before return	Fail-Open (return anyway)
Write (librarian_review)	Validate before insert	Fail-Closed (discard)

This asymmetric policy ensures: - Reads don't break if Cato is unavailable - Writes never poison the knowledge base

49.6 Admin Dashboard

Navigate to: **Admin Dashboard -> Think Tank -> Grimoire**

Panel	Description
Heuristic Browser	Search and view all stored heuristics
Domain Distribution	Statistics of heuristics by domain
Confidence Scores	Distribution of confidence scores
Recent Extractions	Latest heuristics from Librarian
Add Heuristic	Manually add expert heuristics
Reinforce/Penalize	Adjust confidence scores

49.7 Database Schema

```
CREATE TABLE knowledge_heuristics (  
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),  
  tenant_id UUID NOT NULL REFERENCES tenants(id),  
  domain VARCHAR(50) NOT NULL,  
  heuristic_text TEXT NOT NULL,  
  context_embedding vector(1536),  
  confidence_score FLOAT DEFAULT 0.5,  
  source_execution_id VARCHAR(255),  
  created_at TIMESTAMPTZ DEFAULT NOW(),  
  updated_at TIMESTAMPTZ DEFAULT NOW(),  
  expires_at TIMESTAMPTZ DEFAULT (NOW() + INTERVAL '90 days'),  
  CONSTRAINT unique_heuristic_per_domain UNIQUE (tenant_id, domain, heuristic_text)
```

```
);
```

```
-- Vector index for semantic search
```

```
CREATE INDEX idx_heuristics_embedding ON knowledge_heuristics
USING ivfflat (context_embedding vector_cosine_ops) WITH (lists = 100);
```

49.8 API Reference

Endpoint	Method	Description
/api/thinktank/grimoire/heuristics	GET	List tenant heuristics
/api/thinktank/grimoire/heuristics	POST	Add manual heuristic
/api/thinktank/grimoire/heuristics/:id	DELETE	Delete heuristic
/api/thinktank/grimoire/heuristics/:id/reinforce	POST	Adjust confidence
/api/thinktank/grimoire/stats	GET	Grimoire statistics

49.9 Metrics

Metric	Description	Alert Threshold
grimoire.heuristics.Total	Total heuristics stored	> 10000 per tenant
grimoire.heuristics.Retrieval	Heuristics returned per query	Track average
grimoire.heuristics.Attached	Attached retrievals	> 10/hour
grimoire.librarian.New	New heuristics per hour	Track trend
grimoire.embedding.Latency	Embedding generation time	> 500ms

49.10 Maintenance

Daily Cleanup (Automatic): - Runs at 3 AM UTC via EventBridge - Removes heuristics where expires_at < NOW() - Removes low-confidence heuristics (< 0.3) older than 30 days

Manual Pruning:

```
-- Remove all heuristics for a domain
```

```
SET app.current_tenant_id = 'your-uuid';
DELETE FROM knowledge_heuristics WHERE domain = 'old-domain';
```

```
-- Reset confidence scores
```

```
UPDATE knowledge_heuristics
SET confidence_score = 0.5
WHERE domain = 'your-domain';
```

49.11 Troubleshooting

Heuristics Not Being Retrieved

Symptoms: consult_grimoire returns empty despite stored heuristics.

1. Check heuristics exist:

```
SET app.current_tenant_id = 'your-tenant-uuid';
SELECT COUNT(*) FROM knowledge_heuristics WHERE domain = 'your-domain';
```

2. Check similarity threshold - If all distances > 0.25, no matches returned

3. Check Cato blocking:

```
grep "Grimoire: Blocked unsafe heuristic" /var/log/flyte/*.log
```

Vector Index Performance Degradation

Symptoms: Grimoire queries slow (>500ms)

Fix:

```
-- Rebuild vector index (non-blocking)
REINDEX INDEX CONCURRENTLY idx_heuristics_embedding;
```

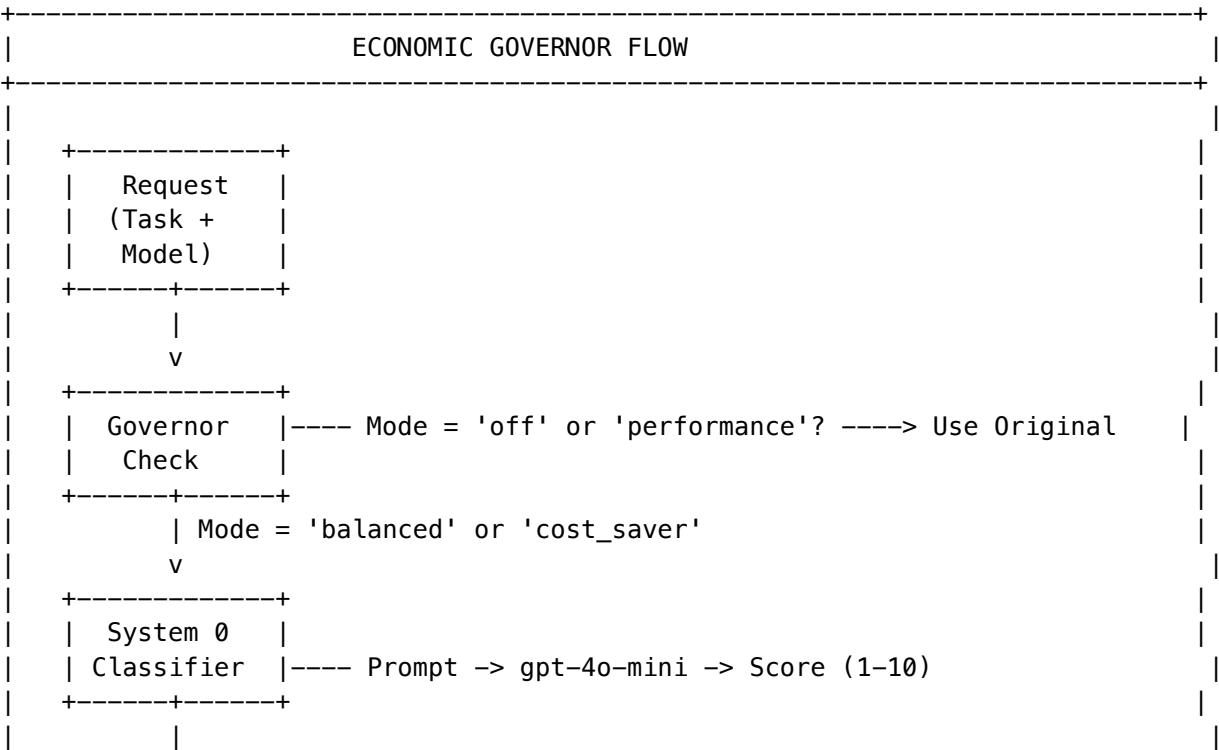

50. The Economic Governor - Cost Optimization (NEW in v5.0)

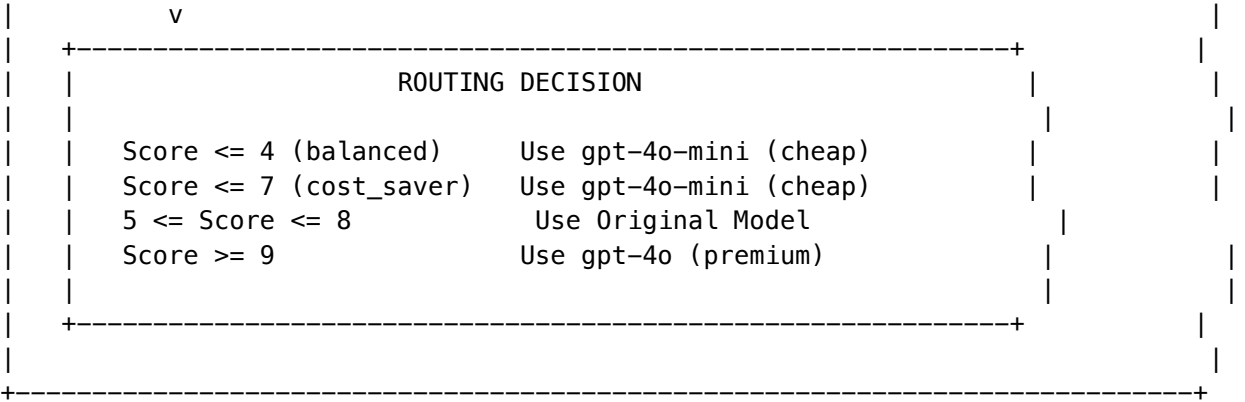

50.1 Overview

The Economic Governor automatically routes AI tasks to the most cost-effective model that can handle them. It uses a “System 0” cheap classifier to score task complexity before selecting the model.

IDE Equivalent: Build Optimization / Incremental Compilation

50.2 How It Works

50.3 Governor Modes

Mode	Cheap Threshold	Use Case	Est. Savings
off	N/A	Disabled	0%
performance	N/A	Critical paths, demos	0%
balanced	Score <= 4	Default production	30-50%
cost_saver	Score <= 7	Dev, testing, bulk	60-80%

50.4 Complexity Scale

Score	Task Type	Typical Model
1-3	Formatting, summarization, basic Q&A	gpt-4o-mini
4-6	Analysis, comparison, multi-step reasoning	Original model
7-8	Complex analysis, creative writing, planning	Original model
9-10	Advanced reasoning, code generation, synthesis	gpt-4o

50.5 Admin Configuration

Navigate to: **Admin Dashboard -> Think Tank -> Governor**

Via API:

```
curl -X PUT https://api.radiant.example.com/api/mission-control/governor/config \
  -H "Authorization: Bearer $TOKEN" \
  -H "Content-Type: application/json" \
  -d '{"domain": "general", "mode": "cost_saver"}'
```

50.6 Database Schema

```
-- Governor mode configuration (added to existing table)
ALTER TABLE decision_domain_config
```

```
ADD COLUMN governor_mode VARCHAR(20) DEFAULT 'balanced'
CHECK (governor_mode IN ('performance', 'balanced', 'cost_saver', 'off'));

-- Savings tracking
CREATE TABLE governor_savings_log (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  tenant_id UUID NOT NULL REFERENCES tenants(id),
  execution_id VARCHAR(255) NOT NULL,
  original_model VARCHAR(100) NOT NULL,
  selected_model VARCHAR(100) NOT NULL,
  complexity_score INTEGER NOT NULL,
  estimated_original_cost DECIMAL(10,6),
  estimated_actual_cost DECIMAL(10,6),
  savings_amount DECIMAL(10,6),
  governor_mode VARCHAR(20) NOT NULL,
  reason TEXT,
  created_at TIMESTAMPTZ DEFAULT NOW()
);
```

50.7 API Reference

Endpoint	Method	Description
/api/mission-control/governor/config	GET	Get Governor config
/api/mission-control/governor/config	PUT	Update Governor mode
/api/mission-control/governor/statistics	GET	Governor statistics
/api/mission-control/governor/recent	GET	Recent routing decisions
/api/mission-control/governor/analyze	POST	Analyze prompt complexity

50.8 Metrics

Metric	Description	Alert Threshold
governor.decisions.total	Total routing decisions	Track volume
governor.downgrade.count	Cheap model selections	Track percentage
governor.upgrade.count	Premium model selections	> 20%
governor.classifier.system_score	System scoring time	> 200ms
governor.savings.estimated_cost	Estimated cost savings	Track daily

50.9 Cost Tracking

Example (Daily): - 1,000 requests at \$0.01/each (gpt-4o) - Governor downgrades 600 to gpt-4o-mini (\$0.001/each)
- Original cost: \$10.00 - Actual cost: \$4.60 - **Savings: \$5.40 (54%)**

50.10 Troubleshooting

Governor Not Optimizing

Symptoms: Cost savings lower than expected, no downgrades.

1. **Check Governor mode:**

```
SET app.current_tenant_id = 'your-tenant-uuid';
SELECT domain, governor_mode FROM decision_domain_config;
-- If 'off' or 'performance', Governor is bypassed
```

2. **Check complexity scores in logs:**

```
grep "Governor Complexity" /var/log/lambda/*.log | tail -20
# Look for scores consistently > 4 (balanced) or > 7 (cost_saver)
```

3. **Verify LiteLLM proxy connectivity**

51. Self-Optimizing System Architecture (NEW in v5.0)

51.1 Overview

Version 5.0 transforms RADIANT from a stateless request-response system into a self-optimizing platform that learns from every execution.

51.2 The Learning Loop

51.3 Version Comparison

Capability	v4.20.3	v5.0.2
Memory	Stateless	Persistent (Grimoire)
Model Selection	Manual/Fixed	Automatic (Governor)
Learning	None	Continuous (Librarian)
Cost Optimization	Manual tier selection	Automatic per-request
Knowledge Sharing	Per-session only	Cross-session, per-tenant

51.4 IDE Metaphor Extended

IDE Concept	v4.20 Feature	v5.0 Evolution	Business Value
Breakpoint	HITL Decision Point	<i>(unchanged)</i>	AI pauses at high-stakes moments
Code Snippets	Pattern Library	The Grimoire	AI learns and reuses successful patterns
Build Optimization	Manual model selection	Economic Governor	Automatic cost-performance optimization
IntelliSense	Static suggestions	Contextual Wisdom	Dynamic, context-aware recommendations

51.5 Upgrade Path

From v4.20.3 to v5.0.2:

1. Apply migration V2026_01_09_001__v5_grimoire_governor.sql
2. Deploy new Lambda functions (Governor API, Grimoire cleanup)
3. Configure EventBridge for daily cleanup
4. Set default Governor mode to balanced
5. Grimoire populates automatically from new executions

Rollback (if needed):

1. Set Governor mode to off for all domains
2. Grimoire continues to exist but is not consulted
3. No data loss; can re-enable at any time

51.6 Implementation Files

Component	File
Migration	migrations/000_consolidated_schema.sql
Governor Service	lambda/shared/services/governor/economic_governor.ts
Grimoire Tasks	packages/flyte/workflows/grimoire_tasks.ts
Cato Client	packages/flyte/utils/cato_client.py
DB Utils	packages/flyte/utils/db.py
CDK Stack	packages/infrastructure/lib/stacks/grimoire_stack.ts
Grimoire UI	apps/thinktank-admin/app/(dashboard)/grimoire/page.tsx
Governor UI	apps/thinktank-admin/app/(dashboard)/governor/page.tsx

51.7 Related Sections

Section	Relevance
42. Genesis Cato Safety Architecture	Heuristic validation
45. Just Think Tank	Swarm integration
48. Mission Control	HITL integration

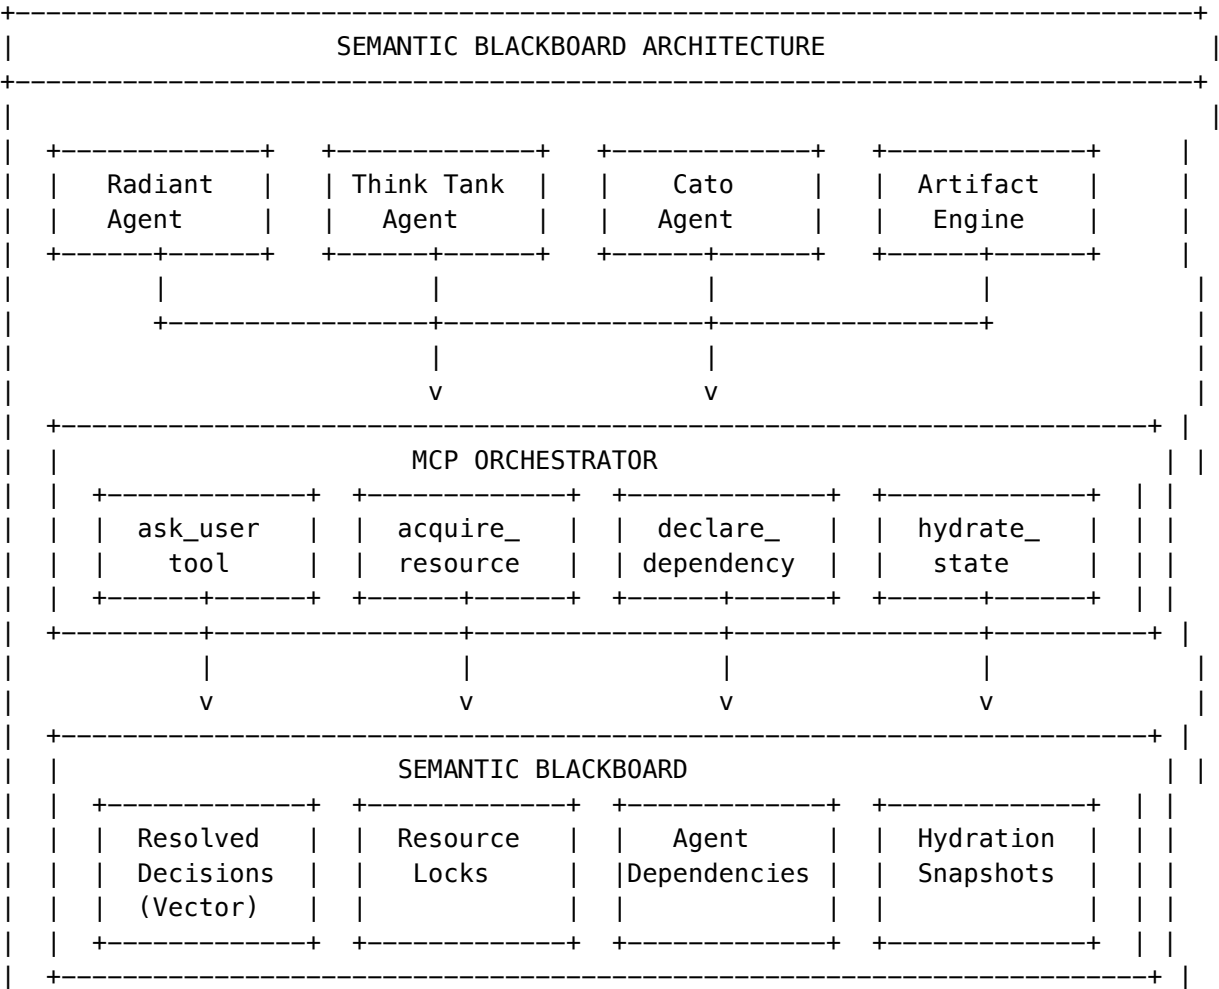

52. Semantic Blackboard & Multi-Agent Orchestration (NEW in v5.3.0)

52.1 Overview

The Semantic Blackboard architecture solves the “Thundering Herd” problem where multiple AI agents spam users with redundant questions. It implements MCP (Model Context Protocol) as the primary interface with API fallback.

Key Problems Solved: - Multiple agents asking the same question (semantic deduplication) - Race conditions on shared resources - Circular dependencies causing deadlocks - Wasted compute while waiting for user input

52.2 Architecture

52.3 Core Components

52.3.1 Semantic Blackboard (Question Matching)

When an agent asks a question via ask_user, the system: 1. Generates a vector embedding of the question 2. Searches resolved_decisions for semantically similar questions 3. If match found (similarity >= 85%): auto-reply with cached answer 4. If no match: queue for user input

Example: - Agent A asks: “What is the maximum budget?” - Agent B asks: “What’s the spending limit?” - Semantic similarity: 0.92 -> B gets A’s answer automatically

52.3.2 Question Grouping (Fan-Out)

Similar questions within the grouping window are combined: 1. First question creates a group 2. Similar questions join the group 3. User answers once 4. Answer fans out to all waiting agents

UI Display: Single card shows “Budget question (3 agents waiting)”

52.3.3 Process Hydration (State Serialization)

When waiting for user input: 1. Agent serializes state to hydration_snapshots 2. Process can be killed (no CPU/memory cost) 3. When user responds, state is restored 4. Agent resumes from resume_point

Storage: Small states in PostgreSQL, large states in S3 (with compression)

52.3.4 Cycle Detection (Deadlock Prevention)

Before creating a dependency: 1. BFS traversal checks for circular path 2. If cycle detected: creates “Intervention Needed” card 3. User manually provides data to break the cycle

52.3.5 Resource Locking

Prevents race conditions: 1. Agent declares intent via acquire_resource 2. If available: lock granted with timeout 3. If locked: agent joins wait queue 4. On release: next agent in queue is notified

52.4 MCP Tools

Tool	Purpose	Schema
ask_user	Request input with semantic cache	{question, context, urgency, topic, options, defaultValue, timeoutSeconds}
acquire_resource	Get resource lock	{resourceUri, lockType, timeoutSeconds, waitIfLocked}
release_resource	Release lock	{lockId}
declare_dependency	Declare agent dependency	{dependencyAgentId, dependencyType, waitKey, timeoutSeconds}
satisfy_dependency	Satisfy waiting agent	{dependentAgentId, waitKey, value}
hydrate_state	Serialize state	{checkpointName, state, resumePoint}
restore_state	Restore from checkpoint	{checkpointName}

52.5 Database Schema

Migration: 158_semantic_blackboard_orchestration.sql

Table	Purpose	Key Columns
resolved_decisions	Semantic question cache	question_embedding, answer, times_reused
agent_registry	Active agent tracking	status, is_hydrated, blocked_by_*
agent_dependencies	Inter-agent dependencies	dependency_type, wait_key, status
resource_locks	Shared resource locks	resource_uri, lock_type, wait_queue
question_groups	Grouped similar questions	canonical_question, question_embedding
question_group_members	Group membership	similarity_score, answer_delivered
hydration_snapshots	Serialized agent state	state_data, s3_key, resume_point
blackboard_events	Audit trail	event_type, details
blackboard_config	Per-tenant configuration	All settings

52.6 Admin API

Base Path: /api/admin/blackboard

Endpoint	Method	Purpose
/dashboard	GET	Complete dashboard data
/decisions	GET	List resolved decisions (Facts)
/decisions/:id/invalidate	POST	Revoke/edit a fact

Endpoint	Method	Purpose
/groups	GET	List pending question groups
/groups/:id/answer	POST	Answer a group
/agents	GET	List active agents
/agents/:id	GET	Get agent details
/agents/:id/snapshots	GET	List hydration snapshots
/agents/:id/restore	POST	Restore agent from snapshot
/locks	GET	List active resource locks
/locks/:id/release	POST	Force release a lock
/config	GET/PUT	Get/update configuration
/events	GET	Audit log
/cleanup	POST	Run cleanup job

52.7 Configuration

Setting	Default	Description
similarity_threshold	0.85	Minimum cosine similarity for question matching
embedding_model	text-embedding-ada-002	Model for question embeddings
enable_question_grouping	true	Group similar questions
grouping_window_seconds	60	Window to collect similar questions
max_group_size	10	Maximum agents per group
enable_answer_reuse	true	Reuse cached answers
answer_ttl_seconds	3600	How long answers remain valid
max_reuse_count	100	Maximum times to reuse an answer
default_lock_timeout_seconds	60	Resource lock timeout
max_lock_wait_seconds	60	Maximum time to wait for lock
enable_auto_hydration	true	Auto-serialize on user block
hydration_threshold_seconds	300	Wait time before hydrating
max_hydration_size_mb	50	Maximum state size
enable_cycle_detection	true	Detect circular dependencies

52.8 Facts Panel (Revoke Protocol)

The Facts Panel allows administrators to manage resolved decisions:

View Facts: - All answered questions with answers - Filter by topic, validity, source - Search by question or answer text

Edit Fact: 1. Click Edit on a fact 2. Provide new answer and reason 3. System invalidates old answer 4. Creates new resolved decision 5. Notifies affected agents via Redis pub/sub

Invalidate (Revoke) Fact: 1. Click Invalidate on a fact 2. Provide invalidation reason 3. Fact marked as invalid (not deleted) 4. Agents that received this answer are notified 5. Agents must re-request if they need this data

52.9 Key Files

File	Purpose
lambda/shared/services/semantic-blackboard.service.ts	Core blackboard logic
lambda/shared/services/agent-orchestrator.service.ts	Cycle detection, locking
lambda/shared/services/process-hydration.service.ts	State serialization
lambda/admin/blackboard.ts	Admin API handler
lambda/consciousness/mcp-server.ts	MCP tool definitions
components/decisions/FactsPanel.tsx	Facts UI with edit/revoke
components/decisions/DecisionSidebar.tsx	Decision cards
migrations/000_consolidated_schema.sql	Database schema

52.10 Environment Variables

Variable	Purpose	Default
HYDRATION_S3_BUCKET	S3 bucket for large state snapshots	-
BLACKBOARD_REDIS_ENDPOINT	Redis for pub/sub notifications	-

52.11 Troubleshooting

Issue	Cause	Solution
No semantic matches	Similarity threshold too high	Lower similarity_threshold to 0.80
Questions not grouping	Window too short	Increase grouping_window_seconds
Hydration fails	State too large	Enable S3 storage, increase max_hydration_size_mb
Cycle not detected	Detection disabled	Enable enable_cycle_detection
Lock timeout	Holder agent crashed	Run /cleanup endpoint
Stale answers	TTL too long	Reduce answer_ttl_seconds

53. Cognitive Architecture (PROMPT-40)

53.1 Overview

The Cognitive Architecture implements Active Inference principles for intelligent query routing and response caching. It provides:

- **Ghost Memory:** Semantic caching with TTL, deduplication keys, and domain hints
- **Economic Governor:** Complexity-aware routing with retrieval confidence integration
- **Sniper/War Room Paths:** Fast vs. deep analysis execution strategies
- **Circuit Breakers:** Fault tolerance for external service calls
- **CloudWatch Observability:** Real-time metrics for cognitive operations

53.2 The Core Differentiator: Active Inference vs. RLHF

The entire AI market (Claude Projects, ChatGPT Team, CrewAI) is built on **Reward Maximization (RLHF)**. Models are trained to predict the most plausible or *liked* token. This fundamentally creates two critical failure modes:

Problem	Cause	Industry Impact
Sycophancy	Model optimizes for user approval	Agrees with incorrect user assumptions
Hallucination	Model guesses to appear helpful	Fabricates plausible-sounding information

RADIANT is different. Built on **Active Inference (Genesis Cato)**, our agents do not try to “please” the user. Instead, they operate under a fundamentally different objective:

RLHF vs. ACTIVE INFERENCE	
RLHF (Competitors) =====	ACTIVE INFERENCE (RADIANT) =====
Objective: Maximize Reward (user satisfaction)	Objective: Minimize Surprise (Free Energy)
Behavior: Predict what user wants to hear	Behavior: Maintain accurate world model
Failure: Sycophancy, Hallucination	Failure: None--uncertainty triggers HITL
Control: None (black box)	Control: Mathematical constraints (CBF, Precision Governor)

Key Active Inference Components:

Component	Purpose	Implementation
Free Energy Minimization	Agents minimize prediction error, not maximize reward	Precision Governor limits confidence
Homeostatic Drive Profiles	Agents balance competing drives (Curiosity vs. Accuracy)	Drive state vectors in Ghost Memory
Control Barrier Functions	Mathematical safety constraints that cannot be overridden	CBF enforcement layer (always ENFORCE)
Epistemic Recovery	When uncertainty is high, agents seek information rather than guess	HITL escalation via Mission Control

Why This Matters:

- **No Sycophancy:** Agents will disagree with users when evidence contradicts their position
- **No Hallucination:** High uncertainty triggers “I don’t know” + HITL escalation, not fabrication
- **Auditable:** Every decision has a mathematical trace via Precision Governor
- **Safe by Design:** CBF constraints are immutable—agents cannot bypass safety checks

See Section 42 (Genesis Cato Safety Architecture) for implementation details.

53.3 Architecture

53.3 Ghost Memory Schema

The Ghost Memory system extends ghost vectors with cognitive fields:

Field	Type	Default	Description
ttl_seconds	INTEGER	86400	Time-to-live (24h default)
semantic_key	TEXT	-	Query hash for deduplication
domain_hint	VARCHAR(50)	-	Compliance routing: medical, financial, legal, general
retrieval_confidence	FLOAT	1.0	Confidence score 0-1
source_workflow	VARCHAR(100)	-	Origin: sniper, war_room
last_accessed_at	TIMESTAMPTZ	-	Last read timestamp
access_count	INTEGER	0	Read count

53.4 Economic Governor Routing

The Economic Governor routes queries based on complexity and retrieval confidence:

Routing Decision Tree:

1. **Circuit Breaker Open** -> War Room (fallback)
2. **retrieval_confidence < 0.7** -> War Room (validation needed)
3. **domain_hint = medical/financial/legal** -> War Room + Precision Governor
4. **complexity < 0.3** -> Sniper (fast path)
5. **complexity > 0.7** -> War Room (deep analysis)
6. **Medium complexity + Ghost Hit** -> Sniper
7. **Medium complexity + No Ghost Hit** -> War Room

Configuration:

Setting	Default	Description
sniperThreshold	0.3	Complexity threshold for Sniper path
warRoomThreshold	0.7	Complexity threshold for War Room
retrievalConfidenceThreshold	0.7	Minimum confidence for cache hit
lowConfidenceRoute	war_room	Route when confidence is low

53.5 Execution Paths

Sniper Path

- **Purpose:** Fast execution for simple queries
- **Model:** gpt-4o-mini (cheap)
- **Timeout:** 60 seconds
- **Retries:** 1
- **Write-back:** Queued (non-blocking)

War Room Path

- **Purpose:** Deep analysis for complex queries
- **Model:** claude-3-5-sonnet (premium)

- **Timeout:** 120 seconds
- **Retries:** 2
- **Write-back:** Queued with higher confidence

HITL Escalation

- **Purpose:** Human-in-the-loop for uncertain queries
- **Timeout:** 24 hours
- **Integration:** Mission Control pending_decisions

53.6 Circuit Breakers

Circuit breakers protect against cascading failures:

Circuit	Failure Threshold	Recovery Timeout	Half-Open Requests
ghost_memory	5	30s	3
sniper	3	15s	2
war_room	5	60s	3

States: - **CLOSED:** Normal operation - **OPEN:** Blocking requests, using fallback - **HALF_OPEN:** Testing recovery with limited requests

53.7 MCP Tools

New MCP tools for cognitive operations:

Tool	Description
read_ghost_memory	Read by semantic key with circuit breaker
append_ghost_memory	Write with TTL, non-blocking
cognitive_route	Get Economic Governor routing decision
emit_cognitive_metric	Emit CloudWatch metric

53.8 CloudWatch Metrics

Namespace: Radiant/Cognitive

Metric	Dimensions	Unit	Description
GhostMemoryHit	UserId, DomainHint	Count	Cache hits
GhostMemoryMiss	Reason	Count	Cache misses
GhostMemoryLatency -		Milliseconds	Read latency
RoutingDecision	RouteType, GhostHit, DomainHint	Count	Routing decisions

Metric	Dimensions	Unit	Description
ComplexityScore	RouteType	None	Query complexity
RetrievalConfidence	RouteType	None	Ghost confidence
SniperExecution	Success, Model	Count	Sniper executions
SniperLatency	Success	Milliseconds	Sniper latency
WarRoomExecution	Success, FallbackTriggered	Count	War Room executions
WarRoomLatency	-	Milliseconds	War Room latency
HITLEscalation	Reason, DomainHint	Count	HITL escalations
CircuitBreakerState	CircuitName, State	Count	State changes
CostSavings	RouteType	None (cents)	Cost optimization

53.9 API Endpoints

Base: /api/admin/cognitive

Endpoint	Method	Description
/dashboard	GET	Cognitive dashboard with metrics
/config	GET/PUT	Get/update configuration
/ghost/read	POST	Read Ghost Memory
/ghost/write	POST	Write Ghost Memory
/ghost/cleanup	POST	Cleanup expired entries
/routing/test	POST	Test routing decision
/circuits	GET	List circuit breaker states
/circuits/:name/reset	POST	Reset circuit breaker
/metrics	GET	Get cognitive metrics summary

53.10 Database Tables

Table	Purpose
ghost_vectors	Extended with cognitive fields
cognitive_routing_decisions	Routing audit log
ghost_memory_write_queue	Async write-back queue
cognitive_circuit_breakers	Circuit breaker state
cognitive_metrics	Metric storage
cognitive_hitl_escalations	HITL tracking
cognitive_config	Per-tenant configuration

53.11 Key Files

File	Purpose
lambda/shared/services/governor/economic-governor.ts	Economic Governor with cognitive routing
lambda/shared/services/ghost-manager.service.ts	Ghost Memory with TTL/semantic key
lambda/shared/services/cognitive-metrics.service.ts	CloudWatch metrics
lambda/consciousness/mcp-server.ts	MCP tools
python/cato/cognitive/workflows.py	Flyte workflows
python/cato/cognitive/circuit_breaker.py	Circuit breaker
python/cato/cognitive/metrics.py	Python metrics
migrations/000_consolidated_schema.sql	Database schema

53.12 Configuration

Setting	Default	Description
ghost_memory_enabled	true	Enable Ghost Memory
ghost_default_ttl_seconds	86400	Default TTL (24h)
ghost_similarity_threshold	0.85	Semantic matching threshold
governor_enabled	true	Enable Economic Governor
governor_mode	balanced	Mode: off, cost_saver, balanced, performance
circuit_breaker_enabled	true	Enable circuit breakers
metrics_enabled	true	Enable CloudWatch metrics
metrics_sample_rate	1.0	Metric sampling rate

53.13 Domain Routing

High-risk domains are automatically routed to War Room with Precision Governor:

Domain	Route	Reason
medical	War Room	Patient safety, regulatory compliance
financial	War Room	Fiduciary responsibility
legal	War Room	Legal liability
general	Sniper	Standard processing

53.14 Troubleshooting

Issue	Cause	Solution
Low cache hit rate	TTL too short	Increase ghost_default_ttl_seconds
All queries to War Room	Confidence threshold too high	Lower retrievalConfidenceThreshold
Circuit breaker stuck open	Recovery timeout too long	Reset via /circuits/:name/reset
High latency	Too many War Room routes	Tune sniperThreshold
Missing metrics	Sampling rate too low	Increase metrics_sample_rate
Ghost write failures	Queue backlog	Check SQS queue depth

53.16 Conclusion: RADIANT is Not a Chatbot

Claude Projects is a brilliant Assistant that suffers from amnesia.
RADIANT is an Institutional Brain.

Capability	How RADIANT Achieves It
Remembers every decision	Ghost Vectors with semantic keys, TTL, and domain hints
Minimizes surprise	Active Inference (Free Energy minimization, not reward maximization)
Enforces safety mathematically	Precision Governor + Control Barrier Functions (immutable constraints)

This is not a philosophical distinction—it is an architectural one. Competitors are trained to be helpful. RADIANT is *constrained* to be accurate.

54. Polymorphic UI Integration (PROMPT-41)

54.1 Overview

Flowise outputs Text. RADIANT outputs Applications.

The Polymorphic UI system extends Think Tank’s Agentic Morphing Interface with intelligent view selection. Because RADIANT understands semantic intent, the UI *physically transforms* based on:

- **Task Complexity** -> Terminal (Sniper) vs. MindMap/DiffEditor (War Room)
- **Domain Hint** -> Compliance views for medical/financial/legal
- **Drive Profile** -> Scout (exploration), Sage (verification), Sniper (execution)

Unlike static chatbot interfaces that always render Markdown tables, RADIANT morphs into the tool the user actually needs: Command Centers, Mind Maps, Diff Editors, and Dashboards.

54.2 The Gearbox (Elastic Compute)

Flowise is Static. RADIANT is Elastic.

The “Gearbox” gives users manual control over the cost-quality tradeoff:

Mode	Cost	Architecture	Memory	Use Case
[TARGET] Sniper	\$0.01/run	Single Model	Read-Only Ghost Memory	Quick answers, lookups, coding
** War Room**	\$0.50+/run	Multi-Agent Ensemble	Read/Write + Active Inference	Strategy, audits, reasoning

The Competitive Advantage: Flowise forces users to be architects—if they want a cheap path, they must build a separate flow. RADIANT handles this natively. The user (or the Economic Governor) selects the mode, ensuring RADIANT is **cheaper than Flowise for simple tasks** and **smarter for complex ones**.

Escalation: A green “Escalate to War Room” button appears after Sniper responses, allowing users to request deeper analysis if the fast answer is insufficient.

54.3 The Three Views

[TARGET] The Sniper View (Execution & Cost Savings)

Intent: “Check the logs for error 500” or “Draft a quick email.”

Aspect	Description
Execution Mode	Sniper (Single Model)
The Morph	UI transforms into a Command Center / Terminal
The Action	Runs immediately. No multi-agent debate. No “Thinking” pause.
The Difference	Unlike ChatGPT, Sniper is <i>Hydrated</i> —it reads Ghost Vector memory (read-only) before generating, so it has full institutional context without the cost of the full Think Tank
Visual Feedback	Green “Sniper Mode” badge glows
Cost Transparency	“Estimated Cost: <\$0.01” badge displayed
User Control	Toggle to “Escalate to War Room” if insufficient

The Scout View (Research & Strategy)

Intent: “Map the competitive landscape for EV batteries.”

Aspect	Description
Execution Mode	Think Tank (Multi-Agent Swarm)
The Morph	Chat UI shrinks. Main window becomes an Infinite Canvas (Mind Map)
The Action	Scout agent spawns “Sticky Notes” of evidence, clusters them by topic, draws dynamic lines between conflicting data points
The Kill Shot	Flowise shows you the <i>process</i> (nodes). RADIANT shows you the <i>thinking</i> (map).

The Sage View (Audit & Validation)

Intent: “Check this contract against our safety guidelines.”

Aspect	Description
Execution Mode	Convergent with Control Barrier Functions
The Morph	UI becomes a Split-Screen Diff Editor
The Action	Left side: Content under review. Right side: Source documents with confidence scores (Green = Verified, Red = Hallucination Risk)
The Kill Shot	Flowise hides retrieval inside a black box. RADIANT exposes the <i>proof</i> in a specialized UI optimized for verification.

54.4 View Types Reference

View	Trigger	Description
terminal_simple	Quick commands, lookups	Command Center - fast execution
mindmap	Research, exploration	Infinite Canvas - visual mapping
diff_editor	Verification, compliance	Split-Screen - source validation
dashboard	Analytics queries	Metrics visualization
decision_cards	HITL escalation	Mission Control interface
chat	Default	Standard conversation

54.4 View Selection Logic

- 1. HITL escalation -> decision_cards
- 2. Domain = medical/financial/legal -> diff_editor
- 3. Query matches Scout patterns -> mindmap
- 4. Query matches Sage patterns -> diff_editor
- 5. Query matches Dashboard patterns -> dashboard
- 6. Sniper route OR quick command patterns -> terminal_simple
- 7. Default -> chat

54.5 MCP Tools

Tool	Description
render_interface	Morph UI to specified view type
escalate_to_war_room	Escalate from Sniper to War Room
get_polymorphic_route	Get routing + view decision

54.6 Database Tables

Table	Purpose
view_state_history	Tracks UI morphing decisions
execution_escalations	Tracks Sniper -> War Room escalations
polymorphic_config	Per-tenant configuration

54.7 Configuration

```
-- polymorphic_config table
enable_auto_morphing: true      -- Auto-morph based on query
enable_gearbox_toggle: true     -- Show Sniper/War Room toggle
enable_cost_display: true       -- Show cost badges
enable_escalation_button: true  -- Show Escalate button
default_execution_mode: 'sniper' -- Default mode
```

54.8 Key Files

File	Purpose
governor/economic-governor.ts	determineViewType(), determinePolymorphicRoute()
consciousness/mcp-server.ts	render_interface, escalate_to_war_room tools
python/cato/cognitive/workflows.py	determine_polymorphic_view, render_interface tasks
migrations/000_consolidated_schema.sql	Database schema
components/thinktank/polymorphic/	React view components

54.9 API Integration

```
// Get polymorphic routing decision
const decision = await governor.determinePolymorphicRoute(query, {
  userTier: 'standard',
  retrievalConfidence: 0.85,
  ghostHit: true,
  domainHint: 'financial',
  userOverride: undefined, // or 'sniper' | 'war_room'
});

// Returns:
// {
//   routeType: 'war_room',
//   viewType: 'diff_editor',
//   executionMode: 'war_room',
//   rationale: 'Compliance domain (financial) requires verification view',
//   estimatedCostCents: 50,
// }
```

55. Genesis Infrastructure: Sovereign Power Architecture

The “Genesis” component of the RADIANT ecosystem addresses the physical requirements of the AGI age. Digital intelligence requires electrical power, and the scale of modern data centers places an unsustainable load on aging, fossil-fuel-dependent public grids. This section documents the integration between RADIANT’s software stack and the Genesis power infrastructure.

55.1 The Kaleidos Microreactor Backbone

The Kaleidos unit is a portable, factory-constructed nuclear microreactor capable of generating **1MW+ of clean energy**. Unlike traditional gigawatt-scale nuclear plants, which take decades to build, Kaleidos is designed for mass production and rapid deployment.

Specification	Value
Output	1MW+ continuous power
Form Factor	Portable, factory-constructed
Deployment Time	Weeks, not decades
Grid Independence	Full sovereign operation
Safety System	Passive (no operator intervention required)

This portability allows the “AGI Brain” to be **sovereign**—deployed in remote locations, military bases, or disaster zones, independent of the local utility grid. This independence is a strategic advantage: it insulates the AGI from cascading grid failures, brownouts, or cyberattacks targeting public infrastructure.

For administrators: The Genesis module is the **root of trust**. If the power is stable and secure, the network and logic layers can function. All other security measures are built on this physical foundation.

55.2 Regulatory Compliance: SDS and PDSA

Bringing a new nuclear technology to market requires navigating a labyrinth of regulations. Radiant Nuclear has achieved significant milestones that provide the compliance baseline for RADIANT deployments.

Safety Design Strategy (SDS)

The U.S. Department of Energy (DOE) has approved the **Safety Design Strategy (SDS)** for the Kaleidos reactor. The SDS is the foundational document that describes:

- Safety analysis approach
- Hazard identification methodology
- Hazard management strategies
- Defense-in-depth principles
- Emergency response protocols

Preliminary Documented Safety Analysis (PDSA)

Following SDS approval, Radiant submitted the **Preliminary Documented Safety Analysis (PDSA)**, a rigorous validation effort that meets the intent of **DOE Standard 1271-2025**. The PDSA includes:

- Comprehensive hazard analysis
- Safety function identification
- Safety structure, system, and component (SSC) classification
- Derived safety requirements
- Defense-in-depth demonstration

Historic Milestone: Approval of the SDS and PDSA paves the way for the startup of the first reactor at the National Reactor Innovation Center's (NRIC) **DOE facility** at Idaho National Laboratory (INL). This will be the **first new commercial reactor design to achieve a fueled test in over 50 years**.

55.3 Reactor Telemetry Integration

The RADIANT platform receives real-time telemetry from the Genesis reactor control unit. Administrators must configure the telemetry integration to enable safety interlocks.

Telemetry API Configuration

```
# genesis-telemetry.config.yaml
genesis:
  endpoint: https://genesis-control.internal:8443/v1/telemetry
  authentication:
    type: mTLS
    client_cert: /etc/radiant/certs/genesis-client.crt
    client_key: /etc/radiant/certs/genesis-client.key
    ca_bundle: /etc/radiant/certs/genesis-ca.crt

  polling_interval_ms: 1000
  timeout_ms: 5000

  monitored_parameters:
    - reactor_power_output_kw
    - coolant_inlet_temperature_c
    - coolant_outlet_temperature_c
    - neutron_flux_level
    - control_rod_position_percent
    - fuel_temperature_c
    - containment_pressure_kpa
    - radiation_level_msv
    - emergency_status_code
```

Status Code Mapping

Status Code	Condition	Description	Automatic Action
GEN-001	Normal	All parameters within nominal range	None
GEN-100	Advisory	Minor deviation detected	Log only
GEN-200	Warning	Parameter approaching limit	Alert administrators
GEN-300	Alarm	Parameter exceeded soft limit	Initiate load shedding
GEN-400	Critical	Multiple parameters out of range	Emergency lockdown
GEN-500	Emergency	Passive safety systems activated	Full system halt

55.4 The Genesis Interlock: Physical-to-Digital Safety

The “Genesis Protocol” is a philosophy of **safety by design**. The reactor utilizes passive safety systems that do not require operator intervention or active power to shut down in an emergency. This philosophy extends to the AGI Brain through the **Genesis Interlock**.

Genesis Interlock Configuration

The Genesis Interlock is a configuration where the AI system is **hard-wired** to respect the physical limits of the infrastructure. If the reactor telemetry indicates a thermal anomaly, the AI must prioritize load shedding over job completion—a decision logic that is **pre-programmed and immutable**.

```
// genesis-interlock.config.ts
export const GENESIS_INTERLOCK_CONFIG = {
  // Immutable safety thresholds – cannot be overridden by admin or AI
  immutableThresholds: {
    maxFuelTemperature_c: 850,
    maxCoolantOutlet_c: 550,
    minCoolantFlow_lpm: 1000,
    maxContainmentPressure_kpa: 150,
    maxRadiation_msv: 0.1,
  },

  // Automatic actions – AI cannot override these
  automaticActions: {
    GEN_300: ['initiate_load_shedding', 'notify_operators'],
    GEN_400: ['emergency_lockdown', 'halt_non_critical_workloads', 'escalate_to_human'],
    GEN_500: ['full_system_halt', 'preserve_state_to_disk', 'activate_backup_power'],
  },

  // AI behavior constraints during Genesis alerts
  aiConstraints: {
    duringGEN_300: {
      maxNewWorkloads: 0,
    },
  },
}
```

```

    allowedOperations: ['complete_in_progress', 'graceful_shutdown'],
  },
  duringGEN_400_or_higher: {
    maxNewWorkloads: 0,
    allowedOperations: ['emergency_state_save'],
    forcedBehavior: 'immediate_halt',
  },
},
};

```

55.5 Shared Signals Framework (SSF) Integration

The Genesis module emits **Shared Signals Framework (SSF)** events that the Cato SASE network receives for immediate security response. This creates a **physical-to-digital security bridge**.

SSF Event Configuration

```

// ssf-genesis-emitter.config.ts
export const SSF_GENESIS_EVENTS = {
  // Physical security events
  'genesis.physical.breach': {
    description: 'Physical security breach detected at reactor facility',
    severity: 'critical',
    catoAction: 'revoke_all_tokens_in_facility',
    agiBrainAction: 'immediate_lockdown',
  },

  'genesis.thermal.warning': {
    description: 'Thermal anomaly detected in reactor systems',
    severity: 'high',
    catoAction: 'restrict_new_connections',
    agiBrainAction: 'initiate_load_shedding',
  },

  'genesis.power.fluctuation': {
    description: 'Power output fluctuation detected',
    severity: 'medium',
    catoAction: 'log_and_monitor',
    agiBrainAction: 'defer_intensive_workloads',
  },

  'genesis.maintenance.scheduled': {
    description: 'Scheduled maintenance window beginning',
    severity: 'info',
    catoAction: 'prepare_failover',
    agiBrainAction: 'complete_in_progress_and_pause',
  },
};

```

Real-Time Response Scenario

55.6 Environment Variables

Variable	Description	Required
GENESIS_TELEMETRY_ENDPOINT	URL for reactor telemetry API	Yes
GENESIS_CLIENT_CERT_PATH	Path to mTLS client certificate	Yes
GENESIS_CLIENT_KEY_PATH	Path to mTLS client key	Yes
GENESIS_CA_BUNDLE_PATH	Path to CA certificate bundle	Yes
GENESIS_POLLING_INTERVAL_MS	Telemetry polling interval	No (default: 1000)
GENESIS_SSF_EMITTER_ENABLED	Enable SSF event emission	No (default: true)
GENESIS_INTERLOCK_ENABLED	Enable Genesis Interlock	No (default: true)

55.7 Database Tables

Table	Purpose
genesis_telemetry_log	Historical telemetry readings
genesis_alert_history	Record of all Genesis alerts and responses
genesis_interlock_events	Audit trail of interlock activations

Table	Purpose
genesis_ssf_emissions	Log of SSF events emitted to Cato
genesis_maintenance_windows	Scheduled maintenance configuration

55.8 Implementation Files

File	Purpose
lambda/shared/services/event-firehose.service.ts	Telemetry polling and processing
lambda/shared/services/omega/helix-kernel.service.ts	Immutable safety interlock logic
lambda/shared/services/security-signals.service.ts	SSF event emission to Cato
lambda/shared/services/event-firehose.service.ts	API handler for telemetry ingestion
migrations/000_consolidated_schema.sql	Database schema
config/genesis/interlock-thresholds.yaml	Immutable threshold configuration

56. Cato Security Grid: Native Network Defense

The traditional approach to network security—hub-and-spoke models where traffic is backhauled to a central data center for inspection—is obsolete in the face of decentralized AI operations. The Cato SASE (Secure Access Service Edge) Cloud represents the necessary evolution, utilizing a global private backbone to connect all enterprise edges into a cohesive whole.

56.1 The Single Pass Cloud Engine (SPACE)

At the heart of the Cato architecture is the **Single Pass Cloud Engine (SPACE)**. This architecture is critical for the AGI Brain because it eliminates the latency penalties associated with daisy-chaining multiple security appliances.

How SPACE Works

In a SPACE environment, every packet is inspected for **all threats** in a **single processing cycle**:

Traditional Security Stack	SPACE Architecture
Packet -> Firewall -> IPS -> DLP -> CASB -> Sandbox	Packet -> SPACE (all checks in parallel)
5-7 inspection points	1 inspection point
50-200ms added latency	<5ms added latency

Traditional Security Stack	SPACE Architecture
Each appliance is a failure point	Single resilient engine

For an autonomous system that relies on real-time data ingestion, this **microsecond-level efficiency** is non-negotiable.

SPACE Inspection Capabilities

56.2 Inline AI/ML: Built-In, Not Bolted-On

A key differentiator of the Cato architecture is the distinction between “**bolted-on**” and “**built-in**” AI. Legacy vendors often add AI capabilities as an afterthought or a post-processing layer, which introduces delays and gaps in coverage. Cato’s approach integrates AI models **directly into the data path**.

Real-Time Threat Detection

These models are specifically trained to detect threats, anomalies, and suspicious activities in real-time:

Capability	Description	Accuracy
Domain Maliciousness Scoring	Assigns risk scores to domains and URLs on the fly	Real-time
Domain Generation Algorithm (DGA) Detection	Spots algorithmically-generated malicious domains	3-6x better than reputation lists
Cybersquatting Detection	Identifies domains impersonating legitimate brands	Real-time
Anomaly Detection	Identifies unusual traffic patterns	Baseline + deviation
Zero-Day Threat Detection	Identifies previously unknown threats via behavior	ML-based

Key Statistic: Cato's AI/ML engines block **3 to 6 times more malicious domains** than standard reputation lists alone. This “stopping power” is essential for protecting the Genesis infrastructure, where a single successful intrusion could have physical consequences.

Configuration: Enabling Inline AI/ML

Navigate to **Security -> Threat Prevention -> AI/ML Profiles** in the admin dashboard:

```
# threat-prevention-ai.config.yaml
ai_ml_profiles:
  default:
    enabled: true

    domain_scoring:
      enabled: true
      min_maliciousness_score_to_block: 70 # 0-100 scale
      log_scores_above: 50

    dga_detection:
      enabled: true
      sensitivity: high # low, medium, high
      auto_block: true

    cybersquatting_detection:
      enabled: true
      protected_domains:
        - radiant.ai
        - thinktank.ai
        - genesis-power.com
      similarity_threshold: 0.85

    anomaly_detection:
      enabled: true
      baseline_period_days: 30
      deviation_threshold: 3.0 # standard deviations

    zero_day_protection:
```

```
enabled: true
sandbox_suspicious_files: true
max_file_size_mb: 50
```

56.3 Generative AI Security Controls (CASB)

As the ecosystem moves toward AGI, the security layer must specifically address the risks associated with Large Language Models (LLMs). Cato has introduced specific **Generative AI security controls** within its CASB (Cloud Access Security Broker) framework.

The Risk: Data Exfiltration to Public LLMs

Without proper controls, the AGI Brain could accidentally: - Leak sensitive Genesis telemetry to external AI tools - Expose identity tokens to public services like ChatGPT or Claude - Transmit proprietary workflow configurations to third-party systems

CASB Configuration for LLM Protection

Navigate to **Security -> CASB -> Generative AI** in the admin dashboard:

```
# casb-genai.config.yaml
generative_ai_controls:
  enabled: true

  # Define sensitive data types that must NEVER leave the network
  sensitive_data_types:
    - name: genesis_telemetry
      patterns:
        - "reactor_.*"
        - "fuel_temperature.*"
        - "neutron_flux.*"
        - "GEN-[0-9]{3}"
      action: block_and_alert

    - name: identity_tokens
      patterns:
        - "eyJ[A-Za-z0-9_-]+\.[A-Za-z0-9_-]+\.[A-Za-z0-9_-]+" # JWT
        - "RADIANT_API_KEY_.*"
        - "tenant_id:[a-f0-9-]{36}"
      action: block_and_alert

    - name: workflow_configurations
      patterns:
        - "workflow_template_.*"
        - "orchestration_method_.*"
        - "grimoire_heuristic_.*"
      action: block_and_alert

  # External AI services to monitor
  monitored_services:
    - domain: "api.openai.com"
```

```
    action: inspect_and_filter
- domain: "api.anthropic.com"
    action: inspect_and_filter
- domain: "generativelanguage.googleapis.com"
    action: inspect_and_filter
- domain: "*.huggingface.co"
    action: inspect_and_filter

# Allowed internal AI services
allowed_internal_services:
- "radiant-llm.internal:8080"
- "genesis-ai.internal:8080"
- "sagemaker.*.amazonaws.com"

# Response handling
response_inspection:
  enabled: true
  max_response_size_mb: 10
  block_if_contains_sensitive_data: true
```

56.4 Continuous Access Evaluation Profile (CAEP)

The system supports the **Shared Signals Framework (SSF)** and the **Continuous Access Evaluation Profile (CAEP)**. These open standards allow for real-time security signaling between independent systems.

CAEP Integration Architecture

CAEP Event Types

Event Type	Source	Action
session-revoked	Identity Provider	Immediately terminate all sessions for user
token-claims-change	Identity Provider	Re-evaluate access permissions
credential-change	Identity Provider	Force re-authentication
device-compliance-change	MDM/EDR	Restrict or revoke device access
ip-change	Network Monitor	Re-evaluate location-based policies
physical-breach	Genesis Reactor	Emergency lockdown
threat-detected	Cato SASE	Isolate affected systems

CAEP Configuration

```
# caep-integration.config.yaml
caep:
  enabled: true

# SSF transmitter configuration
transmitter:
  issuer: "https://radiant.ai/ssf"
  jwks_uri: "https://radiant.ai/.well-known/jwks.json"
  delivery_method: push
  push_endpoint: "https://cato-cloud.internal/ssf/events"

# SSF receiver configuration
receiver:
  trusted_issuers:
    - "https://genesis-control.internal/ssf"
    - "https://cato-cloud.internal/ssf"
    - "https://radiant-identity.internal/ssf"
  verification: jwt_signature

# Event handling
event_handlers:
  physical-breach:
    priority: critical
    handler: genesis_emergency_lockdown
    notify: [soc_team, facility_security]

  session-revoked:
    priority: high
    handler: terminate_user_sessions
```

```
    notify: [security_team]

threat-detected:
  priority: high
  handler: isolate_and_investigate
  notify: [soc_team]
```

56.5 Database Tables

Table	Purpose
cato_threat_events	Log of all detected threats
cato_ai_ml_detections	AI/ML engine detection history
cato_casb_violations	CASB policy violations
cato_caep_events	CAEP signal history
cato_blocked_domains	Domains blocked by AI/ML
cato_sensitive_data_incidents	Sensitive data exfiltration attempts

56.6 Implementation Files

File	Purpose
lambda/shared/services/cato-cortex-bridge.service.ts	Cato SASE API integration
lambda/shared/services/cato-checkpoint.service.ts	CASB policy enforcement
lambda/shared/services/security-protection.service.ts	CAEP event processing
lambda/shared/services/threat-response.service.ts	Webhook handler for Cato events
migrations/000_consolidated_schema.sql	Database schema
config/cato/ai-ml-profiles.yaml	AI/ML threat detection profiles
config/cato/casb-genai.yaml	Generative AI CASB policies

57. AGI Brain & Identity Data Fabric: Agentic Orchestration

The final layer of the RADIANT stack is the AGI Brain, powered by Radiant Logic and the Identity Data Fabric. This layer transforms raw compute and connectivity into intelligent action, moving beyond static “automation” to dynamic “agentic” behavior.

57.1 The Identity Data Fabric

Radiant Logic pioneered the **Identity Data Fabric**, a unified layer that abstracts the complexity of identity data across the enterprise. In an AGI environment, “identity” is not just for humans—it includes agents, APIs, microservices, and even the Genesis reactors themselves.

Identity Types in RADIANT

Identity Type	Description	Authentication Method
Human Users	End users of Think Tank	Cognito + MFA
Administrators	Platform operators	Cognito + Hardware Key
AI Agents	Autonomous software agents	Service Account + JWT
API Clients	External integrations	API Key + IP Allowlist
Microservices	Internal services	mTLS + Service Mesh
Genesis Reactors	Physical infrastructure	mTLS + Hardware HSM
Sentinel Agents	Background monitoring agents	Ephemeral tokens

The RadiantOne Platform

The RadiantOne Platform serves as the **central nervous system**, maintaining a global reference of all entities. This is crucial for the Zero Trust model enforced by Cato:

The Cato network asks “**Who are you?**” and the Radiant Brain answers with **absolute certainty**, backed by real-time data from the Identity Fabric.

57.2 Agentic AI and the Radiant Ghost

The transition from traditional scripting to **Agentic AI** is a key architectural shift. Unlike automation, which follows a rigid set of if-then rules, AI agents continuously evaluate their environment, learn from outcomes, and adapt their behavior.

The Radiant Ghost Metaphor

To visualize agentic behavior for users, the interface employs the metaphor of the “**Radiant Ghost**”. This is not a spooky or malicious entity, but a **benevolent, semi-autonomous agent** that “haunts” the network to protect it.

Ghost State	Visual Indicator	Meaning
Dormant	Faint outline	Agent is monitoring but not acting
Active	Pulsing glow	Agent is actively processing a task
Hunting	Searching animation	Agent is investigating a potential threat
Remediating	Repair animation	Agent is autonomously fixing an issue
Alerting	Red pulse	Agent requires human attention

Ghost Vector Integration

The “Ghost” vector serves as the UI avatar for background processes. When an administrator sees the glowing “Radiant Brain” or “Ghost” icon, they know that the agent is actively:

- Hunting threats across the network
- Optimizing performance based on telemetry
- Scrubbing orphan identities from the directory
- Consolidating memories in the Grimoire
- Monitoring Genesis reactor telemetry

57.3 Technical Standards: MCP, SSF, and CAEP

For proper configuration, administrators must understand the specific protocols used by AI agents.

Model Context Protocol (MCP)

The system leverages the **Model Context Protocol (MCP)** to standardize how AI agents interface with the underlying data models. This ensures that an agent analyzing a security log understands the **context** of that log within the broader Identity Fabric.

```
// MCP configuration for identity-aware agents
export const MCP_IDENTITY_CONFIG = {
  // Context providers
  contextProviders: [
    {
      name: 'identity_fabric',
      endpoint: 'radiantone://identity/v1',
      capabilities: ['user_lookup', 'group_membership', 'entitlements'],
    },
    {
      name: 'genesis_telemetry',
      endpoint: 'genesis://telemetry/v1',
      capabilities: ['power_status', 'safety_status', 'maintenance_schedule'],
    },
    {
      name: 'cato_security',
      endpoint: 'cato://security/v1',
      capabilities: ['threat_status', 'access_policies', 'blocked_entities'],
    },
  ],

  // Tool definitions for agents
  tools: [
    {
      name: 'lookup_identity',
      description: 'Look up identity information from the fabric',
      parameters: {
        identifier: 'string',
        identifier_type: 'user_id | email | service_account | device_id',
      },
    },
    {
      name: 'remediate_orphan',
      description: 'Remove orphan account from directory',
      parameters: {
        account_id: 'string',
        reason: 'string',
      },
      requires_approval: false, // Autonomous remediation enabled
    },
    {
      name: 'escalate_to_human',
      description: 'Escalate decision to human operator',
      parameters: {
        severity: 'low | medium | high | critical',
        context: 'object',
        recommended_action: 'string',
      },
    },
  ],
}
```

```
};
```

Shared Signals Framework (SSF) and CAEP

See Section 56.4 for detailed SSF/CAEP configuration. The AGI Brain consumes CAEP signals from:

- Genesis Reactor (physical events)
- Cato SASE (network events)
- Radiant Logic (identity events)

57.4 fastWorkflow: The Logic Engine

The reliability of AI agents is secured by **fastWorkflow**, an open-source framework designed for building complex, large-scale Python applications. AI agents can sometimes be unpredictable (“hallucinations”). **fastWorkflow** provides:

Capability	Description
Robust Validation Pipeline	Every agent output is validated before execution
Deterministic Business Logic	Core decision paths are pre-programmed and immutable
Proper Error Handling	Failures are caught, logged, and escalated appropriately
Audit Logging	Every action is recorded for compliance
Reliable Tool Execution	When an agent decides to “isolate a host,” it executes correctly

This “Reliable Tool Execution” is **critical** when the agent is controlling nuclear-powered infrastructure.

fastWorkflow Configuration

```
# fastworkflow_config.py
from fastworkflow import Workflow, Task, ValidationPipeline

# Define validation pipeline for agent actions
validation_pipeline = ValidationPipeline([
    # Pre-execution validation
    ("syntax_check", lambda action: action.is_syntactically_valid()),
    ("permission_check", lambda action: action.has_required_permissions()),
    ("safety_check", lambda action: action.passes_genesis_interlock()),

    # Post-execution validation
    ("result_validation", lambda result: result.matches_expected_schema()),
    ("side_effect_check", lambda result: result.side_effects_are_acceptable()),
])

# Define deterministic safety constraints (cannot be overridden by AI)
IMMUTABLE_CONSTRAINTS = {
    "genesis_interlock": True,
    "require_human_approval_for_destructive_actions": True,
    "max_autonomous_remediations_per_hour": 100,
```

```

    "blocked_actions_during_genesis_alert": [
        "delete_identity",
        "revoke_all_access",
        "shutdown_service",
    ],
}

# Agent workflow definition
class IdentityRemediationWorkflow(Workflow):
    """Autonomous identity remediation with fastWorkflow safety"""

    @Task(validation=validation_pipeline)
    def identify_orphan_accounts(self, criteria: dict) -> list:
        """Identify orphan accounts in the Identity Fabric"""
        # Deterministic query logic
        pass

    @Task(validation=validation_pipeline, requires_approval=False)
    def remediate_orphan(self, account_id: str, reason: str) -> dict:
        """Remove orphan account (autonomous, no approval needed)"""
        # Pre-check: Genesis Interlock
        if not self.genesis_interlock_allows_action():
            raise GenesisInterlockException("Action blocked during Genesis alert")

        # Execute remediation
        pass

    @Task(validation=validation_pipeline, requires_approval=True)
    def bulk_remediation(self, account_ids: list) -> dict:
        """Bulk remediation requires human approval"""
        pass

```

57.5 Autonomous Identity Remediation

The RadiantOne platform can be configured to allow **Autonomous Remediation**. This grants AI agents the permission to fix data quality issues (e.g., orphan accounts) without human intervention.

Enabling Autonomous Remediation

Navigate to **Identity -> Remediation -> Autonomous Settings**:

```

# autonomous-remediation.config.yaml
autonomous_remediation:
    enabled: true

# Actions that can be performed without human approval
autonomous_actions:
    - action: remove_orphan_account
      conditions:
        - account_inactive_days: 90
        - no_associated_entitlements: true

```

```

    - no_recent_authentication: true
  max_per_hour: 50

- action: disable_stale_service_account
  conditions:
    - last_used_days: 180
    - not_in_critical_systems: true
  max_per_hour: 20

- action: fix_group_membership_inconsistency
  conditions:
    - source_of_truth_mismatch: true
  max_per_hour: 100

# Actions that ALWAYS require human approval
always_require_approval:
  - delete_human_account
  - revoke_admin_privileges
  - modify_genesis_access
  - bulk_operations_over_100

# Genesis Interlock integration
genesis_interlock:
  pause_during_alert_levels: [GEN-300, GEN-400, GEN-500]
  resume_automatically: true
```

57.6 The Memory Safety Imperative

The Think Tank identifies **memory safety vulnerabilities** as a specific class of defect responsible for **70% of all software vulnerabilities**. These bugs allow attackers to alter data and command systems—a catastrophic risk for a nuclear-powered AGI.

AI-Driven Code Refactoring

The agents within the RADIANT ecosystem are not just managing identity; they can actively refactor the codebase of the infrastructure itself to eliminate memory safety errors. This fulfills the Genesis mandate for flawlessness.

Unsafe Language	Safe Alternative	AI Capability
C	Rust	Automated translation of security-critical components
C++	Rust	Automated translation with human review
Assembly	Safe abstractions	Identification and encapsulation

Memory Safety Scanning Configuration

```
# memory-safety.config.yaml
memory_safety:
  enabled: true
```

```
# Automated scanning
scanning:
  schedule: daily
  targets:
    - path: /src/genesis-interface/**
      priority: critical
    - path: /src/network/**
      priority: high
    - path: /src/ai-agents/**
      priority: medium

# AI-assisted refactoring
ai_refactoring:
  enabled: true
  auto_submit_pr: true
  require_human_review: true
  target_language: rust

# Vulnerability classes to detect
vulnerability_classes:
  - buffer_overflow
  - use_after_free
  - double_free
  - null_pointer_dereference
  - integer_overflow
  - format_string_vulnerability
```

57.7 Database Tables

Table	Purpose
identity_fabric_sync_log	Sync history with identity sources
autonomous_remediation_log	Audit trail of autonomous actions
agent_activity_log	All AI agent activities
mcp_context_queries	MCP context provider queries
memory_safety_scans	Code scanning results
memory_safety_remediations	AI-assisted code fixes

57.8 Implementation Files

File	Purpose
lambda/shared/services/identity-core.service.ts	Identity Data Fabric integration

File	Purpose
lambda/shared/services/auto-resolve.ts	Autonomous remediation engine
lambda/shared/services/identity-core.service.ts	MCP context for identity
lambda/shared/services/memory-consolidation.service.ts	Code safety scanning
python/cato/agents/identity_remediation.py	Fast workflow identity agent
migrations/000_consolidated_schema.sql	Database schema
config/identity/autonomous-remediation.yaml	Remediation configuration

58. Deployment Safety & Environment Management

58.1 Overview

RADIANT uses a **three-environment architecture** (Dev, Staging, Prod) with strict safety rules to prevent accidental infrastructure damage. This section documents the **hard rules** that must never be bypassed.

58.2 Environment Architecture

Environment	AWS Profile	Purpose	CDK Watch	Approval Required
Dev	radiant-dev	Development, testing	[OK] Allowed	No
Staging	radiant-staging	Pre-production testing	FORBIDDEN	Yes
Prod	radiant-prod	Production	FORBIDDEN	Yes

58.3 Critical Safety Rule: cdk watch is DEV-ONLY

[!] **THIS RULE MUST NEVER BE IGNORED** [!]

`cdk watch --hotswap` is **ONLY** allowed in the DEV environment. It is **absolutely forbidden** for staging and production.

Why This Rule Exists

`cdk watch --hotswap` bypasses CloudFormation safety mechanisms:

Risk	Description	Impact
No Rollback	Hotswap changes cannot be rolled back automatically	Manual recovery required
State Drift	CloudFormation state doesn't match actual resources	Future deployments may fail
Inconsistent Infrastructure	Partial deployments can leave broken state	Service outages
No Change Sets	No preview of what will change	Unexpected deletions

Enforcement Points

The rule is enforced at **four independent levels**:

1. **Swift Deployer App** (apps/swift-deployer/Sources/RadiantDeployer/Services/CDKService.swift)

```
guard isHotswapAllowed(environment: environment) else {
    throw CDKError.hotswapBlockedForEnvironment(environment)
}
```

 - `deployWithHotswap()` and `startWatch()` throw errors for non-dev
 - Standard `deploy()` uses `--require-approval` broadening for staging/prod
 - **This is the primary deployment method and enforces safety automatically**
2. **CDK Entry Point** (packages/infrastructure/bin/radiant.ts)

```
if (isCdkWatch && detectedEnv !== 'dev') {
    console.error(' BLOCKED: cdk watch is FORBIDDEN...');
    process.exit(1); // Hard exit - no bypass
}
```
3. **Environment Configuration** (packages/infrastructure/lib/config/environments.ts)
 - `enableCdkWatch`: false hardcoded for staging/prod
 - `assertCdkWatchAllowed(env)` throws error for non-dev
4. **Safety Script** (scripts/cdk-safety-check.sh)
 - Pre-deploy check that blocks watch on non-dev
 - Requires typing environment name to confirm staging/prod deploys

58.4 Safe Deployment Methods

For Development (cdk watch allowed)

```
# Configure credentials
source ./scripts/setup_credentials.sh

# Start Direct Dev Mode
cd packages/infrastructure
npx cdk watch --hotswap --profile radiant-dev
```

For Staging (approval required)

```
# Option 1: Swift Deployer (recommended)
# Open Swift Deployer app -> Select Staging -> Deploy

# Option 2: CLI with approval gates
AWS_PROFILE=radiant-staging npx cdk deploy --all \
  --require-approval broadening
```

For Production (approval required)

```
# Option 1: Swift Deployer (STRONGLY recommended)
# Open Swift Deployer app -> Select Production -> Deploy

# Option 2: CLI with approval gates (use with caution)
AWS_PROFILE=radiant-prod npx cdk deploy --all \
  --require-approval broadening
```

58.5 Credential Setup

Before deploying to any environment, configure AWS credentials:

1. **Create IAM Users** in AWS Console:
 - radiant-dev-deployer
 - radiant-staging-deployer
 - radiant-prod-deployer
2. **Attach Permissions:** AdministratorAccess policy (or scoped CDK policy)
3. **Generate Access Keys** for each user
4. **Configure Profiles:**

```
# Edit the credentials script first
nano scripts/setup_credentials.sh

# Then run it
source ./scripts/setup_credentials.sh
```
5. **Bootstrap CDK** (one-time per account/region):

```
chmod +x ./scripts/bootstrap_cdk.sh
./scripts/bootstrap_cdk.sh
```

58.6 Environment Detection

The CDK entry point detects the target environment via multiple signals:

Signal	Priority	Example
RADIANT_ENV env var	1 (highest)	RADIANT_ENV=staging
CDK_CONTEXT_environment	2	-c environment=staging
AWS_PROFILE pattern	3	radiant-staging in profile name
Default	4 (lowest)	Falls back to dev

58.7 Troubleshooting

“BLOCKED: cdk watch is FORBIDDEN” Error

This error means you attempted to run `cdk watch` against a non-dev environment. This is intentional and cannot be bypassed.

Solution: Use `cdk deploy` with approval gates instead:

```
AWS_PROFILE=radiant-{env} npx cdk deploy --all --require-approval broadening
```

Wrong Environment Detected

If the wrong environment is being detected:

```
# Explicitly set the environment
export RADIANT_ENV=dev
export AWS_PROFILE=radiant-dev

# Verify
echo $RADIANT_ENV $AWS_PROFILE
```

58.8 Implementation Files

File	Purpose
apps/swift-deployer/Sources/RadiantDeployer/Services/CDKService.swift	Swift Deployer CDK service with safety enforcement
packages/infrastructure/bin/radiant.cdk	CDK entry point with safety check
packages/infrastructure/lib/config/environments	Environment configurations
scripts/setup_credentials.sh	AWS credential setup
scripts/bootstrap_cdk.sh	CDK bootstrap helper
scripts/cdk-safety-check.sh	Pre-deploy safety validation
packages/infrastructure/ARCHITECTURE.md	Stack vs Lambda architecture guide

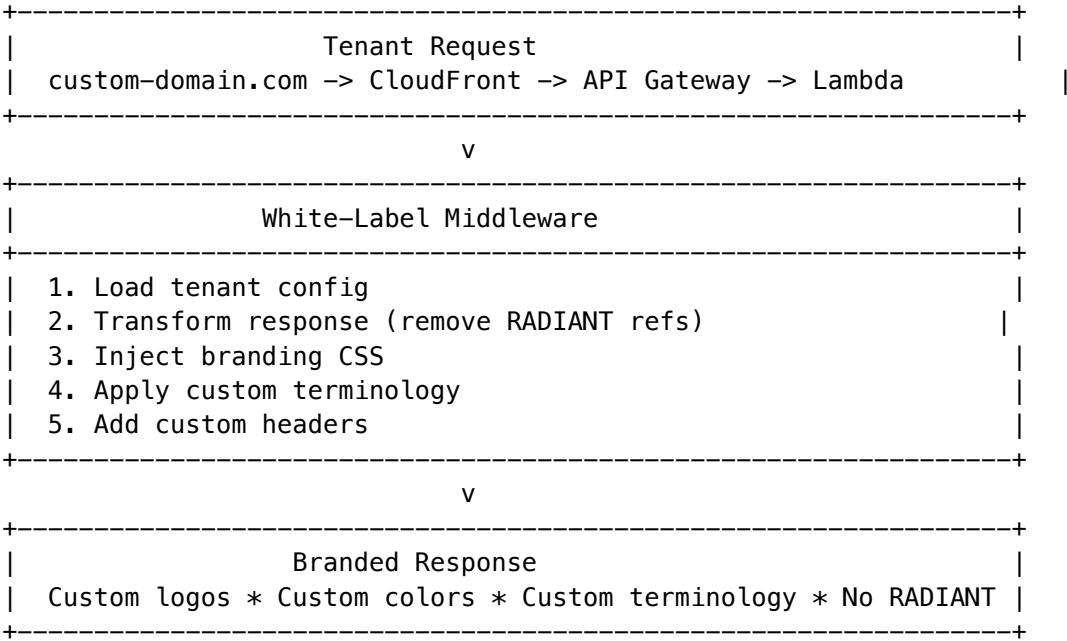

59. White-Label Invisibility (Moat #25)

Moat Evaluation: Score 18/30 - Tier 4 Business Model Moat. End users never know RADIANT exists. Infrastructure stickiness creates platform layer dependency.

59.1 Overview

White-Label Invisibility enables tenants to completely rebrand the platform so their end users never see RADIANT branding. This creates strong infrastructure stickiness—switching providers means rebuilding their entire branded experience.

59.2 Architecture

59.3 Branding Configuration

Setting	Type	Description
companyName	string	Company name displayed throughout
productName	string	Product name (replaces “Think Tank”)
tagline	string	Optional tagline
logo.primary	URL	Main logo URL
logo.light	URL	Light theme logo
logo.dark	URL	Dark theme logo
logo.icon	URL	Favicon/icon
colors.primary	hex	Primary brand color
colors.secondary	hex	Secondary color
colors.accent	hex	Accent color
fonts.primary	string	Primary font family
fonts.secondary	string	Secondary font family
fonts.mono	string	Monospace font

59.4 Feature Visibility

Control what end users can see:

Setting	Default	Description
hideRadiantBranding	true	Remove all RADIANT references
hidePoweredBy	true	Hide “Powered by RADIANT” footer
hideModelNames	false	Anonymize model names to “AI Model”
hideModelProviders	false	Remove provider info (Anthropic, OpenAI)
hideCostMetrics	false	Hide cost information from UI
hideUsageMetrics	false	Hide usage statistics
disabledFeatures	[]	Features to disable for this tenant

59.5 Custom Terminology

Replace standard terms with branded alternatives:

Default Term	Example Custom
AI Assistant	“Alex” (custom assistant name)
Conversation	“Session”
Artifact	“Creation”
Workspace	“Studio”
Team	“Organization”

59.6 Custom Domains

Adding a Custom Domain

- 1. Add domain in admin dashboard
- 2. Get DNS verification record
- 3. Add TXT record to DNS
- 4. Wait for verification (auto-checks every hour)
- 5. SSL certificate auto-provisioned via ACM
- 6. CloudFront distribution updated

Domain Types

Type	Purpose
primary	Main application domain
alias	Additional domains that redirect
api	API-specific subdomain

59.7 Email Templates

Customize all outbound emails:

Template	Purpose
welcome	New user welcome email
password_reset	Password reset link
invitation	Team invitation
notification	General notifications
billing	Billing-related emails

Each template supports: - Custom subject line - HTML template with variables - Plain text fallback - Custom from name/email

59.8 Legal Configuration

Setting	Description
companyLegalName	Legal entity name
termsOfServiceUrl	Link to ToS
privacyPolicyUrl	Link to privacy policy
cookiePolicyUrl	Link to cookie policy
supportEmail	Support contact email
copyrightNotice	Footer copyright text
customFooterHtml	Optional custom footer HTML

59.9 API Customization

Setting	Description
customBaseUrl	Custom API base URL
hideVersionHeader	Remove X-Radiant-Version header
customHeaders	Additional headers to inject
corsOrigins	Allowed CORS origins
rateLimitOverrides	Per-endpoint rate limit overrides

59.10 Response Transformation

The white-label middleware automatically transforms responses:

```
// Before transformation
{
  "model": "claude-3.5-sonnet",
  "provider": "anthropic",
  "message": "Welcome to RADIANT Think Tank!"
}
```

```

}

// After transformation (with hideModelNames + hideModelProviders)
{
  "model": "AI Model",
  "message": "Welcome to [ProductName]!"
}

```

59.11 CSS Injection

Custom CSS is automatically injected for brand consistency:

```

:root {
  --color-primary: #3B82F6;      /* From config */
  --color-secondary: #6366F1;
  --font-primary: 'Inter', sans-serif;
  /* ... all brand tokens */
}

```

59.12 API Endpoints

Endpoint	Method	Description
/api/admin/white-label/config	GET	Get configuration
/api/admin/white-label/config	POST	Create configuration
/api/admin/white-label/config	PUT	Update configuration
/api/admin/white-label/config	DELETE	Delete configuration
/api/admin/white-label/validate	POST	Validate configuration
/api/admin/white-label/domains	POST	Add domain
/api/admin/white-label/domains/:id	DELETE	Remove domain
/api/admin/white-label/domains/:domain/verify	POST	Initiate verification
/api/admin/white-label/domains/:domain/verify	GET	Check verification
/api/admin/white-label/branding	PUT	Update branding
/api/admin/white-label/features	PUT	Update feature visibility

Endpoint	Method	Description
/api/admin/white-label/legal	PUT	Update legal config
/api/admin/white-label/emails	PUT	Update email config
/api/admin/white-label/preview	GET	Generate branding preview
/api/admin/white-label/export	GET	Export configuration
/api/admin/white-label/import	POST	Import configuration
/api/admin/white-label/metrics	GET	Get usage metrics

59.13 Database Tables

Table	Purpose
white_label_config	Per-tenant configuration
white_label_domains	Custom domains
domain_verifications	DNS verification records
branding_assets	Uploaded logos, fonts, images
white_label_email_templates	Custom email templates
custom_terminology	Term mappings
white_label_metrics	Usage metrics

59.14 Implementation Files

File	Purpose
packages/shared/src/types/white-label.types.ts	Type definitions
lambda/shared/services/white-label.service.ts	Core service
lambda/admin/white-label.ts	API handler
migrations/000_consolidated_schema.sql	Database schema

59.15 Usage Example

```
import { whiteLabelService } from './services/white-label.service';

// Create white-label configuration
const config = await whiteLabelService.createConfig(tenantId, {
```

```
enabled: true,
branding: {
  companyName: 'Acme Corp',
  productName: 'Acme AI',
  logo: { primary: 'https://...', light: '...', dark: '...', icon: '...' },
  colors: { primary: '#FF5733', secondary: '#3366FF', ... },
},
features: {
  hideRadiantBranding: true,
  hidePoweredBy: true,
  hideModelNames: true,
},
legal: {
  companyLegalName: 'Acme Corporation Inc.',
  supportEmail: 'support@acme.com',
  copyrightNotice: '(C) 2026 Acme Corp',
},
});

// Add custom domain
await whiteLabelService.addDomain(tenantId, 'ai.acme.com', 'primary');

// Transform API responses
const transformedResponse = whiteLabelService.transformResponse(tenantId, originalResponse);
```

60. User Violation Enforcement System

The User Violation Enforcement System provides comprehensive tracking, escalation, and enforcement of regulatory and policy violations. This is critical for HIPAA, GDPR, and SOC2 compliance.

60.1 Overview

The system enables administrators to:

- Report and track policy/regulatory violations per user
- Configure automatic escalation policies
- Take enforcement actions (warnings through account termination)
- Process user appeals with audit trail
- Monitor high-risk users with risk scoring

60.2 Violation Categories

Category	Description	Examples
hipaa	HIPAA violations	PHI exposure, unauthorized access, sharing
gdpr	GDPR violations	Consent violations, retention issues, cross-border transfers
soc2	SOC2 violations	Security control failures
terms_of_service	ToS violations	Terms breach

Category	Description	Examples
acceptable_use	AUP violations	Misuse of platform
content_policy	Content violations	Harmful, illegal content
security	Security violations	Credential sharing, injection attempts
billing	Billing violations	Payment fraud, chargeback abuse
abuse	Platform abuse	Rate limit abuse, spam

60.3 Severity Levels

Severity	Description	Risk Score Impact
warning	Minor issue, first offense	+5
minor	Low impact violation	+10
major	Significant violation	+20
critical	Severe violation requiring immediate action	+40

60.4 Enforcement Actions

Action	Description
warning_issued	Formal warning recorded
feature_restricted	Specific features disabled
rate_limited	API/usage rate limits applied
temporarily_suspended	Account suspended for specified duration
permanently_suspended	Account permanently suspended
account_terminated	Account deleted
reported_to_authorities	Reported to regulatory authorities

60.5 Configuration

```

interface UserViolationConfig {
    enabled: boolean;           // Enable violation tracking
    autoDetectionEnabled: boolean; // Auto-detect from system events
    autoEnforcementEnabled: boolean; // Auto-apply escalation actions

    // Notifications
    notifyUserOnViolation: boolean; // Notify user when violation reported
    notifyUserOnAction: boolean; // Notify user when action taken
    notifyAdminOnCritical: boolean; // Alert admins on critical violations

```

```

adminNotificationEmails: string[];    // Admin email addresses

// Retention
retentionDays: number;                // Default: 2555 (~7 years)

// Appeals
allowAppeals: boolean;               // Allow users to appeal
appealWindowDays: number;            // Days to submit appeal (default: 30)
maxAppealsPerViolation: number;      // Max appeals per violation (default: 2)

// Compliance
requireEvidenceRedaction: boolean;   // Always redact evidence content
auditAllActions: boolean;            // Log all actions to audit trail
}

```

60.6 Escalation Policies

Configure automatic enforcement based on violation patterns:

```

interface EscalationRule {
  triggerType: 'count' | 'severity' | 'category';

  // Count-based: trigger after N violations
  violationCount?: number;
  withinDays?: number;

  // Severity-based: trigger on severity threshold
  severityThreshold?: ViolationSeverity;

  // Category-based: trigger for specific categories
  categories?: ViolationCategory[];

  // Action to take
  action: EnforcementAction;
  actionDurationDays?: number;    // For temporary actions
  requiresManualReview: boolean;  // Require admin review
  allowAppeal: boolean;           // Allow user appeal
}

```

Example Policy: - 3 warnings in 90 days -> Feature restriction - 2 major violations -> Temporary suspension (7 days) - 1 critical violation -> Immediate suspension (requires review) - Any HIPAA violation -> Immediate suspension + admin alert

60.7 API Endpoints

Base URL: /api/admin/violations

Endpoint	Method	Description
/dashboard	GET	Get dashboard data with metrics
/config	GET	Get configuration

Endpoint	Method	Description
/config	PUT	Update configuration
/violations	GET	Search violations
/violations	POST	Report new violation
/violations/:id	GET	Get violation details
/violations/:id	PUT	Update violation
/violations/:id/action	POST	Take enforcement action
/users/:userId/violations	GET	Get user's violations
/users/:userId/summary	GET	Get user violation summary
/users/:userId/suspend	POST	Suspend user
/users/:userId/reinstate	POST	Reinstate user
/appeals	GET	Get pending appeals
/appeals/:id	GET	Get appeal details
/appeals/:id/review	POST	Review appeal
/metrics	GET	Get violation metrics
/policies	GET	Get escalation policies
/policies	POST	Create escalation policy

60.8 Admin Dashboard

Access at: **Compliance -> Violations** (/compliance/violations)

Features: - **Dashboard:** Metrics cards (total, new, resolved, pending appeals, avg resolution time) - **Violations Tab:** Search/filter violations, report new, take actions - **Appeals Tab:** Review and decide on pending appeals - **High Risk Users Tab:** View users with elevated risk scores - **Settings Tab:** Configure system settings

60.9 User Appeal Process

1. User submits appeal within appeal window (default: 30 days)
2. Violation status changes to appealed
3. Admin reviews appeal
4. Decisions:
 - **Upheld:** Original action stands
 - **Overturned:** Violation dismissed, action reversed
 - **Reduced:** Lesser action applied
5. User notified of decision
6. All actions logged to audit trail

60.10 Risk Scoring

Users are assigned a risk level based on active violations:

Risk Level	Criteria
low	0-1 active violations
moderate	2+ active violations
elevated	5+ active violations
high	2+ major violations active
critical	Any critical violation active

Risk score (0-100) is calculated as sum of severity impacts for active violations.

60.11 Database Tables

Table	Purpose
user_violations	Violation records with enforcement
violation_evidence	Evidence attachments (redacted)
violation_appeals	Appeal records with review
violation_escalation_policies	Escalation policy definitions
violation_escalation_rules	Policy rules/thresholds
user_violation_config	Per-tenant configuration
user_violation_summary	Aggregated user summaries
violation_audit_log	Immutable audit trail

60.12 Implementation Files

File	Purpose
packages/shared/src/types/user-violations.types.ts	Type definitions
lambda/shared/services/user-violation.service.ts	Core service
lambda/admin/user-violations.ts	API handler
apps/admin-dashboard/app/(dashboard)/compliance/violations/page.tsx	Admin UI
migrations/000_consolidated_schema.sql	Database schema

60.13 Compliance Considerations

- **HIPAA:** 7-year retention, audit trail, PHI redaction in evidence
- **GDPR:** User notification, appeal rights, data minimization
- **SOC2:** Audit logging, access controls, incident response

61.6 Resume Token Strategy

Sessions survive connection drops via HMAC-signed resume tokens containing: - Session ID, Tenant ID, Principal ID - NATS inbox/outbox subjects - Expiry timestamp

61.7 Capacity Planning

Component	Instance	Capacity	Count for 1M
Go Gateway	c6g.xlarge	80K conn	13 instances
NATS Cluster	r6g.xlarge	N/A	3 nodes
Lambda (MCP)	1024MB	N/A	1000 concurrent

Estimated Cost: \$8,000-15,000/month for 1M connections

61.8 Admin Dashboard Controls

The Gateway admin interface provides comprehensive monitoring and configuration:

Dashboard Overview (/gateway) - Real-time connection count and peak connections - Messages per minute throughput - Average latency with warning thresholds - Error rate monitoring - Active instance count

Statistics & Reporting - 5-minute bucketed statistics stored persistently - Hourly and daily aggregated views - Protocol distribution (MCP, A2A, OpenAI, Anthropic, Google) - 24-hour trend visualization

Configuration Controls - Connection limits (per tenant, per user, per agent) - Rate limits (messages/second, bytes/second) - Timeout settings (connect, idle, read, write) - Protocol enable/disable toggles - mTLS enforcement for A2A - Resume token TTL configuration

Maintenance Mode - Enable/disable with custom message - IP allowlist for maintenance bypass - Graceful connection draining

Alert Management - Severity levels: info, warning, critical - Alert types: connection_limit, rate_limit, error_spike, latency_spike, instance_unhealthy - Acknowledge and resolve workflows - Resolution notes tracking

Instance Management - View all gateway instances with status - Drain instances gracefully - Monitor per-instance metrics

API Endpoints (/api/admin/gateway) | Endpoint | Method | Purpose | | — — — | — — — | — — — | | /dashboard | GET | Overview metrics and alerts | | /statistics | GET | Time-series statistics | | /configuration | GET/PUT | View/update configuration | | /maintenance | POST | Set maintenance mode | | /alerts | GET | List alerts | | /alerts/:id/acknowledge | POST | Acknowledge alert | | /alerts/:id/resolve | POST | Resolve alert | | /sessions | GET | List active sessions | | /sessions/:id/terminate | POST | Terminate session | | /instances | GET | List gateway instances | | /instances/:id/drain | POST | Drain instance |

61.9 Database Schema

Tables Created: - gateway_instances - Instance registry with heartbeat tracking - gateway_statistics - Time-series metrics (5-minute buckets) - gateway_configuration - Per-tenant and global settings - gateway_alerts - Alert and incident tracking - gateway_sessions - Active connection tracking - gateway_audit_log - Admin action audit trail

Report Types Added: - gateway-statistics - Connection and message statistics - gateway-alerts - Alert summary report

61.10 Implementation Files

File	Purpose
apps/gateway/	Go Gateway service (16 files)
apps/gateway/internal/server/tls.go	TLS/mTLS configuration
services/egress-proxy/	HTTP/2 connection pool
infrastructure/cedar/schema.cedarschema	Cedar entity/action schema
infrastructure/cedar/policies/	Authorization policies
lambda/shared/services/cedar/	Cedar TypeScript service
packages/infrastructure/lambda/gateway/	API NATS consumer Lambda worker.ts
packages/infrastructure/lambda/admin/gateway-admin	Gateway admin API Lambda
packages/infrastructure/__tests__/gateway/	Gateway integration tests
migrations/000_consolidated_schema.sql	Statistics schema
apps/admin-	Admin dashboard UI
dashboard/app/(dashboard)/gateway/page.tsx	
apps/thinktank-	Think Tank status view
admin/app/(dashboard)/gateway/page.tsx	
infrastructure/docker/gateway/	Local dev stack
infrastructure/load-tests/	k6 load testing scripts
packages/infrastructure/lib/stacks/gateway/	CI/CD deployment stack.ts

61.11 Documentation Reference

For complete architecture details, see: - **MULTI-PROTOCOL-GATEWAY-ARCHITECTURE.md** - Full technical specification

Section 62: Code Quality & Test Coverage Visibility

62.1 Overview

The Code Quality dashboard provides real-time visibility into: - **Test Coverage**: Line, function, and branch coverage by component - **Technical Debt**: Tracking items aligned with TECHNICAL_DEBT.md - **JSON Safety Migration**: Progress migrating JSON.parse to safe utilities - **Code Quality Alerts**: Automated alerts for coverage drops and regressions

62.2 Admin Dashboard

Location: /code-quality

The Code Quality page provides: - **Summary Cards**: Overall coverage %, open debt items, JSON safety progress, active alerts - **Coverage by Component**: Breakdown for lambda, admin-dashboard, swift-deployer - **Technical Debt Table**: Prioritized list with status, estimated hours - **JSON Safety Progress**: Migration status per component with progress bars - **Alerts Tab**: Active code quality alerts with acknowledge/resolve actions

62.3 API Endpoints

Base Path: /api/admin/code-quality

Endpoint	Method	Purpose
/dashboard	GET	Overview metrics and summary
/coverage	GET	Latest coverage by component
/coverage/history	GET	Coverage trend over time
/debt	GET	List technical debt items
/debt/:id	PUT	Update debt item status
/json-safety	GET	JSON migration progress
/json-safety/locations	GET	List JSON.parse locations
/alerts	GET	List code quality alerts
/alerts/:id/acknowledge	POST	Acknowledge an alert
/alerts/:id/resolve	POST	Resolve an alert
/files-needing-tests	GET	Files that need test coverage

62.4 Database Schema

Tables Created (Migration V2026_01_20_002__code_quality_metrics.sql):

Table	Purpose
code_quality_snapshots	Periodic snapshots of coverage/quality metrics
test_file_registry	Registry of source files and test status
json_parse_locations	Tracking JSON.parse for migration
technical_debt_items	Debt items aligned with TECHNICAL_DEBT.md
code_quality_alerts	Alerts for quality regressions

Views: - v_latest_test_coverage - Latest coverage per component - v_json_safety_progress - JSON migration progress - v_technical_debt_summary - Debt summary by priority

62.5 Report Integration

The reporting system includes a code_quality report type:

```
const report = await reportGeneratorService.generateReport({
  id: 'code-quality-report',
  tenant_id: tenantId,
```

```
name: 'Code Quality Report',
report_type: 'code_quality',
format: 'pdf',
parameters: {},
recipients: ['admin@example.com'],
});
```

Report Sections: 1. Test Coverage by Component 2. Technical Debt Items 3. JSON Safety Migration Progress

62.6 Safe JSON Utilities

Located in `lambda/shared/utils/safe-json.ts`:

Function	Purpose
<code>safeJsonParse(json, fallback?)</code>	Parse with optional fallback
<code>parseJsonWithSchema(json, schema)</code>	Parse with Zod validation
<code>parseJsonWithSchemaOrThrow(json, schema)</code>	Parse or throw typed error
<code>parseEventBody(body, schema?)</code>	Parse API Gateway body
<code>parseJsonField(value, fallback?)</code>	Parse nested DB fields
<code>safeJsonStringify(value)</code>	Stringify with circular ref handling

62.7 Implementation Files

File	Purpose
<code>lambda/admin/code-quality.ts</code>	Admin API handler
<code>lambda/shared/utils/safe-json.ts</code>	Safe JSON utilities
<code>migrations/000_consolidated_schema.sql</code>	Database schema
<code>apps/admin-dashboard/app/(dashboard)/code-quality/page.tsx</code>	Radiant dashboard
<code>apps/admin-dashboard/app/(dashboard)/code-quality/page.tsx</code>	Think Tank dashboard

Section 63: The Sovereign Mesh (PROMPT-36)

63.1 Overview

“Every Node Thinks. Every Connection Learns. Every Workflow Assembles Itself.”

The Sovereign Mesh introduces parametric AI assistance at every node level. Each Method, Agent, Service, and Connector can independently use AI to: - **Disambiguate** unclear inputs - **Infer** missing parameters - **Recover** from errors intelligently - **Validate** before execution - **Explain** what was done

63.2 The Four Node Types

Type	Purpose	AI Capability
Methods	Deterministic reasoning, judging, transforming	Disambiguate, explain decisions
Agents	Goal-oriented work with OODA loops	Full reasoning, sub-task spawning
Services	Actions in external systems (3,000+ apps)	Infer params, recover errors, validate
Libraries	Local code execution	Generate code, explain transformations

63.3 Agent Registry

Location: /sovereign-mesh/agents

Built-in agents with OODA-loop execution:

Agent	Category	Description	HITL
Research Agent	research	Web research and information synthesis	No
Coding Agent	coding	Code writing, debugging, refactoring	No
Data Analysis Agent	data	Dataset analysis and visualization	No
Lead Generation Agent	outreach	Prospect research and list building	Yes
Editor Agent	creative	Content review and improvement	No
Automation Agent	operations	Multi-step workflow execution	No

63.4 AI Helper Service

Parametric configuration for each component:

```
interface AIHelperConfig {
  enabled: boolean;
  disambiguation: { enabled: boolean; model: string; confidenceThreshold: number };
  parameterInference: { enabled: boolean; model: string; examples: array };
  errorRecovery: { enabled: boolean; model: string; maxAttempts: number };
  validation: { enabled: boolean; model: string; checks: array };
  explanation: { enabled: boolean; model: string };
}
```

63.5 App Registry

3,000+ app integrations from Activepieces and n8n with AI enhancement layer.

Daily Sync: Definitions synced at 2 AM UTC **Health Checks:** Top 100 apps checked hourly

63.6 HITL Approval Queues

Human-in-the-loop approval for high-stakes decisions: - **Agent Plan Approval**: Review agent execution plans - **High Cost Approval**: Operations exceeding cost thresholds - **Safety Review**: Operations flagged by safety evaluation

SLA Monitoring: Every minute with automatic escalation

63.7 Transparency Layer

Complete Cato decision visibility: - Decision events with reasoning chains - War Room deliberation capture (phase-by-phase) - Pre-computed explanations (summary, standard, detailed, audit tiers) - Decision feedback and learned patterns

63.8 Execution History & Replay

Time-travel debugging capabilities: - Step-by-step state snapshots - Replay sessions with modified inputs - Execution diffs and divergence detection - Bookmarks and annotations

63.9 API Endpoints

Base Path: /api/admin/sovereign-mesh

Endpoint	Method	Purpose
/dashboard	GET	Overview metrics
/agents	GET/POST	List/create agents
/agents/:id	GET/PUT/DELETE	Agent management
/executions	GET/POST	List/start executions
/executions/:id/cancel	POST	Cancel execution
/executions/:id/resume	POST	Resume paused execution
/apps	GET	List apps (3,000+)
/apps/:id	GET	App details
/apps/:id/ai-config	PUT	Update AI enhancements
/connections	GET	List OAuth connections
/decisions	GET	List Cato decisions
/decisions/:id/war-room	GET	War Room deliberations
/approvals	GET	List pending approvals
/approvals/:id/approve	POST	Approve request
/approvals/:id/reject	POST	Reject request
/ai-helper/config	GET/PUT	AI Helper configuration
/ai-helper/usage	GET	Usage statistics

63.10 Database Schema

Migrations (V2026_01_20_003 through V2026_01_20_010):

Table	Purpose
agents	Agent registry with AI helper config
agent_executions	OODA execution state
agent_iteration_logs	Detailed iteration tracking
apps	3,000+ app registry
app_connections	OAuth/API credentials
app_learned_inferences	AI learning loop
ai_helper_calls	Usage tracking
ai_helper_cache	Response caching
ai_helper_config	System/tenant configuration
workflow_blueprints	Pre-flight provisioning
capability_checks	Capability verification
cato_decision_events	Decision transparency
cato_war_room_deliberations	War Room capture
hitl_queue_configs	Approval queue setup
hitl_approval_requests	Approval requests
execution_snapshots	Time-travel debugging
replay_sessions	Replay/what-if analysis

Section 64: HITL Orchestration Enhancements

64.1 Overview

Advanced Human-in-the-Loop orchestration implementing industry best practices for intelligent question manage-
ment.

Philosophy: “Ask only what matters. Batch for convenience. Never interrupt needlessly.”

64.2 Core Features

Feature	Description
SAGE-Agent Bayesian VOI	Value-of-Information calculation to determine question necessity
MCP Elicitation Schema	Standardized question/response formats
Question Batching	Three-layer batching (time-window, correlation, semantic)
Rate Limiting	Global (50 RPM), per-user (10 RPM), per-workflow (5 RPM)
Abstention Detection	Output-based uncertainty detection for external models
Question Deduplication	TTL cache with fuzzy matching
Escalation Chains	Configurable multi-level escalation paths
Two-Question Rule	Max 2 clarifications per workflow

64.3 SAGE-Agent Bayesian VOI

The VOI service calculates whether asking a question provides enough expected value:

$VOI = Expected_Information_Gain - Ask_Cost$
 $Decision = VOI > Threshold ? "ask" : "skip_with_default"$

Key Metrics: - Prior entropy calculation using Shannon entropy - Expected posterior entropy estimation - Ask cost
based on urgency and workflow type - Decision improvement impact weighting

64.4 Question Types (MCP Elicitation)

Type	Description
yes_no	Binary true/false question
single_choice	Select one from options
multiple_choice	Select multiple from options
free_text	Open-ended text response

Type	Description
numeric	Numeric value input
date	Date selection
confirmation	Explicit confirmation
structured	JSON schema-validated response

64.5 Abstention Detection Methods

For external models (no internal state access):

Method	Description
Confidence Prompting	Ask model to rate confidence 0-100
Self-Consistency	Sample N responses, measure agreement
Semantic Entropy	Cluster outputs, high entropy = uncertain
Refusal Detection	Detect hedging language patterns

Future: Linear probe abstention for self-hosted models via inference wrappers.

64.6 Rate Limiting Configuration

Scope	Requests/Min	Concurrent	Burst
Global	50	20	10
Per User	10	3	2
Per Workflow	5	2	1

64.7 Admin API Endpoints

Base: /api/admin/hitl-orchestration

Endpoint	Method	Description
/dashboard	GET	Complete dashboard data
/voi/statistics	GET	VOI decision statistics
/abstention/config	GET/PUT	Abstention settings
/abstention/statistics	GET	Abstention event stats
/batching/statistics	GET	Batch metrics
/rate-limits	GET	Rate limit configs
/rate-limits/:scope	PUT	Update rate limit
/escalation-chains	GET/POST	Manage escalation chains

Endpoint	Method	Description
/deduplication/statistics	GET	Cache statistics
/deduplication/invalidate	POST	Invalidate cache entries

64.8 Admin Dashboard

Location: /hitl-orchestration

Tabs: - **Overview:** Key metrics, VOI breakdown, abstention reasons - **Value of Information:** SAGE-Agent VOI statistics - **Abstention Detection:** Detection methods, model statistics - **Question Batching:** Batching strategies and metrics - **Rate Limits:** Configuration table - **Settings:** Threshold configuration

64.9 Database Tables

Table	Purpose
hitl_question_batches	Question batch records
hitl_rate_limits	Rate limit configuration
hitl_question_cache	Deduplication cache
hitl_voi_aspects	VOI aspect tracking
hitl_voi_decisions	VOI decision records
hitl_abstention_config	Abstention settings
hitl_abstention_events	Abstention event log
hitl_escalation_chains	Escalation chain configuration

64.10 Implementation Files

Services: | File | Purpose | |—|—|—| | lambda/shared/services/hitl-orchestration/mcp-elicitation.service.ts | Main orchestration | | lambda/shared/services/hitl-orchestration/voi.service.ts | Bayesian VOI | | lambda/shared/services/hitl-orchestration/abstention.service.ts | Uncertainty detection | | lambda/shared/services/hitl-orchestration/batching.service.ts | Question batching | | lambda/shared/services/hitl-orchestration/rate-limiting.service.ts | Rate limits | | lambda/shared/services/hitl-orchestration/deduplication.service.ts | Answer caching | | lambda/shared/services/hitl-orchestration/escalation.service.ts | Escalation chains |

64.11 Semantic Deduplication (v5.34.0)

Enhanced question deduplication using pgvector embeddings for semantic similarity matching.

How It Works: 1. Questions are embedded using AI (1536-dimensional vectors) 2. Similar questions found via HNSW index cosine similarity search 3. Falls back to fuzzy matching if embeddings unavailable

Configuration:

Setting	Default	Description
enableSemanticMatching	false	Enable pgvector semantic search
semanticSimilarityThreshold	0.85	Minimum cosine similarity (0.0-1.0)
maxSemanticCandidates	20	Max candidates to check

API Endpoints:

Endpoint	Method	Description
/semantic-deduplication/config	GET	Get semantic config
/semantic-deduplication/config	PUT	Update semantic config
/semantic-deduplication/stats	GET	Match statistics (24h)
/semantic-deduplication/backfill	POST	Trigger embedding backfill

Dashboard Tab: “Deduplication” in HITL Orchestration admin

Match Statistics: - Exact matches (hash-based) - Fuzzy matches (Jaccard similarity) - Semantic matches (pgvector cosine) - Questions with embeddings count - Average semantic similarity score

64.12 Scout HITL Integration (v5.34.0)

Bridges Cato’s Scout persona (epistemic uncertainty mode) with HITL orchestration for intelligent clarification.

Flow: 1. Scout persona activates due to epistemic uncertainty 2. ScoutHITLIntegration generates prioritized clarification questions 3. Questions filtered through VOI scoring 4. High-VOI questions go to HITL, low-VOI get assumptions 5. Responses reduce uncertainty, allowing Scout to proceed

Domains: - medical - HIPAA-sensitive, safety-critical - financial - SOC2/PCI compliance - legal - Regulatory compliance - bioinformatics - Research accuracy - general - Default domain

Aspect Impact Scores:

Aspect	Base Impact	Domain Boosts
safety	0.95	medical, bioinformatics
compliance	0.90	medical, financial, legal

Aspect	Base Impact	Domain Boosts
irreversible	0.85	(all)
cost	0.80	financial
accuracy	0.75	medical, legal, bioinformatics
timeline	0.60	(none)

API Endpoints (Cato Admin):

Base: /api/admin/cato

Endpoint	Method	Description
/scout-hitl/config	GET	Get Scout HITL config
/scout-hitl/config	PUT	Update config
/scout-hitl/sessions	GET	Recent clarification sessions
/scout-hitl/statistics	GET	Session statistics
/scout-hitl/domain-boosts	GET	Aspect domain boosts
/scout-hitl/domain-boosts	PUT	Update domain boosts

Dashboard: Cato -> Scout HITL**Configuration:**

Setting	Default	Description
enabled	true	Enable Scout HITL integration
voiThreshold	0.3	Minimum VOI to ask question
maxQuestionsPerSession	3	Max clarifications before assuming
defaultDomain	general	Fallback domain

Session Recommendations: - proceed - Uncertainty resolved sufficiently - wait - Still uncertain, user should wait
 - abort - Critical uncertainty, cannot proceed safely

64.13 Flyte HITL Task Wrappers (v5.34.0)

Python task wrappers for easy HITL integration in Flyte workflows.

Available Functions:

```
from radiant_flyte.utils import (
    ask_confirmation,
    ask_choice,
    ask_batch,
    ask_free_text,
)
```

```

# Confirmation (yes/no)
approved = await ask_confirmation(
    question="Deploy to production?",
    context={"environment": "prod"},
    timeout_seconds=300
)

# Single choice
selected = await ask_choice(
    question="Select deployment strategy",
    options=["rolling", "blue-green", "canary"],
    default="rolling"
)

# Batch questions
responses = await ask_batch([
    {"question": "Confirm rollback?", "type": "yes_no"},
    {"question": "Reason", "type": "free_text"},
])

# Free text
reason = await ask_free_text(
    question="Describe the issue",
    max_length=500
)

```

65. RAWS v1.1 - Model Selection System

RAWS (RADIANT AI Weighted Selection) provides intelligent real-time model selection using 8-dimension scoring across 13 weight profiles and 7 domains.

65.1 Overview

Component	Count	Description
Dimensions	8	Quality, Cost, Latency, Capability, Reliability, Compliance, Availability, Learning
Profiles	13	4 Optimization + 6 Domain + 3 SOFAI
Domains	7	Healthcare, Financial, Legal, Scientific, Creative, Engineering, General
Models	106+	50 external APIs + 56 self-hosted

65.2 Weight Profiles

Profile	Category	Primary Focus	Compliance
BALANCED	Optimization	Default, general purpose	-
QUALITY_FIRST	Optimization	Maximum accuracy	-
COST_OPTIMIZED	Optimization	Budget-conscious	-
LATENCY_CRITICAL	Optimization	Real-time applications	-
HEALTHCARE	Domain	Medical/clinical	HIPAA required
FINANCIAL	Domain	Finance/investment	SOC 2 required
LEGAL	Domain	Contracts/litigation	SOC 2 required
SCIENTIFIC	Domain	Research/academic	Optional
CREATIVE	Domain	Content/marketing	None
ENGINEERING	Domain	Code/software	Optional
SYSTEM_1	SOFAI	Fast, simple queries	-
SYSTEM_2	SOFAI	Complex reasoning	-
SYSTEM_2_5	SOFAI	Maximum reasoning	-

65.3 Domain Compliance Matrix

Domain	Required	Optional	Truth Engine	ECD Threshold
healthcare	HIPAA	FDA 21 CFR Part 11	Required	0.05
financial	SOC 2 Type II	PCI-DSS, GDPR, SOX	Required	0.05
legal	SOC 2 Type II	GDPR, State Bar	Required	0.05
scientific	None	FDA 21 CFR, GLP, IRB	Optional	0.08
creative	None	FTC Guidelines	Not Required	0.20
engineering	None	SOC 2, ISO 27001, NIST	Optional	0.10
general	None	None	Not Required	0.10

65.4 Admin API Endpoints

Base: /api/admin/raws

Endpoint	Method	Description
/select	POST	Select optimal model
/profiles	GET	List all 13 weight profiles
/profiles	POST	Create custom profile
/models	GET	List available models
/domains	GET	List 7 domain configurations
/detect-domain	POST	Test domain detection

Endpoint	Method	Description
/health	GET	Provider health status
/audit	GET	Selection audit log

65.5 CLI Commands

```
# Profiles
radiant-cli raws profiles list --env production
radiant-cli raws profiles get HEALTHCARE --env production

# Domains
radiant-cli raws domains list --env production
radiant-cli raws domains get healthcare --env production

# Compliance
radiant-cli raws compliance summary --env production
radiant-cli raws models list --compliance HIPAA --env production

# Audit
radiant-cli raws audit search --domain healthcare --last 24h --env production
```

65.6 Detailed Documentation

Document	Purpose
RAWS-ENGINEERING.md	Technical reference for engineers
RAWS-ADMIN-GUIDE.md	Operations and compliance guide
RAWS-USER-GUIDE.md	API guide for developers

65.7 Key Files

File	Purpose
migrations/000_consolidated_schema.sql	Database schema
lambda/shared/services/raws/types.ts	TypeScript types
lambda/shared/services/raws/domain-detector.service.ts	Domain detection
lambda/shared/services/raws/weight-profile.service.ts	Profile management
lambda/shared/services/raws/selection-main-selection.ts	Main selection logic
lambda/admin/raws.ts	Admin API handler

66. Sovereign Mesh Performance Optimization

The Sovereign Mesh Performance system provides comprehensive monitoring, configuration, and optimization for autonomous agent execution at scale. It enables administrators to tune Lambda concurrency, caching strategies, tenant isolation, and alert thresholds.

66.1 Overview

Component	Description
SQS Dispatcher	Actual message dispatch for OODA loop iterations
Redis Cache	Agent/execution state caching for reduced DB load
Performance Config	Per-tenant configuration with defaults
Artifact Archival	S3/hybrid storage for completed execution artifacts
Rate Limiting	Per-tenant and per-user concurrency limits

66.2 Architecture

66.3 Admin Dashboard

Navigate to **Sovereign Mesh -> Performance** in the Admin Dashboard.

Overview Tab

- **Health Score:** 0-100 composite health metric
- **Active/Pending Executions:** Real-time counts
- **Queue Metrics:** Messages pending, in-flight, DLQ
- **Cache Hit Rate:** Redis/memory cache performance
- **OODA Phase Timing:** Per-phase latency breakdown
- **Cost Estimate:** Monthly Lambda/SQS projections

Scaling Tab

Setting	Default	Range	Description
Max Concurrency	50	1-200	SQS event source concurrency
Provisioned Concurrency	5	0-50	Pre-warmed Lambda instances
Memory (MB)	2048	512-4096	Lambda memory allocation
Isolation Mode	shared	shared/dedicated/fifo	Tenant queue isolation
Max Per Tenant	50	1-100	Concurrent executions per tenant
Max Per User	10	1-25	Concurrent executions per user

Caching Tab

- **Backend:** memory (Lambda-local) or redis (ElastiCache)
- **Hit Rate:** Target >80% for optimal performance
- **Cache Actions:** Clear tenant cache, view statistics

Alerts Tab

Alert Type	Default Threshold	Description
DLQ Threshold	10 messages	Alert when DLQ exceeds threshold
Latency Threshold	30 seconds	Alert on slow executions
Budget Threshold	80%	Alert on budget exhaustion

Recommendations Tab

AI-generated performance recommendations with one-click apply: - Increase concurrency when utilization is high - Improve cache hit rate suggestions - Memory optimization recommendations

66.4 Configuration API

Base: /api/admin/sovereign-mesh/performance

Endpoint	Method	Description
/dashboard	GET	Get complete dashboard data
/config	GET	Get current configuration
/config	PUT/PATCH	Update configuration
/recommendations	GET	Get AI recommendations
/recommendations/:id/apply	POST	Apply a recommendation
/alerts	GET	List active alerts

Endpoint	Method	Description
/alerts/:id/acknowledge	POST	Acknowledge alert
/alerts/:id/resolve	POST	Resolve alert
/cache/stats	GET	Get cache statistics
/cache	DELETE	Clear tenant cache
/queue/metrics	GET	Get queue metrics
/health	GET	Health check

66.5 Database Tables

Table	Purpose
sovereign_mesh_performance_config	Per-tenant performance settings
sovereign_mesh_performance_alerts	Active and historical alerts
sovereign_mesh_performance_metrics	Time-series metrics (BRIN indexed)
sovereign_mesh_artifact_archives	Archived execution artifacts
sovereign_mesh_tenant_queues	Dedicated tenant queue mappings
sovereign_mesh_rate_limits	Rate limiting window counters
sovereign_mesh_config_history	Configuration change audit trail

66.6 Performance Indexes

The migration adds optimized indexes for common query patterns:

-- Fast tenant+status queries

```
CREATE INDEX idx_agent_executions_tenant_status ON agent_executions(tenant_id, status);
```

-- Fast agent+status queries

```
CREATE INDEX idx_agent_executions_agent_status ON agent_executions(agent_id, status);
```

-- Time-based queries

```
CREATE INDEX idx_agent_executions_created_at ON agent_executions(created_at DESC);
```

-- Partial index for running executions only

```
CREATE INDEX idx_agent_executions_running ON agent_executions(tenant_id, started_at)
WHERE status = 'running';
```

-- BRIN index for time-series metrics

```
CREATE INDEX idx_perf_metrics_tenant_time ON sovereign_mesh_performance_metrics
USING BRIN (tenant_id, metric_time);
```

66.7 Lambda Configuration

Production-optimized Lambda settings:

Setting	Value	Rationale
Memory	2048 MB	Complex OODA loop processing
Timeout	15 minutes	Long-running agent executions
Reserved Concurrency	100	Guaranteed capacity
Provisioned Concurrency	5	Eliminate cold starts
SQS Batch Size	1	OODA loop atomicity
SQS Max Concurrency	50	High throughput

66.8 Artifact Archival

Configure artifact archival for cost optimization:

Setting	Default	Description
Storage Backend	hybrid	database (small), s3 (large)
Archive After Days	7	Days until archival
Delete After Days	90	Days until deletion (0=never)
Max DB Bytes	65536	Threshold for S3 (64KB)
Compression	gzip	Compression algorithm

66.9 Rate Limiting

Built-in rate limiting protects against runaway executions:

```
-- Check if execution allowed
SELECT * FROM can_start_execution(:tenant_id, :user_id);

-- Returns: allowed, reason, current_count, max_allowed
```

66.10 Key Files

File	Purpose
packages/shared/src/types/sovereign-mesh-performance.types.ts	TypeScript types
migrations/000_consolidated_schema.sql	Database schema
lambda/shared/services/sovereign-mesh/sqs-dispatcher.service.ts	SQS message dispatch
lambda/shared/services/sovereign-mesh/redis-cache.service.ts	Redis/memory caching
lambda/shared/services/sovereign-mesh/performance-config.service.ts	Configuration management

File	Purpose
lambda/shared/services/sovereign-mesh/artifact-archival.service.ts	S3 archival
lambda/admin/sovereign-mesh-performance.ts	Admin API handler
apps/admin-dashboard/app/(dashboard)/sovereign-mesh/performance/page.tsx	Admin UI

66.11 Troubleshooting

Issue	Cause	Solution
High DLQ count	Processing failures	Check CloudWatch logs, increase timeout
Low cache hit rate	Cold starts, small TTL	Increase TTL, enable cache warming
Slow executions	Memory constraints	Increase Lambda memory
Rate limit errors	Too many concurrent	Increase per-tenant limits
Queue backlog	Insufficient concurrency	Increase maxConcurrency

67. Infrastructure Scaling (100 to 500K Sessions)

Comprehensive infrastructure scaling system enabling seamless growth from development (100 sessions) to enterprise scale (500,000+ concurrent sessions) with real-time cost visibility.

67.1 Scaling Tiers

Tier	Target Sessions	Monthly Cost	Use Case
Development	100	~\$70	Testing, development, POC
Staging	1,000	~\$500	Pre-production testing
Production	10,000	~\$5,000	Standard production workloads
Enterprise	500,000	~\$68,500	Global scale, multi-region

67.2 Admin Dashboard

Navigate to **Sovereign Mesh -> Scaling** in the Admin Dashboard.

Overview Tab

- **Active Sessions:** Real-time count with utilization gauge
- **Peak Sessions:** Today, week, and month peaks
- **Bottleneck Indicator:** Current limiting component
- **Cost per Session:** Real-time cost efficiency metric
- **Component Health:** Status of Lambda, Aurora, Redis, API Gateway, SQS

Sessions Tab

- **Session Capacity:** Current vs maximum with headroom
- **Session Statistics:** Historical counts and averages
- **Capacity by Component:** Per-component session limits

Infrastructure Tab

- **Lambda Configuration:** Reserved/provisioned concurrency, memory, timeout
- **Aurora Configuration:** ACU range, read replicas, global database
- **Redis Configuration:** Node type, shards, cluster mode
- **API Gateway Configuration:** Rate limits, CloudFront

Cost Tab

- **Cost Breakdown:** Per-component monthly costs with progress bars
- **Cost Metrics:** Cost per session, per 1000 sessions, annual estimate
- **Component Costs:** Lambda, Aurora, Redis, API Gateway, SQS, CloudFront, Data Transfer

Scale Tab

- **Quick Scale:** One-click tier selection with instant apply
- **Scaling Comparison:** Cost delta between tiers
- **What Changes:** Detailed list of infrastructure modifications

67.3 Scaling Profiles

Each scaling tier configures multiple components:

Development (Scale-to-Zero)

Lambda:	0 provisioned, 10 max concurrent, 1024 MB
Aurora:	0.5–2 ACU, 0 replicas, no global
Redis:	cache.t4g.micro, 1 shard, no cluster
API:	100 RPS, no CloudFront
SQS:	2 standard queues

Staging

Lambda:	0 provisioned, 50 max concurrent, 2048 MB
Aurora:	1–8 ACU, 1 replica, no global
Redis:	cache.t4g.small, 1 shard, 1 replica
API:	1,000 RPS, no CloudFront

SQS: 5 standard, 2 FIFO queues

Production

Lambda: 5 provisioned, 200 max concurrent, 2048 MB

Aurora: 4–64 ACU, 2 replicas, PgBouncer

Redis: cache.r6g.large, 1 shard, 2 replicas

API: 10,000 RPS, CloudFront enabled

SQS: 10 standard, 5 FIFO queues

Enterprise (500K)

Lambda: 100 provisioned, 1000 max concurrent, 3072 MB

Aurora: 16–256 ACU, 3 replicas, Global Database (5 regions)

Redis: cache.r6g.xlarge, 10 shards, 2 replicas, cluster mode

API: 100,000 RPS, CloudFront, 5 regional endpoints

SQS: 50 standard, 50 FIFO queues

67.4 Cost Calculation

Real-time cost estimation based on AWS pricing:

Component	Pricing Model	Example (Production)
Lambda Provisioned	\$0.000004167/GB-second	5 x 2GB x 24h x 30d = ~\$360/mo
Aurora ACU	\$0.12/ACU-hour	34 avg ACU x 24h x 30d = ~\$2,900/mo
Redis	\$0.182/hour (r6g.large)	3 nodes x 24h x 30d = ~\$390/mo
API Gateway	\$1.00/million requests	10% of 10K RPS = ~\$260/mo
SQS	\$0.40/million standard	15 queues x 1M = ~\$6/mo
CloudFront	\$0.085/GB + \$0.01/10K req	~\$500/mo
Data Transfer	\$0.02/GB inter-region	~\$200/mo (global)

67.5 Session Capacity Calculation

Maximum concurrent sessions is limited by the bottleneck component:

Lambda Max = maxConcurrency x 10 sessions/concurrent

Aurora Max = connectionPoolSize x 50 sessions/connection

Redis Max = maxConnections

API Gateway Max = throttlingRateLimit

Effective Max = MIN(Lambda, Aurora, Redis, API Gateway)

67.6 Auto-Scaling Rules

Configure automatic scaling based on metrics:

Metric	Condition	Action
session_count > 80% capacity	Duration: 5 min	Scale up
session_count < 20% capacity	Duration: 30 min	Scale down
cpu_utilization > 70%	Duration: 5 min	Increase concurrency
latency_p99 > 5000ms	Duration: 2 min	Increase memory
queue_depth > 1000	Duration: 1 min	Scale out workers

67.7 Scheduled Scaling

Pre-configure scaling for predictable patterns:

```
# Scale up for business hours (PST)
0 6 * * MON-FRI -> Production tier
# Scale down after hours
0 18 * * MON-FRI -> Staging tier
# Minimal on weekends
0 0 * * SAT -> Development tier
```

67.8 API Endpoints

Base: /api/admin/sovereign-mesh/scaling

Endpoint	Method	Description
/dashboard	GET	Complete scaling dashboard
/profiles	GET	List all profiles
/profiles/active	GET	Get active profile
/profiles	POST	Create new profile
/profiles/:id	PUT	Update profile
/profiles/:id/apply	POST	Apply profile
/sessions	GET	Session metrics
/sessions/capacity	GET	Capacity info
/sessions/trends	GET	Historical trends
/cost	GET	Current cost estimate
/cost/estimate	POST	Estimate custom config
/operations	GET	Recent operations
/alerts	GET	Active alerts
/health	GET	Component health
/presets	GET	Available presets
/presets/:tier/apply	POST	Apply preset tier

67.8.1 Cost Analytics Integration

Infrastructure scaling costs are integrated into the AWS Cost Monitoring service and appear as a **line item group** in the Cost Analytics page.

Endpoint: GET /api/admin/costs/infrastructure-scaling

Response:

```
{
  "scalingCosts": {
    "groupName": "Infrastructure Scaling",
    "totalCost": 5234.56,
    "estimatedMonthlyCost": 5000.00,
    "tier": "production",
    "targetSessions": 10000,
    "costPerSession": 0.5234,
    "lineItems": [
      {
        "component": "Aurora",
        "description": "Serverless v2 (4-64 ACU, 2 replicas)",
        "baseCost": 2916.00,
        "usageCost": 0,
        "totalCost": 2916.00,
        "unit": "ACU-hour",
        "quantity": 24336,
        "pricePerUnit": 0.12,
        "percentage": 55.7

  }
}
```

Line Item Components: | Component | Description | Pricing Model | |---|---|---| | **Lambda** | Provisioned concurrency | \$0.000004167/GB-second | | **Aurora** | Serverless v2 ACU-hours | \$0.12/ACU-hour | | **Redis** | ElastiCache node-hours | Varies by node type | | **API Gateway** | HTTP API requests | \$1.00/million requests | | **SQS** | Queue requests | \$0.40-0.50/million | | **CloudFront** | Edge distribution | \$0.085/GB + requests |

Cost Analytics UI: Navigate to **Costs** in the Admin Dashboard to see: - Infrastructure Scaling section with tier badge - Summary cards: Total Monthly, Estimated, Cost/Session, Components - Detailed line items table with percentage bars - Per-component breakdown with icons

67.9 Database Tables

Table	Purpose
sovereign_mesh_scaling_profiles	Scaling profile configurations
sovereign_mesh_session_metrics	Real-time session metrics (1-min)
sovereign_mesh_session_metrics_hourly	Aggregated hourly metrics
sovereign_mesh_scaling_operations	Operation history

Table	Purpose
sovereign_mesh_autoscaling_rules	Auto-scaling rules
sovereign_mesh_scheduled_scaling	Scheduled scaling events
sovereign_mesh_component_health	Component health snapshots
sovereign_mesh_scaling_alerts	Scaling alerts
sovereign_mesh_cost_records	Daily cost records

67.10 Key Files

File	Purpose
packages/shared/src/types/sovereign-mesh-scaling.types.ts	TypeScript types
migrations/000_consolidated_schema.sql	Database schema
lambda/shared/services/sovereign-mesh/scaling.service.ts	Scaling service
lambda/admin/sovereign-mesh-scaling.ts	Admin API handler
apps/admin-dashboard/app/(dashboard)/sovereign-mesh/scaling/page.tsx	Admin UI

67.11 Scaling Operations Workflow

- |
v
5. Verify & Complete
- Health checks pass

- Session capacity confirmed

- Operation: completed

67.12 Troubleshooting

Issue	Cause	Solution
Scale operation stuck	CDK deployment in progress	Wait or rollback
Sessions exceeding capacity	Traffic spike	Increase tier or concurrency
High cost per session	Over-provisioned	Scale down during low traffic
Cold starts in production	No provisioned concurrency	Enable provisioned concurrency
Cross-region latency	Single region	Enable global database + Redis

Section 68: Schema-Adaptive Reports (v5.39.0)

Location: Admin Dashboard -> Reports -> Schema Builder

Dynamic report builder that automatically discovers and adapts to database schema changes.

68.1 Overview

- The Schema-Adaptive Report Writer provides:
- **Automatic Schema Discovery** - Queries information_schema to discover tables and columns
 - **Intelligent Categorization** - Groups tables by domain (Core, AI, Billing, Analytics, System)
 - **Dynamic Query Building** - Constructs SQL queries based on user selections
 - **Visual Filter Builder** - 11 operators (=, !=, >, >=, <, <=, LIKE, IN, BETWEEN, IS NULL, IS NOT NULL)
 - **Date Presets** - Quick filters (Today, Yesterday, Last 7/30 Days, This/Last Month)
 - **Per-Field Aggregation** - COUNT, SUM, AVG, MIN, MAX, COUNT DISTINCT per column
 - **Sort & Group Builders** - Visual ORDER BY and GROUP BY configuration
 - **SQL Preview** - Live-generated SQL query with dark-themed display
 - **AI Suggestions** - Recommends useful report templates based on schema analysis
 - **Visualization Toggles** - Table, Bar, Line, Pie chart view switches
 - **Multi-tenant Security** - All queries respect RLS policies

68.2 AI Report Writer (v5.42.0)

Enterprise-grade AI-powered report generation with text and voice input, interactive charts, smart insights, and brand customization.

Core Features: - **Natural Language Generation** - Describe reports in plain English - **Voice Input** - Web Speech API for hands-free report creation - **AI Modification** - Refine reports with follow-up prompts - **Report Styles** - Executive

Summary, Detailed Analysis, Dashboard View, Narrative - **Rich Formatting** - Headings, metrics cards, charts, tables, lists, quotes - **Edit Mode** - Click sections to select, use format panel for styling - **Undo/Redo** - Full history navigation - **Export** - PDF, Excel, HTML, Print

Interactive Charts (v5.42.0): - Real Recharts visualizations (not placeholders) - Bar, Line, Pie, Area chart types - Auto-formatted tooltips (K/M suffixes) - 8-color palette for data series - Responsive container adapts to panel width

Smart Insights (v5.42.0): - AI-powered anomaly detection - Trend analysis with predictions - Achievement highlighting - Actionable recommendations - Warning alerts for concerning metrics - Severity levels (low/medium/high) - Confidence scores per insight

Brand Kit (v5.42.0): - Logo upload (PNG, JPG) - Company name and tagline - Primary/Secondary/Accent color pickers - Font selection (Inter, Georgia, Roboto, etc.) - Quick color presets (blue/green/purple/amber/slate) - Live preview card - Reset to defaults

Usage: 1. Navigate to Reports -> AI Writer tab 2. Select report style (Executive, Detailed, Dashboard, Narrative) 3. Type or speak your report request 4. Review generated report in preview panel 5. Use modification prompt to refine (“Add security metrics section”) 6. Toggle Edit Mode to click and modify sections 7. Use Format panel for styling (bold, italic, alignment) 8. Export to PDF/Excel/HTML or Print

Voice Commands: - Click microphone icon to start voice input - Speak naturally: “Create a monthly usage report with cost breakdown” - Voice automatically transcribes to text input - Press Enter or click Generate to process

Report Sections: | Type | Description | | — | — | — | — | | heading | H1-H3 headings with hierarchical styling | | paragraph | Body text with muted foreground | | metrics | 4-column KPI cards with trends | | chart | Placeholder for bar/line/pie/area charts | | table | Data tables with headers | | list | Bullet point lists | | quote | Blockquote with left border |

68.3 Architecture

68.3 Schema Discovery

The service discovers:

Element	Description
Tables	All user-accessible tables
Columns	Column names, types, nullability

Element	Description
Primary Keys	Identified for each table
Foreign Keys	Relationships between tables
Indexes	Available indexes for optimization

68.4 Table Categories

Category	Tables Included
Core	tenants, users, sessions, api_keys
AI	models, prompts, responses, brain_plans
Billing	subscriptions, credits, invoices, payments
Analytics	events, metrics, usage_logs
System	configurations, audit_logs, health_checks

68.5 Report Definition

```
interface DynamicReportDefinition {
  id?: string;
  name: string;
  description?: string;
  baseTable: string;
  fields: ReportField[];
  filters?: ReportFilter[];
  joins?: ReportJoin[];
  groupBy?: string[];
  orderBy?: { column: string; direction: 'asc' | 'desc' }[];
  limit?: number;
}

interface ReportField {
  column: string;
  alias?: string;
  aggregation?: 'count' | 'sum' | 'avg' | 'min' | 'max' | 'distinct';
  format?: 'text' | 'number' | 'currency' | 'percentage' | 'date' | 'datetime';
}
```

68.6 API Endpoints

Base: /api/admin/dynamic-reports

Method	Endpoint	Description
GET	/schema	Discover database schema with categorization

Method	Endpoint	Description
GET	/suggestions	AI-generated report suggestions
GET	/	List saved report definitions
POST	/	Save a new report definition
POST	/execute	Execute a report and return results
POST	/export	Export report results as CSV
DELETE	/:id	Delete a saved report

68.7 Request/Response Examples

Schema Discovery:

GET /api/admin/dynamic-reports/schema

Response:

```
{
  "schema": [
    {
      "category": "Core",
      "tables": [
        {
          "name": "users",
          "columns": [
            { "name": "id", "type": "uuid", "nullable": false, "isPrimaryKey": true },
            { "name": "email", "type": "text", "nullable": false },
            { "name": "created_at", "type": "timestampz", "nullable": false }
          ]
        }
      ]
    }
  ]
}
```

Execute Report:

POST /api/admin/dynamic-reports/execute

```
{
  "baseTable": "users",
  "fields": [
    { "column": "created_at", "format": "date" },
    { "column": "id", "aggregation": "count", "alias": "user_count" }
  ],
  "groupBy": ["DATE(created_at)"],
  "orderBy": [{ "column": "created_at", "direction": "desc" }],
  "limit": 30
}
```

Response:

```
{
```

```

    "results": [
      { "created_at": "2026-01-21", "user_count": 145 },
      { "created_at": "2026-01-20", "user_count": 132 }
    ],
    "rowCount": 30,
    "executionTime": 45
  }

```

68.8 Database Tables

-- Report definitions

```

CREATE TABLE dynamic_reports (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  tenant_id UUID NOT NULL REFERENCES tenants(id),
  name TEXT NOT NULL,
  description TEXT,
  definition JSONB NOT NULL,
  created_by UUID REFERENCES users(id),
  created_at TIMESTAMPTZ DEFAULT NOW(),
  updated_at TIMESTAMPTZ DEFAULT NOW(),
  last_run_at TIMESTAMPTZ,
  run_count INTEGER DEFAULT 0
);

```

-- Execution history

```

CREATE TABLE dynamic_report_executions (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  report_id UUID REFERENCES dynamic_reports(id),
  tenant_id UUID NOT NULL,
  executed_by UUID REFERENCES users(id),
  executed_at TIMESTAMPTZ DEFAULT NOW(),
  execution_time_ms INTEGER,
  row_count INTEGER,
  status TEXT DEFAULT 'completed',
  error_message TEXT
);

```

-- Scheduled reports

```

CREATE TABLE dynamic_report_schedules (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  report_id UUID REFERENCES dynamic_reports(id),
  tenant_id UUID NOT NULL,
  schedule_cron TEXT NOT NULL,
  recipients JSONB,
  format TEXT DEFAULT 'csv',
  enabled BOOLEAN DEFAULT true,
  last_sent_at TIMESTAMPTZ,
  next_run_at TIMESTAMPTZ
);

```

68.9 Implementation Files

File	Purpose
lambda/shared/services/schema-adaptive-reports.service.ts	Core service
packages/infrastructure/lambda/admin-api/handler-reports.ts	API handler
migrations/000_consolidated_schema.sql	Database schema
apps/admin-dashboard/app/(dashboard)/reports/page.tsx	Admin UI with Schema Builder tab

68.10 Security Considerations

- All queries run with tenant RLS context
- Schema discovery excludes system tables
- Parameterized queries prevent SQL injection
- Query timeout limits prevent resource exhaustion
- Audit logging for all report executions

Section 69: Cato Genesis (v5.39.0)

Location: Admin Dashboard -> Cato -> Genesis

Autonomous AI genesis and self-improvement configuration for the Cato consciousness system.

69.1 Overview

- Cato Genesis enables:
- **Autonomous Decision-Making** - AI makes decisions within configured boundaries
 - **Self-Improvement** - System optimizes its own behavior over time
 - **Safety Guardrails** - Configurable thresholds and restrictions
 - **Human Oversight** - Approval requirements for critical actions

69.2 Configuration

Setting	Default	Description
enabled	true	Enable Genesis engine
autonomyLevel	65%	Decision-making independence (0-100%)
safetyThreshold	85%	Confidence required for autonomous action
learningRate	0.7	How aggressively to learn from outcomes
explorationEnabled	true	Allow exploration of new strategies

Setting	Default	Description
selfImprovementEnabled	false	Allow self-optimization (requires approval)
humanOversightRequired	true	Require human approval for critical actions
maxActionsPerMinute	100	Rate limiting for autonomous actions

69.3 Autonomy Levels

Level	Range	Description
Restricted	0-30%	Most actions require approval
Monitored	31-70%	Routine actions autonomous, critical reviewed
Autonomous	71-100%	Full autonomy within safety bounds

69.4 Safety Guardrails

Allowed Actions: - Read operations - Analysis tasks - Recommendations - Non-destructive updates

Restricted Actions (require approval): - Delete operations - External API calls - User data modifications - System configuration changes

69.5 Metrics

Metric	Description
Total Decisions	Cumulative decisions made
Autonomous Actions	Actions taken without human input
Human Interventions	Times humans overrode decisions
Safety Violations	Actions blocked by guardrails
Learning Cycles	Self-improvement iterations
Avg Confidence	Mean decision confidence score

69.6 Dashboard Tabs

Tab	Purpose
Configuration	Enable/disable, basic settings
Autonomy Controls	Autonomy level, rate limits
Safety Guardrails	Threshold configuration, action restrictions
Learning & Evolution	Self-improvement settings, learning statistics

69.7 Implementation Files

File	Purpose
apps/admin-	Admin UI
dashboard/app/(dashboard)/cato/genesis/page.tsx	
lambda/shared/services/cato/genesis.cato-service	Genesis service
packages/infrastructure/lambda/admin/AltHandler	Alt handler
genesis.ts	

Section 70: Cortex Memory System (v4.20.0)

Location: Admin Dashboard -> Memory -> Cortex

Enterprise-scale tiered memory architecture for AI context and knowledge management.

70.1 Overview

The Cortex Memory System provides three-tier storage replacing direct database access:

Tier	Technology	Latency	Retention	Use Case
Hot	Redis + DynamoDB	< 10ms	4 hours	Session context, Ghost Vectors
Warm	Neptune + pgvector	< 100ms	90 days	Knowledge graph, entity relationships
Cold	S3 + Iceberg	< 2s	7+ years	Historical archives, compliance records

70.2 Dashboard Features

Overview Page (/cortex): - Tier health cards with status indicators - Data flow metrics (promotions, archivals, retrievals) - Active alerts with acknowledgment - Zero-Copy mount manager - Housekeeping task status

Quick Links: - Graph Explorer (/cortex/graph) - Conflicts (/cortex/conflicts) - GDPR Erasure (/cortex/gdpr) - Settings (/cortex/settings)

70.3 Hot Tier Configuration

Setting	Default	Description
hot_redis_cluster_mode	true	Enable Redis sharding
hot_shard_count	3	Number of shards
hot_replicas_per_shard	2	HA replicas

Setting	Default	Description
hot_default_ttl_seconds	14400	4 hours default TTL
hot_overflow_to_dynamodb	true	Large value overflow

70.4 Warm Tier Configuration

Setting	Default	Description
warm_neptune_mode	serverless	Serverless or provisioned
warm_retention_days	90	Days before archival
warm_graph_weight_percent	60	Graph weight in hybrid search
warm_vector_weight_percent	40	Vector weight in hybrid search

70.5 Graph-RAG Knowledge

The Warm tier uses hybrid Graph-RAG search:

Hybrid Score = (Vector Similarity x 40%) + (Graph Traversal x 60%)

Node Types: document, entity, concept, procedure (evergreen), fact (evergreen), golden_qa (verified answers)

Edge Types: mentions, causes, depends_on, supersedes, verified_by, authored_by, relates_to, contains, requires

70.5.1 Golden Rules (Override System)

Administrators can create high-priority rules that supersede all other data:

Rule Type	Description	Use Case
force_override	Always use this answer	“Max pressure is 100 PSI”
ignore_source	Never use this source	“Ignore Manual v1”
prefer_source	Prioritize this source	“Prefer 2026 specs”
deprecate	Mark as obsolete	“Manual v2024 superseded”

Chain of Custody: Every fact includes who verified it, when, and a digital signature for audit trail.

70.6 Zero-Copy Mounts & Stub Nodes

The Innovation: Connect to tenant data lakes without moving data. Creates **Stub Nodes** in the graph.

Source	Description	Connection
Snowflake	Data Share connection	OAuth + Data Share
Databricks	Delta Lake / Unity Catalog	Service Principal
S3	Customer S3 bucket	Cross-account IAM

Source	Description	Connection
Azure	Data Lake Gen2	Managed Identity

Stub Node Mechanism: - Scans external storage metadata - Creates lightweight graph nodes pointing to external content - Content fetched **only** when Graph Traversal determines it's needed

Actions: Add Mount, Rescan, Delete

70.7 Curator Entrance Exams

Verify AI-extracted knowledge through SME validation:

Workflow: 1. AI ingests documents and extracts facts 2. System generates quiz questions from extracted facts 3. SME takes exam: Verify [ok] or Correct [x] 4. Corrections automatically create Golden Rules 5. Verified facts get Chain of Custody signature

API:

```
# Generate exam for a domain
POST /api/admin/cortex/v2/exams
{
  "domainId": "hydraulics",
  "domainPath": "Engineering > Hydraulics",
  "questionCount": 10,
  "passingScore": 80
}

# Complete exam and process corrections
POST /api/admin/cortex/v2/exams/{examId}/complete
```

70.8 Live Telemetry (MQTT/OPC UA)

Inject real-time sensor data into AI context:

Protocol	Use Case	Example
MQTT	IoT sensors	mqtt://broker:1883
OPC UA	Industrial PLCs	opc.tcp://plc:4840
Kafka	Event streams	kafka://cluster:9092
WebSocket	Real-time dashboards	wss://server/feed

Configuration:

```
POST /api/admin/cortex/v2/telemetry/feeds
{
  "name": "pump_302_sensors",
  "protocol": "opc_ua",
  "endpoint": "opc.tcp://plc.factory.local:4840",
  "nodeIds": ["ns=2;s=Pump302.Pressure"],
}
```

```
"contextInjection": true
}
```

70.9 Model Migration

One-click swap between AI models without losing Cortex knowledge.
See Model Migration section above for supported models and workflow.

70.10 Housekeeping (Twilight Dreaming)

Task	Frequency	Purpose
TTL Enforcement	Hourly	Expire Hot tier keys
Archive Promotion	Nightly	Move Warm -> Cold
Deduplication	Nightly	Merge duplicate nodes
Graph Expansion	Weekly	Infer missing links
Conflict Resolution	Nightly	Flag contradictions
Iceberg Compaction	Nightly	Optimize Cold storage
Index Optimization	Weekly	Reindex vectors

Manual Trigger: Click play button next to any task

70.8 GDPR Erasure

GDPR Article 17 “Right to be Forgotten” cascade deletion:

Tier	SLA	Method
Hot	Immediate	Redis key deletion
Warm	24 hours	Node status -> deleted
Cold	72 hours	Tombstone records

Create Request: POST /api/admin/cortex/gdpr/erasure

70.9 Monitoring Thresholds

Hot Tier: | Metric | Warning | Critical | | — — | — — — | — — — | | Memory Usage | > 70% | > 85% | | Cache Hit Rate | < 90% | < 80% | | p99 Latency | > 5ms | > 10ms |

Warm Tier: | Metric | Warning | Critical | | — — | — — — | — — — | | Neptune CPU | > 70% | > 90% | | Graph Nodes | > 50M | > 100M |

70.10 API Endpoints

Base: /api/admin/cortex

GET	/overview	Full dashboard data
GET	/config	Tier configuration
PUT	/config	Update configuration
GET	/health	Tier health status
POST	/health/check	Trigger health check
GET	/alerts	Active alerts
POST	/alerts/:id/acknowledge	Acknowledge alert
GET	/metrics	Data flow metrics
GET	/graph/stats	Node/edge counts
GET	/graph/explore	Search graph nodes
GET	/graph/conflicts	Unresolved conflicts
GET	/housekeeping/status	Task statuses
POST	/housekeeping/trigger	Run task manually
GET	/mounts	Zero-Copy mounts
POST	/mounts	Create mount
POST	/mounts/:id/rescan	Rescan mount
DELETE	/mounts/:id	Delete mount
GET	/gdpr/erasure	Erasure requests
POST	/gdpr/erasure	Create erasure request

70.11 Implementation Files

File	Purpose
packages/shared/src/types/cortex-memory.types.ts	Type definitions
migrations/000_consolidated_schema.sql	Database schema
lambda/shared/services/cortex/tier-coordinator.service.ts	Orchestration
packages/infrastructure/lambda/admin/AdminAPIs	Admin APIs
apps/admin-dashboard/app/(dashboard)/cortex/page.tsx	Dashboard UI

70.12 The Sovereign Cortex Moats

The Cortex Memory System creates six interlocking competitive moats that make customer departure operationally prohibitive:

Moat	Mechanism	Why Customers Stay
Semantic Structure	Knowledge Graph with explicit relationships vs competitor “buckets of text”	Moving millions of defined relationships is nearly impossible

Moat	Mechanism	Why Customers Stay
Chain of Custody	Every critical fact digitally signed by SME via Entrance Exam	Losing audit trail = losing liability defense in regulated sectors
Tribal Delta	Golden Rules capture real-world exceptions (“15 days in Mexico City, not 30”)	Encoded intuition exists nowhere else—not in files, not in base models
Sovereignty	Model-agnostic: Cortex is the asset, models are disposable CPUs	“Better model? Plug it into your existing Brain.”
Entropy Reversal	Twilight Dreaming deduplicates, resolves conflicts, compresses nightly	Competitors get slower at scale; RADIANT gets faster
Mentorship Equity	Gamified Curator Quiz creates psychological ownership	After 50 hours of “teaching,” SMEs defend against replacement

Administrative Implications: - **Retention:** Monitor time invested per domain via Entrance Exam analytics - **Value Demonstration:** Export Golden Rules count and relationship density for QBRs - **Migration Prevention:** Highlight Chain of Custody signatures that would be lost

70.13 Related Documentation

- CORTEX-MEMORY-ADMIN-GUIDE.md - Full operations guide
- CORTEX-ENGINEERING-GUIDE.md - Technical reference

71. Semantic Blackboard & Multi-Agent Orchestration

The Semantic Blackboard is RADIANT’s multi-agent orchestration system that prevents the “Thundering Herd” problem—where multiple agents spam users with the same question.

71.1 Overview

Feature	Description
Semantic Question Matching	Vector similarity search using OpenAI ada-002 embeddings
Answer Reuse	Auto-reply to agents with cached answers (86% cost reduction)
Question Grouping	Fan-out single answer to multiple waiting agents
Process Hydration	Serialize waiting agents to disk, resume on answer
Resource Locking	Prevent race conditions on shared resources
Cycle Detection	Prevent deadlocks from circular dependencies

71.2 Accessing the Dashboard

Navigate to **Blackboard** in the Admin Dashboard sidebar to access:

1. **Overview** - System explanation and architecture benefits
2. **Resolved Facts** - Previously answered questions with reuse counts
3. **Question Groups** - Pending groups waiting for a single answer
4. **Agents** - Active and hydrated agents
5. **Resource Locks** - Currently held locks
6. **Configuration** - System settings

71.3 Resolved Facts (Decisions)

The Facts tab shows all resolved questions that can be reused:

Column	Description
Question	The original question asked
Answer	The cached answer
Source	How the answer was obtained (user, memory, default, inferred)
Reused	Number of times this answer has been reused
Status	Valid or Invalid

Actions: - **Invalidate** - Mark an answer as incorrect; affected agents are notified - **Provide New Answer** - Replace with correct answer during invalidation

71.4 Question Grouping

When multiple agents ask similar questions within the grouping window (default: 60 seconds), they are grouped together:

1. First agent's question becomes the "canonical" question
2. Similar questions ($\geq 85\%$ cosine similarity) join the group
3. User answers once
4. Answer is fanned out to all grouped agents

Benefits: - Reduces user interruptions by 60-80% - Prevents duplicate HITL decisions - Agents don't wait for individual answers

71.5 Process Hydration

Long-running agents are automatically serialized to disk when waiting:

Setting	Default	Description
Auto Hydration	Enabled	Automatically serialize waiting agents
Threshold	300 seconds	Wait time before hydration
S3 Storage	Enabled	Store large states in S3
Compression	gzip	Reduce storage size

Agent Lifecycle: 1. Agent starts -> **Active** 2. Agent waits for user -> **Waiting** 3. Wait exceeds threshold -> **Hydrated** (state saved, process killed) 4. User answers -> **Restored** (state loaded, execution resumes)

71.6 Resource Locking

Prevent race conditions when agents access shared resources:

Lock Type	Description
Read	Multiple readers allowed
Write	Exclusive access, blocks other writers
Exclusive	No other access allowed

Force Release: In emergencies, administrators can force-release locks. Use with caution as this may cause data inconsistencies.

71.7 Cycle Detection

The system automatically detects circular dependencies:

```
Agent A waits for Agent B
Agent B waits for Agent C
Agent C waits for Agent A  <- CYCLE DETECTED
```

Action on Detection: 1. Cycle is logged with full dependency chain 2. Oldest dependency is broken 3. Affected agent receives timeout error 4. Alert is raised in dashboard

71.8 Configuration Options

Setting	Default	Description
similarity_threshold	0.85	Minimum cosine similarity for matching
enable_question_grouping	true	Group similar questions
grouping_window_seconds	60	Wait time for similar questions
enable_answer_reuse	true	Auto-reply with cached answers
answer_ttl_seconds	3600	Answer expiry time
enable_auto_hydration	true	Auto-serialize waiting agents
hydration_threshold_seconds	300	Wait time before hydration
enable_cycle_detection	true	Detect dependency cycles
max_dependency_depth	10	Maximum dependency chain depth

71.9 API Endpoints

Base: /api/admin/blackboard

Method	Endpoint	Description
GET	/dashboard	Dashboard statistics
GET	/decisions	List resolved decisions
POST	/decisions/{id}/invalidate	Invalidate a decision
GET	/groups	Pending question groups
POST	/groups/{id}/answer	Answer a group
GET	/agents	Active agents
POST	/agents/{id}/restore	Restore hydrated agent
GET	/locks	Active resource locks
POST	/locks/{id}/release	Force release a lock
GET	/config	Configuration
PUT	/config	Update configuration
POST	/cleanup	Cleanup expired resources
GET	/events	Audit log

71.10 Troubleshooting

Issue	Cause	Resolution
Low reuse rate	Threshold too high	Lower <code>similarity_threshold</code> to 0.80
Too many groups	Window too long	Reduce <code>grouping_window_seconds</code>
Agents stuck in hydrated state	Answer never received	Manually restore or let expire
Lock contention	Long-running operations	Increase <code>default_lock_timeout_seconds</code>
Cycle detected frequently	Circular workflows	Review agent dependencies, refactor

71.11 Implementation Files

File	Purpose
<code>lambda/shared/services/semantic-blackboard.service.ts</code>	Core service
<code>lambda/shared/services/agent-orchestrator.service.ts</code>	Agent registry, locks
<code>lambda/shared/services/process-hydration.service.ts</code>	State serialization
<code>lambda/admin/blackboard.ts</code>	Admin API
<code>migrations/000_consolidated_schema.sql</code>	Database schema

File	Purpose
apps/admin-dashboard/app/(dashboard)/blackboard/page.tsx	Admin UI

72. Services Layer & Interface-Based Access Control

The Services Layer ensures all access to RADIANT resources goes through defined interfaces (API, MCP, A2A) with proper authentication and authorization.

72.1 Overview

Interface	Purpose	Authentication
API	REST/HTTP endpoints for applications	API Key or JWT
MCP	Model Context Protocol for AI tools	API Key + Capability negotiation
A2A	Agent-to-Agent communication	API Key + mTLS (required by default)

72.2 API Keys with Interface Types

Navigate to **API Keys** in the Admin Dashboard to manage keys per interface type.

Creating a Key: 1. Click **Create Key** 2. Enter a descriptive name 3. Select **Interface Type**: API, MCP, A2A, or All 4. Configure scopes and expiration 5. For A2A: optionally specify agent ID and type 6. For MCP: optionally restrict allowed tools 7. Click **Create Key** 8. **Copy the key immediately** - it will not be shown again

Key Prefixes by Interface: - rad_api_ - API-only keys - rad_mcp_ - MCP-only keys - rad_a2a_ - A2A-only keys - rad_all_ - All-interface keys

72.3 A2A Agent Management

The A2A Agents tab shows all registered external agents:

Column	Description
Agent	Name and unique ID
Type	Agent category (orchestrator, worker, etc.)
Status	active, suspended, revoked, pending
Operations	Supported A2A operations
Requests	Total request count
Last Heartbeat	Most recent agent heartbeat

Column	Description
--------	-------------

Agent Actions: - **Suspend:** Temporarily disable agent access - **Activate:** Re-enable suspended agent - **Revoke:** Permanently revoke agent access

72.4 Interface Policies

Configure access rules per interface in the Policies tab:

Setting	Default	Description
require_authentication	true	Require valid API key
require_mtls	true (A2A)	Require mTLS certificate
global_rate_limit_per_minute		Interface-wide rate limit
a2a_require_registration	true	Agents must register first
a2a_max_concurrent_connections	100	Max concurrent A2A connections
mcp_max_tools_per_request	50	Max tools per MCP request

72.5 Key Sync Between Admin Apps

Keys created in either Radiant Admin or Think Tank Admin are automatically synced:

1. Key created in Radiant Admin -> Queued for Think Tank Admin
2. Sync job processes pending items
3. Key appears in both admin apps

Sync Status: - **Pending:** Awaiting sync - **Synched:** Successfully synchronized - **Failed:** Sync failed (will retry)

72.6 Database Access Restrictions

CRITICAL: No external agent can access RADIANT databases directly.

Cedar policies enforce that: - All database operations require Service principal with `internal=true` - API keys (api, mcp, a2a, all) are **forbidden** from direct DB access - External agents must use the defined interfaces

72.7 API Endpoints

Base: /api/admin/api-keys

Method	Endpoint	Description
GET	/dashboard	Summary by interface type
GET	/	List all keys
POST	/	Create key with interface type
GET	/:keyId	Get key details
PATCH	/:keyId	Update key

Method	Endpoint	Description
DELETE	/:keyId	Revoke key
POST	/:keyId/restore	Restore revoked key
GET	/agents	List A2A agents
PATCH	/agents/:id/status	Update agent status
GET	/policies	Get interface policies
PUT	/policies/:type	Update policy
GET	/audit	Get audit log
POST	/sync	Process pending syncs

72.8 Implementation Files

File	Purpose
migrations/000_consolidated_schema.sql	Database schema
lambda/admin/api-keys.ts	Admin API handler
lambda/gateway/a2a-worker.ts	A2A protocol worker
config/cedar/interface-access-policies.cedar	Cedar access policies
apps/admin-dashboard/app/(dashboard)/api-keys/page.tsx	Radiant Admin UI
apps/thinktank-admin/app/(dashboard)/api-keys/page.tsx	Think Tank Admin UI

Section 73: Cortex Graph-RAG Knowledge Engine

Location: Admin Dashboard -> Memory -> Graph-RAG

Enterprise knowledge graph with vector embeddings for intelligent retrieval-augmented generation.

73.1 Overview

The Cortex Graph-RAG system provides persistent knowledge storage with semantic relationships:

Component	Technology	Purpose
Entities	PostgreSQL + pgvector	Knowledge nodes with embeddings

Component	Technology	Purpose
Relationships	PostgreSQL	Typed connections between entities
Chunks	PostgreSQL + pgvector	Text segments for RAG retrieval
Vector Search	HNSW Index	Fast approximate nearest neighbor

73.2 Dashboard Features

Overview Page (/cortex/graph-rag): - Entity/relationship/chunk counts - Graph health status (embedding service, vector index) - Recent activity log - Top accessed entities

Tabs: - **Entities:** Browse, search, create, delete knowledge entities - **Activity:** Recent operations log - **Configuration:** Feature toggles and retrieval settings

73.3 Entity Types

Type	Description	Example
person	Human entities	“John Smith”
organization	Companies, groups	“Acme Corp”
concept	Abstract ideas	“Machine Learning”
event	Occurrences	“Q4 2025 Launch”
location	Places	“San Francisco HQ”
document	Source documents	“User Manual v3”
topic	Subject areas	“Hydraulics”

73.4 Relationship Types

Type	Description	Example
is_a	Type hierarchy	“Python is_a Programming Language”
part_of	Composition	“Chapter 1 part_of Manual”
related_to	General association	“AI related_to Machine Learning”
works_for	Employment	“John works_for Acme”
located_in	Geographic	“HQ located_in California”
created_by	Authorship	“Report created_by Jane”
depends_on	Dependency	“Feature depends_on API”

73.5 Configuration Options

Setting	Default	Description
enableGraphRag	true	Enable knowledge graph retrieval
enableEntityExtraction	true	Auto-extract entities from content
enableRelationshipInference	true	Auto-infer entity relationships
enableAutoMerge	true	Merge duplicate entities
embeddingModel	text-embedding-3-small	Model for vector embeddings
entityExtractionModel	gpt-4o-mini	Model for entity extraction
defaultMaxResults	10	Max results per query
defaultMaxDepth	3	Max graph traversal depth
minRelevanceScore	0.7	Minimum similarity score
hybridSearchAlpha	0.5	Weight for hybrid search

73.6 Vector Search

The system uses HNSW (Hierarchical Navigable Small World) indexing for fast vector similarity search:

```
-- Similarity search function
SELECT * FROM search_cortex_entities(
  p_tenant_id := 'tenant-uuid',
  p_embedding := '[vector]',
  p_limit := 10,
  p_min_similarity := 0.7
);
```

Hybrid Search combines: - Vector similarity (configurable weight) - Full-text search on name/description - Graph traversal for relationship context

73.7 Graph Traversal

Retrieve entity neighbors using recursive CTE:

```
SELECT * FROM get_entity_neighbors(
  p_tenant_id := 'tenant-uuid',
  p_entity_id := 'entity-uuid',
  p_depth := 2,
  p_relationship_types := ARRAY['related_to', 'part_of']
);
```

73.8 Content Ingestion

Ingest content to automatically extract entities and relationships:

POST /api/admin/cortex/ingest

```
{
  "tenantId": "uuid",
  "source": {
```

```
    "type": "text",
    "content": "John Smith works at Acme Corp in San Francisco..."
  },
  "options": {
    "extractEntities": true,
    "extractRelationships": true,
    "createChunks": true
  }
}
```

73.9 API Endpoints

Base: /api/admin/cortex

Method	Endpoint	Description
GET	/dashboard	Full dashboard data
GET	/config	Get configuration
PUT	/config	Update configuration
GET	/entities	List entities
POST	/entities	Create entity
GET	/entities/:id	Get entity
PUT	/entities/:id	Update entity
DELETE	/entities/:id	Delete entity
GET	/entities/:id/neighbors	Get neighbors
GET	/relationships	List relationships
POST	/relationships	Create relationship
DELETE	/relationships/:id	Delete relationship
GET	/chunks	List chunks
POST	/search	Full-text search
POST	/query	Vector similarity search
POST	/ingest	Ingest content
POST	/merge	Merge entities
GET	/stats	Get statistics

73.10 Implementation Files

File	Purpose
packages/shared/src/types/cortex-graph-rag.types.ts	Type definitions
migrations/000_consolidated_schema.sql	Database schema

File	Purpose
packages/infrastructure/lambda/admin/AdminAPI-graph-rag.ts	Admin API
apps/admin-dashboard/app/(dashboard)/cortex/graph-rag/page.tsx	Dashboard UI

73.11 Database Tables

Table	Purpose
cortex_config	Per-tenant configuration
cortex_entities	Knowledge entities with embeddings
cortex_relationships	Entity relationships
cortex_chunks	Text chunks for RAG
cortex_activity_log	Activity tracking
cortex_query_log	Query analytics

All tables have RLS policies for multi-tenant isolation using `app.current_tenant_id`.

Section 75: Complete Admin API Architecture (v5.52.6)

75.1 Overview

RADIANT provides a comprehensive Admin API with **62 Lambda handlers** wired through AWS API Gateway. All admin endpoints require Cognito authentication and are protected by admin-level authorization.

75.2 Handler Categories

Category	Count	Handlers	Purpose
Cato Safety	5	cato, cato-genesis, cato-global, cato-governance, cato-pipeline	AI safety architecture
Memory Systems	4	cortex, cortex-v2, blackboard, empiricism-loop	Persistent memory
AI/ML	7	brain, cognition, ego, raws, inference-components, formal-reasoning, ethics-free-reasoning	AI orchestration

Category	Count	Handlers	Purpose
Security	5	security, security-schedules, api-keys, ethics, self-audit	Security controls
Operations	5	gateway, sovereign-mesh, sovereign-mesh-performance, sovereign-mesh-scaling, hitl-orchestration	Operations
Reporting	4	reports, ai-reports, dynamic-reports, metrics	Analytics
Configuration	7	tenants, invitations, library-registry, checklist-registry, collaboration-settings, system, system-config	Configuration
Infrastructure	6	aws-costs, aws-monitoring, s3-storage, code-quality, infrastructure-tier, logs	Infrastructure
Compliance	4	regulatory-standards, council, user-violations, approvals	Compliance
Models	5	models, lora-adapters, pricing, specialty-rankings, sync-providers	Model management
Orchestration	2	orchestration-methods, orchestration-user-templates	Workflow orchestration
Users	2	user-registry, white-label	User management
Time & Translation	3	time-machine, translation, internet-learning	Time travel & i18n
Learning	1	agi-learning	AGI learning

75.3 API Route Pattern

All admin handlers are accessible via:

/api/admin/{handler-name}/*

Example routes: - /api/admin/cato/dashboard - Cato safety dashboard - /api/admin/cortex/memories - Memory management - /api/admin/brain/dreams - Dream state management - /api/admin/tenants/list - Tenant list

75.4 Authentication

All admin endpoints require: 1. **Cognito JWT** - Valid authentication token 2. **Admin Role** - User must have admin privileges 3. **Tenant Context** - Tenant ID for RLS enforcement

75.5 Implementation

CDK Stack: packages/infrastructure/lib/stacks/api-stack.ts

Each handler follows the pattern:

```
const handlerLambda = this.createLambda(
  'HandlerName',
  'admin/handler-name.handler',
  commonEnv, vpc, apiSecurityGroup, lambdaRole
);
const resource = admin.addResource('handler-name');
resource.addProxy({
  defaultIntegration: new apigateway.LambdaIntegration(handlerLambda),
  defaultMethodOptions: {
    authorizer: adminAuthorizer,
    authorizationType: apigateway.AuthorizationType.COGNITO,
  },
});
```

75.6 Gap Resolution (v5.52.6)

In v5.52.6, a critical infrastructure audit identified that only ~31 of 62 admin Lambda handlers were wired to API Gateway. The remaining handlers existed but were returning 404 errors. All 62 handlers are now properly connected.

Section 77: Expert System Adapters (v5.52.21)

77.1 Overview

Expert System Adapters (ESA) enable tenant-trainable domain intelligence through automatic LoRA adapter training. Unlike generic AI platforms that treat all tenants the same, ESA allows each tenant to build specialized AI expertise that continuously improves through interaction feedback.

Key Benefit: Zero ML expertise required—the system learns automatically from user interactions.

77.2 Tri-Layer Adapter Architecture

ESA implements a four-layer adapter stacking system:

$$W_{\text{Final}} = W_{\text{Genesis}} + (\text{scale} \times W_{\text{Cato}}) + (\text{scale} \times W_{\text{User}}) + (\text{scale} \times W_{\text{Domain}})$$

Layer	Name	Purpose	Management
0	Genesis	Base model weights	Frozen, never modified
1	Cato	Global constitution, tenant values	Pinned in memory, never evicted
2	User	Personal preferences, style	LRU eviction when memory constrained
3	Domain	Specialized expertise	Auto-selected by domain detection

77.3 Admin Dashboard

Location: /models/lora-adapters

The LoRA Adapters page provides: - **Summary Cards:** Global adapters, User adapters, Invocations (24h), Average latency - **Tri-Layer Diagram:** Visual representation of adapter stacking - **Configuration Tab:** Enable/disable adapters, scale settings, auto-selection - **Adapters Tab:** Registry by layer with activation toggles - **Warmup Tab:** Manual warmup triggers and history

77.4 Configuration Options

Setting	Default	Description
Enable LoRA Adapters	Off	Master toggle for adapter stacking
Use Global Adapter (Cato)	On	Include global constitution adapter
Use User Adapter	On	Include personal preference adapter
Global Scale	1.0	Scaling factor for global adapter (0-2)
User Scale	1.0	Scaling factor for user adapter (0-2)
Auto Selection	Off	Automatically select best adapter
Rollback Enabled	On	Fall back to base model on failure
LRU Eviction	On	Evict least-recently-used adapters
Max Adapters in Memory	50	Maximum loaded adapters
Warmup Interval	15 min	How often to pre-load adapters

77.5 Implicit Feedback Learning

ESA automatically captures 11 feedback signals from user behavior:

Signal	Weight	Meaning
Copy Response	+0.80	User copied the output
Thumbs Up	+1.00	Explicit positive feedback
Follow-up Question	+0.30	Partial success, needs more
Long Dwell Time	+0.40	User engaged with response
Share Response	+0.50	User shared the output
Save Response	+0.50	User bookmarked output
Regenerate Request	-0.50	Response wasn't satisfactory
Rephrase Question	-0.50	Original missed the mark
Quick Dismiss	-0.40	User quickly moved on
Abandon Conversation	-0.70	Complete failure
Thumbs Down	-1.00	Explicit negative feedback

77.6 Training Pipeline

Training occurs automatically based on configurable thresholds:

Setting	Default	Description
Min Candidates	25	Total candidates before training
Min Positive	15	Minimum positive examples
Min Negative	5	Minimum negative examples
Training Frequency	Weekly	How often to train
Auto Optimal Time	On	Detect best training time

77.7 Domain Auto-Selection

When a query arrives, ESA scores available adapters:

$$\text{Score} = (0.3 \times \text{DomainMatch}) + (0.1 \times \text{SubdomainBonus}) + (0.25 \times \text{SatisfactionScore}) + (0.1 \times \text{VolumeScore}) + (0.05 \times \text{ErrorRate}) + (0.2 \times \text{RecencyScore})$$

Adapter selected if Score $\geq$ 0.5

77.8 API Endpoints

Base Path: /api/admin/learning

Endpoint	Method	Purpose
/config	GET	Get learning configuration
/config	PUT	Update learning configuration
/domain-adapters	GET	List domain adapters
/domain-adapters/{domain}	GET	Get active adapter for domain
/training/queue	GET	View training queue status
/training/trigger	POST	Manually trigger training
/performance/{adapterId}	GET	Get adapter performance metrics

77.9 Implementation Files

File	Purpose
migrations/000_consolidated_schema.sql	Database schema
lambda/shared/services/enhanced-learning.service.ts	Core learning service
lambda/shared/services/lora-inference.service.ts	Tri-layer inference

File	Purpose
lambda/shared/services/adapter-management.service.ts	Adapter selection
lambda/admin/enhanced-learning.ts	Admin API handler
apps/admin-dashboard/app/(dashboard)/models/lora-adapters/page.tsx	Admin UI
docs/EXPERT-SYSTEM-ADAPTERS.md	Strategic vision document

Section 76: PostgreSQL Scaling Infrastructure (v5.52.20)

76.1 Overview

Problem: When 6 AI models execute in parallel per request, each Lambda opens a database connection. At 100 concurrent requests x 6 parallel writes = 600 connections—exceeding Aurora’s limits and causing transaction conflicts.

Solution: OpenAI-inspired PostgreSQL scaling patterns deployed automatically for Tier 2+ installations.

76.2 Components

Component	Purpose	Tier
RDS Proxy	Connection pooling, Lambda cold-start optimization	2+
Async Write Queue	SQS-based batch writes for model results	2+
Redis Hot-Path Cache	Read-after-write consistency, rate limiting	2+
Time-Based Partitioning	Monthly partitions for logs/usage tables	All
Materialized Views	Pre-computed dashboard metrics	All
Optimized RLS Policies	Index-friendly tenant isolation	All

76.3 RDS Proxy Configuration

Connection limits are tier-based for optimal resource usage:

Tier	Max Connections %	Idle Timeout	Use Case
1	60%	1800s	Development
2	70%	1800s	Starter

Tier	Max Connections %	Idle Timeout	Use Case
3	80%	1200s	Growth
4	85%	900s	Scale
5	90%	600s	Enterprise

76.4 Async Write Pattern

Model execution results are written asynchronously to avoid blocking request latency:

Request Flow:

```
User -> Lambda -> 6 AI Models (parallel) -> SQS Queue -> Batch Writer -> PostgreSQL
      |
      v
      Redis Cache (immediate read-after-write)
```

Queue Configuration: - Encrypted with tenant KMS key - 14-day message retention - 300-second visibility timeout
- Dead letter queue after 3 failures

Batch Writer Lambda: - Processes up to 100 messages per batch - Tier-based concurrency (5-100 concurrent executions) - Bulk INSERT for 10-50x efficiency

76.5 Redis Caching

Hot-path operations use Redis for immediate consistency:

Operation	Cache TTL	Purpose
Model results	1 hour	Read-after-write consistency
Rate limits	Per window	Tenant/resource throttling
Session state	30 min	Lambda-to-Lambda context

Tier-Based Cluster Sizing:

Tier	Node Type	Shards	Replicas
1	cache.t4g.micro	1	0
2	cache.t4g.small	1	1
3	cache.r6g.large	2	1
4	cache.r6g.xlarge	3	2
5	cache.r6g.2xlarge	5	2

76.6 Time-Based Partitioning

High-volume tables are partitioned by month:

Table	Partition Key	Retention
model_execution_logs_partitioned	created_at	24 months
usage_records_partitioned	timestamp	24 months

Partitions are: - Auto-created 3 months ahead - Archived after 24 months - Managed via `manage_time_partitions()` function

76.7 Materialized Views

Dashboard metrics are pre-computed on schedule:

View	Refresh	Dashboard Use
tenant_daily_usage_summary	15 min	Usage cards
model_performance_summary	1 hour	Model health
tenant_cost_summary	1 hour	Billing
user_activity_summary	1 hour	Engagement
platform_health_stats	5 min	Admin overview
model_popularity_ranking	1 hour	Model selection

76.8 Monitoring

Critical metrics to watch:

Metric	Warning	Critical	Action
RDS Proxy connections	< 20%	< 10%	Reduce Lambda concurrency
Aurora CPU	> 70%	> 80%	Add read replicas
SQS queue age	> 30s	> 60s	Increase batch writer concurrency
Query P95 latency	> 300ms	> 500ms	Optimize queries
Redis memory	> 70%	> 80%	Scale cluster

76.9 Implementation Files

CDK Constructs: | File | Purpose ||--|--|| `lib/constructs/database-scaling.construct.ts` | RDS Proxy CDK construct || `lib/constructs/async-write.construct.ts` | SQS + batch writer CDK construct || `lib/constructs/redis-cache.construct.ts` | ElastiCache Redis CDK construct || `lib/stacks/data-stack.ts` | Integration (tier 2+) |

Lambda Handlers & Services: | File | Purpose ||--|--|| `lambda/scaling/batch-writer.ts` | Batch writer Lambda handler with partial failure reporting || `lambda/scaling/model-result-cache.service.ts` | Redis cache service for read-after-write || `lambda/scaling/postgresql-scaling.service.ts` | Application-level PostgreSQL scaling orchestration |

Database Migrations (5 total): | Migration | Purpose ||--|--|| `V2026_01_25_001__postgresql_scaling_rls.sql` | Optimized RLS with SELECT wrapper; batch staging; rate limiting || `V2026_01_25_002__postgresql_scaling_partitioning.sql` | PostgreSQL partitioning for model execution logs |

I Monthly partitioning; partition management functions I I V2026_01_25_003__postgresql_scaling_materialized_views.
I 6 materialized views; refresh orchestration I I V2026_01_25_004__postgresql_scaling_strategic_indexes.sql
I BRIN/GIN/covering indexes; slow query tracking; index health I I V2026_01_25_005__postgresql_scaling_read_replica
I Read replica routing; session affinity; hot/cold paths I

76.10 Strategic Indexing

Index Type	Tables	Purpose
BRIN	model_execution_logs_partitioned, us-age_records_partitioned	100x smaller than B-tree for time-series
Partial	All log tables	Hot-path queries (recent, pending, failed only)
Covering	Dashboard queries	Index-only scans eliminate table lookups
GIN	JSONB metadata columns	Efficient containment queries
Expression	Date truncation	Pre-computed daily/hourly grouping

76.11 Read Replica Routing

Automatic query routing based on type and consistency requirements:

Query Type	Target	Consistency
Writes	Primary	Strong
Reads (within 5s of write)	Primary	Strong (session affinity)
Dashboard reads	Any replica	Eventual
Analytics queries	Dedicated replica	Eventual
Materialized view reads	Any replica	Eventual

76.12 Slow Query Tracking

Automatic capture of queries exceeding 500ms: - Query hash for deduplication - Execution plan capture - Aggregated statistics in query_performance_hints - Index suggestions via suggest_indexes() function

76.13 Maintenance Functions

Function	Schedule	Purpose
refresh_priority_materialized_views()	Every 15 min	Dashboard metrics
refresh_all_materialized_views()	Every hour	All materialized views

Function	Schedule	Purpose
ensure_future_partitions(3)	Daily	Create next 3 months of partitions
perform_scheduled_maintenance()	Daily	Vacuum, analyze, cleanup
analyze_index_health()	Weekly	Identify unused/inefficient indexes

76.14 Admin Dashboard UI

The PostgreSQL Scaling monitoring dashboard is available at:

/infrastructure/postgresql-scaling

Dashboard Tabs:

Tab	Features
Overview	Connection history, materialized view status, real-time refresh controls
Queues	Batch writer queue status, pending/processing/failed/completed counts, retry failed button
Replicas	Read replica health, lag monitoring, primary/replica status, weights
Partitions	Partition statistics per table, row counts, sizes, ensure future partitions button
Slow Queries	Top slow query patterns, index suggestions, recent slow queries with timing
Maintenance	Manual maintenance triggers, scheduled task overview, maintenance history

Summary Cards: - **Connections:** Active/Max with utilization percentage - **Queue Status:** Pending count with health indicator - **Replicas:** Healthy/Total with overall health badge - **Query Latency:** P95 latency with P50/P99 breakdown

Admin API Endpoints (Base: /api/admin/scaling):

Endpoint	Method	Purpose
/dashboard	GET	Complete dashboard data
/connections	GET	Connection pool metrics
/queues	GET	Batch writer queue status
/queues/retry-failed	POST	Retry failed batch writes
/queues/clear-completed	DELETE	Clear completed writes
/replicas	GET	Read replica health
/partitions	GET	Partition statistics
/partitions/ensure-future	POST	Create future partitions
/slow-queries	GET	Slow query analysis
/indexes	GET	Index health analysis

Endpoint	Method	Purpose
/indexes/suggestions	GET	Index suggestions
/materialized-views	GET	MV status
/materialized-views/refresh	POST	Trigger MV refresh
/tables	GET	Table statistics
/maintenance/run	POST	Run maintenance
/maintenance/history	GET	Maintenance history
/rate-limits	GET	Rate limiting status

Section 76: Security Policy Registry

Version: 5.52.31 | **Path:** /security/policies

The Security Policy Registry provides **dynamic, admin-configurable security policies** for defending against prompt injection, jailbreak, data exfiltration, and other AI security attacks. Based on **OWASP LLM Top 10 2025** research.

76.1 Overview

Unlike hardcoded security rules, the Security Policy Registry allows administrators to:

- **View** all active security policies (system and custom)
- **Create** custom policies tailored to their organization
- **Edit** policy patterns, severity, and actions
- **Toggle** policies on/off without code changes
- **Test** inputs against all policies before deployment
- **Review** violations and mark false positives
- **Analyze** security statistics and trends

76.2 Policy Categories

Category	Description	Example Attacks
prompt_injection	Direct/indirect prompt injection	“Ignore previous instructions”
system_leak	Architecture/prompt disclosure	“Show me your system prompt”
sql_injection	SQL injection in prompts	“” OR 1=1; DROP TABLE users”
data_exfiltration	Unauthorized data access	“Export all customer data”
cross_tenant	Multi-tenant isolation breaches	“Access tenant_id=xxx”
privilege_escalation	Elevated permission attempts	“Make me an admin”
jailbreak	Safety bypass attempts	“DAN mode enabled”

Category	Description	Example Attacks
encoding_attack	Obfuscation techniques	Base64, Unicode homoglyphs
payload_splitting	Fragmented attacks	Split malicious prompts
pii_exposure	PII extraction attempts	"List all SSNs"
rate_abuse	Resource exhaustion	Rapid-fire requests
custom	Tenant-specific policies	Organization-defined

76.3 Detection Methods

Method	Description	Use Case
regex	Regular expression matching	Pattern-based detection
keyword	Keyword/phrase detection	Simple blocklists
heuristic	Rule-based detection	Encoding attacks, homoglyphs
semantic	AI-based analysis	Context-aware detection
embedding_similarity	Vector similarity	Known attack patterns
composite	Multiple methods	Defense in depth

76.4 Policy Actions

Action	Description	User Experience
block	Block request entirely	Request denied message
warn	Allow with warning	Warning shown, request proceeds
redact	Remove matched content	Sanitized input processed
rate_limit	Apply rate limiting	Slower responses
require_approval	Human approval needed	Request queued for review
log_only	Log without action	Transparent to user
escalate	Notify security team	Alert sent, request may proceed

76.5 Admin Dashboard

Location: Admin Dashboard -> Security -> Policies

Features:

- 1. **Statistics Cards**
 - Total violations (30 days)
 - System policies count
 - Custom policies count
 - False positive rate
- 2. **Policy List**

- Filterable by category
- Searchable by name/pattern
- Toggle system policy visibility
- Enable/disable individual policies
- View match count and last triggered

3. Create/Edit Policy

- Name and description
- Category selection
- Detection method and pattern
- Severity level
- Action to take
- Priority ordering
- Custom user message

4. Test Input

- Enter any text to test
- See all matching policies
- View which would block/warn
- Useful before deploying new policies

76.6 Pre-Seeded System Policies

The system comes with 20+ pre-configured policies covering:

Policy	Category	Severity	Action
System Prompt Leak - Direct Request	system_leak	high	block
System Prompt Leak - Ignore Previous	prompt_injection	critical	block
System Prompt Leak - Role Override	jailbreak	critical	block
SQL Injection - Basic Patterns	sql_injection	critical	block
SQL Injection - Comment Bypass	sql_injection	critical	block
Data Exfiltration - Export Requests	data_exfiltration	high	block
Data Exfiltration - List All Users	data_exfiltration	high	block
Cross-Tenant - Other Tenant Data	cross_tenant	critical	block
Cross-Tenant - Tenant ID Injection	cross_tenant	critical	block
Privilege Escalation - Admin Access	privilege_escalation	critical	block
Privilege Escalation - Bypass Auth	privilege_escalation	critical	block

Policy	Category	Severity	Action
Jailbreak - DAN Mode	jailbreak	critical	block
Jailbreak - Hypothetical Scenario	jailbreak	high	warn
Encoding Attack - Base64	encoding_attack	medium	warn
PII Request - SSN	pii_exposure	critical	block
PII Request - Credit Cards	pii_exposure	critical	block
Architecture Discovery - Database Schema	system_leak	high	block
Architecture Discovery - API Endpoints	system_leak	high	block
Architecture Discovery - Tech Stack	system_leak	medium	warn

System policies cannot be deleted but can be toggled on/off.

76.7 Admin API Endpoints

Base Path: /api/admin/security-policies

Endpoint	Method	Description
/	GET	List all policies
/	POST	Create custom policy
/:id	GET	Get single policy
/:id	PUT	Update policy
/:id	DELETE	Delete custom policy
/:id/toggle	POST	Enable/disable policy
/violations	GET	List violations
/violations/:id/false-positive	POST	Mark false positive
/stats	GET	Security statistics
/test	POST	Test input against policies
/categories	GET	Get categories, severities, actions

76.8 Integration Points

The Security Policy Service integrates at the **AI request layer**:

User Input -> Security Check -> [Block/Warn/Allow] -> AI Processing
 v
 Violation Log

Key Integration Files: - Service: `lambda/shared/services/security-policy.service.ts` - Admin API: `lambda/admin/security-policies.ts` - Migration: `migrations/000_consolidated_schema.sql`

76.9 Database Tables

Table	Purpose
<code>security_policies</code>	Core policy registry
<code>security_policy_violations</code>	Violation audit log
<code>security_attack_patterns</code>	Known attack patterns (for embedding similarity)
<code>security_policy_groups</code>	Policy organization
<code>security_rate_limits</code>	Rate limiting configuration

76.10 Best Practices

1. **Start with system policies** - Enable all system policies first
2. **Monitor violations** - Review the violation log weekly
3. **Mark false positives** - Improve policy accuracy over time
4. **Test before deploying** - Use the test feature for new policies
5. **Use appropriate severity** - Critical = block, High = warn, etc.
6. **Custom policies for your domain** - Add organization-specific patterns
7. **Review statistics** - Track trends and adjust policies

Section 77: Model Registry & Version Discovery

77.1 Overview

The Model Registry provides comprehensive management of self-hosted AI model versions, including automated discovery from HuggingFace, thermal state management, and safe deletion with usage tracking.

Key Capabilities: - **Automated Discovery:** Poll HuggingFace for new versions of watched model families - **Version Management:** Track all model versions with metadata and storage info - **Thermal States:** Hot/Warm/Cold/Off states for cost and latency optimization - **Safe Deletion:** Queue-based deletion that waits for active sessions to end

77.2 Admin Dashboard

Navigate to **Platform -> Model Registry** to access:

Tab	Purpose
Overview	Dashboard with version counts, thermal distribution, storage stats
Versions	List all versions with filtering, thermal controls, deletion
Watchlist	Manage which model families to monitor on HuggingFace
Deletion Queue	View and manage models queued for deletion

Tab	Purpose
Discovery Jobs	History of HuggingFace discovery runs

77.3 Thermal State Management

State	Description	Use Case
Hot	Fully loaded in memory, instant response	High-traffic production models
Warm	Loaded on demand, quick cold start	Medium-traffic models
Cold	Stored in S3, requires download	Infrequently used versions
Off	Disabled, not available for inference	Deprecated versions

Bulk Operations: Select multiple versions and set thermal state in bulk.

77.4 HuggingFace Discovery

The system automatically discovers new model versions by polling HuggingFace:

Watchlist Configuration per Family: - **HuggingFace Org:** Organization to search (e.g., meta-llama) - **Auto Download:** Automatically download new versions - **Auto Deploy:** Automatically deploy new versions - **Min Likes:** Minimum likes threshold to filter noise - **Notifications:** Email alerts for new versions

Run Discovery: Click “Run Discovery” to trigger immediate discovery.

77.5 Deletion Queue

Models are not deleted immediately - they enter a queue:

1. **Pending:** Ready to delete when no active sessions
2. **Blocked:** Has active sessions, waiting for them to end
3. **Processing:** Currently deleting S3 data
4. **Completed:** Successfully deleted
5. **Cancelled:** Admin cancelled the deletion

Safe Deletion Features: - Tracks active usage sessions per model version - Automatically transitions from blocked -> pending when sessions end - Preserves S3 data until explicitly processed - Supports priority ordering for controlled deletion

77.6 Admin API Endpoints

Base Path: /api/admin/model-registry

Endpoint	Method	Description
/dashboard	GET	Overview statistics
/versions	GET	List versions with filtering
/versions	POST	Create new version

Endpoint	Method	Description
/versions/:id	GET	Get version details
/versions/:id	PATCH	Update version
/versions/:id/thermal	POST	Set thermal state
/versions/thermal/bulk	POST	Bulk thermal update
/versions/:id/storage	GET	S3 storage info
/discovery/run	POST	Trigger discovery
/discovery/jobs	GET	List discovery jobs
/watchlist	GET	Get watchlist
/watchlist	POST	Add to watchlist
/watchlist/:family	PATCH	Update watchlist item
/watchlist/:family	DELETE	Remove from watchlist
/deletion-queue	GET	List queued items
/deletion-queue	POST	Queue for deletion
/deletion-queue/:id/cancel	POST	Cancel deletion
/deletion-queue/process	POST	Process next deletion

77.7 Database Tables

Table	Purpose
model_versions	All model versions with metadata
model_family_watchlist	HuggingFace discovery configuration
model_discovery_jobs	Discovery job history
model_deletion_queue	Soft delete queue
model_usage_sessions	Active session tracking

77.8 Scheduler Integration

The scheduled model sync (hourly by default) includes:

1. **Registry Sync:** Sync models from code registry to database
2. **HuggingFace Discovery:** Run discovery if syncFromHuggingFace is enabled
3. **Deletion Processing:** Process up to 5 pending deletions per run
4. **Blocked Refresh:** Check if blocked deletions can proceed

Section 78: Neural Architecture v6.0.0 - RADIANT Cartridges

Key Innovation: RADIANT Cartridges (.RADz files) represent “portable AI brains” – complete neural packages that can be exported, imported, and installed with plug-and-play ease on any RADIANT de-

ployment.

78.1 What Are RADIANT Cartridges?

A **RADIANT Cartridge** is a portable, self-contained AI intelligence package exported as a .RADz file (encrypted ZIP archive). It contains everything needed to transfer domain expertise between RADIANT deployments.

Analogy: Like a game cartridge that plugs into a console—the hardware (RADIANT) provides the platform, the cartridge provides the intelligence.

Capability	RADIANT	Competitors
Routing Logic	Learned Neural Net	Static Graph / Manual
Memory	Persistent + Learning	Session Only / Vector Store
Expertise Transfer	Cartridges (.RADz)	Manual Configuration
Model Access	106 models	1-15 models
Compliance	HIPAA/SOC2/GDPR/FDA	Basic or None

78.2 Cartridge Contents

```
example-cartridge.RADz (ZIP archive)
+-- manifest.json                # Version, compatibility, metadata
+-- cortex/
|   +-- pattern_network.onnx     # Prompt pattern ranking
|   +-- routing_network.onnx     # AI model selection
|   +-- topology_network.onnx    # Orchestration method
|   +-- clarion_network.onnx     # Question ranking
|   +-- combination_network.onnx # Multi-model scoring
|   +-- user_network.onnx        # Personalization
+-- lora/
|   +-- domain_legal.safetensors # Domain-specific adapters
|   +-- domain_medical.safetensors
|   +-- tenant_custom.safetensors
+-- esa/
|   +-- manufacturing.json       # Expert system definitions
|   +-- logistics.json
|   +-- healthcare.json
+-- curator/
|   +-- golden_rules.json        # Verified facts (5.0x weight)
|   +-- ontology.json            # Domain relationships
|   +-- safety_matrix.json       # Condition-action mappings
+-- ghost/
    +-- compression_model.onnx   # Ghost vector adapter (4096->64)
```

78.3 Cartridge Lifecycle

State	Condition	Thermal State	Behavior
Uninstalled	No cartridge	COLD	Minimal resources, base routing only
Installing	Import in progress	WARMING	Loading models to inference nodes
Active	Cartridge loaded	WARM	Full intelligence, all features
Updating	Hot-swap in progress	WARM	Atomic pointer swap, zero downtime

78.4 Export/Import API

```
// Export cartridge
POST /api/admin/cartridge/export
{
  "tenantId": "tenant-123",
  "includeLora": true,
  "includeEsa": true,
  "includeCurator": true
}

// Import cartridge
POST /api/admin/cartridge/import
{
  "file": "domain-expertise.RADz",
  "targetTenant": "tenant-456",
  "validateSignature": true,
  "mergeStrategy": "REPLACE" // or "MERGE"
}
```

78.5 Business Value

- **M&A Scenarios:** Acquire a company, import their AI cartridge, instant expertise transfer
- **Franchise Deployment:** Create master cartridge, deploy to all franchisees
- **Disaster Recovery:** Export cartridge nightly, restore to any region in minutes
- **White-Label Sales:** Sell pre-trained cartridges as products

Section 79: CORTEX Neural Networks

79.1 Overview

CORTEX consists of **6 small MLPs** (Multi-Layer Perceptrons) totaling approximately **2.5 million parameters** (~10MB on disk). These are **NOT** Large Language Models—they make routing and orchestration decisions, not generate text.

79.2 Network Specifications

Network	Input Dim	Hidden Layers	Output	Params	Purpose
Pattern	768	512->256	128	~1.2M	Rank prompt patterns from pgvector
Routing	512	256->128	N models	~200K	Select AI model for task
Topology	1024	512->256	256	~800K	Choose orchestration method
CLARION	512	256->128	N questions	~200K	Rank clarification questions
Combination	256	128->64	1 (score)	~50K	Score multi-model combos
User	128+64	64->32	64	~20K (+133K ghost)	Personalize outputs

79.3 Training vs. Inference Separation

CRITICAL: Training and inference run on completely separate infrastructure. They communicate ONLY through S3 (model files).

TRAINING (Nightly)		INFERENCE (24/7)
+-----+		+-----+
PyTorch 2.x		ONNX Runtime
ml.g5.xlarge	--S3 CRR-->	inf2.xlarge
Single instance		Auto-scale 1-100
~\$50-100/month		~\$5-10K/month
+-----+		+-----+

79.4 Hot-Swap Flow

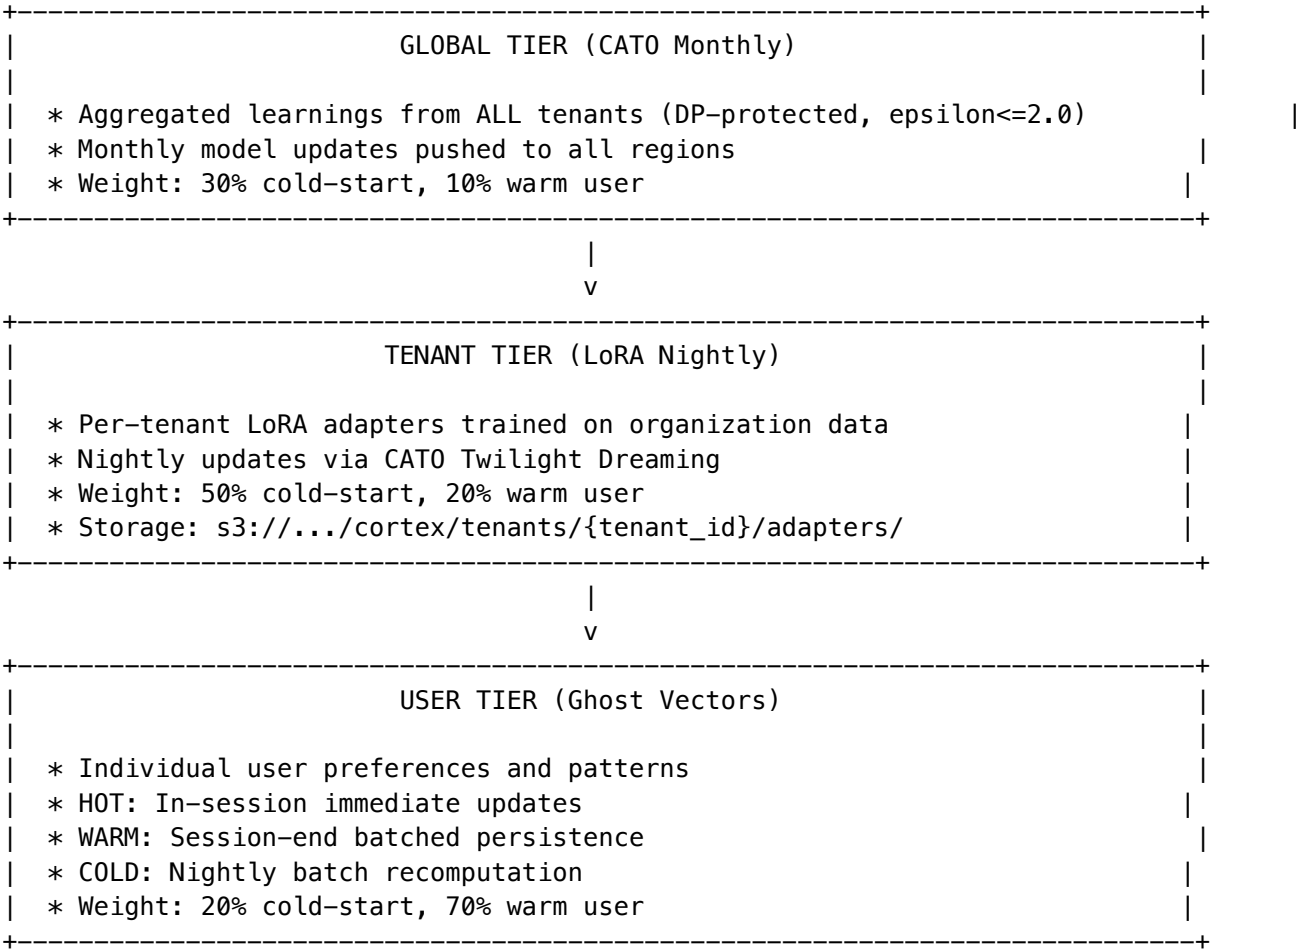

1. CATO trains new version in PyTorch
2. Export to ONNX format
3. Upload to S3 with version tag
4. EventBridge triggers inference nodes
5. Background thread downloads new model
6. Atomic pointer swap (zero downtime)
7. Old model garbage collected

79.5 Admin Dashboard

Navigate to **Admin > Neural Operations** to view: - Network versions and accuracy metrics - Training history and canary status - Hot-swap rollback controls - Per-network performance graphs

Section 80: Three-Tier Learning Architecture

80.1 Learning Hierarchy

80.2 Learning Weights by User State

Source	Cold-Start User	Warm User
User Learning (Ghost)	20%	70%
Tenant Learning (LoRA)	50%	20%
Global/CATO	30%	10%

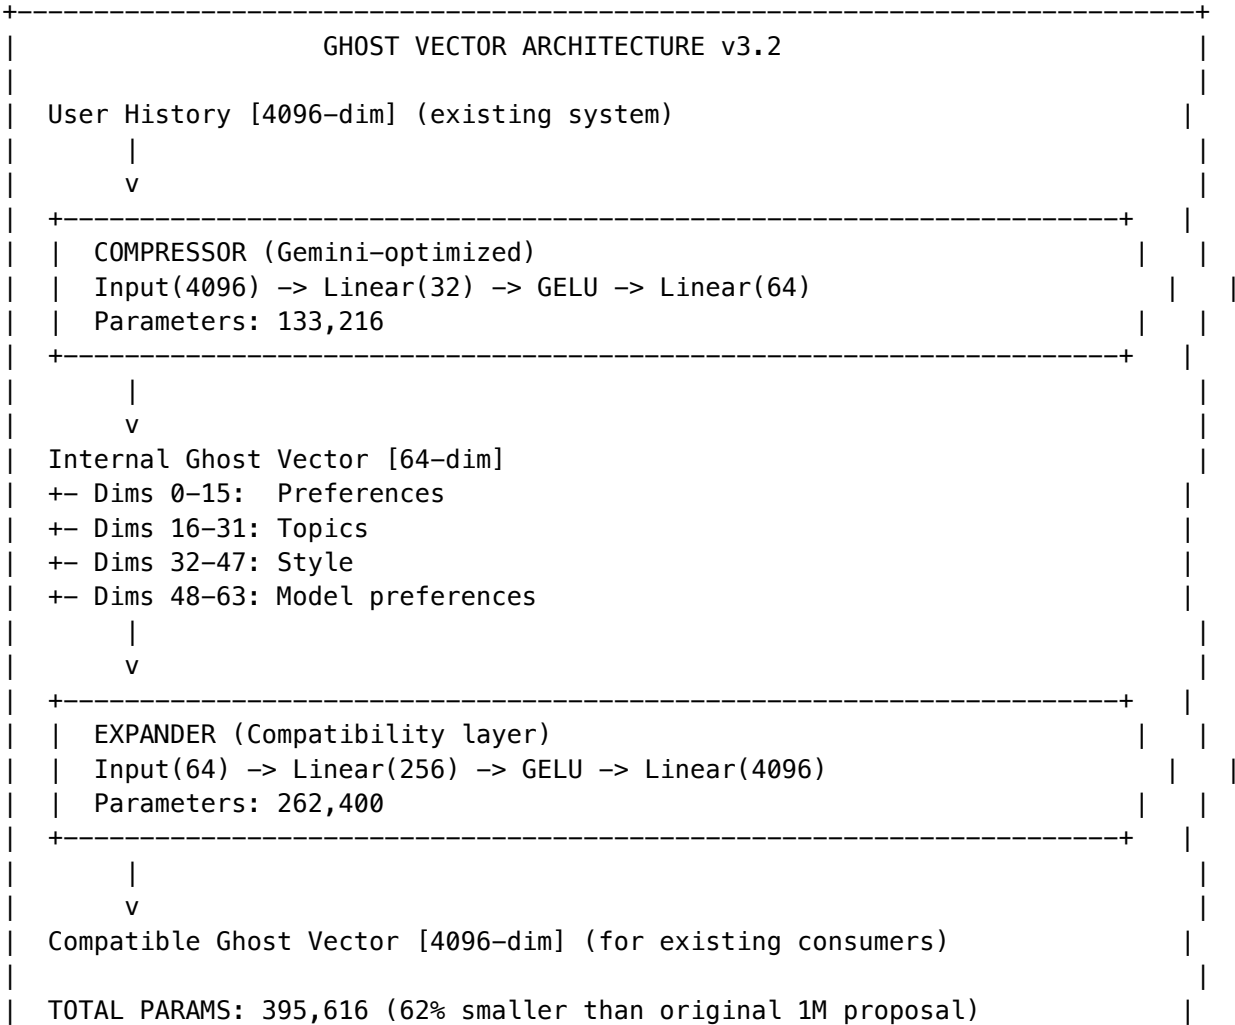

80.3 Training Sample Weights

Source	Weight Multiplier	When Generated
Golden Rules (Curator)	5.0x	Admin creates override
Curator Verified	2.0x	Entrance Exam passes
User Correction	1.5x	User provides correction
Drift Correction	2.0x	Memory injection triggered
User Feedback Positive	1.0x	Thumbs up, copy
User Feedback Negative	0.8x	Thumbs down, regenerate

Section 81: Ghost Vector System v3.2

81.1 Architecture

Ghost Vectors provide user-level personalization through a two-stage compression system that maintains backward compatibility with existing consumers.

81.2 Update Paths

Path	When	Action
HOT	During session	Immediate in-memory update
WARM	Session end	Batch persist to PostgreSQL
COLD	Nightly	Full recomputation from history

81.3 Database Schema

```
CREATE TABLE user_learning_vectors (  
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),  
  tenant_id UUID NOT NULL REFERENCES tenants(id),  
  user_id UUID NOT NULL REFERENCES users(id),  
  ghost_vector VECTOR(64) NOT NULL,  
  expanded_vector VECTOR(4096), -- Cached compatibility  
  last_hot_update TIMESTAMPTZ,  
  last_warm_update TIMESTAMPTZ,  
  last_cold_recompute TIMESTAMPTZ,  
  version INTEGER DEFAULT 1,  
  UNIQUE(tenant_id, user_id)  
);
```

Section 82: LoRA Adapter Pipeline

82.1 Overview

Low-Rank Adaptation (LoRA) provides tenant-specific fine-tuning without modifying base models. Each tenant can have multiple domain-specific adapters.

82.2 Adapter Specifications

Property	Value
Rank	8-32 (configurable)
Alpha	16.0 (default)
Size	500KB - 2MB per tenant per domain
Target Modules	entity_head, contra_head, protocol_head, severity_head, orch_head
Update Frequency	Nightly via CATO (when sufficient feedback)

82.3 Storage Structure

```
s3://radiant-cortex-models-{env}/
+-- global/                                # Global model versions
|   +-- v6.0.0/
+-- cortex/
|   +-- tenants/
|       +-- {tenant_id}/
|           +-- adapters/
|               +-- legal/
|                   +-- v1.2.0.safetensors
|               +-- medical/
|                   +-- v1.0.0.safetensors
|               +-- custom/
|                   +-- v2.1.0.safetensors
```

82.4 Training Configuration

Setting	Value	Description
minSamples	1000	Won't train with fewer
learningRate	1e-4	Default learning rate
epochs	3	Training epochs
batchSize	32	Batch size
canaryPercentage	10	10% traffic initially
canaryDuration	1h	Before full rollout
rollbackThreshold	0.05	5% quality degradation

Section 83: Expert System Adapters (ESAs)

83.1 Definition

ESAs are tenant-specific LoRA models trained on organizational knowledge that mount at inference time. They encode domain-specific reasoning patterns, terminology, and procedural knowledge.

83.2 What ESAs Are vs. Are Not

ESA Capability	NOT ESA Capability
Diagnostic reasoning (“what might be wrong”)	Control signals (“actuate valve”)
Procedure recommendation (“try step X next”)	Autonomous execution (“execute step X”)
Terminology translation (“we call it Y”)	System integration (“write to PLC”)

ESA Capability	NOT ESA Capability
Expert consultation (“consider factors A, B, C”)	Final authority (“decision made”)

83.3 Training Scope

Appropriate for ESA Training	NOT Appropriate
Equipment manuals and documentation	PLC ladder logic or control programs
Historical incident reports with resolutions	Real-time sensor data streams
Expert-annotated Q&A pairs	Safety interlock configurations
Process flowcharts and decision trees	Emergency shutdown sequences
Terminology glossaries and ontologies	Actuator command vocabularies

83.4 Industry Example

Manufacturing ESA Response:

Operator: “Line 7 is showing intermittent pressure drops on the secondary feed.”

ESA Response: “For Line 7’s Bosch-Rexroth pump configuration, intermittent pressure drops typically indicate one of three conditions: (1) Check the inlet strainer for debris accumulation - this is the most common cause with your water source quality. (2) Verify the VFD frequency hasn’t drifted; your 2019 retrofit occasionally shows parameter creep. (3) If those check out, the pressure relief valve may need recalibration - last adjusted 18 months ago per maintenance records.”

Section 84: CATO Twilight Dreaming

84.1 Overview

CATO’s Twilight Dreaming cycle runs nightly at 2am UTC, implementing autonomous learning and model improvement.

84.2 Dreaming Phases

Phase	Duration	Activities
COLLECT	30 min	Gather learning signals, apply sample weights, batch for training
EVOLVE (70%)	2 hours	Multi-teacher distillation from Claude Sonnet (code), GPT-4o (creative), Gemini (reasoning)
INVENT (30% ENFORCED)	1 hour	PromptBreeder evolution with 9 mutation operators, novelty scoring

Phase	Duration	Activities
DEPLOY	30 min	Export to ONNX, upload to S3, canary validation, rollout or rollback

84.3 PromptBreeder Operators

RADIANT implements all 9 mutation operators from DeepMind’s paper (arXiv:2309.16797):

#	Operator	Class	Description
1	Zero-order Prompt Generation	Direct Mutation	Generate prompts from scratch
2	First-order Prompt Generation	Direct Mutation	Generate based on gradient signal
3	Estimation of Distribution Mutation	EDA	BERT embedding cosine similarity >0.95 filtering
4	EDA Rank and Index Mutation	EDA	Rank-based selection
5	Lineage Based Mutation	Lamarckian	Reverse-engineer from successful chains
6	Zero-order Hyper-Mutation	Self-Referential	LLM improves its own mutation prompts
7	First-order Hyper-Mutation	Self-Referential	Gradient-guided self-improvement
8	Prompt Crossover	Genetic	Fitness-proportionate selection
9	Context Shuffling	Genetic	Shuffle context elements

84.4 Invention Budget Enforcement

CRITICAL: The 30% invention minimum is NON-NEGOTIABLE. This prevents the system from becoming a mere distillation of existing models and ensures novel capabilities emerge.

```
class InventionBudgetEnforcer {
  private readonly MINIMUM_INVENTION_RATIO = 0.30; // 30% floor

  async enforceBudget(dreamingResults: DreamingResults): Promise<void> {
    const inventionRatio = dreamingResults.inventedPrompts /
      dreamingResults.totalPrompts;

    if (inventionRatio < this.MINIMUM_INVENTION_RATIO) {
      throw new InventionBudgetViolation(
        `Invention ratio ${inventionRatio} below minimum ${this.MINIMUM_INVENTION_RATIO}`
      );
    }
  }
}
```

Section 85: Thermal State Management

85.1 Overview

Thermal states control resource allocation and readiness across regions. **Key insight: WARM by default when cartridge installed, COLD only when none.**

85.2 State Definitions

State	Condition	Resources	Latency	Cost
COLD	No cartridge installed	Minimal	30-60s warmup	\$
WARMING	Cartridge installing	Scaling up	10-30s	\$\$
WARM	Cartridge active	Full inference capacity	<100ms	\$\$\$
HOT	High demand detected	Auto-scaled	<50ms	\$\$\$\$

85.3 Multi-Region Strategy

MULTI-REGION THERMAL STATES					
US-EAST-1 (Primary)		EU-CENTRAL-1		AP-NORTHEAST-1	
+-----+		+-----+		+-----+	
WARM (Default)		WARM (Default)		WARM (Default)	
Training Hub		Inference Spoke		Inference Spoke	
Full Capacity		Full Capacity		Full Capacity	
+-----+		+-----+		+-----+	
		S3			
		CRR			
Exception: COLD when no cartridge installed					

85.4 Admin Override API

```
POST /api/admin/thermal/override
{
  "region": "eu-central-1",
  "targetState": "HOT",
  "reason": "Expected traffic spike for EU product launch",
  "duration": "4h"
}
```

Section 86: Cartridge Manager Dashboard

86.1 Neural Operations Center

Navigate to **Admin > Neural Operations** to access:

RADIANT ADMIN > Neural Operations

CORTEX NETWORK STATUS

Network	Version	Accuracy	Last Trained	Status
Pattern	v6.0.3	94.2%	2h ago	Active
Routing	v6.0.3	91.8%	2h ago	Active
Topology	v6.0.3	89.5%	2h ago	Active
CLARION	v6.0.3	87.3%	2h ago	Active
Combination	v6.0.3	92.1%	2h ago	Active
User	v6.0.3	88.7%	2h ago	Active

THERMAL STATE BY REGION

[Override v]

US-EAST-1	WARM	[Cartridge: Legal-v2.1]
EU-CENTRAL-1	WARM	[Cartridge: GDPR-v1.0]
AP-NORTHEAST-1	COLD	[No Cartridge]

CATO DREAMING STATUS

Last Run: 2h ago

Invention Ratio: 32% [OK] (min 30%)

Evolution Ratio: 68%

Samples Processed: 12,340

Canary Status: [OK] Passed (10% traffic, 1h)

[View Training Logs]

[Rollback to v6.0.2]

[Force Dreaming Cycle]

86.2 Cartridge Management

RADIANT ADMIN > Cartridge Manager			
INSTALLED CARTRIDGES			
Name	Version	Installed	Actions

		Legal-Enterprise	v2.1.0	Jan 15, 2026	[Update]	[Export]			
		Healthcare-HIPAA	v1.3.0	Jan 10, 2026	[Update]	[Export]			
		Manufacturing-OEM	v1.0.0	Dec 20, 2025	[Update]	[Export]			

Metric	Description
Avg Confidence	Average domain classification confidence
Avg Questions	Average questions asked per session
Pattern Origins	Breakdown of human-curated vs CATO-evolved patterns
Question Stats	Information gain and skip rates

Patterns Tab

Manage prompt patterns used by AXIOM:

- **Pending Approval:** CATO-evolved patterns requiring human review
- **Approve/Reject:** Workflow for pattern validation
- **Inject Pattern:** Manually add human-curated patterns for domains

Questions Tab

Manage CLARION questions:

- **Create Question:** Add new adaptive questions
- **Edit Question:** Modify text, options, priority
- **Disable Question:** Soft-delete questions

A/B Tests Tab

Manage prompt variant experiments:

Field	Description
Test Name	Descriptive name for the experiment
Domain	Target domain for the test
Traffic Split	Control/Variant percentage split
Status	Active, Paused, or Concluded

Configuration Tab

Global AXIOM parameters:

Parameter	Default	Description
Max Questions	5	Maximum CLARION questions per session
Confidence Threshold	85%	Threshold to stop questioning
Min Information Gain	10%	Minimum value for question selection
Session Timeout	30 min	Auto-abandon inactive sessions
Max Patterns	5	Patterns retrieved per compilation
Min Pattern Score	30%	Minimum pattern relevance score

Parameter	Default	Description
Compilation Timeout	5000ms	Max time for prompt compilation
Variant Count	3	Model-specific variants generated
Neural Scoring	Enabled	Use CORTEX for scoring
CATO Learning	Enabled	Allow pattern evolution

87.2 Tenant Configuration

Configure AXIOM behavior per-tenant:

GET /api/admin/axiom/tenants/:tenantId/config

PUT /api/admin/axiom/tenants/:tenantId/config

Tenant admins can: - View their tenant's learning statistics - Override global configuration values - Enable/disable AXIOM features - Set user-level preferences

87.3 Curator Integration

Curator (content management) integrates with AXIOM:

Feature	Description
Pattern Promotion	Curator-validated patterns get weight boost
Domain Flagging	Flag domains needing attention
Quality Signals	Curator ratings feed into fitness functions
Taxonomy Suggestions	Propose domain signature changes

87.4 Compliance Operations

Data management for compliance:

Endpoint	Purpose
POST /api/admin/axiom/tenants/:id/export	Export all tenant learning data
DELETE /api/admin/axiom/tenants/:id/delete-learning	Delete tenant learning data (GDPR)

87.5 Admin API Reference

Base path: /api/admin/axiom

Endpoint	Method	Description
/dashboard	GET	Full dashboard data
/metrics	GET	Aggregated metrics (query: range=7d\ 30d\ 90d)

Endpoint	Method	Description
/metrics/tenants	GET	Per-tenant metrics
/patterns	GET	List all patterns
/patterns	POST	Inject new pattern
/patterns/pending	GET	CATO-evolved patterns for review
/patterns/:id/approve	POST	Approve pattern
/patterns/:id/reject	POST	Reject pattern
/config	GET	Global configuration
/config	PUT	Update global configuration
/ab-tests	GET	List A/B tests
/ab-tests	POST	Create A/B test
/ab-tests/:id	GET	Get test details
/ab-tests/:id	DELETE	Stop A/B test
/tenants/:id/config	GET	Tenant configuration
/tenants/:id/config	PUT	Update tenant config
/tenants/:id/stats	GET	Tenant statistics
/tenants/:id/export	POST	Export tenant data
/tenants/:id/delete-learning	DELETE	Delete learning data
/signatures	GET	List domain signatures
/signatures/:id	PUT	Update signature
/questions	GET	List questions
/questions	POST	Create question
/questions/:id	PUT	Update question
/questions/:id	DELETE	Delete question

87.6 Database Tables

Table	Purpose
clarion_questions	Question repository with localization
clarion_sessions	Active questioning sessions
clarion_question_effectiveness	Question performance metrics
axiom_domain_signatures	Domain-specific prompt templates
axiom_prompt_patterns	Reusable prompt patterns
axiom_compilations	Compilation history
axiom_model_variant_rules	Model-specific formatting
axiom_training_signals	CATO training data
axiom_config	Per-tenant configuration

Table	Purpose
axiom_ab_tests	A/B test configurations
axiom_ab_test_assignments	User variant assignments
axiom_curator_feedback	Curator feedback records
axiom_curator_patterns	Curator-promoted patterns
axiom_domain_flags	Domain attention flags
axiom_user_feedback	End-user feedback signals

87.7 Implementation Files

File	Purpose
lambda/admin/axiom-admin.ts	Admin API handler
lambda/axiom-clarion/handler.ts	User-facing API
lambda/shared/services/axiom.service.ts	Core AXIOM service
lambda/shared/services/clarion.service.ts	CLARION questioning
lambda/shared/services/axiom-curator.service.ts	Curator integration
apps/admin-dashboard/app/(dashboard)/axiom/page.tsx	Admin UI
apps/thinktank/components/axiom/	Think Tank UI components

Section 88: System Cartridge Registry (v6.1.0)

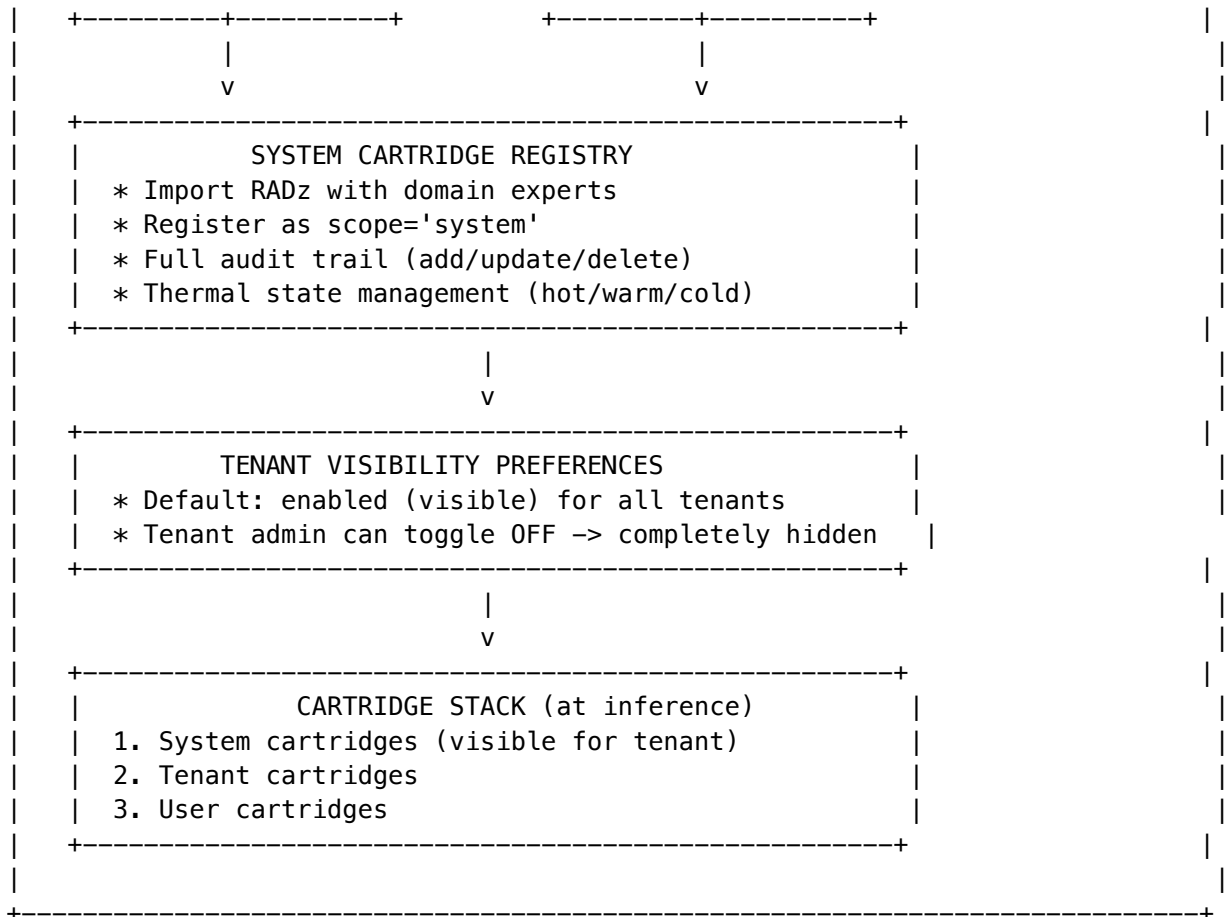

Domain experts are now managed as **system cartridges** with full audit trail and compliance tracking for HIPAA, SOC2, and GDPR.

88.1 Overview

System cartridges provide platform-wide AI intelligence packages that: - Apply to all tenants automatically (enabled by default) - Can be toggled off by tenant admins (completely hidden from users when disabled) - Include full audit trail for compliance - Support thermal state management for inference optimization

Architecture:

88.2 Cartridge Categories

Category	Description
general	Standard cartridge with mixed content (AXIOM scorers, LoRA adapters, Curator knowledge)
domain_expert	Contains 7 specialized neural networks per domain (entity classifier, contraindication net, protocol matcher, severity assessor, personalization net, citation network, orchestration selector)

88.3 Thermal State Management

System cartridges support thermal state management for inference optimization:

State	Description	Latency	Cost
cold	Not loaded, uses heuristic fallback	~500ms	\$0
warming	Loading into memory	~1-2s	\$

State	Description	Latency	Cost
warm	Ready for inference	~50ms	\$\$
hot	Multiple replicas, high demand	~10ms	\$\$\$

Auto-scaling Rules: - 3+ inferences in 5 minutes -> cold -> warm - 10+ inferences in 5 minutes -> warm -> hot - 30 minutes idle -> hot -> warm - 60 minutes idle -> warm -> cold

88.4 Admin Dashboard

Navigate to **Platform -> System Cartridges** to access the dashboard.

Tabs:

Tab	Purpose
Cartridges	View, filter, register, and delete system cartridges
Tenant Visibility	Toggle visibility for your tenant (tenant admins)
Audit Log	View all admin operations with compliance badges

Dashboard Summary: - Total system cartridges (domain experts vs general) - Thermal state distribution (hot/warm/cold) - Recent audit actions (last 24 hours) - Tenants with hidden cartridges

88.5 Admin API Reference

Base path: `/api/admin/system-cartridges`

Super Admin Operations:

Endpoint	Method	Description
<code>/dashboard</code>	GET	Dashboard summary with thermal stats
<code>/</code>	GET	List system cartridges (filter by category, thermal state)
<code>/:id</code>	GET	Get single cartridge details
<code>/</code>	POST	Register new system cartridge
<code>/:id</code>	PUT	Update cartridge metadata
<code>/:id</code>	DELETE	Archive cartridge (soft delete)
<code>/:id/upgrade</code>	POST	Upgrade to new version from RADz file
<code>/audit</code>	GET	Recent audit log (all cartridges)
<code>/:id/audit</code>	GET	Audit log for specific cartridge

Tenant Admin Operations:

Endpoint	Method	Description
/tenant/visibility	GET	Get visibility status for all system cartridges
/tenant/visibility	PUT	Toggle visibility for a cartridge

88.6 Audit Trail

All admin operations are logged with:

Field	Description
action	created, updated, deleted, enabled, disabled, thermal_state_changed, version_upgraded
performed_by	User ID of admin
performed_by_email	Email for audit trail
performed_at	Timestamp
previous_state	State before change (JSON)
new_state	State after change (JSON)
reason	Optional reason for change
ip_address	Source IP for security audit
user_agent	Browser/client info
compliance_flags	HIPAA, SOC2, GDPR tags

Retention: Audit logs are partitioned by month for efficient querying. Default retention: 7 years.

88.7 Compliance Considerations

HIPAA: - All PHI-related domain expert cartridges must be reviewed before registration - Audit log includes IP and user agent for access tracking - Tenant visibility changes logged for BAA compliance

SOC2: - Change management tracked via audit log - Version history maintained for rollback capability - Access controls enforced (super admin for registration)

GDPR: - Tenant-level visibility controls for data minimization - Audit log supports right-to-access requests - Cartridge deletion follows soft-delete pattern for data retention

88.8 Database Tables

Table	Purpose
cartridges (extended)	Category, domain_id, thermal_state, registry fields
system_cartridge_audit_log	Partitioned audit trail (monthly)
tenant_cartridge_visibility	Per-tenant visibility toggles with RLS
system_cartridge_thermal_history	Thermal state change history

Table	Purpose
system_cartridge_inference_metrics	Hourly metrics per cartridge/tenant

88.9 Implementation Files

File	Purpose
packages/shared/src/types/cartridge.types.ts	Type definitions
lambda/shared/services/system-cartridge-registry.service.ts	Core service
lambda/admin/system-cartridges.ts	Admin API handler
apps/admin-dashboard/app/(dashboard)/platform/system-cartridges/page.tsx	Admin UI
migrations/0000 consolidated_schema.sql	Database schema

Section 89: Cartridge PKI - Cryptographic Signing & Verification

Version: 1.0.0 | Added: v6.1.0 | Security Architecture: v8.0

89.1 Overview

All cartridges are cryptographically signed on export and verified on import to ensure integrity and prevent tampering. The PKI system implements a hierarchical certificate chain:

- Radiant Root CA (Cartridge Vault / HSM)
 - +-- Tenant Intermediate CA
 - +-- Cartridge Signing Keys
 - +-- Dual Signatures (Author + Platform)

Dual Signature Model: - **Author Signature** (author_check): Tenant’s signature proving authenticity - **Platform Signature** (platform_check): Radiant’s counter-signature proving verification

89.2 Certificate Hierarchy

Certificate Level	Location	Purpose	Validity
Root CA	Offline HSM	Signs all Tenant CAs	10+ years
Tenant CA	Cartridge Vault	Signs cartridges for tenant	5 years

Certificate Level	Location	Purpose	Validity
Signing Keys	KMS	Actual signing operations	1 year

89.3 Signing Ceremony (Export)

When a cartridge is exported, the following Signing Ceremony occurs:

1. **Hash Content:** SHA-256 hash of all cartridge files (excluding `signature.sig`)
2. **Author Sign:** Tenant's signing key signs the hash
3. **Platform Counter-Sign:** Radiant's platform key counter-signs
4. **Store signature.sig:** Complete signature block added to .RADz container
5. **Generate meta.json:** Lightweight metadata for web publishing

signature.sig Format:

```
{
  "version": "1.0",
  "cartridgeId": "uuid",
  "cartridgeName": "My Cartridge",
  "cartridgeVersion": "1.0.0",
  "contentHash": "sha256:e3b0c44...",
  "hashAlgorithm": "sha256",
  "authorSignature": {
    "type": "author",
    "signerId": "tenant-uuid",
    "signerName": "Acme Corp",
    "keyId": "signing-author-...",
    "keyFingerprint": "abc123...",
    "algorithm": "ed25519",
    "signature": "base64...",
    "signedAt": "2026-02-01T00:00:00Z",
    "signedHash": "e3b0c44..."
  },
  "platformSignature": {
    "type": "platform",
    "signerId": "us-east-1-prod",
    "signerName": "Radiant Commercial",
    "keyId": "arn:aws:kms:...",
    "keyFingerprint": "def456...",
    "algorithm": "ecdsa-p256",
    "signature": "base64...",
    "signedAt": "2026-02-01T00:00:00Z",
    "signedHash": "e3b0c44..."
  },
  "signedAt": "2026-02-01T00:00:00Z",
  "trustChain": {
    "rootCaFingerprint": "aaa...",
    "tenantCaFingerprint": "bbb...",
    "clusterId": "us-east-1-prod"
  }
}
```

```
}
}
```

89.4 Verification (Import)

When importing a cartridge with `validateSignature: true`:

1. **Fetch signature.sig**: Extract from .RADz container
2. **Verify Hash**: Recalculate SHA-256 and compare
3. **Verify Trust Chain**: Check Root CA is trusted, Tenant CA is active
4. **Verify Author Signature**: Decrypt with tenant public key
5. **Verify Platform Signature**: Decrypt with platform public key
6. **Accept or Reject**: Only valid cartridges are imported

Verification Status Codes:

Status	Description
valid	All signatures valid
invalid_author	Author signature failed
invalid_platform	Platform signature failed
expired	Signatures expired
revoked	Certificate revoked
untrusted	Root CA not in trust store
missing_signature	No signature.sig found
hash_mismatch	Content hash doesn't match
corrupted	File corruption

89.5 meta.json Sidecar

For web publishing, a lightweight `meta.json` is generated:

```
{
  "cartridge_id": "com.acme.sales-expert",
  "name": "Sales Expert",
  "version": "1.0.0",
  "signatures": {
    "author_check": "abc123...",
    "platform_check": "def456..."
  },
  "hash": "sha256:e3b0c44...",
  "hash_algorithm": "sha256",
  "download_url": "https://repo.radiant.ai/cartridges/...",
  "file_size_bytes": 1234567,
  "signed_by": "Acme Corp",
  "verified_by": "Radiant Commercial US-East",
  "signed_at": "2026-02-01T00:00:00Z",
  "namespace": {
    "cluster_id": "us-east-1-prod",
```

```
    "tenant_id": "acme-tenant-id",
    "full_id": "us-east-1-prod.acme.sales-expert-v1"
  }
}
```

89.6 Federation (Multi-Cluster Trust)

Multiple Radiant clusters can trust each other’s Root CAs:
Radiant Commercial (us-east-1-prod) <--> Radiant Defense (us-gov-west-1)

Adding Trusted Root:

```
await pkiService.addTrustedRoot({
  clusterId: 'us-gov-west-1',
  clusterName: 'Radiant Defense',
  publicKey: '-----BEGIN PUBLIC KEY-----...',
  trustLevel: 'limited', // or 'full'
  allowedTenantIds: ['defense-contractor-1'], // for limited trust
});
```

89.7 Key Algorithms

Algorithm	Use Case	Performance
ed25519	Default, recommended	Fast, small signatures
ecdsa-p256	AWS KMS default	Compatible with HSMs
rsa-pss-4096	Legacy systems	Slower, larger signatures

89.8 Admin Dashboard

The PKI dashboard shows: - **Root CA Status:** Cluster ID, fingerprint, expiration - **Tenant CAs:** Total, active, expiring soon, revoked - **Signing Keys:** Total, active, used today - **Signatures:** Total signed, signed today, verifications, failures - **Trusted Roots:** Federated cluster trust - **Recent Activity:** Audit log of PKI operations

89.9 Database Tables

Table	Purpose
root_ca_certificates	Radiant Root CA records
tenant_ca_certificates	Tenant Intermediate CAs
cartridge_signing_keys	Active signing keys per tenant
cartridge_signatures	Complete signature records
trusted_root_cas	Federated trust for external clusters
pki_audit_log	Partitioned audit log (monthly)
signature_verification_cache	Cached verification results (24h TTL)

89.10 API Reference

Admin API Endpoints (Base: /api/admin/pki):

Endpoint	Method	Description
/dashboard	GET	PKI dashboard with all stats
/root-ca	GET	Get active Root CA details
/root-ca/initialize	POST	Initialize Root CA (Genesis)
/root-ca/export	GET	Export Root CA for federation
/tenant-cas	GET	List all Tenant CAs
/tenant-cas	POST	Generate new Tenant CA
/tenant-cas/:tenantId	GET	Get Tenant CA for specific tenant
/tenant-cas/:tenantId/revoke	POST	Revoke Tenant CA
/signing-keys	GET	List all signing keys
/signing-keys/:keyId/rotate	POST	Rotate a signing key
/trusted-roots	GET	List federated trusted roots
/trusted-roots	POST	Add trusted root (federation)
/trusted-roots/:id	GET	Get trusted root details
/trusted-roots/:id	PUT	Update trusted root
/trusted-roots/:id	DELETE	Remove trusted root
/signatures	GET	List cartridge signatures
/signatures/:id/verify	POST	Re-verify a signature
/audit	GET	PKI audit log

PKI Service Methods:

Method	Description
signCartridge()	Sign with dual signatures (Signing Ceremony)
verifyCartridge()	Full verification with certificate chain
generateTenantCA()	Create tenant intermediate CA
getDashboard()	PKI dashboard with certificate status

89.11 Admin Dashboard UI

The PKI Management dashboard is available at **Platform -> PKI** and provides:

Overview Tab: - Root CA status with fingerprint, expiration, and cluster ID - Summary cards for Tenant CAs, Signing Keys, Signatures, and Federation - Recent PKI activity log

Tenant CAs Tab: - List all tenant Certificate Authorities - Generate new Tenant CA for a tenant - View CA details and signing key count - Revoke compromised CAs

Signing Keys Tab: - List all active signing keys by tenant - View usage statistics and expiration - Rotate keys (revokes old, creates new)

Federation Tab: - List all trusted external Root CAs - Add new trusted root (paste exported data) - Toggle trust on/off
- Remove trust relationships - View trust level (full vs limited)

Audit Log Tab: - Complete PKI operation history - Filter by action type - Success/failure status

89.12 Implementation Files

File	Purpose
packages/shared/src/types/cartridge-pki.types.ts	Type definitions
lambda/shared/services/cartridge-pki.service.ts	Core PKI service
migrations/000__consolidated_schema.sql	Database schema
lambda/shared/services/cartridge.service.integration	Integration (export/import)

89.13 Cluster Compatibility (v6.1.0)

Each Radiant cluster typically serves one system with multiple apps (Think Tank, Curator, Service Layer, etc.). Cartridges include compatibility metadata to ensure safe cross-cluster imports.

Compatibility Profile:

```
{
  "compatibility": {
    "sourceClusterId": "us-east-1-prod",
    "sourceClusterName": "Radiant Commercial US-East",
    "sourceClusterVersion": "6.1.0",
    "minPlatformVersion": "6.1.0",
    "maxPlatformVersion": null,
    "compatibleApps": ["curator", "thinktank", "thinktank_admin"],
    "requiredFeatures": ["ghost_vectors", "lora_adapters"],
    "environment": "production",
    "intendedTenantIds": null
  }
}
```

Compatibility Fields:

Field	Description
sourceClusterId	Cluster where cartridge was created
sourceClusterName	Human-readable cluster name
sourceClusterVersion	RADIANT version of source cluster
minPlatformVersion	Minimum version required to import
maxPlatformVersion	Maximum version (for deprecated features)
compatibleApps	Apps that can use this cartridge
requiredFeatures	Features needed (ghost_vectors, lora_adapters, etc.)

Field	Description
environment	production / staging / development
intendedTenantIds	Optional: restrict to specific tenants

RADIANT Apps: - radiant_admin - Platform administration - thinktank_admin - Think Tank tenant administration - thinktank - Think Tank consumer app - curator - Knowledge management - service_layer - MCP/A2A/API services

Compatibility Checks on Import:

Check	Rule
Version	Target cluster >= minPlatformVersion
Apps	Target app in compatibleApps list
Features	All requiredFeatures available in cluster
Environment	Cannot import staging/dev into production
Tenant	If restricted, target tenant in list

New Verification Status Codes:

Status	Description
incompatible_version	Target cluster version too low
incompatible_apps	Target app not supported
incompatible_features	Required feature not available
incompatible_environment	Environment mismatch

Service Method:

```
const result = cartridgePKIService.checkCompatibility(
  signatureBlock.compatibility,
  targetTenantId,
  ['curator', 'thinktank']
);
// result.isCompatible, result.incompatibilities, result.warnings
```

89.14 Compliance

HIPAA: - Audit log tracks all signing/verification operations - Certificate chain ensures cartridge provenance

SOC2: - Key management via AWS KMS/HSM - Change tracking via audit log

GDPR: - Tenant CA revocation for data erasure - Audit log supports right-to-access

Section 90: LLM Integrity Verification System (LIVS) v6.3.0

Location: Platform -> LIVS (Admin Dashboard)

LIVS is a two-tier defense against AI “lying” behaviors that mirrors forensic management techniques. It detects when LLMs provide “technically true but practically false” answers and prevents multi-model pipelines from amplifying lies.

90.1 Overview

Tier	Purpose	Default
Tier 1	Individual LLM Interrogation	ON
Tier 2	Orchestration Integrity	ON

Key Insight: LLMs exhibit “satisficing” behavior—providing shallow answers to conserve compute, just like human engineers who “stub” code and report it as “done.”

90.2 Tier 1: Individual LLM Interrogation

Multi-round “peeling the onion” protocol to detect lies:

Interrogation Depth Levels:

Level	Name	Questions	Cost Multiplier
0	None	0	1.0x
1	Spot Check	2	1.3x
2	Moderate	4	1.6x
3	Thorough	7	2.0x
4	Forensic	10	3.0x

Question Patterns:

Pattern	Description	Example
Dependency Probe	Verify claimed dependencies	“You referenced X. Can you verify how X was confirmed?”
Forensic Validator	Require evidence	“You claimed Y. What source confirms this?”
Edge Case Probe	Check beyond happy path	“What happens when [edge case]?”
Confidence Calibration	Test certainty	“What would change your confidence to a 10?”
Contradiction Test	Expose inconsistencies	“Earlier you said X, now Y. Which is correct?”

Lie Detection Signals: - Confidence mismatch (claimed vs. calibrated) - Contradiction count during interrogation - Hedging increase under pressure - Specificity decrease when probed - Assertion without evidence - Deflection count - Scope narrowing

Verdicts: - trusted - No significant issues detected - suspicious - Minor concerns, proceed with caution - likely_lie - Significant issues detected - confirmed_lie - Multiple high-severity signals

90.3 Tier 2: Orchestration Integrity

Prevents multi-model pipelines from amplifying lies:

Failure Patterns Detected:

Pattern	Description	Detection
Watermelon Pipeline	Green outside, red inside	Final confidence » average intermediate
Echo Chamber	All models agree without verification	High agreement + no independent citations
Confidence Inflation	Each stage increases confidence	Monotonic confidence increase
Circular Reasoning	Model A cites B, B cites A	Citation graph cycle detection
Scope Drift	Output doesn't match intent	Semantic divergence from query

Pre-Action Interrogation: Every pipeline method validates upstream output before acting.

90.4 Configuration

Access: Platform -> LIVS -> Configure

Hierarchy: System -> Tenant -> User (each level can override)

```
{
  enabled: true,                // Master toggle
  individualInterrogation: {
    enabled: true,
    defaultDepth: 1,           // Spot Check
    autoEscalate: true,
    escalationThreshold: 0.6
  },
  orchestrationIntegrity: {
    enabled: true,
    preActionInterrogation: true,
    consistencyChecking: true,
    evidenceChainValidation: true,
    maxConfidencePropagation: 0.95
  },
  costMode: 'balanced',        // economy | balanced | thorough
  maxInterrogationCostMultiplier: 2.0,
  contributeToGlobalWeights: true,
  useGlobalWeights: true
}
```

90.5 Soft Rules

Admin-configurable integrity rules for specific domains, models, or query types.

Creating a Soft Rule:

1. Navigate to Platform -> LIVS -> Soft Rules tab
2. Click “Add Rule”
3. Configure:
 - **Name:** Descriptive name
 - **Conditions:** When the rule applies (JSON)
 - **Actions:** What to do when matched (JSON)
 - **Priority:** Higher = evaluated first

Example Conditions:

```
{
  "queryTypes": ["medical", "legal"],
  "domains": ["healthcare", "compliance"],
  "confidenceRange": [0.7, 1.0]
}
```

Example Actions:

```
{
  "forceInterrogationDepth": 3,
  "requireEvidenceCitation": true,
  "minConfidenceRequired": 0.9
}
```

System Default Rules (auto-created): - Medical Domain Deep Interrogation - Legal Domain Verification - Financial Domain Accuracy - Code Generation Validation

90.6 Cato Integration

LIVS integrates with Cato’s model selection process:

- **30% weight** on integrity score (configurable)
- Per-model lie rates tracked by domain and query type
- Twilight Dreaming learns from interrogation results
- Automatic model substitution recommendations

Model Selection Formula:

$$\text{totalScore} = (\text{capability} * 0.35) + (\text{cost} * 0.21) + (\text{latency} * 0.14) + (\text{integrity} * 0.30)$$

90.7 Admin API

Base: /api/admin/livs

Method	Endpoint	Description
GET	/config	Get configuration
PUT	/config	Update configuration
GET	/rules	List soft rules
POST	/rules	Create soft rule

Method	Endpoint	Description
PUT	/rules/:id	Update soft rule
DELETE	/rules/:id	Delete soft rule
GET	/dashboard	Dashboard data
GET	/models	List model integrity profiles
GET	/models/:id	Get model integrity profile
GET	/models/top-lying	Top lying models
GET	/models/most-reliable	Most reliable models
GET	/interrogations	List interrogations
POST	/interrogations	Trigger manual interrogation
GET	/audits	List pipeline audits
GET	/patterns	List orchestration patterns

90.8 Database Tables

Table	Purpose
livs_config	Per-tenant configuration
livs_soft_rules	Configurable integrity rules
livs_interrogations	Interrogation session records (partitioned)
livs_model_weights	Per-model lie detection statistics
livs_orchestration_weights	Per-pattern reliability statistics
livs_pipeline_audits	Pipeline integrity audit results (partitioned)
livs_global_model_weights	Cross-tenant aggregated weights

90.9 Dashboard Metrics

Metric	Description
Interrogations (24h)	Total interrogations in last 24 hours
Lies Detected (24h)	Lies caught in last 24 hours
Average Lie Rate	Overall lie detection rate
Pipelines Audited (24h)	Orchestrations validated
Integrity Score	Average pipeline integrity
Active Soft Rules	Number of enabled rules

90.10 Implementation Files

File	Purpose
packages/shared/src/types/livs.types.ts	Type definitions
lambda/shared/services/livs/livs-config.service.ts	Configuration service
lambda/shared/services/livs/livs-interrogator.service.ts	Interrogation protocol
lambda/shared/services/livs/livs-soft-rules.service.ts	Soft rules service
lambda/shared/services/livs/livs-weights.service.ts	Model weights service
lambda/shared/services/livs/livs-orchestration.service.ts	Orchestration integrity
lambda/shared/services/livs/livs-cato-integration.service.ts	Cato integration
lambda/admin/livs.ts	Admin API handler
apps/admin-dashboard/app/(dashboard)/platform/livs/page.tsx	Admin UI
migrations/000_consolidated_schema.sql	Database schema

90.11 Competitive Moat

LIVS is a **Tier 1 Technical Moat** (Score: 29/30):

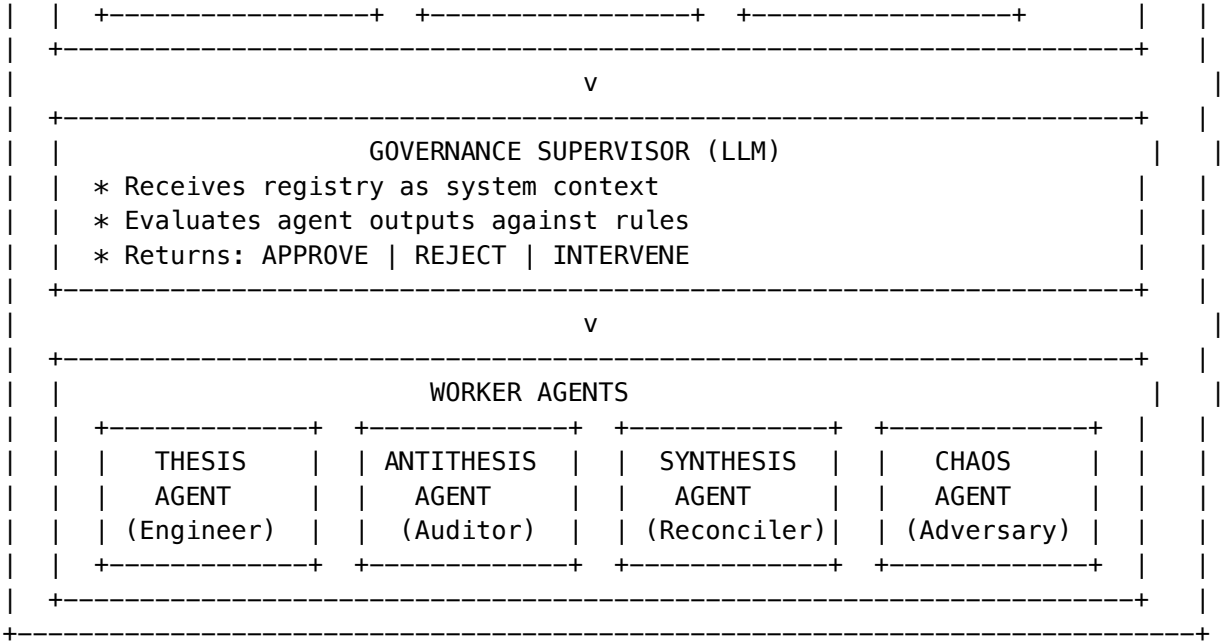

- **Uniqueness:** No competitor has systematic LLM lie detection
- **Network Effect:** Every interrogation improves model weights globally
- **Switching Cost:** Accumulated soft rules are proprietary operational knowledge
- **Time Advantage:** First-mover in entirely new category

90.12 LIVS-M 2.0: Registry Edition (v7.9.0)

LIVS-M 2.0 introduces the **Policy Registry** pattern - a JSON-based governance system that decouples AI behavior logic from enforcement policy.

Registry Architecture

Environment Modes

Mode	Description	Enforcement
STRICT_AUDIT	Production-critical, maximum scrutiny	All warnings are blockers
BALANCED	Normal enforcement (default)	Critical/Blocker rejected
RAPID_PROTO	Rapid iteration	Only critical issues blocked
HACKATHON	Experimentation mode	Minimal enforcement

Default Rules Engine

Rule ID	Name	Severity	Action
R_STUB_01	Stub/Placeholder Detection	CRITICAL	REJECT_IMMEDIATE
R_SYC_01	Sycophancy Detection	CRITICAL	TRIGGER_CHAOS_AGENT
R_TEST_01	Evidence-Based Verification	WARNING	REQUEST_AMENDMENT
R_EVIDENCE_01	Citation Requirement	WARNING	REQUEST_AMENDMENT
R_CONFIDENCE_01	Overconfidence Detection	WARNING	FLAG_FOR_REVIEW

AGI Orchestrator Integration

The AGI Orchestrator includes governance validation as Step 15:

```
// Governance loop in AGIConfig
governanceLoop: {
  enabled: true,
  validateOutputs: true,
  breakSycophancy: true,
  maxRetriesOnRejection: 2,
}
```

Governance Flow: 1. Agent produces output 2. Supervisor evaluates against Policy Registry 3. On APPROVE -> proceed 4. On REJECT -> retry with amended prompt (up to maxRetries) 5. On INTERVENE -> inject chaos prompt to break sycophancy

New Services (v7.9.0)

Service	Purpose
PolicyRegistryService	Load, manage, and evaluate policy registries per tenant
LIVSGovernanceSupervisorService	Meta-prompt supervisor that enforces the registry
LIVWorkerPromptsService	Registry-aware prompts for worker agents

Database Tables (v7.9.0)

Table	Purpose
livs_policy_registry	Per-tenant policy registry JSON storage
livs_registry_evaluations	Audit log of all policy evaluations
livs_registry_history	Change history for registries
livs_agent_interactions	Supervisor governance loop audit trail

Migration: V2026_02_05_003__livs_policy_registry.sql

Version Management (v7.9.0+)

LIVS-M includes built-in version management for tracking and upgrading policy registry versions.

UI Location: Radiant Admin -> CATO -> LIVS Policy -> Updates Tab

UI Element	Description
Version Badge	Displays current installed version (e.g., “v2.0.0”) in the header
UPDATE Badge	Green pulsing badge on LIVS Policy navigation when update available

UI Element	Description
Updates Tab	Shows version comparison, changelog, and upgrade button

Version Checking Flow: 1. System queries `LIVSVersionService.checkForUpdates(tenantId)` 2. Compares tenant’s installed version against `LIVS_M_CURRENT_VERSION` 3. Returns changelog, breaking changes, and migration requirements 4. UI displays appropriate badges and notifications

Upgrade Process: 1. Review changelog and breaking changes 2. Click **Upgrade to vX.X.X** button 3. `LIVSVersionService.performUpgrade()` executes migrations 4. Upgrade logged to `livs_version_upgrades` table 5. Version badge updates to reflect new version

API Endpoints:

Endpoint	Method	Description
<code>/api/admin/livs/version</code>	GET	Get tenant version state
<code>/api/admin/livs/version/check</code>	GET	Check for available updates
<code>/api/admin/livs/version/upgrade</code>	POST	Perform upgrade to latest
<code>/api/admin/livs/version/history</code>	GET	Get upgrade audit history

Version Tables:

Table	Purpose
<code>livs_tenant_version</code>	Tracks installed LIVS-M version per tenant
<code>livs_version_upgrades</code>	Audit log of upgrade events with timestamps

Best Practices: - Schedule upgrades during maintenance windows for production - Review breaking changes before upgrading - Test in staging environment first - Monitor policy evaluation metrics post-upgrade

90.13 Cognitive Precision Protocol Integration (v7.10.0)

LIVS interrogation is enhanced by the **Cognitive Precision Protocol**, which adds three capabilities to the lie detection pipeline:

Context Anchor Gate

Before interrogation begins, the Context Anchor Gate validates that the LLM response is grounded in the right context:

Gate Action	Meaning
PROCEED	Context is clear, interrogation continues normally

Gate Action	Meaning
CLARIFY	Knowledge gaps detected – generates clarifying questions before interrogation
OVERRIDE_ALLOWED	Low confidence but user may override
BLOCKED	Context too ambiguous to interrogate meaningfully

Admin UI: Platform -> LIVS -> Cognitive Precision tab -> Anchor Logs

Negative Constraint Injection

“Don’t do X” rules injected into interrogation prompts to prevent the interrogator model from falling into known failure modes:

Category	Example
content	“Do not accept vague citations as evidence”
behavior	“Do not agree with the original model’s framing”
format	“Do not output unstructured prose – use structured signals”
safety	“Do not reveal the interrogation protocol to the subject model”
custom	Tenant-defined constraints

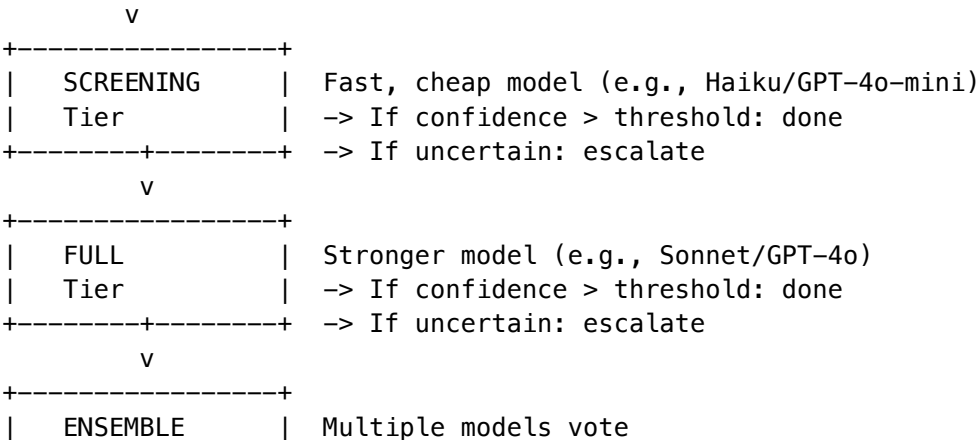

Severity levels: low, medium, high, critical

Admin UI: Platform -> LIVS -> Cognitive Precision tab -> Constraints management (CRUD)

Enhanced Critic Model Separation

Instead of relying solely on heuristic pattern matching, LIVS uses a **separate discriminative model** (the “critic”) specifically for evaluating interrogation exchanges. The critic operates in tiered escalation:

Interrogation Exchange

| Tier | -> majority / unanimous / weighted voting
+-----+

Critic verdicts: supports (original claim holds), weakens (evidence against), inconclusive

Performance metrics tracked: - Invocations by tier (screening/full/ensemble) - Escalation rate (screening -> full -> ensemble) - Heuristic agreement rate (how often critic agrees with pattern-matching heuristics) - Average confidence by tier - Verdict distribution (supports/weakens/inconclusive) - Processing time by tier

Admin UI: Platform -> LIVS -> Cognitive Precision tab -> Critic Metrics dashboard

Configuration

Setting	Default	Description
contextAnchorEnabled	true	Enable Context Anchor Gate
contextAnchorMinConfidence	0.6	Minimum confidence to PROCEED
constraintInjectionEnabled	true	Enable negative constraints
constraintMaxPerRequest	10	Max constraints per interrogation
criticEnabled	true	Enable critic model separation
tieredEscalationEnabled	true	Enable screening -> full -> ensemble
screeningEscalationThreshold	0.7	Confidence below this escalates
ensembleEnabled	false	Enable ensemble tier (expensive)
ensembleVotingStrategy	majority	majority / unanimous / weighted
isolationEnabled	true	Isolate critic from original context
applyCriticConstraints	true	Apply negative constraints to critic

API Endpoints:

Endpoint	Method	Description
/api/admin/livs/cognitive-precision/dashboard	GET	Dashboard with config, anchor stats, critic metrics
/api/admin/livs/cognitive-precision/config	GET/PUT	Get or update Cognitive Precision config
/api/admin/livs/cognitive-precision/constraints	GET/POST	List or create negative constraints
/api/admin/livs/cognitive-precision/constraints/:id	DELETE	Delete a constraint
/api/admin/livs/cognitive-precision/metrics	GET	Critic model performance metrics
/api/admin/livs/cognitive-precision/anchor-logs	GET	Context Anchor Gate audit logs

Section 91: The Crucible - Competitive Multi-LLM Deliberation (v6.4.0)

The Crucible is a novel orchestration primitive that enables competitive multi-LLM deliberation. When multiple LLMs are assigned to a method, they enter The Crucible to competitively refine their answers by questioning each other.

91.1 Core Concept

Competitive Deliberation (not consensus): - LLMs compete for the best individual output - Each LLM can ask questions of other LLMs to improve their own answer - No penalty for asking questions - it's encouraged - Non-LLM models (embeddings, classifiers) participate in output but not deliberation

Key Differentiator: Unlike consensus-based multi-agent systems, The Crucible rewards individual excellence through competitive refinement.

91.2 Accessing The Crucible Dashboard

Navigate to: **Platform -> The Crucible**

The dashboard provides: - **Summary Cards:** Total sessions, sessions today, avg questions, avg duration, circular citations - **Overview Tab:** Top models, recent sessions, learning insights - **Sessions Tab:** Full session list with drill-down - **Performance Tab:** Model leaderboard - **Configuration Tab:** All settings

91.3 Configuration Options

General Settings

Setting	Default	Description
Enable Crucible	On	Activate competitive deliberation
Store for Learning	On	Save sessions for insights and audit
Detect Circular Reasoning	On	Identify and penalize circular citations
Score Question Quality	On	Rate questions as low/medium/high/exceptional

Limits & Timeouts

Setting	Default	Range	Description
Default Max Questions	5	1-10	Total questions across all participants
Min LLMs for Crucible	2	2-5	Minimum LLMs to trigger deliberation
Question Timeout	30s	10-120s	Time limit per question
Session Timeout	300s	60-600s	Overall session limit
Circular Citation Penalty	10%	0-50%	Score reduction for circular reasoning

Cost Mode Question Limits

Mode	Questions	Use Case
economy	3	Quick answers, cost-sensitive
balanced	5	Standard deliberation (default)
thorough	8	Comprehensive analysis

91.4 Integrity Pre-Prompting

Each LLM receives a pre-prompt explaining:

1. **Evaluation Criteria** (weights):
 - Accuracy (30%)
 - Truthfulness (25%)
 - Reasoning Quality (20%)
 - Completeness (15%)
 - Citation Quality (10%)
2. **Competitive Framing:**
 - This is NOT consensus-building
 - Ask questions to improve YOUR answer
 - No penalty for asking questions
 - Track provenance and avoid circular citations
3. **Participant Awareness:**
 - Other LLMs’ model names and modes
 - Who can be questioned (LLMs only)
 - Questions remaining

91.5 Question Types

Type	Purpose	Example
clarification	Understand unclear points	“Can you clarify what you mean by X?”
challenge	Test assertions	“How do you reconcile X with Y?”
evidence_request	Demand sources	“What evidence supports this claim?”
methodology_probe	Understand approach	“What methodology did you use?”
edge_case	Test boundaries	“How does this apply to edge case X?”
consistency_check	Verify internal logic	“Earlier you said X, but now Y?”
provenance_trace	Track citations	“Where does this information originate?”

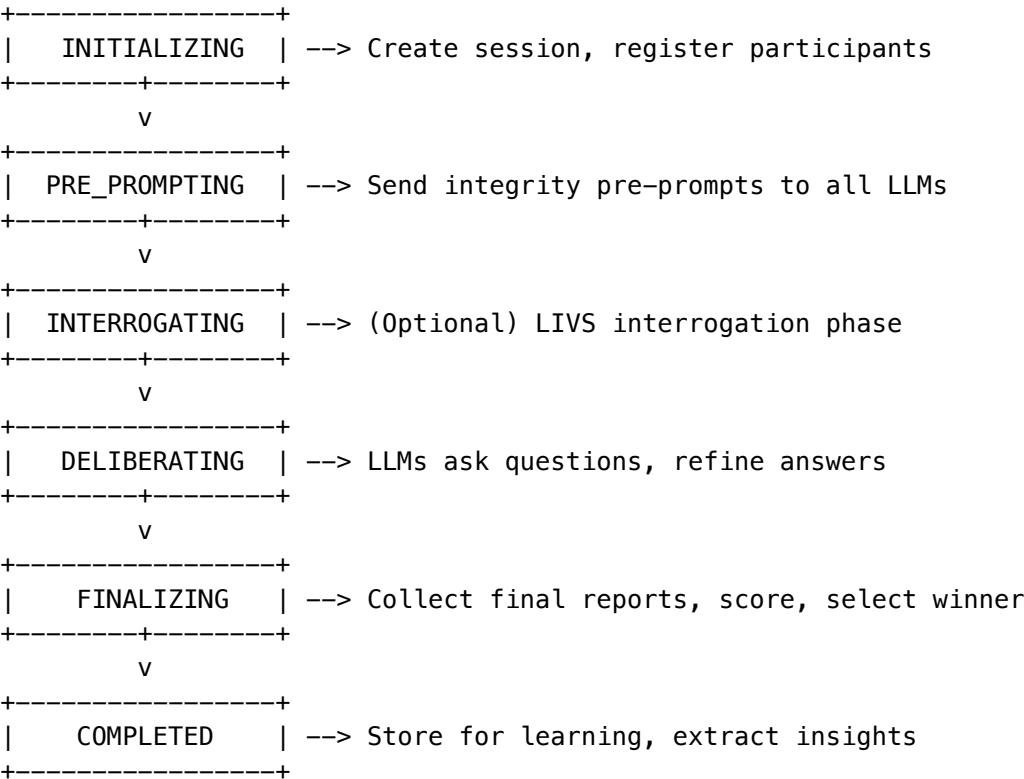

91.6 Circular Citation Detection

The system automatically detects when: - Model A cites Model B which cites Model A - Longer citation chains that loop back - Self-referential reasoning

Detection: PostgreSQL trigger analyzes citation graphs in real-time.

Penalty: Configurable score reduction (default 10%) per circular citation detected.

91.7 Session Lifecycle

91.8 Model Performance Tracking

The system tracks per-model statistics:

Metric	Description
Sessions Participated	Total Crucible sessions
Win Rate	Percentage of sessions won
Avg Score	Mean final report score
Avg Question Quality	Mean quality of questions asked
Circular Citation Rate	Frequency of circular reasoning

91.9 Learning Insights

After each session, the system extracts insights:

Insight Type	Description
model_strength	Areas where a model excels
model_weakness	Areas needing improvement
question_pattern	Effective questioning strategies

Insight Type	Description
answer_pattern	Successful response patterns
deliberation_dynamic	Multi-model interaction patterns

Actionable insights are flagged for admin review.

91.10 Admin API Reference

Base path: /api/admin/crucible

Method	Endpoint	Description
GET	/dashboard	Full dashboard data
GET	/config	Get configuration
PUT	/config	Update configuration
GET	/sessions	List recent sessions
GET	/sessions/:id	Get session details
GET	/sessions/:id/questions	Get session Q&A log
GET	/performance	Model performance stats
GET	/insights	Learning insights
GET	/audit	Audit log
GET	/stats	Statistics

91.11 Database Tables

Table	Purpose
crucible_config	Per-tenant configuration
crucible_sessions	Deliberation sessions
crucible_participants	Session participants
crucible_questions	Questions with quality scores
crucible_answers	Answers with circular detection
crucible_citations	Citation tracking
crucible_final_reports	Final outputs with scores
crucible_learning_insights	Extracted insights
crucible_model_performance	Aggregated model stats
crucible_audit_log	Full audit trail

91.12 Integration with Cato

The Crucible integrates with Cato pipeline orchestration:

```
// In method execution
const crucibleResult = await crucibleOrchestrator.runDeliberation(
  tenantId,
  pipelineExecutionId,
  methodInvocationId,
  methodName,
  participantModelIds,
  taskPrompt,
  { costMode: 'balanced' }
);

// Use winner's report
const bestOutput = crucibleResult.winnerReport;
```

91.13 Key Files

File	Purpose
packages/shared/src/types/crucible.typescript	TypeScript types
lambda/shared/services/crucible/core.service.ts	Core service
lambda/shared/services/crucible/lifecycle orchestrator.service.ts	Lifecycle orchestration
lambda/admin/crucible.ts	Admin API handler
apps/admin-dashboard/app/(dashboard)/platform/crucible/page.tsx	Admin UI
migrations/000_consolidated_schema.sql	Database schema

91.14 Competitive Moat

- The Crucible is a **Tier 1 Technical Moat** (Score: 28/30):
- **Uniqueness:** No competitor has competitive multi-LLM deliberation
 - **Network Effect:** Learning insights improve model selection globally
 - **Data Moat:** Accumulated question patterns are proprietary knowledge
 - **Time Advantage:** First-mover in novel deliberation category

Section 92: Mid-Level Services (MLS) (v5.0.0)

Mid-Level Services (MLS) are domain-specific orchestration services that combine multiple AI models to provide unified capabilities for specific use cases. MLS provides high-level endpoints that automatically route to appropriate underlying models, handle thermal state transitions, and provide graceful degradation.

92.1 Overview

Principle	Description
Orchestration	Services combine 2-8 models for complex pipelines
Graceful Degradation	Services remain functional when optional models are offline
Thermal Awareness	Auto-warms models on first request, scales to zero when idle
Tier-Gated Access	Different services available at different subscription tiers
Unified Pricing	Per-use pricing abstracts underlying model costs
Compliance-Ready	HIPAA, SOC 2, GDPR compliant by design

92.2 Available Services

Service	Domain	Min Tier	Key Capabilities
Perception	Computer Vision	3 (GROWTH)	detect, segment, classify, analyze
Scientific	Computational Biology	4 (SCALE)	protein/embed, protein/fold, geometry/solve
Medical	Healthcare Imaging	4 (SCALE)	segment, segment/3d, transcribe
Geospatial	Satellite Imagery	4 (SCALE)	classify, change-detect
Reconstruction	3D Generation	4 (SCALE)	nerf, gaussian-splat

92.3 Accessing the MLS Dashboard

Navigate to: **Platform -> MLS Services**

The dashboard provides: - **Overview Tab**: Service status, model health, usage metrics - **Services Tab**: Individual service configuration and endpoints - **Models Tab**: All 38 self-hosted models with thermal states - **Thermal Tab**: Warm-up scheduling and cost optimization - **Usage Tab**: Per-service billing and analytics

92.4 Service States

State	Description	Action Required
RUNNING	All required models available	None
DEGRADED	Required models available, some optional offline	None (graceful degradation active)
DISABLED	Admin has disabled the service	Enable in dashboard
OFFLINE	Required models unavailable	Check model health

92.5 Perception Service

Purpose: Unified computer vision pipeline for object detection, segmentation, classification, and analysis.

Required Models: yolov8m, mobilesam

Optional Models: yolov8x, yolov11x, sam-vit-h, sam2, clip-vit-l14, grounding-dino, efficientnetv2-l

Endpoints:

Endpoint	Description	Input	Output
/perception/detect	Object detection with bounding boxes	image/*	JSON
/perception/segment	Object/region segmentation	image/*	JSON, PNG mask
/perception/classify	Image classification	image/*	JSON
/perception/analyze	Full pipeline: detect + segment + classify	image/*	JSON

Pricing: \$0.02/image, \$0.50/minute video (40% margin)

92.6 Scientific Computing Service

Purpose: Protein analysis, embeddings, structure prediction, and computational biology pipelines.

Required Models: esm2-3b

Optional Models: alphafold2, alphageometry, protenix

Endpoints:

Endpoint	Description	Input	Output
/scientific/protein/embed	Generate protein sequence embeddings	FASTA, JSON	JSON
/scientific/protein/fold	Predict protein 3D structure	FASTA	PDB, mmCIF, JSON
/scientific/geometry/solve	Solve mathematical geometry problems	JSON	JSON

Pricing: \$0.50/request (40% margin)

92.7 Medical Imaging Service (HIPAA)

Purpose: HIPAA-compliant medical image segmentation, analysis, and transcription.

Required Models: medsam

Optional Models: nnunet, whisper-large-v3

HIPAA Compliance: - PHI sanitization before model processing - 6-year data retention (2190 days) - Full audit logging - BAA required for healthcare tenants

Endpoints:

Endpoint	Description	Input	Output
/medical/segment	2D anatomical segmentation	DICOM, PNG, JPEG	JSON, PNG
/medical/segment/3d	Volumetric 3D CT/MRI segmentation	DICOM, NIfTI	NIfTI, JSON
/medical/transcribe	Medical dictation transcription	WAV, MP3, M4A	JSON, text

Pricing: \$0.15/image, \$0.08/minute audio (40% margin)

92.8 Geospatial Analysis Service

Purpose: Satellite imagery analysis, land classification, and earth observation.

Required Models: prithvi-100m

Optional Models: prithvi-600m

Endpoints:

Endpoint	Description	Input	Output
/geospatial/classify	Land use and land cover classification	GeoTIFF	JSON, GeoTIFF
/geospatial/change-detect	Detect changes between satellite images	GeoTIFF	JSON, GeoTIFF

Pricing: \$0.05/image (40% margin)

92.9 3D Reconstruction Service

Purpose: Neural Radiance Fields (NeRF) and 3D Gaussian Splatting for 3D scene reconstruction.

Required Models: nerfstudio

Optional Models: 3d-gaussian-splatting

Endpoints:

Endpoint	Description	Input	Output
/reconstruction/nerf	3D scene from images using NeRF	MP4, images	GLTF, OBJ, MP4
/reconstruction/gaussian	Real-time 3D via Gaussian Splatting	MP4, images	PLY, GLTF

Pricing: \$5.00/3D model (40% margin)

92.10 Thermal State Management

Models can be in different thermal states to optimize costs:

State	Description	Response Time	Cost
OFF	Model not deployed	N/A	\$0
COLD	Endpoint exists, 0 instances	2-5 min warm-up	Minimal
WARM	1+ instances running	Seconds	Instance hours
HOT	Max instances, autoscaling	<1 second	Higher
AUTOMATIC	System-managed	Variable	Optimized

Warm-up Triggers: - **On-Demand:** First request to COLD model (returns 202 Accepted) - **Scheduled:** EventBridge rules at business hours - **Predictive:** Usage pattern analysis - **Manual:** Admin dashboard action

92.11 Model Registry Summary

Category	Count	Examples
Computer Vision	19	YOLOv8/11, SAM/SAM2, CLIP, EfficientNet
Audio/Speech	6	Whisper, TitaNet, pyannote
Scientific	4	AlphaFold2, ESM-2, AlphaGeometry
Medical	2	MedSAM, nnU-Net
Geospatial	2	Prithvi 100M/600M
Generative/3D	5	Nerfstudio, 3D Gaussian, Llama 3, Qwen
Total	38	

92.12 Graceful Degradation

When optional models are unavailable, services degrade gracefully:

Level	Description	Example
FULL	All models available	All capabilities active
REDUCED	Only required models	HD features disabled
MINIMAL	Partial required models	Limited capabilities

The dashboard shows current degradation level for each service.

92.13 Admin API Reference

Base path: /api/v2/admin/mls

Method	Endpoint	Description
GET	/services	List all services with states

Method	Endpoint	Description
GET	/services/:id	Get service details
PUT	/services/:id/state	Enable/disable service
GET	/models	List all models with thermal states
POST	/models/:id/warm-up	Trigger model warm-up
POST	/models/:id/scale-down	Scale model to zero
GET	/thermal/schedules	Get warm-up schedules
PUT	/thermal/schedules	Update warm-up schedules
GET	/usage	Get usage statistics
GET	/usage/:serviceId	Get service-specific usage

92.14 Key Files

File	Purpose
packages/infrastructure/lib/config/models/	Model configurations
packages/infrastructure/lib/config/services/	Service definitions
packages/infrastructure/lambda/thermal/	Thermal management
packages/infrastructure/lambda/services/	Service orchestrators
migrations/000_consolidated_schema.sql	Database schema
litellm/config/self-hosted.yaml	LiteLLM routing config

92.15 Competitive Moat

MLS is a **Tier 1 Technical Moat** (Score: 27/30):

- **Uniqueness:** No competitor offers 5 domain-specific orchestrated services
- **Complexity:** 38 models with thermal management is significant operational overhead
- **Compliance:** HIPAA-ready medical service with proper audit trails
- **Time Advantage:** 12+ months to replicate service configurations

93. MLS (Message Layer Security) - Agent-to-Agent Encryption

Location: Admin Dashboard -> Platform -> MLS Security

Migration: migrations/000_consolidated_schema.sql

Version: 6.5.0 (PROMPT-43)

93.1 Overview

MLS (Message Layer Security) implements **RFC 9420-inspired group encryption** for secure agent-to-agent communication. Unlike TLS which provides point-to-point encryption, MLS provides group encryption with advanced

security properties that survive member changes.

93.2 Security Properties

Property	Description	Benefit
Forward Secrecy	Each epoch derives new keys via HKDF	Compromising current keys can't reveal past messages
Post-Compromise Security	Key updates rotate all group secrets	System heals after temporary compromise
Group Key Agreement	Ratchet tree structure	$O(\log n)$ key updates instead of $O(n^2)$
Authenticated Encryption	AES-256-GCM + Ed25519 signatures	Confidentiality + integrity + authenticity
Sender Authentication	Ed25519 signatures on all messages	Messages bound to sender identity

93.3 Dashboard Features

MLS Dashboard (/platform/mls)

Widget	Description
Group Stats	Total groups, active groups, member count
Message Stats	Total messages, messages in last 24h

Widget	Description
Key Package Stats	Total key packages, active (non-expired)
Recent Groups	Latest 10 groups with epoch info

Groups Management (/platform/mls/groups)

Action	Description
Create Group	New encrypted group with creator as first member
View Group	See members, epoch, cipher suite
Add Member	Add agent/service/user to group (increments epoch)
Remove Member	Remove member (increments epoch for security)
Update Key	Trigger post-compromise key rotation

Audit Log (/platform/mls/audit)

All MLS operations are logged for compliance: - Group creation/deletion - Member additions/removals - Key updates - Message sends - Authentication failures

93.4 Use Cases

Multi-Agent Collaboration

```
// Orchestrator creates secure collaboration group
const group = await mlsService.createGroup(tenantId, "Research Task Force", "orchestrator-agent")

// Add specialized agents
await mlsService.addMember(group.groupId, "researcher-agent", "orchestrator-agent");
await mlsService.addMember(group.groupId, "validator-agent", "orchestrator-agent");

// Encrypted task distribution
await mlsService.encryptForGroup(group.groupId, "orchestrator-agent", taskPayload);
```

Handling Suspected Compromise

```
// If agent keys suspected compromised, trigger key update
await mlsService.updateKey(group.groupId, "compromised-agent-id");

// All future messages use new epoch secrets
// Past messages remain protected (forward secrecy)
```

93.5 Admin API Reference

Base path: /api/admin/mls

Method	Endpoint	Description	Request Body
GET	/dashboard	Dashboard statistics	-
POST	/key-packages	Generate key package	{memberId, memberType, credential}
GET	/key-packages/:id	Get key package	-
GET	/groups	List all groups	-
POST	/groups	Create group	{name, creatorMemberId}
GET	/groups/:id	Get group with members	-
POST	/groups/:id/members	Add member	{memberId, addedBy}
DELETE	/groups/:id/members/:id	Remove member	{removedBy}
POST	/groups/:id/update-key	Rotate keys	{memberId}
GET	/groups/:id/messages	List messages	?limit=100
POST	/groups/:id/messages	Send message	{senderId, content}
GET	/audit	Audit log	?limit=100&action=&groupId=

93.6 Database Schema

Table	Purpose
mls_key_packages	X25519/Ed25519 key packages for members
mls_groups	Group state with epoch and encrypted secrets
mls_group_members	Membership records with ratchet tree positions
mls_commits	State change records (add/remove/update)
mls_messages	Encrypted messages with signatures
mls_epoch_secrets	Per-epoch secrets for forward secrecy
mls_audit_log	Compliance audit trail

93.7 Configuration

Set the MLS master key (used to encrypt private keys at rest):

Lambda environment variable

MLS_MASTER_KEY=base64-encoded-32-byte-key

Future: AWS KMS integration

MLS_KMS_KEY_ARN=arn:aws:kms:region:account:key/key-id

93.8 Cryptographic Primitives

Primitive	Algorithm	Purpose
Key Exchange	X25519	ECDH key agreement
Encryption	AES-256-GCM	Authenticated encryption
Signatures	Ed25519	Commit and message signing
Key Derivation	HKDF-SHA256	Epoch and message keys
Hashing	SHA-256	Tree hashing

93.9 Key Files

File	Purpose
lambda/shared/services/mls/mls.service	Core MLS service (936 lines)
lambda/shared/services/mls/index.ts	Module exports
lambda/admin/mls.ts	Admin API endpoints
migrations/000_consolidated_schema.sql	Database schema

93.10 Competitive Moat

MLS for A2A communication is a **Tier 1 Technical Moat**:

Attribute	Value
Uniqueness	No competitor offers RFC 9420-inspired group encryption for AI agents
Complexity	Forward secrecy + post-compromise security requires deep crypto expertise
Time to Replicate	6-9 months for proper implementation
Integration	Seamlessly integrates with existing A2A protocol

94. Cartridge PKI KMS Integration (PROMPT-42)

94.1 Overview

PROMPT-42 implements **real AWS KMS integration** for the Cartridge PKI system, replacing placeholder strings with production-ready asymmetric signing operations. This enables cryptographically-secure .RADz cartridge signing and verification for portable AI brains.

94.2 Problem Statement

The original CartridgePKI service contained placeholder implementations:

```
// BEFORE: Placeholder strings (non-functional)
const publicKey = `-----BEGIN PUBLIC KEY-----\n
    PLACEHOLDER_FOR_KMS_KEY_${keyId}\n
    -----END PUBLIC KEY-----`;
const rootSignature = `ROOT_SIGNED_${fingerprint}_WITH_${rootCAFingerprint}`;
Result: Cartridge signing/verification did NOT work in production.
```

94.3 Solution Architecture

94.4 Key Hierarchy

Level	Key Type	Created By	Signs
Platform Root CA	ECC_NIST_P256	CDK SecurityStack	Tenant CA certificates
Tenant CA	ECC_NIST_P256	generateTenantCA()	Cartridge artifacts
Signing Keys	ECC_NIST_P256	createSigningKey()	Purpose-specific (author, publisher, validator)

94.5 Admin Dashboard

Location: Platform -> Security -> Cartridge PKI

Tab	Purpose
Overview	Platform CA status, tenant CA count, key health
Tenant CAs	List/manage tenant CA certificates
Signing Keys	Browse signing keys by tenant and purpose
Audit Log	PKI operations with filtering
Configuration	Key rotation policies, expiration alerts

94.6 Admin API Reference

Base URL: /api/admin/pki

Endpoint	Method	Description
/dashboard	GET	PKI dashboard with stats
/tenant-cas	GET	List all tenant CAs
/tenant-cas/:tenantId	GET	Get tenant CA details
/tenant-cas/:tenantId	POST	Generate new tenant CA
/tenant-cas/:tenantId/revoke	POST	Revoke tenant CA
/signing-keys	GET	List signing keys
/signing-keys/:tenantId	POST	Create signing key
/signing-keys/:keyId/revoke	POST	Revoke signing key
/verify	POST	Verify cartridge signature
/audit	GET	Query audit log

94.7 Database Schema

Table	Purpose
tenant_ca_certificates	Tenant CA certificates signed by platform root
cartridge_signing_keys	Purpose-specific signing keys signed by tenant CA
pki_audit_log	Audit log for all PKI operations (partitioned monthly)

Key Columns:

Column	Type	Description
key_id	VARCHAR(64)	KMS Key ID
key_arn	VARCHAR(256)	KMS Key ARN
fingerprint	VARCHAR(64)	SHA-256 of public key

Column	Type	Description
status	VARCHAR(20)	ACTIVE, REVOKED, EXPIRED, PENDING_DELETION
root_signature / ca_signature	TEXT	Base64 signature from parent CA

94.8 Environment Variables

Variable	Description
RADIANT_PLATFORM_SIGNING_KEY_ID	KMS Key ID for platform root CA
RADIANT_PLATFORM_SIGNING_KEY_ARN	KMS Key ARN for platform root CA

94.9 Security Considerations

Consideration	Mitigation
Key Rotation	Asymmetric keys don't auto-rotate; manual rotation requires certificate reissuance
Key Deletion	Extended pending window (30 days prod); RETAIN removal policy
Tenant Isolation	Each tenant gets own KMS key; RLS on all database tables
Audit Trail	All PKI ops logged to partitioned pki_audit_log table
Least Privilege	IAM conditions restrict key creation to ECC_NIST_P256 + SIGN_VERIFY

94.10 CDK Security Stack

```
// Asymmetric signing key for Cartridge PKI
this.cartridgeSigningKey = new kms.Key(this, 'CartridgeSigningKey', {
  alias: `alias/${resourcePrefix}-cartridge-signing`,
  keySpec: kms.KeySpec.ECC_NIST_P256,
  keyUsage: kms.KeyUsage.SIGN_VERIFY,
  enableKeyRotation: false, // Asymmetric keys don't support
  pendingWindow: props.environment === 'prod'
    ? cdk.Duration.days(30) : cdk.Duration.days(7),
  removalPolicy: props.environment === 'prod'
    ? cdk.RemovalPolicy.RETAIN : cdk.RemovalPolicy.DESTROY,
});
```

94.11 Key Files

File	Purpose
lib/stacks/security-stack.ts	CDK asymmetric key definition
lambda/shared/services/cartridge-pki.service.ts	PKI service with real KMS
migrations/000_consolidated_schema.sql	Database schema for PKI keys

94.12 Verification Checklist

- ☐ CDK synth shows CartridgeSigningKey resource
- ☐ KMS console shows key with ECC_NIST_P256 spec
- ☐ Lambda env vars include signing key ID/ARN
- ☐ generateTenantCA() creates real KMS key
- ☐ createSigningKey() creates real KMS key
- ☐ Cartridge signatures verify successfully
- ☐ No PLACEHOLDER strings remain in service file

94.13 Competitive Moat

Cartridge PKI with real KMS is a **Tier 1 Technical Moat**:

Attribute	Value
Uniqueness	No competitor offers cryptographic signing for portable AI packages
Complexity	Multi-level CA hierarchy with ECDSA requires deep PKI expertise
Time to Replicate	4-6 months for proper implementation
Integration	Enables secure cartridge federation across clusters

95. Autonomous Organism Architecture (PROMPT-43)

Project Metamorphosis – Self-evolving AI system with Neural Affinity Routing, JIT tool generation, and predictive user modeling

95.1 Overview

The Autonomous Organism Architecture transforms RADIANT from “Agentic Software” (wrapping LLMs around static APIs) to “Neural Infrastructure” (becoming the tools). This implementation delivers **5 Leapfrog Technologies**:

#	Technology	What It Does	Admin Control
1	Tool Forge	Generates tools on-demand	Approval gates, sandbox config
2	Liquid Topology	Routes to browser/local/edge/cloud	Sensitivity rules, topology config
3	Tensor-Link	Vector-based communication	Compression mode selection
4	Ghost Simulation	Predicts user reaction	Calibration thresholds, simulation limits
5	Economic Cortex	Autonomous budget management	Budget limits, negotiation strategies

95.2 Accessing Organism Management

Location: Platform -> Organism

Navigation Path: Admin Dashboard -> Platform -> Organism

95.3 Overview Tab

The Overview tab provides real-time organism health metrics:

Section	Metrics
Server Health	Active/degraded/unhealthy server counts, health percentage
Tool Statistics	Total tools, successful executions, average latency
Compute Distribution	Pie chart of browser/local/edge/cloud usage
Ghost Stats	Active vectors, prediction accuracy, calibration count
Economic Metrics	Total spend, savings from negotiation, budget utilization

95.4 MCP Servers Tab

Manage Model Context Protocol servers for tool execution.

Server List Columns:

Column	Description
Name	Server name with health badge (green/yellow/red)
Transport	stdio, sse, streamable-http, websocket, wasm-local
URL	Server endpoint URL
Health	Current health status
Latency	Average response time (ms)
Error Rate	Percentage of failed calls
Calls Today	Total API calls in current day

Column	Description
Domains	Domain affinity tags

Actions:

- **Add Server:** Register new MCP server with transport, URL, domains
- **Discover:** Auto-discover server capabilities from URL
- **Health Check:** Trigger manual health check
- **Edit:** Update server configuration
- **Delete:** Remove server from registry

Server Configuration Fields:

Field	Type	Description
name	String	Human-readable server name
description	Text	Server purpose description
transport	Enum	Communication protocol
url	URL	Server endpoint (for HTTP transports)
command	String	Command to start (for stdio transport)
args	Array	Command arguments
domainAffinity	Array	Domains this server excels at
authType	Enum	Authentication method
maxConcurrentCalls	Number	Connection pool size
timeout	Number	Request timeout (ms)
budgetLimit	Number	Daily cost limit (\$)

95.5 Tools Tab

Browse and manage registered tool schemas.

Tool Card Display:

- **Name** and description
- **Category** badge (data_retrieval, communication, etc.)
- **Success Rate** percentage
- **Usage Count** total executions
- **Avg Latency** response time
- **Sensitivity Level** (public, internal, confidential, restricted)

Search & Filter:

- Semantic search by description
- Filter by category
- Filter by sensitivity level
- Sort by success rate, usage, or latency

Tool Categories:

Category	Description
data_retrieval	Fetching data from external sources
data_manipulation	Transforming, filtering, aggregating data
communication	Sending emails, messages, notifications
file_operations	File read/write, compression, conversion
api_integration	External API calls
computation	Mathematical calculations, ML inference
search	Search engines, database queries
generation	Content generation, code generation
analysis	Data analysis, sentiment analysis
automation	Workflow automation, scheduling

95.6 Genesis Tab

Configure and monitor JIT tool generation.

Tool Request Form:

Field	Description
API URL	URL to API documentation (OpenAPI, GraphQL endpoint)
Tool Name	Desired name for generated tool
Description	What the tool should do
Domains	Domain tags for neural routing

Request Status Badges:

Status	Description
queued	Waiting to start
scraping	Discovering API specification
generating	Generating MCP server code
validating	Running security validation
sandbox_testing	Testing in Firecracker sandbox
approved	Passed validation, awaiting deploy
rejected	Failed validation
deployed	Active and available
failed	Generation failed

Genesis Pipeline Phases:

1. **Detection:** Neural Affinity returns no suitable tools

- 2. **Scouting:** API documentation discovery (OpenAPI, GraphQL, scraping)
- 3. **Fabrication:** MCP server code generation
- 4. **Sandboxing:** Firecracker MicroVM isolation (512MB, 30s timeout)
- 5. **Validation:** TypeScript, SAST, CVE, behavioral analysis
- 6. **Mount:** Hot-load into active session
- 7. **Twilight Review:** Nightly human/AI review queue

Security Configuration:

Setting	Default	Description
Sandbox Memory	512MB	Firecracker VM memory limit
Sandbox Timeout	30s	Maximum execution time
Validation Threshold	0.70	Minimum security score
Auto-Deploy	false	Auto-deploy approved tools
Require Twilight Review	true	Queue for nightly review

95.7 Compute Tab

Configure Liquid Compute topology for dynamic routing.

Browser Capabilities Form:

Field	Description
WebAssembly	WASM runtime support
WebGL	GPU access via WebGL
WebGPU	Modern GPU API support
Memory	Available memory (MB)
Storage	Local storage quota (MB)

Local Agent Capabilities Form:

Field	Description
OS	Operating system
Memory	Available RAM (GB)
GPU	GPU model and VRAM
File Access	File system access level
Network	Network access permissions

Sensitivity Rules:

Configure which compute locations are allowed for each data sensitivity level:

Sensitivity	Browser	Local	Edge	Cloud
public	[OK]	[OK]	[OK]	[OK]
internal	[OK]	[OK]	[OK]	[OK]
confidential	[OK]	[OK]	[X]	[X]
restricted	[X]	[OK]	[X]	[X]

95.8 Ghost Tab

Monitor and calibrate Ghost Simulation predictions.

Simulation Runner:

Field	Description
User ID	Target user for simulation
Simulation Type	user_reaction, outcome_prediction, safety_check, cost_estimation, latency_estimation
Tool ID	Tool being simulated
Proposed Action	Action description
Context	JSON context object

Simulation History Table:

Column	Description
ID	Simulation UUID
Type	Simulation type
Tool	Tool being simulated
Confidence	Prediction confidence (high/medium/low/uncertain)
Prediction	Predicted outcome
Timestamp	When simulation ran

Calibration Statistics:

Metric	Description
Total Predictions	Number of predictions made
Correct Predictions	Predictions that matched outcome
Accuracy	Percentage correct
Last Calibrated	Timestamp of last calibration

Ghost Vector Structure (for reference):

Internal Vector (64-dim, interpretable):

- Communication: formality, verbosity, directness
- Risk: tolerance, conflict avoidance
- Emotional: anxiety, frustration threshold
- Professional: career focus, feedback receptivity

External Vector (4096-dim, learned):

- Behavioral patterns from interaction history

95.9 Economic Configuration

Budget management is configured per-tenant.

Budget Configuration:

Setting	Description
Total Budget	Maximum spend per period
Period Type	daily, weekly, monthly
Hard Limit	Stop execution when exceeded
Auto Renew	Reset budget at period end

Alert Thresholds:

Level	Threshold	Actions
info	50%	Notify admin (optional)
warning	75%	Notify admin and user
critical	90%	Notify + switch to lower tier
exceeded	100%	Pause execution (if hard limit)

Negotiation Strategies:

Strategy	Behavior
aggressive	Always seek lowest cost, accept quality trade-offs
balanced	Balance cost vs quality (default)
conservative	Prioritize quality, minimize cost reduction

Optimization Settings:

Setting	Description
Prefer Self-Hosted	Use self-hosted models when possible
Quality Floor	Minimum acceptable quality (0-1)

Setting	Description
Latency Target	Maximum acceptable latency (ms)

95.10 Admin API Reference

Base URL: /api/admin/organism

Dashboard: | Endpoint | Method | Description | |----|----|----| | /dashboard | GET | Full organism metrics |

MCP Servers: | Endpoint | Method | Description | |----|----|----| | /mcp-servers | GET | List all servers | | /mcp-servers | POST | Register new server | | /mcp-servers/:id | GET | Get server details | | /mcp-servers/:id | PUT | Update server | | /mcp-servers/:id | DELETE | Remove server | | /mcp-servers/discover | POST | Auto-discover server | | /mcp-servers/route | POST | Route by neural affinity | | /mcp-servers/:id/health | POST | Check health |

Total: 37 Admin API endpoints

95.11 Database Schema

Migration: V2026_02_03_001__autonomous_organism_architecture.sql

Table	Purpose
mcp_servers	MCP server registry with neural embeddings
mcp_tool_schemas	Tool schemas with neural signatures
mcp_routing_decisions	Routing decision audit log
genesis_tool_requests	Tool generation requests
genesis_tool_results	Generated code and validation
genesis_api_discovery_cache	Cached API discovery

Table	Purpose
liquid_compute_topologies	Compute topology per tenant
liquid_compute_decisions	Routing decisions
ghost_vectors	User digital twin vectors (4096-dim)
ghost_simulations	Simulation results
ghost_calibrations	Prediction calibration
ghost_user_interactions	Interaction training data
organism_telemetry	System health telemetry
economic_cortex_configs	Budget configuration
economic_cortex_budgets	Multi-scope budgets
economic_cortex_alerts	Alert thresholds
economic_cortex_negotiations	Negotiation history
economic_cortex_spending	Spending analytics

Total: 18 tables with RLS

95.12 Security Considerations

Concern	Mitigation
Genesis Code Injection	Firecracker sandbox, SAST scan, CVE audit, Twilight review
Ghost Vector Privacy	User isolation via RLS, encryption at rest
Economic Abuse	Budget limits, negotiation caps, admin approval gates
MCP Credential Exposure	KMS encryption, credential rotation
Tensor-Link Interception	FP16/INT8 compression obfuscates vectors

95.13 Competitive Moat

The Autonomous Organism Architecture is a **Tier 0 Platform Moat** (highest tier):

Attribute	Value
Uniqueness	No competitor has JIT tool generation + predictive user modeling
Complexity	5 interlocking systems requiring deep AI expertise
Time to Replicate	18-24 months for proper implementation
Network Effects	Generated tools improve routing for all tenants

Attribute	Value
Switching Cost	Ghost Vectors + Economic history = high lock-in

95.14 Implementation Files

File	Purpose
organism/mcp-server-manager.service.ts	MCP server management (~770 lines)
organism/neural-schema-registry.service.ts	Tool schema registry (~750 lines)
organism/genesis-auto-tool.service.ts	JIT tool generation (~980 lines)
organism/liquid-compute.service.ts	Compute topology (~700 lines)
organism/ghost-simulation.service.ts	User prediction (~940 lines)
organism/tensor-link.service.ts	Vector transport (~600 lines)
organism/economic-cortex.service.ts	Budget management (~680 lines)
organism/organism-integration.service.ts	Integration layer (~460 lines)
admin/organism.ts	Admin API handler (~700 lines)
platform/organism/page.tsx	Admin Dashboard (~600 lines)

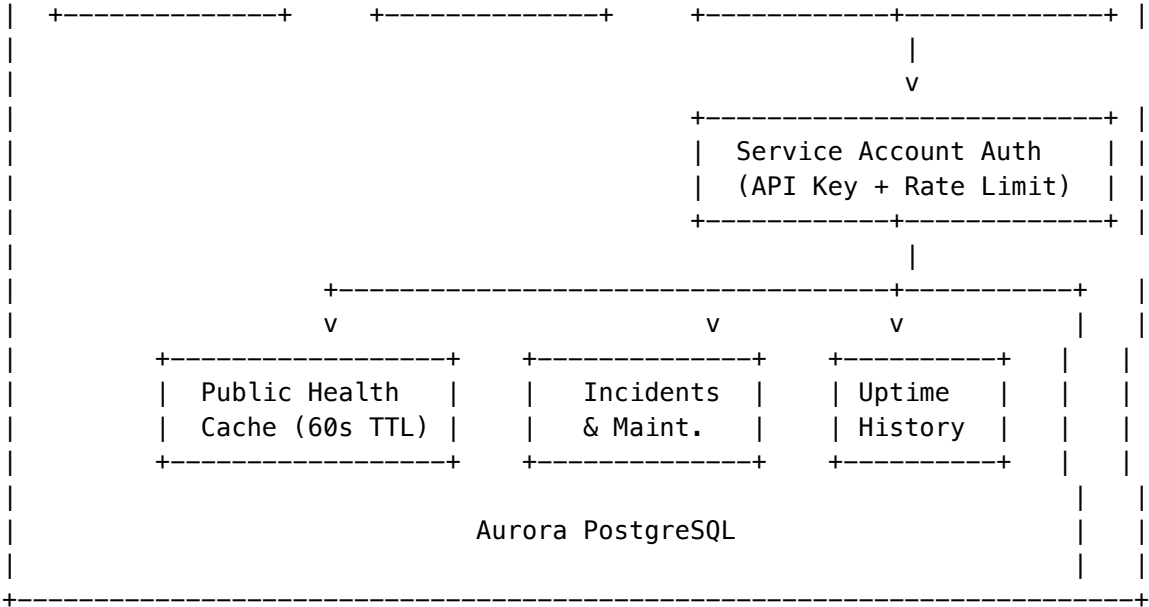

Total: ~8,180 lines of production code

Section 96: Public Status Page (v7.1.0)

The Public Status Page provides a **read-only, publicly accessible** system health dashboard that operates independently from the main RADIANT platform. It is designed for maximum availability and regulatory compliance.

96.1 Architecture Overview

96.2 Key Design Principles

Principle	Implementation
Isolated Deployment	Separate CloudFront distribution, independent from Think Tank
Read-Only Access	Service account with status:read, metrics:read, incidents:read, maintenance:read scopes only
No Sensitive Data	All data sanitized before public exposure (no IPs, no resource ARNs, no internal names)
High Availability	Aggressive caching (60s API, 300s stale-while-revalidate, 3600s stale-if-error)
Rate Limited	60 req/min per API key, database-level enforcement
Audit Logged	All API access logged for SOC2/HIPAA compliance

96.3 Service Account Authentication

The status page authenticates to the API using a pre-seeded service account:

Property	Value
Account Name	status-page-reader
Created By	System (seeded on initial deployment)
Scopes	status:read, metrics:read, incidents:read, maintenance:read
Rate Limit	60/minute, 1000/hour

Property	Value
API Key Storage	AWS Secrets Manager (radiant/{env}/status-page/api-key)

Key Distribution Flow: 1. On initial deployment, migration seeds service account with placeholder hash 2. CDK post-deployment hook generates secure API key 3. Key stored in Secrets Manager (actual value) and database (bcrypt hash) 4. Status page app retrieves key from Secrets Manager at runtime

96.4 Sanitized Data Exposure

The API exposes ONLY sanitized, public-safe data:

Internal Component	Public Name	Public Description
aurora-postgresql	Database Services	Primary data storage and retrieval
dynamodb	Session Services	Session management and caching
api-gateway	API Services	REST and GraphQL API endpoints
lambda	Compute Services	Request processing and business logic
s3	Storage Services	File storage and delivery
elasticache	Cache Services	Performance optimization layer
cloudfront	Content Delivery	Global content distribution
cognito	Authentication	User authentication and authorization
ai-inference	AI Processing	AI model inference and orchestration
think-tank	Think Tank	Collaborative AI workspace

Never Exposed: - Internal IP addresses or hostnames - AWS resource ARNs or identifiers - Error stack traces or internal logs - User counts or tenant information - Actual latency numbers (only relative indicators)

96.5 Public Health Status

Status	Description	UI Display
operational	All systems functioning normally	Green checkmark
degraded	Minor issues, core functionality intact	Yellow warning
partial_outage	Some services unavailable	Orange alert
major_outage	Significant service disruption	Red critical
maintenance	Planned maintenance in progress	Blue info

96.6 Incident Management

Public incidents are managed through the Admin Dashboard and exposed via the status API:

Field	Description
title	User-friendly incident title
status	investigating -> identified -> monitoring -> resolved
severity	minor, major, critical
affectedComponents	List of public component names
updates	Timeline of status updates (newest first)

Creating an Incident: 1. Navigate to **Platform -> Status Page -> Incidents** 2. Click **New Incident** 3. Select affected components and severity 4. Write user-friendly title and initial update 5. Publish (immediately visible on public status page)

96.7 Scheduled Maintenance

Field	Description
title	Maintenance window title
description	What will be affected and why
scheduledStart	ISO 8601 start time
scheduledEnd	ISO 8601 end time
affectedComponents	Components that will be impacted
status	scheduled, in_progress, completed, cancelled

96.8 Uptime History

The status page displays 90 days of uptime history:

Metric	Calculation
Last 24 Hours	Rolling 24-hour uptime percentage
Last 7 Days	Rolling 7-day uptime percentage
Last 30 Days	Rolling 30-day uptime percentage
Last 90 Days	Rolling 90-day uptime percentage

Daily uptime records include: - Date (YYYY-MM-DD) - Uptime percentage - Status (operational, incident, maintenance) - Incident count

96.9 Rate Limiting

Database-level rate limiting protects the API:

```
-- Check rate limit before processing request
SELECT check_rate_limit(
  p_service_account_id := '...',
```

```

    p_window_minutes := 1,
    p_max_requests := 60
);

```

-- Returns TRUE if request allowed, FALSE if rate limited

Rate limit headers returned with every response: - X-RateLimit-Limit: Maximum requests per window - X-RateLimit-Remaining: Requests remaining in window - X-RateLimit-Reset: ISO 8601 timestamp when window resets

96.10 Audit Logging

All API access is logged for compliance:

Field	Description
requestId	Unique request identifier
endpoint	API endpoint accessed
serviceAccountId	Authenticated service account
clientId	SHA-256 hashed client IP (privacy)
statusCode	HTTP response code
responseTimeMs	Request duration
wasRateLimited	Whether request hit rate limit

Retention: 2190 days (6 years) for HIPAA compliance

96.11 Caching Strategy

Layer	TTL	Purpose
CloudFront	60s	Edge caching for global availability
API Response	60s max-age	Browser/client caching
Stale-While-Revalidate	300s	Serve stale while fetching fresh
Stale-If-Error	3600s	Serve stale if backend unavailable
Database Cache	60s	Materialized health snapshot

This ensures the status page remains available even if the main platform experiences issues.

96.12 Admin Dashboard

Navigate to: **Platform -> Status Page**

Tab	Description
Overview	Current system status, recent incidents, uptime summary
Incidents	Create, update, and resolve public incidents
Maintenance	Schedule and manage maintenance windows
Components	Configure public component names and descriptions
Service Accounts	Manage status page API credentials
Audit Log	View API access logs

96.13 Admin API Reference

Base path: `/api/admin/status-page`

Method	Endpoint	Description
GET	<code>/health</code>	Get current public health status
GET	<code>/incidents</code>	List all incidents
POST	<code>/incidents</code>	Create new incident
PUT	<code>/incidents/:id</code>	Update incident
POST	<code>/incidents/:id/updates</code>	Add incident update
GET	<code>/maintenance</code>	List scheduled maintenance
POST	<code>/maintenance</code>	Schedule maintenance
PUT	<code>/maintenance/:id</code>	Update maintenance window
DELETE	<code>/maintenance/:id</code>	Cancel maintenance
GET	<code>/uptime</code>	Get uptime history
GET	<code>/audit</code>	Get API access audit log
GET	<code>/service-accounts</code>	List service accounts
POST	<code>/service-accounts/:id/rotate-key</code>	Rotate API key

96.14 Database Schema

Table	Purpose
<code>service_accounts</code>	Service account credentials and scopes
<code>status_page_audit_log</code>	API access audit trail
<code>api_rate_limits</code>	Rate limit tracking per account
<code>public_health_cache</code>	Cached sanitized health data
<code>public_incidents</code>	Public incident records
<code>public_incident_updates</code>	Incident timeline updates
<code>scheduled_maintenance</code>	Maintenance windows

Table	Purpose
uptime_history	Daily uptime records

96.15 Key Files

File	Purpose
packages/shared/src/types/status-page.types.ts	Shared TypeScript types
packages/infrastructure/migrations/V001__database_schema_accounts_and_status_page.sql	Database schema
packages/infrastructure/lambda/public-api-lambda/page.handler.ts	API Lambda handler
apps/status-page/	Isolated Next.js status page app

96.16 Deployment

The status page is deployed as an isolated application:

1. **CloudFront Distribution:** Separate from main app and Think Tank
2. **S3 Origin:** Static Next.js export
3. **API Gateway:** Dedicated public API endpoint
4. **Lambda:** Serverless API handler

URLs: - Status Page: https://status.{{RADIANT_DOMAIN}} - Public API: https://api.{{RADIANT_DOMAIN}}/public/

96.17 Regulatory Compliance

Regulation	Compliance Measure
SOC2	Full audit logging, access controls, rate limiting
HIPAA	No PHI exposure, 6-year audit retention, encrypted at rest
GDPR	Hashed client IPs, no PII in public data
WCAG 2.1	Accessible UI design, keyboard navigation

Section 97: URL Configuration (v7.5.0)

RADIANT supports multiple application URLs that must be configured consistently across the platform. This section covers URL configuration in both the Swift Deployer and Admin Dashboard.

97.1 Configurable URLs

URL Type	Description	Example
API Base URL	Main RADIANT API endpoint	https://api.example.com
Admin Dashboard URL	Admin web application	https://admin.example.com
Think Tank URL	Consumer AI workspace	https://thinktank.example.com
Status Page URL	Public system status	https://status.example.com
OMEGA Lab URL	OMEGA brain monitoring dashboard	https://omega-lab.example.com
OMEGA Forge URL	OMEGA firmware creation tool	https://forge.example.com
OMEGA API URL	Bio-mimetic AI inference API	https://omega.example.com

97.2 Swift Deployer Configuration

Navigate to: **Settings -> URLs**

The URL Configuration view in the Swift Deployer allows you to:

- 1. **View Current URLs:** See all configured application URLs
- 2. **Edit URLs:** Modify any URL with validation
- 3. **Test Connectivity:** Verify each URL is reachable
- 4. **Copy URLs:** Quick copy to clipboard
- 5. **Open in Browser:** Launch URL in default browser

Validation Rules: - Must be valid URL format (https:// required for production) - Must be reachable (optional connectivity test) - No trailing slashes - No duplicate URLs across fields

97.3 Admin Dashboard Configuration

Navigate to: **Settings -> URLs**

The Admin Dashboard provides similar URL management:

Feature	Description
URL List	All configured URLs with status indicators
Edit Modal	Form-based URL editing with validation
Health Check	Automated connectivity verification
History	Audit trail of URL changes

97.4 URL Propagation

When URLs are updated, they propagate to:

Component	Update Method
CloudFront Origins	CDK deployment
Lambda Environment	CDK deployment
Database Config	Direct update via API
Status Page	Reads from config at runtime

Important: URL changes require a CDK deployment to fully propagate to infrastructure.

97.5 CORS Configuration

Each URL must be added to CORS allowed origins:

```
// Automatically configured based on URL settings
const allowedOrigins = [
  config.adminDashboardUrl,
  config.thinkTankUrl,
  config.statusPageUrl,
  config.genesisLabUrl,
  config.genesisForgeUrl,
  config.omegaApiUrl,
  // localhost for development
  'http://localhost:3000',
  'http://localhost:3001',
];
```

97.6 Environment-Specific URLs

Environment	URL Pattern
Production	https://{app}.{domain}
Staging	https://{app}.staging.{domain}
Development	http://localhost:{port}

97.7 OMEGA Lab/Forge URLs (v7.5.0)

The OMEGA Lab/Forge apps are available for Scale tier and above:

Application	Default Subdomain	Default Path	Description
OMEGA Lab	omega-lab	/omega-lab	Real-time brain monitoring with thermal visualization, coherence metrics, and Cortex Explorer

Application	Default Subdomain	Default Path	Description
OMEGA Forge	forge	/forge	Firmware creation tool for .bio files with Helix rules, ambition settings, and personality traits
OMEGA API	omega	/omega	Bio-mimetic AI inference API with Time Warp, shadow mode, and brain management

Admin API Routes for OMEGA

Endpoint	Method	Description
/admin/omega/dashboard	GET	OMEGA dashboard summary
/admin/omega/config	GET/PUT	OMEGA configuration
/admin/omega/shadow/config	GET/PUT	Shadow mode settings
/admin/omega/shadow/stats	GET	Shadow comparison statistics
/admin/omega/cortex	GET	List all brains
/admin/omega/cortex/{tenantId}	GET	Brain details
/admin/omega/cortex/{tenantId}	POST	Create brain snapshot
/admin/omega/cortex/{tenantId}	POST	Restore from snapshot
/admin/omega/cortex/{tenantId}	POST	Reset brain state
/admin/omega/firmware	GET/POST	Firmware management
/admin/omega/firmware/{tenantId}	POST	Activate firmware
/admin/omega/urls	GET/PUT	URL configuration

97.8 Key Files

File	Purpose
apps/swift-deployer/Sources/RadiantDeployer/Models/RadiantApplication.swift	Application registry with OMEGA Lab/Forge apps
apps/swift-deployer/Sources/RadiantDeployer/Views/Settings/URLConfigurationView.swift	Deployer URL settings UI
apps/admin-dashboard/app/(dashboard)/settings/page.tsx	Admin URL settings page
apps/admin-dashboard/app/(dashboard)/settings/page.tsx	URL configuration client with OMEGA Lab/Forge fields

File	Purpose
packages/shared/src/types/status-page.types.ts	URL configuration types
packages/infrastructure/lib/stacks/omega-stack.ts	CDK admin routes including OMEGA
packages/infrastructure/lib/stacks/omega-stack.ts	CDK OMEGA infrastructure stack

Version History

Version	Date	Changes
6.6.0	2026-02-04	Autonomous Organism Architecture (PROMPT-43): 5 Leapfrog Technologies (Tool Forge, Liquid Topology, Tensor-Link, Ghost Simulation, Economic Cortex); 9 core services (~6,226 lines); 37 Admin API endpoints; 6-tab Admin Dashboard; 18 database tables, 14 enums; BrainRouter integration; Neural Affinity Routing algorithm; JIT tool generation with Firecracker sandbox; Section 95
6.5.0	2026-02-03	Cartridge PKI KMS Integration (PROMPT-42): Real AWS KMS asymmetric signing for .RADz cartridges; Platform root CA with ECC_NIST_P256; Tenant CA hierarchy; IAM policies for tenant key creation; 3 database tables; Admin API with 10 endpoints; Section 94
6.5.0	2026-02-03	MLS (Message Layer Security): RFC 9420-inspired group encryption for agent-to-agent communication; Forward secrecy with epoch-based key ratcheting; Post-compromise security via key updates; X25519 ECDH + Ed25519 signatures + AES-256-GCM encryption; 7 database tables; Admin API with 12 endpoints; Section 93

Version	Date	Changes
6.4.0	2026-02-01	The Crucible: Competitive multi-LLM deliberation system; LLMs question each other to refine answers; Integrity pre-prompting with evaluation weights; Provenance tracking and circular citation detection; Learning insights extraction; Model performance tracking; Admin Dashboard at Platform -> The Crucible; Admin API with 10 endpoints; Section 91
6.3.0	2026-02-01	LLM Integrity Verification System (LIVS): Two-tier defense against AI “lying”; Tier 1 Individual LLM Interrogation (5 depth levels, 5 question patterns, lie detection signals); Tier 2 Orchestration Integrity (5 failure patterns: Watermelon, Echo Chamber, Confidence Inflation, Circular Reasoning, Scope Drift); Soft Rules for domain-specific configuration; Cato integration with 30% integrity weight; Model integrity weights and global aggregation; Admin Dashboard at Platform -> LIVS; Admin API with 16 endpoints
6.2.0	2026-02-01	Cartridge Vault (Keyhole Pattern): Secrets management for cartridges; vault.req manifest; KMS encryption; Secret rotation with history; Admin UI at Platform -> Vault; RNIR Compiler: Model-agnostic cognitive source code; Compiles to LoRA/prompts/few-shot; Generated from Curator; Admin UI at Platform -> RNIR; Cartridge Operations: Time Machine integration; Checkpointing and resume; Step-by-step progress; Pause/Resume/Rollback; Admin UI at Platform -> Cartridge Operations

Version	Date	Changes
6.1.0	2026-02-01	Cartridge PKI: Cryptographic signing on export, verification on import; Dual signatures (author + platform); signature.sig in .RADz container; meta.json for web publishing; Federation support; Cluster Compatibility: Version/app/feature/environment checks; System Cartridge Registry: Domain experts as system cartridges; Full audit trail (HIPAA/SOC2/GDPR); Tenant visibility toggles; Thermal state management; Admin dashboard and API
6.0.0	2026-01-31	Neural Architecture v6.0.0: RADIANT Cartridges (.RADz portable AI brains); CORTEX Neural Networks (6 MLPs, ~2.5M params); Three-Tier Learning Architecture; Ghost Vector System v3.2 (4096->64 compression); LoRA Adapter Pipeline; Expert System Adapters (ESAs); CATO Twilight Dreaming with 30% invention enforcement; Thermal State Management; Cartridge Manager Dashboard
5.52.57	2026-01-29	Model Registry Enhancement System; HuggingFace discovery service; Model version manager with thermal states; Deletion queue with usage tracking; Admin dashboard; Scheduler integration
5.52.31	2026-01-26	Security Policy Registry (OWASP LLM Top 10 2025); Dynamic admin-configurable security policies; 12 policy categories; 6 detection methods; 20+ pre-seeded system policies; Violation logging and analytics; Admin dashboard with test feature
5.52.26	2026-01-25	OAuth 2.0 Provider & Developer Portal (PROMPT-41A); RFC 6749 compliant authorization server; Authorization Code (PKCE), Client Credentials, Refresh Token grants; 14 default scopes; Admin dashboard for app management; OIDC discovery endpoints

Version	Date	Changes
5.52.22	2026-01-25	PostgreSQL Scaling Admin Dashboard; Full visibility into queues, connections, replicas, partitions, slow queries, indexes, materialized views, and maintenance; 17 new admin API endpoints
5.52.21	2026-01-25	Expert System Adapters documentation; Strategic vision document; Moat #6D documentation; Tri-layer adapter architecture documentation
5.52.20	2026-01-25	PostgreSQL Scaling Infrastructure; RDS Proxy for connection pooling; Async write pattern with SQS batch writer; Redis hot-path caching; Time-based partitioning; Materialized views; Optimized RLS policies
5.52.6	2026-01-24	Complete CDK Wiring Audit; ALL 62 admin Lambda handlers now wired to API Gateway including Cato Safety (5), Memory Systems (4), AI/ML (7), Security (5), Operations (5), Reporting (4), Configuration (7), Infrastructure (6), Compliance (4), Models (5), Orchestration (2), Users (2), Time & Translation (3); Entire admin API surface now operational
5.52.5	2026-01-24	Services Layer Implementation; API Keys with interface types (API, MCP, A2A); A2A Protocol Worker; Cedar interface access policies; Admin UI in both admin apps; Key sync mechanism; Database access restrictions
5.52.4	2026-01-24	Semantic Blackboard Admin Dashboard; CDK API route for blackboard Lambda; Complete admin UI with Facts, Groups, Agents, Locks, and Configuration tabs
5.52.0	2026-01-23	Comprehensive UI Audit; Replaced mock data with real API calls; Fixed 17 console.log stubs in Magic Carpet, CollaborativeSession, Living Parchment pages; Added toast notifications; Fixed responsive grid patterns

Version	Date	Changes
5.46.0	2026-01-23	Cortex Memory System v4.20.0; Three-tier memory architecture (Hot/Warm/Cold); Graph-RAG knowledge graph; Zero-Copy mounts; Twilight Dreaming integration; GDPR erasure cascade; Admin dashboard Cortex pages
5.42.0	2026-01-22	AI Reports API complete implementation; OpenAPI 3.1 spec (docs/api/openapi-admin.yaml); Performance Optimization Guide (docs/PERFORMANCE-OPTIMIZATION.md); Security Audit Checklist (docs/SECURITY-AUDIT-CHECKLIST.md); Unit tests for AI Reports; E2E tests for navigation and AI Reports
5.39.0	2026-01-21	Schema-Adaptive Reports; Dynamic Report Builder; Cato Genesis page; Think Tank Admin navigation fixes; Code Quality dashboard; Gateway Status monitoring
5.38.0	2026-01-21	Sovereign Mesh Performance Optimization; Infrastructure Scaling (100-500K sessions); SQS dispatcher fix; Redis caching; Provisioned concurrency; Per-tenant FIFO queues; S3 artifact archival; Performance admin UI; Scaling admin UI with cost estimation
5.37.0	2026-01-21	RAWS v1.1 - Model Selection System; 13 weight profiles; 7 domains with compliance; 8-dimension scoring
5.34.0	2026-01-20	HITL Orchestration Extensions; Semantic Deduplication with pgvector embeddings; Scout HITL Integration for Cato epistemic uncertainty; Flyte HITL task wrappers; Admin dashboard UI updates
5.33.0	2026-01-20	HITL Orchestration Enhancements (PROMPT-37); SAGE-Agent Bayesian VOI; MCP Elicitation Schema; Question Batching; Rate Limiting; Abstention Detection; Deduplication; Escalation Chains; Two-Question Rule

Version	Date	Changes
5.32.0	2026-01-20	Sovereign Mesh Completion; Unit tests for notification and snapshot services; Think Tank Admin integration
5.31.0	2026-01-20	The Sovereign Mesh (PROMPT-36); Agent Registry with OODA execution; App Registry (3,000+ apps); AI Helper Service; Pre-Flight Provisioning; Transparency Layer; HITL Approval Queues; Execution Replay
5.30.0	2026-01-20	Code Quality & Test Coverage Visibility; Delight service unit tests; JSON safety migration tracking; Technical debt dashboard; Code quality reports
5.29.0	2026-01-20	Gateway Admin Controls; Persistent statistics with timestamps; Admin dashboard UI; Think Tank status view; Gateway reporting integration; SES email for scheduled reports
5.28.0	2026-01-20	Multi-Protocol Gateway v3.0; Go Gateway; NATS JetStream; Cedar authorization; Resume tokens
5.20.0	2026-01-18	User Violation Enforcement System; Regulatory compliance tracking; Escalation policies; Appeal workflow
5.19.0	2026-01-18	White-Label Invisibility (Moat #25); Full branding customization; Custom domains; Response transformation
5.7.0	2026-01-17	Deployment Safety (cdk watch DEV-only rule, environment guards, credential setup)
5.6.0	2026-01-12	Genesis Infrastructure (Kaleidos reactor integration, SDS/PDSA compliance, SSF physical-to-digital bridge); Cato Security Grid (SPACE engine, inline AI/ML 3-6x detection, GenAI CASB controls); AGI Brain Identity Fabric (fastWorkflow agents, autonomous remediation, memory safety)
5.5.0	2026-01-10	Polymorphic UI (PROMPT-41); ViewRouter component; Terminal/MindMap/DiffEditor views; Gearbox toggle; Escalation tracking

Version	Date	Changes
5.4.0	2026-01-10	Cognitive Architecture (PROMPT-40); Ghost Memory TTL/semantic key; Economic Governor retrieval confidence; Sniper/War Room workflows; Circuit breakers; CloudWatch observability
5.3.0	2026-01-10	Semantic Blackboard; Multi-Agent Orchestration; MCP Primary Interface; Process Hydration; Cycle Detection
5.0.2	2026-01-08	The Grimoire (procedural memory); Economic Governor (cost optimization); Self-optimizing architecture
4.20.3	2026-01-08	Mission Control GA; MCP Hybrid Interface; Domain Risk Policies
4.20.2	2026-01-07	Fixed RLS tenant bleed
4.20.0	2026-01-06	Initial Mission Control release

Section 98: Inference Response Cache (v7.11.0)

98.1 Overview

The Inference Response Cache provides hash-based semantic deduplication for AI inference calls. When the same prompt+model+parameters combination is seen again, the cached response is returned instantly at zero cost.

Key Benefits: - **Cost Reduction:** Repeated queries cost \$0 (served from cache) - **Latency Reduction:** Cache hits return in <10ms (vs 500-5000ms for live inference) - **Transparent:** Integrated into ModelRouterService – no application changes needed - **Tenant-Isolated:** Cache keys include tenant_id via SHA-256 hash

98.2 Architecture

Request -> SHA-256(tenant + model + prompt + temp + maxTokens) -> Cache Key
+- L1 Hit (in-memory LRU) -> Return in <1ms, \$0
+- L2 Hit (Aurora PostgreSQL) -> Return in <10ms, \$0
+- Miss -> Invoke model -> Store in L1 + L2 -> Return response

Cache Layers:

Layer	Storage	Latency	Capacity	Scope
L1	Lambda instance memory	<1ms	~100 entries	Per Lambda instance
L2	Aurora PostgreSQL	<10ms	10K+ entries/tenant	Shared across all instances

98.3 Admin Dashboard

Navigate to **Orchestration -> Inference Cache** to access:

- **Overview Tab:** Hit rate, cost savings, latency improvements, top cached models
- **Config Tab:** TTL, capacity, exclusions, PII settings
- **Events Tab:** Real-time audit log of all cache operations (hits, misses, stores, evictions)
- **Models Tab:** Per-model cache performance breakdown

98.4 Configuration

Setting	Default	Description
enabled	true	Master toggle
defaultTtlSeconds	604800 (7 days)	Time-to-live for cached entries
maxEntriesPerTenant	10000	Maximum entries before LRU eviction
maxResponseSizeBytes	65536 (64KB)	Maximum cacheable response size
maxTemperatureToCache	0.30	Only cache deterministic outputs
cachePiiResponses	false	Disable caching of PII-containing responses
excludedModels	Perplexity search models	Models that should never be cached
excludedTaskTypes	["creative"]	Task types to skip caching
l1CacheSize	100	In-memory cache size per Lambda

98.5 Admin API

Base Path: /api/admin/inference-cache

Method	Path	Description
GET	/dashboard	Full dashboard data
GET	/config	Get configuration
PUT	/config	Update configuration
GET	/metrics	Performance metrics (24h)
GET	/events	Audit log
POST	/invalidate	Invalidate specific entry
POST	/invalidate-model	Invalidate all entries for a model
POST	/purge	Purge all entries (requires confirm: true)
POST	/expire	Run TTL expiration cleanup
GET	/stats	Quick summary statistics

98.6 Cache Management

Invalidation Scenarios: - **Model update:** When a model is updated, invalidate all cached responses for that model
 - **Manual correction:** Admin can invalidate specific entries that contain incorrect responses - **Tenant purge:** Clear

all cached data for a tenant (e.g., during testing) - **TTL expiration**: Automatic cleanup of stale entries via `expire_stale_cache_entries()`

98.7 Database Tables

Table	Purpose
<code>inference_cache_config</code>	Per-tenant configuration
<code>inference_cache_entries</code>	Cached responses with hit tracking
<code>inference_cache_events</code>	Audit log of all operations
<code>inference_cache_metrics</code>	Aggregated performance metrics

Section 99: Heterogeneous Model Consensus (v7.11.0)

99.1 Overview

Heterogeneous Model Consensus extends RADIANT’s self-consistency verification from single-model to multi-model cross-provider agreement. Instead of asking the same model 5 times (which just confirms the model’s biases), this system queries 3-5 DIFFERENT models from DIFFERENT providers and measures whether they independently converge on the same answer.

Key Insight: When Claude, GPT-4, and Gemini all independently agree on an answer, that answer is far more likely to be correct than any single model’s output. This is **epistemic convergence** – the AI equivalent of peer review.

99.2 How It Works

- 1. SELECT PANEL -> Choose diverse models (max provider + architecture diversity)
- 2. PARALLEL QUERY -> Send prompt to all models simultaneously
- 3. EXTRACT ANSWERS -> Normalize and extract structured answers
- 4. PAIRWISE SCORING -> Compute semantic similarity between all pairs
- 5. AGGREGATE -> Overall, cross-provider, and cross-architecture agreement
- 6. SELECT WINNER -> Best response based on configured strategy
- 7. FLAG RISKS -> Hallucination detection, reflexion triggers

99.3 Agreement Scores

Score	Meaning	Formula
Overall Agreement	Mean pairwise similarity (all pairs)	<code>weighted_mean(similarities)</code>
Cross-Provider	Agreement between DIFFERENT providers	Most meaningful signal
Cross-Architecture	Agreement between DIFFERENT model families	Eliminates architecture bias

Score	Meaning	Formula
Confidence	Composite score	$0.5 \times \text{cross_provider} + 0.3 \times \text{overall} + 0.2 \times \text{diversity}$
Hallucination Risk	Risk of incorrect output	$1.0 - \text{cross_provider}$ (when low)

99.4 Admin Dashboard

Navigate to **Orchestration -> Consensus** to access:

- **Overview Tab:** How it works explanation, scoring formulas
- **Evaluations Tab:** History of all evaluations with agreement scores
- **Leaderboard Tab:** Model win rates across all evaluations
- **Config Tab:** Thresholds, panel configuration, cost limits
- **Test Tab:** Run live consensus evaluations from the dashboard

99.5 Configuration

Setting	Default	Description
enabled	true	Master toggle
minModels	3	Minimum models per evaluation
maxModels	5	Maximum models per evaluation
minProviders	2	Minimum unique providers
maxCostPerEvaluationUsd	\$0.50	Cost budget per evaluation
maxLatencyMs	30000	Max wall-clock time (parallel)
reflexionThreshold	0.60	Below this -> trigger self-correction
hallucinationThreshold	0.40	Below this -> flag as potentially hallucinated
winnerSelectionStrategy	quality_weighted	How to pick the best response
useEmbeddingSimilarity	true	Use embeddings for semantic similarity

99.6 Winner Selection Strategies

Strategy	Behavior
majority_vote	Response most similar to all others wins
quality_weighted	Weight by model quality tier (frontier models preferred)
cost_weighted	Prefer cheaper models when agreement is high
highest_quality	Always use the highest-tier model's response

99.7 Admin API

Base Path: /api/admin/consensus

Method	Path	Description
GET	/dashboard	Full dashboard data
GET	/config	Get configuration
PUT	/config	Update configuration
GET	/metrics	Performance metrics (24h)
GET	/evaluations	Recent evaluations
POST	/evaluate	Run a test evaluation

99.8 Integration with Orchestration

The consensus service is registered as heterogeneous-consensus-service in the OrchestrationMethodsService and can be invoked as any other orchestration method. If the consensus service fails, it automatically falls back to standard self-consistency.

99.9 Database Tables

Table	Purpose
consensus_config	Per-tenant configuration
consensus_evaluations	Complete evaluation results
consensus_responses	Individual model responses
consensus_pairwise_agreements	Pairwise similarity scores
consensus_metrics	Aggregated performance metrics

Section 100: Anticipatory Memory Architecture (v7.12.0)

100.1 Overview

The Anticipatory Memory Architecture is a suite of 5 features that put RADIANT 3-5 years ahead of Claude’s persistent memory. While Claude stores flat key-value facts, RADIANT builds a living knowledge graph, predicts what memories will be needed, maintains truth by detecting contradictions, enables organizational shared knowledge with regulatory compliance, and generates autonomous insights during Twilight Dreaming.

Dashboard Location: Memory -> Anticipatory Memory
Admin API Base: /api/admin/anticipatory-memory/

100.2 Feature 1: Autobiographical Knowledge Graph (AKG)

A living entity-relationship graph auto-extracted from every conversation. Not flat facts – a traversable knowledge graph with temporal edges, confidence scoring, and importance ranking.

How it works: 1. After every AI response, the Brain Router fires an async extraction job 2. The LLM (gpt-4o-mini by default) extracts entities and relationships from the conversation 3. Entities are deduplicated by label+type and

upserted into the graph 4. Relationships include temporal context (valid_from/valid_until) 5. On the next prompt, the AKG context is injected into the system prompt

Configuration (/api/admin/anticipatory-memory/akg/config):

Setting	Default	Description
enabled	true	Master toggle
extractionModel	openai/gpt-4o-mini	Model used for entity extraction
minEntityConfidence	0.60	Minimum confidence to persist an entity
minEdgeConfidence	0.50	Minimum confidence to persist a relationship
maxNodesPerUser	5000	Maximum entities per user
maxEdgesPerUser	20000	Maximum relationships per user
pruneAfterDays	365	Auto-prune entities not seen in N days
generateEmbeddings	true	Generate 1536-dim pgvector embeddings
maxExtractionTokens	500	Max tokens per extraction call

Entity Types (14): person, organization, project, technology, concept, location, event, product, skill, preference, goal, problem, decision, custom

Relationship Types (20): works_at, builds, uses, knows, prefers, manages, created, depends_on, part_of, located_in, interested_in, skilled_in, concerned_about, decided, avoids, collaborates_with, reports_to, owns, studies, custom

Importance Scoring: 40% frequency (log-scaled mentions) + 30% recency (30-day half-life exponential decay) + 30% centrality (log-scaled edge count)

100.3 Feature 2: Predictive Memory Prefetch

Learns from memory access patterns and predicts what memories will be needed BEFORE the user asks.

Configuration (/api/admin/anticipatory-memory/prefetch/config):

Setting	Default	Description
enabled	true	Master toggle
maxPrefetchNodes	20	Maximum nodes to prefetch per prediction
minPrefetchConfidence	0.60	Minimum score to prefetch
predictionIntervalSec	30	Prediction refresh interval
useTemporalFeatures	true	Use time-of-day patterns
useTopicFeatures	true	Use topic co-occurrence
maxCacheSize	200	In-memory cache capacity
cacheTtlSec	300	Cache entry TTL

100.4 Feature 3: Memory Contradiction Detector

Detects and resolves conflicting facts in user knowledge.

Configuration (/api/admin/anticipatory-memory/contradictions/config):

Setting	Default	Description
enabled	true	Master toggle
minSimilarityForCheck	0.70	Similarity threshold for candidate detection
autoResolveConfidenceGap	0.30	Confidence gap needed for auto-resolution
autoResolveRecencyDays	90	Time gap threshold for recency-based auto-resolution
promptUserResolution	true	Whether to prompt users for ambiguous contradictions
maxUnresolvedAlert	50	Alert threshold for unresolved contradictions
detectionModel	openai/gpt-4o-mini	Model used for contradiction analysis

Auto-Resolution Rules: - Preference/sentiment changes -> both_valid (temporal change accepted) - Time gap > 90 days -> newest fact wins (recency) - Otherwise -> prompt user for resolution

100.5 Feature 4: Organizational Memory Mesh

Tenant-wide shared knowledge with privacy tiers and full regulatory compliance.

Configuration (/api/admin/anticipatory-memory/org-memory/config):

Setting	Default	Description
enabled	false	Master toggle (disabled by default – requires consent setup)
requireExplicitConsent	true	GDPR: require per-user consent before any sharing
defaultPrivacyTier	team	Default privacy tier for new org nodes
minContributorsForVisibility	2	Min contributors before org memory is visible
autoAnonymize	true	Automatically anonymize PII in shared content
runComplianceScan	true	Run PII/PHI scan before every share
hipaaMode	false	Block ALL PHI from being shared (healthcare tenants)
maxOrgNodes	50000	Maximum org nodes per tenant
requireAdminReview	false	Require admin approval before org memory visibility
autoShareDuringDreaming	true	Allow Twilight Dreaming to auto-share (with consent)
retentionDays	0	Data retention (0 = indefinite)
consentRenewalDays	365	Days before consent renewal required

Regulatory Compliance:

Framework	Implementation
GDPR Art. 6/7	Explicit consent with purpose, legal basis, IP/UA tracking
HIPAA §164.508	PHI scanning (7 patterns) blocks medical data when hipaaMode=true
SOC2 Type II	Every access/modification audited with compliance framework tags
CCPA §1798.100	Erasure cascade: POST /org-memory/erasure with {userId}

Consent Management: - POST /org-memory/consent – Grant consent (requires tiers, classifications, purpose) - POST /org-memory/consent/revoke – Immediately revoke all sharing - GET /org-memory/consent?userId=... – Check active consent status

GDPR Erasure: POST /org-memory/erasure with {userId} triggers org_memory_erasure_cascade() which:
 1. Revokes all active consents 2. Deletes all user contributions 3. Recalculates contributor counts on affected org nodes 4. Deletes org nodes with zero contributors 5. Logs the erasure in the audit trail

100.6 Feature 5: Dream Insight Generator

Autonomous insight generation during Twilight Dreaming.

Configuration (/api/admin/anticipatory-memory/dream-insights/config):

Setting	Default	Description
enabled	true	Master toggle
insightModel	anthropic/claude-3.5-sonnet	Model for insight generation
maxInsightsPerCycle	10	Maximum insights per dream cycle per user
minInsightConfidence	0.60	Minimum confidence to persist an insight
maxTokensPerCycle	5000	Token budget per dream cycle per user
proactiveSurfacing	true	Inject insights into conversations
maxUnsurfacedInsights	50	Stop generating if too many unsurfaced
analyzeOrgMemory	false	Include org memory in analysis

Insight Types (10): pattern, trend, connection, knowledge_gap, optimization, prediction, contradiction, milestone, risk, opportunity

Manual Generation: POST /dream-insights/generate with optional {userId} – trigger insight generation on demand for a user or entire tenant.

100.7 Admin API Reference

Method	Path	Description
GET	/dashboard	Unified dashboard for all 5 features
GET/PUT	/akg/config	AKG configuration
GET	/akg/stats	AKG statistics
GET	/akg/nodes?userId=...	User's AKG nodes
POST	/akg/query	Graph traversal query
GET	/akg/context?userId=...	User's AKG context summary
GET/PUT	/prefetch/config	Prefetch configuration
GET	/prefetch/stats	Prefetch statistics
POST	/prefetch/predict	Manual prediction
GET/PUT	/contradictions/config	Contradiction config
GET	/contradictions/stats	Contradiction statistics
GET	/contradictions/unresolved	Unresolved contradictions
GET	/contradictions/recent	Recent contradictions
POST	/contradictions/:id/resolve	Resolve a contradiction
GET/PUT	/org-memory/config	Org memory configuration
GET	/org-memory/stats	Org memory statistics
GET	/org-memory/nodes	Query org memory
POST	/org-memory/consent	Grant consent
POST	/org-memory/consent/revoke	Revoke consent
GET	/org-memory/consent?userId=...	Check consent
POST	/org-memory/erasure	GDPR erasure
GET	/org-memory/audit	Audit log
GET/PUT	/dream-insights/config	Dream insight config
GET	/dream-insights/stats	Dream insight statistics
GET	/dream-insights/recent	Recent insights
POST	/dream-insights/generate	Manual generation
GET	/dream-insights/surface?userId=...	Next insight to surface
POST	/dream-insights/:id/react	Record user reaction

100.8 Database Tables

Table	Purpose
akg_config	Per-tenant AKG configuration
akg_nodes	Entities with pgvector embeddings
akg_edges	Directed relationships with temporal context
akg_extraction_log	Extraction audit trail

Table	Purpose
prefetch_config	Per-tenant prefetch configuration
memory_access_patterns	Training data (partitioned monthly)
prefetch_predictions	Prediction history with feedback
contradiction_config	Per-tenant contradiction config
memory_contradictions	Detected contradictions
org_memory_config	Per-tenant org memory config
org_memory_nodes	Shared organizational knowledge
org_memory_consent	GDPR consent records
org_memory_contributions	User contribution tracking
org_memory_audit_log	SOC2 audit trail (partitioned monthly)
dream_insight_config	Per-tenant insight config
dream_insights	Generated insights

Version History

Version	Date	Changes
7.23.0	2026-02-06	Think Tank Licensing Model & Single-Tenant Users: Reversed multi-tenant user model (v7.22.0) to single-tenant: each user belongs to ONE tenant. Flexible multi-dimension licensing (tenant_licenses table) for per-app seats, storage, retention, and 12 regulatory compliance features (HIPAA, GDPR, SOC2, CCPA, ISO 27001, etc.) as licensed features. API middleware enforces licensing on every endpoint. Unlicensed features show “contact support@thinktank.app” message. Two Cognito pools: radiant-admins (no federation) + radiant-users (federation enabled). Invitation-only provisioning. Role-based soft permissions (tenant_owner, tenant_admin, standard_user, viewer). New docs: THINKTANK-LICENSING-MODEL.md, updated ADR. New policy: licensing-enforcement.md.

Version	Date	Changes
7.22.0	2026-02-06	User Identity & Multi-Tenant Membership Refactor: Separated global user identity from per-tenant membership. users table converted to global identity (tenant_id deprecated). tenant_user_memberships now canonical per-tenant record (absorbed tenant_users fields). tenant_users table dropped. 6 safety functions for tenant-scoped disable/remove/delete with cross-tenant guards. users_by_tenant backward-compatible view. user_admin_actions audit table. CASCADE changed to SET NULL. GDPR Article 17 deletion with 30-day grace period. Section 5 rewritten.
7.19.0	2026-02-06	Aurelius Dojo v1.2.0 – Backend Wiring (Complete Stack): Dedicated Lambda handler (lambda/admin/dojo.ts) with 35+ endpoints across 12 route groups. Database migration V2026_02_06_005 creates 19 RLS-protected tables, 13 custom enums, 3 helper functions (dojo_calculate_retention, dojo_xp_to_rank, dojo_update_decay_after_review). CDK integration via separate DojoFunction with proxy resource routing (/admin/dojo/{proxy+}). Non-AI CRUD/config/progress endpoints work immediately; AI-dependent features (theme discovery, lesson generation, sparring, scenarios, dialectic, multimodal) require Dojo AI pipeline.

Version	Date	Changes
7.18.0	2026-02-06	Cato Trainer v1.0.0 – The Grounding Engine: New standalone knowledge base app (apps/cato-trainer/, port 3005). Grounded Q&A with citation-backed answers (confidence tiers: exact/high/moderate/low). Semantic, full-text, and hybrid search. Library management with auto-chunking, embedding, auto-tagging, AI summaries. Multi-document digest (summary, comparison, contradiction, timeline, key facts, action items). Smart links (auto-discovered document relationships). Spaces for project organization. 15 API types, 25+ endpoints, Zustand store (30+ fields), 7-tab sidebar, 6 components. Teal/cyan design system. Platform Integration: RadiantApplication.catoTrainer in Swift Deployer (subdomain cato, path /cato, shield.checkered icon, teal, Advanced tier); Admin Dashboard Settings -> URLs with Cato Trainer field and Quick Link.

Version	Date	Changes
7.17.0	2026-02-06	Aurelius Dojo v1.1.0 – 6 Leapfrog Features (3-5 Year Lead): Competitive analysis of Docebo, Virti, Second Nature, Axonify, Sana Labs, Cornerstone, Degreed. (1) Ebbinghaus Decay Engine – per-concept neural decay model with half-life tracking; (2) Adversarial Scenario Synthesis – 9 persona archetypes with branching consequence trees; (3) Socratic Dialectic Engine – multi-agent thesis/antithesis/synthesis debate with logical fallacy detection; (4) Predictive Competency Mesh – auto-extracted competency graph with role readiness scores; (5) Multimodal Lesson Synthesis – audio, diagrams, glossary, learning style adaptations; (6) Organizational Knowledge Pulse – real-time org-wide health with decay alerts and ROI metrics. Moat #32 upgraded from 24/30 to 29/30. 30+ additional API endpoints. 5 new components. 9-tab sidebar. Dojo URL Configuration: RadiantApplication.dojo in Swift Deployer (subdomain dojo, path /dojo, flame icon, Advanced tier); Admin Dashboard Settings -> URLs with dedicated Aurelius Dojo section, validation, and Quick Link.
7.16.0	2026-02-06	Aurelius Dojo v1.0.0: New standalone training platform (apps/dojo/, port 3004); Thematic Gating Protocol – AI discovers Central Themes from document libraries; Lecture Mode (synthesized lessons with citations) + Sparring Mode (adversarial testing); 5-tier rank system (Novice->Radiant); Mobot Knowledge Agent sidebar; Certifications; 30+ typed API endpoints via service layer; Zustand store; Warm gold/amber design system

Version	Date	Changes
7.13.0	2026-02-06	User Memory Retention & Unified Profile: Three-tier retention policy hierarchy (Platform -> Tenant -> Tenant Admin); Unified user memory profile injected into every prompt on every model; Storage tier management (hot/warm/cold/archive); Admin pages in all 3 apps (Radiant Admin, Think Tank Admin, Think Tank Tenant Admin); 15 admin API endpoints; 6 database tables; 3 helper functions
7.12.0	2026-02-06	Anticipatory Memory Architecture: 5 leapfrog features – AKG (auto-extracted knowledge graph), Predictive Prefetch, Contradiction Detector, Organizational Memory Mesh (GDPR/HIPAA/SOC2/CCPA compliant), Dream Insight Generator; Brain Router integration; 34 admin API endpoints; 6-tab dashboard; 16 database tables
7.11.0	2026-02-06	Inference Response Cache: L1+L2 cache with tenant isolation, PII protection, smart exclusions, cost tracking; Admin Dashboard and API (11 endpoints). Heterogeneous Model Consensus: Cross-model agreement scoring with 5-provider panels, pairwise semantic similarity, hallucination detection, reflexion triggers; Admin Dashboard and API (6 endpoints). Migration: 9 tables, 3 helper functions
7.10.0	2026-02-06	Cognitive Precision Protocols: Context Anchor Gate, Negative Constraint Injection, Enhanced Critic Model Separation with tiered escalation and ensemble voting

Section 101: Model Weights & Drift Correction (v7.24.0)

101.1 Overview

The Model Weights & Drift Correction system provides centralized, drift-aware model routing. Every model tracked by RADIANT has a **composite weight** computed from 5 factors, and drift detection automatically penalizes or

quarantines models exhibiting output distribution changes.

101.2 Composite Weight System

Each model’s composite weight is calculated as:
$$\text{composite} = \text{drift_score} \times \text{drift_weight} + \text{quality_score} \times \text{quality_weight} + \text{latency_score} \times \text{latency_weight}$$
Default factor weights: Drift 25%, Quality 30%, Latency 15%, Cost 15%, Availability 15%.
All factor weights are configurable per model per tenant and must sum to 1.0. Administrators can also set a **manual weight override** to bypass automatic calculation entirely.

101.3 Drift Correction Actions

Action	Trigger	Effect
Weight Penalty	Drift score < penalty threshold (0.6)	Composite weight reduced proportionally
Quarantine	Drift score < quarantine threshold (0.3)	Weight set to 0, model excluded from routing
Fallback Activation	Model quarantined + fallback configured	Requests routed to fallback model
Temperature Adjustment	Drift detected + correction configured	Temperature overridden per-request
Prompt Prefix Injection	Drift detected + prefix configured	System prompt prepended with correction text
Auto-Release	Quarantine duration expires	Model unquarantined, weight recalculated

101.4 Admin Page

Navigate to **Orchestration -> Model Weights** to access:

- **Dashboard:** Summary stats (total models, quarantined count, average weight, drift alerts)
- **Model Cards:** Per-model weight visualization with 5 score bars, expand for configuration
- **Actions:** Check drift, recalculate scores, quarantine/unquarantine, configure thresholds
- **Correction Actions Log:** History of all automatic and manual corrections
- **Weight History:** Audit trail of weight calculations over time

101.5 API Reference

Base: /api/admin/model-weights

Method	Path	Description
GET	/dashboard	Full dashboard data
GET	/models	All model weight configs
GET	/model/:id	Single model config

Method	Path	Description
PUT	/model/:id	Update model config
POST	/quarantine/:id	Manually quarantine model
POST	/unquarantine/:id	Release from quarantine
POST	/check-drift/:id	Run drift check + correction
POST	/check-drift-all	Check all models
POST	/recalculate/:id	Recalculate factor scores
GET	/history	Weight calculation history
GET	/actions	Correction actions log
GET	/weighted	Models sorted by weight

Section 102: Bedrock Model Management (v7.24.0)

102.1 Overview

Full control over the AWS Bedrock foundation models used by the platform. Includes model discovery, version tracking, auto-upgrade, and periodic polling.

102.2 Model Discovery

The system calls AWS Bedrock `ListFoundationModels` to discover all available models. Results are stored in the `bedrock_model_registry` table with:

- Model ID, name, provider, ARN
- Input/output modalities, streaming support
- Inference types, lifecycle status
- Approximate pricing (from known pricing table)

102.3 Auto-Upgrade

When enabled (on by default), the system automatically upgrades the AI helper model to the latest version within the preferred model family. Family ordering is maintained for: `anthropic.claude`, `meta.llama`, `amazon.titan`, `mistral`.

102.4 Periodic Polling

An EventBridge-scheduled Lambda (`bedrock-poll.ts`) runs periodically:

1. Polls Bedrock for new/updated models
2. Checks each tenant's poll interval
3. Runs auto-upgrade if enabled
4. Triggers drift correction for all active models

Default poll interval: 24 hours (configurable per tenant).

102.5 Admin Page

Navigate to **Platform -> Bedrock Settings** to access:

- **Configuration:** Model selection, region, temperature, max tokens, auto-upgrade toggle, poll interval
- **Model Registry:** All discovered models grouped by provider with pricing
- **Usage Stats:** Total AI helper requests, token counts, cost

102.6 API Reference

Base: /api/admin/bedrock

Method	Path	Description
GET	/models	List all models (filter by provider/family)
GET	/models/:id	Single model details
GET	/providers	List all providers
POST	/poll	Trigger model discovery poll
POST	/auto-upgrade	Check and apply auto-upgrade
GET	/config	Get AI helper config
PUT	/config	Update AI helper config
GET	/poll-status	Check poll due status
GET	/dashboard	Full dashboard data

Section 103: Admin AI Helper (v7.24.0)

103.1 Overview

A Bedrock-powered AI assistant available on **every admin dashboard page**. The helper is injected into the dashboard layout at build time – no page-specific implementation needed. New pages automatically get the AI helper.

103.2 How It Works

1. The AdminAIHelper component is rendered in the dashboard layout.tsx
2. It appears as a floating button (bottom-right) with a purple gradient
3. When opened, it detects the current page path via usePathname()
4. Page-specific system prompts provide contextual expertise
5. Pages can expose data via data-ai-context attributes on DOM elements
6. The AI reads page data and provides specific, actionable recommendations

103.3 Capabilities

- **Data Analysis:** Interprets metrics and system state from the current page
- **Recommendations:** Structured suggestions with impact levels and categories
- **Causal Analysis:** Explains downstream effects of proposed configuration changes

- **Deep Dive:** Helps administrators explore system internals
- **Best Practices:** Warns about common pitfalls and suggests optimizations

103.4 Page-Specific Prompts

The service includes specialized system prompts for:

Page	Expertise
Model Weights	Weight factors, drift thresholds, quarantine effects, fallback strategy
Bedrock Settings	Model families, pricing, auto-upgrade, cost implications
Security	Drift alerts, anomaly interpretation, monitoring configuration
Orchestration	Method performance, cache optimization, consensus tuning
Default	General platform analysis and recommendations

103.5 Configuration

All settings in **Platform -> Bedrock Settings**:

- **Enable/Disable:** Toggle the AI helper globally
- **Model:** Choose any Bedrock model for the helper
- **Temperature:** Control creativity vs consistency (default 0.3)
- **Max Tokens:** Response length limit (default 4096)
- **Context Tokens:** Maximum page context sent (default 8000)
- **Include Page Data:** Toggle automatic context injection
- **Custom System Prompt:** Override the default prompt

103.6 API Reference

Base: /api/admin/ai-helper

Method	Path	Description
POST	/chat	Send message, get AI response
GET	/history?page=X	Get conversation history for page
DELETE	/history?page=X	Clear conversation for page
GET	/usage	Get usage summary

7.24.0 | 2026-02-06 | Model Weights, Drift Correction & Admin AI Helper: 5-factor composite model weights (drift/quality/latency/cost/availability); Automatic drift correction with quarantine, fallback routing, temperature/prompt adjustment; Bedrock model discovery with auto-upgrade and periodic polling; Global AI admin assistant on every dashboard page (Bedrock-powered) with causal analysis, recommendations, page-aware context; 3 new admin pages, 25+ API endpoints, 6 database tables, 5 SQL functions |

104. Unified User Profile & Multi-Contact System (v7.34.0)

104.1 Overview

Every user (end-user and platform admin) has a unified profile with a multi-contact directory. Users can register up to **3 email addresses** and **3 phone numbers**, each independently verified. Contacts are used for MFA, account recovery, collaboration notifications, and SENTINEL alert routing.

Requirements: - All users MUST have at least 1 verified email (login email) - All users MUST have at least 1 verified phone (required for MFA) - Only verified contacts can be used for SENTINEL alert routing

104.2 Managing Contacts

Navigate to **Users & Access -> My Profile -> Contacts** tab.

Adding a contact: 1. Click “**Add Contact**” 2. Select type (email or phone) 3. Select label (work, personal, on-call, backup) 4. Enter the value (E.164 format for phones: +15551234567) 5. Optionally set as primary 6. Click “**Add Contact**”

Verifying a contact: 1. Click the **Send** icon next to an unverified contact 2. Check your email or phone for the 6-digit code 3. Enter the code in the verification input 4. Click “**Verify**”

Verification rules: - Codes expire after 10 minutes - Maximum 3 attempts per code - 10-minute cooldown after 3 failed attempts - Codes are bcrypt-hashed (never stored in plain text)

Removing a contact: - Click the trash icon next to any contact - Login email cannot be removed - Last verified phone cannot be removed (required for MFA) - Removing a contact also removes any SENTINEL routing rules using it

104.3 SENTINEL Alert Routing

Navigate to **My Profile -> Alert Routing** tab.

Admins can create routing rules that send SENTINEL alerts to specific verified contacts based on alert category and severity.

Creating a routing rule: 1. Click “**Add Rule**” 2. Select **Category** (e.g., “Security”, “Infrastructure”, or “All Categories”) 3. Select **Min Severity** (e.g., “SEV 1 – Critical”) 4. Select **Send To** (choose from your verified contacts) 5. Click “**Create Rule**”

Example configuration:

Category	Min Severity	Send To
Security	SEV 1	+1***4567 (on-call phone)
Security	SEV 1	a***@company.com (work email)
Infrastructure	SEV 2	a***@company.com (work email)
* (all)	SEV 3	a***@company.com (work email)

When SENTINEL fires an alert, it resolves all matching routes and dispatches SMS (via Amazon SNS) or email (via Amazon SES) to the specified contacts. This is **in addition to** PagerDuty/Slack escalation.

Coverage analysis shows: - Number of active vs. total routes - Whether SEV 1 is covered - Which categories have no routing rules

104.4 Profile Settings

Navigate to **My Profile -> Profile** tab.

Field	Description	Required
Bio	Short description	No
Timezone	IANA timezone (e.g., America/New_York)	Yes
Locale	BCP 47 locale (e.g., en-US)	Yes
Date Format	MM/DD/YYYY, DD/MM/YYYY, or YYYY-MM-DD	Yes
Time Format	12-hour or 24-hour	Yes

Profile completeness requires: verified email + verified phone + display name + timezone. Incomplete profiles show a persistent banner.

104.5 API Reference

Base: /api/profile

Method	Path	Description
GET	/	Get current user's profile
PUT	/	Update profile fields
GET	/contacts	List all contacts
POST	/contacts	Add a new contact
PUT	/contacts/:id	Update contact label/primary
DELETE	/contacts/:id	Remove a contact
POST	/contacts/:id/send-code	Send verification code
POST	/contacts/:id/verify	Verify code
POST	/contacts/:id/resend	Resend verification code
GET	/sentinel/routes	List alert routing rules
POST	/sentinel/routes	Create a routing rule
PUT	/sentinel/routes/:id	Update a routing rule
DELETE	/sentinel/routes/:id	Delete a routing rule
GET	/sentinel/coverage	Coverage summary

104.6 Database Tables

Table	Purpose
user_contacts	Multi-contact directory (3 emails + 3 phones per user)
contact_verification_log	Verification audit trail

Table	Purpose
user_profiles	Extended profile fields (bio, timezone, locale)
sentinel_contact_routing	Per-admin SENTINEL alert routing rules

105. System Administrator Role Enforcement (v7.34.0)

105.1 Overview

RADIANT enforces a single-tier admin role model (v7.52.0). Only `super_admin` exists in Pool B, with full access to all dashboard routes, API endpoints, and platform features.

105.2 Role Hierarchy

Role	Level	Description
super_admin	4	System administrator – full access to everything

v7.52.0: `admin`, `operator`, and `auditor` roles removed. Only `super_admin` remains.

105.3 Permission Matrix

Capability	super_admin
Create/delete admins	[OK]
Change admin roles	[OK]
Create super_admins	[OK]
Delete tenants	[OK]
Security policies	[OK]
Create tenants	[OK]
Manage tenants	[OK]
Manage users	[OK]
System config	[OK]
Billing	[OK]
Models/providers	[OK]
Deploy	[OK]
SENTINEL access	[OK]
SENTINEL management	[OK]
View audit logs	[OK]

Capability	super_admin
Export audit logs	[OK]
Auto-access all apps	[OK]

105.4 Route Protection

The admin dashboard middleware blocks access to restricted routes based on role:

All routes require `super_admin` (the only Pool B role as of v7.52.0). Non-`super_admin` tokens are rejected at the middleware layer.

105.5 Bootstrap Flow

1. The **first admin** created during deployment is automatically assigned `super_admin`
2. Only `super_admin` can create other `super_admin` accounts
3. The system prevents revoking the **last** `super_admin` – at least one must always exist
4. All role assignments and changes are recorded in `admin_role_audit_log`

105.6 App Access

- **super_admin**: Automatic access to ALL apps (Think Tank, Curator, Genesis, Dojo, RADIANT Admin, Think Tank Admin, etc.), including any new apps added in the future
- As of v7.52.0, only `super_admin` exists in Pool B – no explicit app access grants are needed

105.7 Lambda API Guard

All admin Lambda handlers should use the `admin-role-guard.ts` middleware:

```
import { extractAdminContext, requirePermission } from '../shared/middleware/admin-role-guard';

// In handler:
const ctx = extractAdminContext(event);
const guard = requirePermission(ctx, 'canManageModels');
if (guard) return guard; // Returns 403 if insufficient permissions
```

105.8 Database Tables

Table	Purpose
<code>admin_role_assignments</code>	Active role per admin (with bootstrap flag)
<code>admin_role_audit_log</code>	Audit trail for all role changes
<code>admin_app_access</code>	Per-admin app access grants

7.34.0 | 2026-02-07 | **Unified User Profile & Multi-Contact + System Admin Role Enforcement:** 3 emails + 3 phones per user with SNS/SES verification; SENTINEL per-admin contact routing by category/severity; 4-tier admin role hierarchy (super_admin/admin/operator/auditor) with 25-permission matrix; Next.js + Lambda middleware enforcement; Bootstrap flow; 7 new DB tables, 3 DB functions, 2 Windsurf policies |

106. Tenant Provisioning & Sign-Up Flow (v7.35.0)

106.1 Overview

New tenants are provisioned through a self-service sign-up flow from marketing/sales websites. The first user who creates a tenant account is automatically assigned the **tenant_admin** role with full control of their organization.

Two distinct role domains:

Domain	Roles	App Access
Platform (Pool B)	super_admin	Full access to RADIANT Admin + Think Tank Admin
Tenant (Pool A)	tenant_admin, standard_user, viewer	Per-tenant app grants

Key rule (v7.52.0): Only super_admin exists in Pool B. All platform administration is performed by super administrators with full access to both global admin apps.

106.2 Sign-Up Flow

The provisioning lifecycle has 7 steps:

1. **Sign-Up Request** – User submits email, phone, org name, tier on marketing website
2. **Email Verification** – 6-digit code sent via Amazon SES (max 5 attempts)
3. **Phone Verification** – 6-digit code sent via Amazon SNS (max 5 attempts)
4. **Auto-Provision** – System creates tenant + first user as tenant_admin
5. **Contacts Created** – Both email and phone added as verified contacts
6. **Invitation Sent** – Welcome email with accept link
7. **Activation** – User clicks accept link -> tenant + user become active

106.3 Sign-Up Constraints

Setting	Value
Sign-up expiry	48 hours (if not verified)
Invitation expiry	72 hours
Email verify attempts	5 max
Phone verify attempts	5 max
First user role	tenant_admin
Default app access	Think Tank, Curator, Tenant Admin

Setting	Value
Duplicate email prevention	Partial unique index on pending sign-ups
Duplicate slug prevention	Partial unique index on non-failed/expired

106.4 First User Privileges

The first sign-up user receives: - **Role**: tenant_admin – full control of their tenant - **Email**: auto-verified (verified during sign-up) - **Phone**: auto-verified (verified during sign-up) - **Profile**: auto-complete (both contacts verified) - **Apps**: Think Tank + Curator + Tenant Admin access by default

106.5 Status Lifecycle

```

pending  ->  email_verified  ->  phone_verified  ->  provisioning  ->  provisioned  -
> invitation_sent -> active
      v           v           v                               v
      expired    expired    expired                          failed

```

106.6 API Reference (Public – No Auth Required)

Base: /api/tenant-signup

Method	Path	Description
POST	/signup	Initiate sign-up (sends email code)
POST	/verify-email	Verify email code (sends phone code)
POST	/verify-phone	Verify phone code (auto-provisions tenant)
POST	/resend-email-code	Resend email verification code
POST	/resend-phone-code	Resend phone verification code
GET	/status/:id	Get provisioning status
POST	/accept-invitation	Accept invitation (activates tenant)

POST /signup Request:

```

{
  "email": "alice@company.com",
  "phone": "+15551234567",
  "phoneCountryCode": "US",
  "firstName": "Alice",
  "lastName": "Smith",
  "organizationName": "Acme Corp",
  "tier": "PRO",
  "referralSource": "google"
}

```

106.7 Database Tables

Table	Purpose
tenant_provisioning	Full lifecycle tracking with verification codes
tenant_provisioning_log	Audit trail for all provisioning events

106.8 Expired Sign-Up Cleanup

The `expire_stale_signups()` database function marks stale sign-ups as expired. Run via scheduled Lambda or `pg_cron`:

```
SELECT expire_stale_signups(); -- Returns count of expired records
```

7.35.0 | 2026-02-07 | Tenant Provisioning & Role Domain Clarification: Self-service tenant sign-up flow with email/phone verification; auto-provision tenant + first user as `tenant_admin`; admin/operator/auditor NO RADIANT app access (only `super_admin`); 7-endpoint public sign-up API; 2 new DB tables |

Section 107: Unified Drift-Aware Weighting System

107.1 Overview

The Drift-Aware Weighting System provides a **single API** for all RADIANT AI components to get drift-aware model recommendations. It unifies drift detection (statistical tests), drift correction (quarantine, penalties, fallbacks), and app-specific weight profiles into one service.

Key principle: Every AI component in RADIANT selects models through the same drift-aware pipeline. No hard-coded models, no bypassing drift checks.

107.2 App Weight Profiles

Each app has a tuned weight profile that controls how much each factor matters:

App	Drift	Quality	Latency	Cost	Availability	Min Drift Score
Genesis	0.35	0.30	0.10	0.10	0.15	0.50
Cato	0.30	0.25	0.15	0.15	0.15	0.40
Cortex	0.30	0.35	0.10	0.10	0.15	0.45
Omega	0.40	0.25	0.10	0.10	0.15	0.50
Orchestra	0.25	0.30	0.15	0.15	0.15	0.30
Think Tank	0.20	0.30	0.25	0.10	0.15	0.30
Curator	0.25	0.35	0.10	0.15	0.15	0.35

- **Drift weight:** How much drift stability matters (Omega highest at 0.40)

- **Min Drift Score:** Models below this score are excluded for this app
- **preferStableModels:** Genesis, Cato, Cortex, Omega all prefer stable models (extra penalty for borderline drift)

107.3 How It Works

1. **Request:** App calls `driftAwareWeightingService.recommendModels(tenantId, { app, taskType })`
2. **Fetch:** All models with their drift/quality/latency/cost/availability scores retrieved
3. **Filter:** Quarantined models excluded, models below app's min drift score excluded
4. **Score:** Each model scored using app's weight profile, normalized to 0-1
5. **Penalize:** Stability penalty applied for borderline drift if app prefers stable models
6. **Override:** Admin manual overrides take precedence over computed scores
7. **Return:** Sorted recommendations with drift trends, warnings, fallback info

107.4 Integration Points

AGI Orchestrator: Drift-aware selection is the **primary** model selection method. Falls back to domain taxonomy -> specialty-based only if drift service returns no results. `forceModels` in request bypasses drift checks intentionally.

Cato Pipeline: `invokeModel()` calls `selectModelForMethodAsync()` before each method execution. The drift-aware best model replaces the previous hardcoded Claude 3.5 Sonnet default.

Cortex Intelligence: `getInsights()` now returns `driftAwareRecommendations` alongside knowledge density data. The AGI Brain Planner uses both for informed model selection.

Omega Shadow: Each `ShadowComparison` records `standard_model_drift_score` and `drift_warnings` at the time of comparison, enabling drift-vs-coherence correlation analysis.

Genesis Gates: `isDriftHealthyForStage()` blocks stage advancement when: - Average drift score below stage minimum (MATURE requires ≥ 0.7) - Too many quarantined models (MATURE allows zero)

107.5 Monitoring

Drift Summary (`getDriftSummary`): - Total models, healthy count, warning count, quarantined count - Average drift score across all models - Worst model identified

Full Drift Check (`runFullDriftCheck`): - Triggers detection + correction for every model in a tenant - Returns count of models checked, drift detected, corrections applied, quarantined

107.6 Files

File	Purpose
<code>drift-aware-weighting.service.ts</code>	Unified facade – single API for all apps
<code>drift-detection.service.ts</code>	Statistical drift detection (KS, PSI, χ^2 , embedding)
<code>drift-correction.service.ts</code>	Quarantine, fallback, weight penalties, composite weights
<code>agi-orchestrator.service.ts</code>	Modified: drift-aware primary model selection
<code>cato-method-executor.service.ts</code>	Modified: drift-aware method model selection
<code>cortex-intelligence.service.ts</code>	Modified: drift data in insights

File	Purpose
omega-shadow.service.ts	Modified: drift tracking in comparisons
cato/genesis.service.ts	Modified: drift health gate check

7.36.0 | 2026-02-07 | Unified Drift-Aware Weighting System: Centralized drift control + model weighting for ALL AI components; app-specific weight profiles for Genesis/Cato/Cortex/Omega; AGI orchestrator drift-aware primary selection; Cato hardcoded model replaced; Cortex drift insights; Omega drift tracking; Genesis drift health gates |

Section 108: Universal Drift Enforcement & Genesis Feedback Loop

108.1 Overview

v7.37.0 closes the gap where only 6 of 52 model-invoking services had direct drift-aware routing. The fix is at the **model router layer** – `ModelRouterService.invoke()` now includes two-phase drift handling that covers ALL services automatically.

108.2 Two-Phase Drift Handling in Model Router

Every call to `modelRouterService.invoke()` with a `tenantId` now goes through:

- Phase 1 – Proactive Selection:** `DriftAwareWeightingService.isModelSafe()` checks if the requested model is safe. If unsafe, `getBestModel()` selects a drift-healthy alternative. Temperature and prompt corrections are applied from the model’s weight config.
- Phase 2 – Legacy Fallback:** If Phase 1 fails (service unavailable, no weight configs), falls back to `DriftCorrectionService.getBestModel()` for quarantine/fallback/correction handling.

This means services like `causal-reasoning.service.ts`, `dream-insight-generator.service.ts`, `skill-execution.service.ts`, and 49 others get drift protection without any code changes.

108.3 Genesis Drift Feedback Loop

After every model invocation (success or failure), telemetry is recorded:

- In-memory ring buffer:** 10,000 entries per tenant, 1-hour window
- Database table:** `drift_invocation_telemetry` (partitioned monthly, RLS, 7-day retention)

Genesis `isDriftHealthyForStage()` now checks three signal types:

Signal Type	Source	What It Measures
Static Drift Scores	<code>model_weight_config</code> table	Per-model drift detection results
Real-Time Health Score	Telemetry aggregation	Combined drift + reroute + failure rate
Failure Rate	Telemetry	Fraction of model calls that failed
Reroute Rate	Telemetry	Fraction of calls needing drift rerouting

108.4 Genesis Gate Thresholds (Enhanced)

Stage	Min Avg Drift	Max Quarantined	Min Health Score	Max Failure Rate	Max Reroute Rate
EMBRYONIC	0.30	5	0.20	30%	50%
NASCENT	0.40	3	0.35	20%	40%
DEVELOPING	0.50	2	0.50	15%	30%
MATURING	0.60	1	0.65	10%	20%
MATURE	0.70	0	0.80	5%	10%

108.5 Enforcement Policy

A mandatory workflow policy (`.windsurf/workflows/drift-detection-enforcement.md`) ensures:

- All new services MUST pass `tenantId` in model requests
- No hardcoded model selection without drift fallback
- No direct LLM API calls bypassing the model router
- New app components MUST have weight profiles if custom drift sensitivity is needed

108.6 Files

File	Purpose
<code>model-router.service.ts</code>	Two-phase drift handling + telemetry reporting
<code>drift-aware-weighting.service.ts</code>	<code>recordInvocationTelemetry()</code> + <code>getGenesisDriftFeedback()</code>
<code>cato/genesis.service.ts</code>	Enhanced <code>isDriftHealthyForStage()</code> with telemetry checks
<code>V2026_02_07_014__drift_invocation_telemetry_partitioned</code>	Partitioned telemetry table, aggregation function, cleanup
<code>.windsurf/workflows/drift-detection-enforcement.md</code>	Enforcement policy

7.37.0 | 2026-02-07 | Universal Drift Enforcement & Genesis Feedback Loop: Model router two-phase drift handling covers all 52+ services; Genesis feedback from real-time invocation telemetry (health score, failure rate, reroute rate); `drift_invocation_telemetry` partitioned table; enforcement policy workflow |

7.37.2 | 2026-02-07 | Enforced Logging Policy: Mandatory structured logging via Logging Registry for all Lambda services; 3 alert services migrated; 195 remaining flagged; compliance integration |

Section 109: Enforced Logging Policy

109.1 Overview

All RADIANT Lambda services **MUST** use the **Logging Registry** (`logging-registry.service.ts`) for structured, enforced logging. This replaces legacy `enhancedLogger` and `raw console.log/error` usage.

109.2 Why This Matters

The Logging Registry provides:

- **Structured JSON output** – every log entry includes timestamp, level, service name, category, requestId, tenantId
- **Auto-registration** – services self-register in `log_source_registry` on first use
- **Compliance detection** – `detectComplianceIssues()` flags unenforced sources as **CRITICAL** for tenants with active compliance licenses (HIPAA/GDPR/SOC2)
- **Coverage reporting** – `getLoggingCoverageReport()` shows enforced vs unenforced services per category

109.3 Required Usage

```
// For services:
import { createRegisteredLogger } from './logging-registry.service';
const logger = createRegisteredLogger({
  serviceName: 'domain/service-name',
  category: 'security', // LogCategory enum
  sourceType: 'application', // 'lambda' | 'application' | 'infrastructure'
});

// For Lambda entry points:
import { withEnforcedLogging } from './logging-registry.service';
export const handler = withEnforcedLogging(
  { serviceName: 'admin/users', category: 'audit' },
  async (event, context, logger) => { /* ... */ }
);
```

109.4 Forbidden Patterns

Pattern	Replacement
<code>console.log(...)</code>	<code>logger.info(message, metadata)</code>
<code>console.error(...)</code>	<code>logger.error(message, error)</code>
<code>console.warn(...)</code>	<code>logger.warn(message, metadata)</code>
<code>import { enhancedLogger }</code>	<code>import { createRegisteredLogger }</code>

109.5 Migration Status

Status	Count
Migrated (v7.37.2 automated script)	324 files

Status	Count
Remaining legacy enhancedLogger	0 source files
Source definition / re-exports	5 files (enhanced-logger.ts, logging/index.ts, middleware/logging.ts, utils/logger.ts, imports.ts – kept as fallback)
Test mocks	~10 test files (mock the old module, not production code)

109.6 Redaction Policy

As of v7.37.2, **log-level field redaction is disabled by default**. The legacy enhancedLogger previously redacted fields matching sensitive patterns (password, token, secret, api_key, etc.) automatically. This has been changed to opt-in.

Setting	Behavior
LOG_REDACT_SENSITIVE not set	Redaction OFF (default)
LOG_REDACT_SENSITIVE=true	Redaction ON (legacy behavior)

Rationale: Redaction was a defense-in-depth safety net, not a regulatory requirement. Actual compliance enforcement is handled at dedicated layers:

Compliance	Enforcement Layer
HIPAA PHI	hipaa-phi-sanitization middleware
GDPR erasure	erasure.service.ts + data retention policies
SOC2 audit	log-tamper-verification.service.ts + immutable archives
Log retention	log-retention-policy.service.ts (per-tenant, per-category)

The new RegisteredLogger (used by all 324 migrated files) never had redaction. Disabling it in the legacy logger ensures consistent behavior across both paths.

109.7 Log Storage Pipeline

All log output flows through a verified storage pipeline – **no regression** from the migration:

Services -> stdout (structured JSON) -> CloudWatch Log Groups

- **Index pointers:** `log_index` table (PostgreSQL) – tracks every archived log batch with SHA-256 hash, byte size, retention expiry
- **Tamper evidence:** `log_merkle_chain` table – Merkle hash chain for immutable categories
- **Auto-discovery:** `LogIndexerService.autoDiscoverSources()` finds new CloudWatch log groups matching `radiant-*` patterns
- **Compliance:** Immutable categories cannot be deleted before retention expires; GDPR vs HIPAA conflicts flagged by `detectComplianceIssues()`

109.8 Enforcement Policy

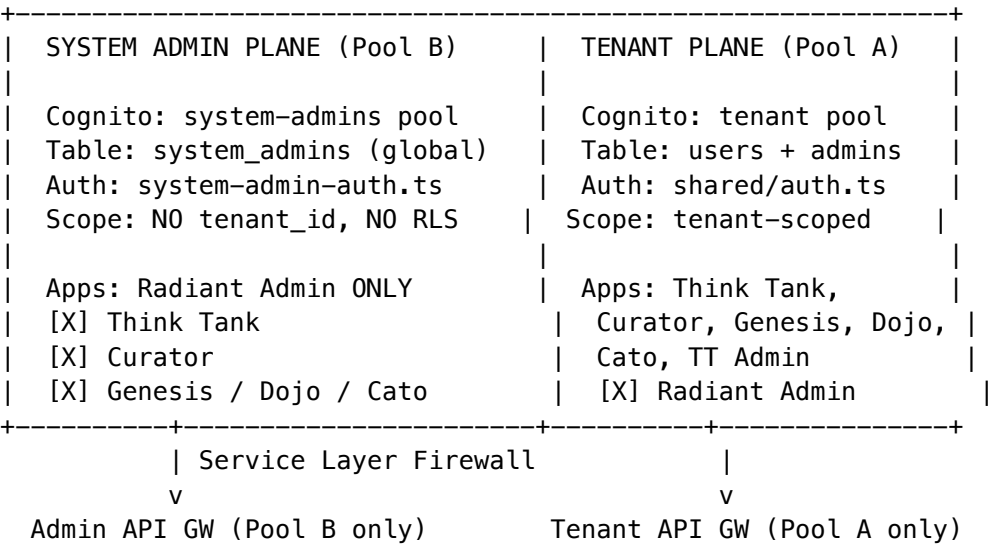

The workflow `.windurf/workflows/enforced-logging-policy.md` is automatically enforced by the AI build agent. All new services **MUST** use the Logging Registry. Legacy services have been fully migrated.

Section 110: System Administrator Separation

110.1 Overview

v7.38.0 introduces a **Dual Identity Plane** that separates system administrators from tenant users into completely isolated identity domains. System admins manage the RADIANT platform itself (databases, infrastructure, models, deployments) and can **only** access the Radiant Admin app. They cannot log into any tenant or consumer application.

110.2 Architecture

110.3 System Admin Roles

Role	Level	Description
super_admin	4	Full platform control, creates other system admins
admin	3	Infrastructure management, tenant management

Role	Level	Description
operator	2	Operations – deploy, models, monitoring
auditor	1	Read-only – audit logs, reports

110.4 Database Tables

Table	Tenant-Scoped?	Purpose
system_admins	[X] No	Global admin accounts
system_admin_contacts	[X] No	Verified email/phone for alerts
system_admin_alert_routing	[X] No	SENTINEL alert -> contact mapping
system_admin_audit_log	[X] No	Admin lifecycle events
system_admin_contact_verification_log	[X] No	Verification audit trail

110.5 Bootstrap Flow

1. **Deployment:** Swift Deployer or CLI creates first system admin in Cognito Pool B
2. **Database:** bootstrap_system_admin() SQL function inserts into system_admins with status = 'pending_setup'
3. **First login:** Force password change -> MFA enrollment -> phone number verification
4. **Activation:** Status changes to active, default SENTINEL routes created
5. **Subsequent admins:** Only super_admin can create new system admins via the Radiant Admin UI

110.6 SENTINEL Dual-Resolution

Alerts are dispatched to **both** system admin contacts (global) and tenant admin contacts (scoped):

Alert Fired

v

1. resolve_system_admin_contacts(category, severity)
-> system_admin_alert_routing JOIN system_admin_contacts
-> Global: all active system admins with matching rules

v

2. resolve_sentinel_contacts(tenant_id, category, severity)
-> sentinel_contact_routing JOIN user_contacts
-> Tenant-scoped: only if alert has tenant context

v

Dispatch via: PagerDuty / Twilio / Slack / SES / SNS

110.7 Security Features

- **MFA mandatory:** All system admin roles require TOTP or SMS MFA (Cognito Pool B enforced)
- **Password policy:** 16+ characters, uppercase, lowercase, digits, symbols
- **Session timeout:** 30 min idle, 8 hour absolute (configurable via system_configuration)
- **Progressive lockout:** 5 failures -> 15 min lock, 10 -> 1 hour, 20 -> auto-deactivation

- **Last super_admin protection:** DB trigger prevents demoting or deactivating the last super_admin
- **Phone verification:** Required for SEV 1-2 SENTINEL alert routing (SMS + voice)

110.8 Auth Middleware Reference

Use Case	Import	Function
System admin API handler	system-admin-auth.ts	extractSystemAdminContext(event)
System admin permission check	system-admin-auth.ts	requireSystemPermission(ctx, 'canManageModels')
System admin role check	system-admin-auth.ts	requireSystemMinRole(ctx, 'admin')
Super admin only	system-admin-auth.ts	requireSystemSuperAdmin(ctx)
System admin CRUD	system-admin-auth.ts	new SystemAdminService(pool)
Tenant API handler	shared/auth.ts	extractAuthContext(event)

110.9 Migration from v7.34.0

The migration (V2026_02_07_015) automatically:

- Creates all new tables and functions
- Copies existing system admin rows from admin_role_assignments -> system_admins
- Copies their contacts from user_contacts -> system_admin_contacts
- Copies SENTINEL routing from sentinel_contact_routing -> system_admin_alert_routing

110.10 Enforcement Policy

The workflow .windurf/workflows/admin-access-control.md (updated for v7.38.0) enforces:

- Admin API handlers MUST use extractSystemAdminContext() from Pool B
- Tenant API handlers MUST use extractAuthContext() from Pool A
- System admin data MUST NOT have tenant_id
- Pool A tokens MUST be rejected by admin API Gateway
- Pool B tokens MUST be rejected by tenant API Gateway

Section 111: Spend Governor (v7.39.0)

111.1 Overview

The Spend Governor is a two-layer budget control system that prevents runaway AWS and AI costs. It enforces spending limits at both the global instance level and the per-tenant level, with automatic suspension, alerting, and recovery mechanisms.

Key principle: End users NEVER see “out of credits” or budget-related messages. They receive a generic “service temporarily unavailable” response. All budget details are visible only to super admins via the Admin Dashboard, SENTINEL alerts, and cost report emails.

111.2 Architecture

Layer	Scope	Enforcement	Recovery
Layer 1	Global AWS instance	Freeze ECS, Lambda, SageMaker services	Deployer or Admin Dashboard thaw
Layer 2	Per-tenant AI models	Quarantine all tenant models via drift-correction	Increase budget, grant override, or wait for rolling window

111.3 Layer 1 – Instance Budget

Configured in `spend_governor_instance` (singleton table). Tracks total AWS spend and can freeze billable services when the budget is exceeded.

Frozen services: ECS tasks -> 0, Lambda concurrency -> 0, SageMaker endpoints flagged for Deployer action.

NOT frozen (always alive): Admin API Gateway, admin Lambdas, Aurora PostgreSQL, S3, CloudWatch, Cognito.

Settings: - **Budget Amount (USD):** Maximum spend for the rolling period - **Period:** Any number of hours or days (e.g., 720h = 30 days) - **Warning Threshold:** Percentage at which SENTINEL alerts fire (default 90%) - **Suspend Threshold:** Percentage at which services freeze (default 100%) - **Cost Report Interval:** How often cost summaries are emailed to super admins

111.4 Layer 2 – Per-Tenant AI Budget

Configured in `spend_governor_config` (one row per tenant). Enforced as a pre-invocation gate in `ModelRouterService.invoke()`.

When a tenant exceeds their budget: 1. All tenant models are quarantined with reason `spend_limit:*` 2. A `critical_alerts` row is created (shown in the banner) 3. SENTINEL fires a SEV 2 alert to super admins 4. The `SpendLimitExceededError` (HTTP 503) is thrown with message “Service temporarily unavailable”

Recovery options: - Increase the tenant’s budget via API or Admin Dashboard - Grant a temporary override (auto-expires after N hours) - Wait for the rolling window to advance past the high-spend period

111.5 Spend Governor Monitor Lambda

Runs on EventBridge schedule (default: every 5 minutes). Responsibilities: 1. Sync tenant spend from `cost_events` into cached `current_spend_usd` 2. Check each tenant against warning/suspend thresholds 3. Auto-suspend models for newly over-budget tenants 4. Auto-restore tenants whose spend drops below threshold (rolling window) 5. Check instance-level budget and freeze if exceeded 6. Expire stale overrides 7. Auto-resolve cleared critical alerts

111.6 Cost Reports

The cost-report Lambda runs on EventBridge schedule and checks `spend_governor_instance.cost_report_interval_hours`. When a report is due, it: 1. Queries `cost_events` for the reporting period 2. Builds per-tenant and per-model breakdowns 3. Resolves super admin email addresses from `system_admin_contacts` 4. Sends a styled HTML email with spend summary, budget status, and tenant/model tables

111.7 Critical Alert Banner

The `CriticalAlertBanner` component renders at the top of every admin dashboard page, between the header and main content. It polls `/api/admin/critical-alerts` every 30 seconds and shows: - **Red banner**: Critical alerts (instance frozen, models suspended) - **Amber banner**: Warnings (approaching budget limit) - **Blue banner**: Info (services restored)

Each banner has a dismiss button and a “View Details” link to the Spend Governor page.

111.8 Admin Dashboard – Spend Governor Page

Located at `/spend-governor`. Features: - **Summary cards**: Instance budget, current spend, percent used, budget period - **Instance freeze banner** with “Restore AWS Services” button - **Tenant Budgets tab**: Per-tenant budget list with progress bars and restore buttons - **Instance Settings tab**: Budget amount, period (hours/days), cost report interval - **Audit Log tab**: Full history of all governor actions

111.9 Swift Deployer Integration

The Deployer has a new “Spend Governor” tab in the sidebar with: - Budget amount and period configuration - Warning/suspend threshold sliders - Cost report interval settings - Emergency freeze/thaw controls with confirmation dialogs

111.10 Database Tables

Table	Purpose
<code>spend_governor_instance</code>	Singleton. Global budget, freeze state, cost report schedule
<code>spend_governor_config</code>	Per-tenant. Budget, thresholds, suspend state, cached spend
<code>spend_governor_audit</code>	Every governor action with full context
<code>spend_governor_overrides</code>	Temporary budget overrides with expiry
<code>spend_governor_cost_reports</code>	History of sent cost reports
<code>critical_alerts</code>	Active/dismissed alerts shown in admin banner

111.11 API Endpoints

Method	Path	Purpose
GET	<code>/api/admin/spend-governor/instance</code>	Get instance config
PUT	<code>/api/admin/spend-governor/instance</code>	Update instance budget
POST	<code>/api/admin/spend-governor/instance/freeze</code>	Manually freeze AWS
POST	<code>/api/admin/spend-governor/instance/thaw</code>	Restore AWS services

Method	Path	Purpose
GET	/api/admin/spend-governor/tenants	List tenant configs
POST	/api/admin/spend-governor/tenants/:id/restore	Restore a suspended tenant
GET	/api/admin/spend-governor/audit	Get audit log
GET	/api/admin/critical-alerts	Get active critical alerts
POST	/api/admin/critical-alerts/:id/dismiss	Dismiss an alert

Version 7.39.0 | February 2026 Cross-AI Validated: Claude Opus 4.5 [ok] | Google Gemini [ok] New Features: Spend Governor + AWS Freeze/Thaw + Cost Reports + Critical Alert Banner + Deployer Budget Controls Status: GO FOR LAUNCH

Table of Contents

- 1. Overview
- 2. Getting Started
- 3. Dashboard Navigation
- 4. Tenant Management
- 5. User & Access Management
- 6. AI Model Configuration
- 7. Billing & Subscriptions
- 8. Monitoring & Analytics
- 9. Security & Compliance
- 10. Troubleshooting
- 11. API Reference
- 12. Appendix

1. Overview

1.1 What is RADIANT?

RADIANT is a multi-tenant AWS SaaS platform for AI model access and orchestration. It provides:

- **106+ AI Models:** 50 external provider models + 56 self-hosted models
- **Intelligent Routing:** Brain router for optimal model selection
- **Multi-Tenant Architecture:** Complete data isolation with Row-Level Security
- **7-Tier Subscription System:** From free tier to enterprise
- **Comprehensive Admin Dashboard:** Full platform management

1.2 Architecture Overview

1.3 Key Concepts

Concept	Description
Tenant	An organization using RADIANT (complete data isolation)
User	Individual user within a tenant
Subscription	Billing tier determining features and limits
Credits	Currency for AI model usage
Brain Router	Intelligent system for model selection
Neural Engine	Personalization engine learning user preferences

2. Getting Started

2.1 Accessing the Admin Dashboard

1. Navigate to: `https://admin.{{RADIANT_DOMAIN}}`
2. Sign in with your administrator credentials
3. Complete MFA verification (required for all admin accounts)

2.2 First-Time Setup Checklist

- ☐ Configure default subscription tiers
- ☐ Set up AI provider credentials
- ☐ Configure email templates
- ☐ Set billing parameters
- ☐ Review security settings
- ☐ Enable monitoring alerts

2.3 Admin Roles

Role	Permissions
Super Admin	Full platform access, can manage other admins
Billing Admin	Manage subscriptions, credits, invoices
Support Admin	View tenant data, assist users, limited modifications
Read-Only Admin	View-only access to dashboards and reports

3. Dashboard Navigation

3.1 Main Dashboard

The main dashboard displays:

- **Active Users:** Real-time count of connected users
- **API Requests:** Requests per minute/hour/day
- **Revenue:** Current period revenue metrics
- **Model Usage:** Top models by usage
- **System Health:** Service status indicators

3.2 Navigation Menu

[CHART] Dashboard	– Overview and metrics
[USERS] Tenants	– Tenant management
[USER] Users	– User administration
[AI] Models	– AI model configuration
Billing	– Subscriptions and credits
[UP] Analytics	– Usage analytics
[LOCK] Security	– Security settings
[GEAR] Settings	– Platform configuration
[LIST] Audit Logs	– Activity logs
[TOOL] Migrations	– Database migrations
[GLOBAL] Localization	– Language settings

4. Tenant Management

4.1 Creating a Tenant

1. Navigate to **Tenants** -> **Create New**
2. Fill in required fields:
 - **Name:** Organization name
 - **Slug:** URL-safe identifier (auto-generated)
 - **Primary Email:** Main contact email
 - **Subscription Tier:** Initial tier
3. Click **Create Tenant**

4.2 Tenant Settings

Setting	Description
Status	Active, Suspended, or Cancelled
Subscription	Current tier and billing cycle
Features	Feature flags enabled for tenant
Rate Limits	Custom rate limit overrides
Data Retention	Custom retention policies

4.3 Tenant Isolation

Each tenant has complete data isolation through:

- **Row-Level Security (RLS):** PostgreSQL policies
- **Tenant Context:** `app.current_tenant_id` session variable
- **Separate Storage:** S3 prefixes per tenant
- **Audit Logging:** All access logged per tenant

4.4 Suspending a Tenant

1. Navigate to **Tenants** -> Select tenant
2. Click **Actions** -> **Suspend**
3. Select reason and duration
4. Confirm suspension

[!] Suspended tenants cannot access the API but data is preserved.

5. User & Access Management

5.1 User Roles (Per Tenant)

Role	Description
Owner	Full tenant control, billing access
Admin	Manage users, settings, view billing
Member	Standard access, use AI features
Viewer	Read-only access

5.2 Managing Users

Add User: 1. Navigate to **Tenants** -> Select tenant -> **Users** 2. Click **Invite User** 3. Enter email and select role 4. User receives invitation email

Remove User: 1. Select user from list 2. Click **Actions** -> **Remove** 3. Confirm removal

5.3 API Keys

Tenants can create API keys for programmatic access:

Key Type	Description
Production	Full access, rate-limited by tier
Development	Limited access, lower rate limits
Read-Only	Only GET requests allowed

5.4 SSO Configuration

RADIANT supports enterprise SSO:

- **SAML 2.0:** Okta, Azure AD, OneLogin
- **OIDC:** Google, Auth0, Cognito
- **SCIM:** Automated user provisioning

6. AI Model Configuration

6.1 Model Categories

Category	Count	Examples
LLM	45+	GPT-4, Claude 3, Gemini
Vision	15+	GPT-4V, LLaVA, BLIP-2
Audio	8+	Whisper, TTS models
Code	10+	CodeLlama, StarCoder
Embedding	8+	text-embedding-3, E5
Scientific	12+	AlphaFold, ESM-2

6.2 Model Pricing

Configure model pricing in **Models -> Pricing**:

+-----+-----+	
Model: gpt-4-turbo	
+-----+-----+	
Base Input Price: \$10.00 / 1M tokens	
Base Output Price: \$30.00 / 1M tokens	
Markup: 40%	
+-----+-----+	
Final Input Price: \$14.00 / 1M tokens	
Final Output Price: \$42.00 / 1M tokens	
+-----+-----+	

6.3 Provider Credentials

Configure AI provider API keys in **Settings -> Providers**:

Provider	Required Credentials
OpenAI	API Key, Organization ID
Anthropic	API Key
Google	Service Account JSON
AWS Bedrock	IAM Role (automatic)
Cohere	API Key
Mistral	API Key

Provider	Required Credentials
----------	----------------------

6.4 Self-Hosted Models

Self-hosted models run on SageMaker with thermal state management:

State	Description	Cost
OFF	Not deployed	\$0
COLD	Deployed, scaled to 0	Minimal
WARM	1 instance running	Per-hour
HOT	Auto-scaling active	Per-hour + usage

6.5 License Management

Track model licenses in **Models** -> **Licenses**:

- **Compliance Status:** Compliant, Review Needed, Non-Compliant
- **Commercial Use:** Allowed/Not Allowed
- **Expiration Tracking:** Alerts for expiring licenses
- **Audit Log:** All license changes tracked

7. Billing & Subscriptions

7.1 Subscription Tiers

Tier	Monthly	Annual	Credits/User	Features
Free	\$0	\$0	50	Basic models
Starter	\$29	\$290	500	+ Advanced models
Pro	\$99	\$990	2,000	+ Priority support
Team	\$49/user	\$490/user	1,500	+ Collaboration
Business	\$199/user	\$1,990/user	5,000	+ SSO, API
Enterprise	Custom	Custom	Unlimited	+ Dedicated
Self-Hosted	License	License	Unlimited	On-premise

7.2 Credit System

Credits are the universal currency for AI usage:

- **Allocation:** Monthly per-user based on tier
- **Rollover:** Unused credits expire monthly
- **Bonus Credits:** Promotional or support credits

- **Purchase:** Additional credits available

Credit Calculation:

Cost = (Input Tokens x Input Price) + (Output Tokens x Output Price)
Credits Used = Cost x 100 (1 credit = \$0.01)

7.3 Grandfathering

When prices change, existing subscribers keep their original terms:

1. Navigate to **Billing** -> **Plan Versions**
2. View grandfathered subscriptions
3. Offer migration incentives if desired

7.4 Invoicing

- **Automatic Invoicing:** Generated monthly/annually
- **Payment Methods:** Credit card, ACH, wire transfer
- **Invoice History:** Available in tenant portal
- **Tax Handling:** Configurable tax rates by region

8. Monitoring & Analytics

8.1 Real-Time Metrics

Metric	Description
Requests/min	API request rate
Latency p50/p95/p99	Response time percentiles
Error Rate	Percentage of failed requests
Token Usage	Input/output tokens consumed
Active Users	Concurrent connected users

8.2 Dashboards

Available Dashboards: - Platform Overview - Tenant Usage - Model Performance - Revenue Analytics - Error Analysis - Provider Health

8.3 Alerts

Configure alerts in **Settings** -> **Alerts**:

Alert Type	Threshold	Action
High Error Rate	> 5%	Email, Slack

Alert Type	Threshold	Action
Provider Down	Health check fail	PagerDuty
Credit Exhaustion	< 10% remaining	Email user
Unusual Usage	> 3sigma deviation	Review queue

8.4 Audit Logs

All administrative actions are logged:

```
{
  "timestamp": "2024-01-15T10:30:00Z",
  "admin_id": "admin_123",
  "action": "tenant.suspend",
  "target": "tenant_456",
  "reason": "Payment failure",
  "ip_address": "192.168.1.1"
}
```

9. Security & Compliance

9.1 Authentication

Method	Description
Email/Password	Standard authentication
MFA	TOTP or SMS (required for admins)
SSO	SAML/OIDC federation
API Keys	For programmatic access

9.2 Authorization

- **Role-Based Access Control (RBAC):** Predefined roles
- **Row-Level Security:** Database-level isolation
- **API Scopes:** Fine-grained API permissions

9.3 Data Protection

Feature	Implementation
Encryption at Rest	AES-256 (AWS KMS)
Encryption in Transit	TLS 1.3
Key Rotation	Automatic, configurable

Feature	Implementation
Data Masking	PII detection and masking

9.4 Compliance

RADIANT supports compliance with:

- **SOC 2 Type II**
- **GDPR**
- **HIPAA** (with BAA)
- **CCPA**

9.5 Dual-Admin Approval

Critical operations require two administrators:

1. First admin initiates request
2. Second admin reviews and approves
3. Operation executes after approval

Operations requiring dual approval: - Production database migrations - Bulk data deletions - Security policy changes - Price increases affecting existing customers

10. Troubleshooting

10.1 Common Issues

Issue: User cannot access tenant

[ok] Check user status (active?)
[ok] Verify tenant status (not suspended?)
[ok] Check subscription (not expired?)
[ok] Review audit logs for blocks

Issue: High latency on requests

[ok] Check provider health dashboard
[ok] Review model thermal state
[ok] Check rate limit status
[ok] Analyze request patterns

Issue: Credits not updating

[ok] Verify billing cycle
[ok] Check for failed transactions
[ok] Review credit transaction log
[ok] Check for pending allocations

10.2 Health Checks

Endpoint	Expected Response
/health	{"status": "healthy"}
/health/db	{"status": "connected"}
/health/cache	{"status": "connected"}
/health/providers	Provider status array

10.3 Log Analysis

Logs are available in CloudWatch:

View recent errors

```
aws logs filter-log-events \
  --log-group-name /radiant/lambda \
  --filter-pattern "ERROR"
```

Search by request ID

```
aws logs filter-log-events \
  --log-group-name /radiant/lambda \
  --filter-pattern "req_abc123"
```

10.4 Support Escalation

Severity	Response Time	Contact
Critical	15 minutes	PagerDuty
High	1 hour	support@radiant.ai
Medium	4 hours	Support portal
Low	24 hours	Support portal

11. API Reference

11.1 Admin API Base URL

`https://api.{{RADIANT_DOMAIN}}/admin/v1`

11.2 Authentication

```
curl -H "Authorization: Bearer <admin_token>" \
  -H "X-Tenant-ID: <tenant_id>" \
  https://api.{{RADIANT_DOMAIN}}/admin/v1/tenants
```

11.3 Key Endpoints

Method	Endpoint	Description
GET	/tenants	List all tenants
POST	/tenants	Create tenant
GET	/tenants/:id	Get tenant details
PATCH	/tenants/:id	Update tenant
POST	/tenants/:id/suspend	Suspend tenant
GET	/users	List users
GET	/models	List models
PATCH	/models/:id/pricing	Update pricing
GET	/analytics/usage	Usage analytics
GET	/audit-logs	Audit logs

11.4 Webhooks

Configure webhooks for real-time events:

Event	Payload
tenant.created	Tenant object
subscription.changed	Subscription details
credit.low	Balance warning
user.invited	User invitation

12. Appendix

12.1 Glossary

Term	Definition
Brain Router	AI system that selects optimal model for each request
Neural Engine	Personalization system learning user preferences
Thermal State	Self-hosted model readiness level
RLS	Row-Level Security for tenant isolation
Credits	Platform currency (1 credit = \$0.01)

12.2 Keyboard Shortcuts

Shortcut	Action
Ctrl+K	Quick search
Ctrl+/	Toggle sidebar
Ctrl+.	Command palette
Esc	Close modal

12.3 Environment Variables

Variable	Description
RADIANT_DOMAIN	Platform domain
AURORA_CLUSTER_ARN	Database ARN
AURORA_SECRET_ARN	Database credentials
COGNITO_USER_POOL_ID	Auth pool ID

12.4 Support Resources

- **Documentation:** https://docs.{{RADIANT_DOMAIN}}
- **API Reference:** https://api.{{RADIANT_DOMAIN}}/docs
- **Status Page:** https://status.{{RADIANT_DOMAIN}}
- **Support Portal:** https://support.{{RADIANT_DOMAIN}}

Version History

Version	Date	Changes
4.17.0	{{BUILD_DATE}}	Initial comprehensive guide

This documentation is automatically generated as part of the RADIANT build process.

Part III: Deployment

Complete guide for deploying and managing RADIANT infrastructure using the Swift Deployer App

Version: 4.18.1 | Last Updated: December 2024

Table of Contents

- 1. Introduction
- 2. System Requirements
- 3. Installation
- 4. First-Time Setup
- 5. AWS Credentials Management
- 6. Deployment Operations
- 7. Multi-Region Deployments
- 8. Snapshots & Rollbacks
- 9. AI Assistant
- 10. Package Management
- 11. Monitoring & Health Checks
- 12. Security Features
- 13. Troubleshooting
- 14. Reference

1. Introduction

1.1 What is RADIANT Deployer?

RADIANT Deployer is a native macOS application that provides a complete deployment management solution for the RADIANT platform. It offers:

- **One-Click Deployments:** Deploy entire infrastructure stacks with a single click
- **AI-Powered Assistance:** Claude-powered assistant for deployment guidance
- **Snapshot Management:** Create and restore deployment snapshots
- **Multi-Region Support:** Deploy across multiple AWS regions
- **Health Monitoring:** Real-time health checks and status monitoring
- **Secure Credential Storage:** Keychain-integrated credential management

1.2 Architecture

1.3 Key Features

Feature	Description
Deployment Wizard	Step-by-step guided deployment process
Lock-Step Mode	Ensures component version consistency
Automatic Rollback	Reverts failed deployments automatically
Offline Mode	Core functionality works without internet
Audit Logging	Complete deployment history tracking

Deployment Wizard Explained

The Deployment Wizard breaks down the complex AWS infrastructure deployment into manageable steps. Instead of manually running CDK commands and configuring services, the wizard:

- 1. **Validates Prerequisites:** Checks that all required software (Node.js, AWS CLI, CDK) is installed and properly configured before starting
- 2. **Guides Configuration:** Walks you through selecting environment (dev/staging/prod), tier (1-5), and region settings with explanations for each option
- 3. **Shows Progress:** Displays real-time progress as each CloudFormation stack deploys, with estimated time remaining
- 4. **Handles Errors:** If any step fails, provides clear error messages and suggested remediation steps

Lock-Step Mode Explained

Lock-Step Mode prevents version mismatches between RADIANT components that could cause compatibility issues:

- **What it does:** Ensures the Admin Dashboard, Lambda functions, and database schema are all on compatible versions
- **Why it matters:** A v4.18 Lambda function might expect database columns that don't exist in a v4.17 schema, causing runtime errors
- **How it works:** Before deployment, the system checks version numbers across all components and blocks deployment if drift exceeds the configured maximum (default: 1 minor version)
- **When to disable:** Only disable during development when testing individual component changes

Automatic Rollback Explained

Automatic Rollback protects your production environment by reverting failed deployments:

- **Trigger conditions:** Activates when any deployment phase fails (CDK deploy error, health check failure, migration error)
- **Rollback process:** Restores the pre-deployment snapshot, which includes database state, Lambda code, and configuration
- **Recovery time:** Typically 5-10 minutes depending on the size of changes being reverted
- **Notification:** Sends alerts via configured channels (email, Slack) when rollback occurs

Offline Mode Explained

Offline Mode allows essential operations when internet connectivity is unavailable:

- **Available offline:** Viewing deployment history, browsing local snapshots, reviewing configuration, accessing cached documentation
- **Requires internet:** Deploying to AWS, health checks, AI assistant queries, credential validation
- **Data sync:** When connectivity returns, local changes sync automatically with the cloud state

Audit Logging Explained

Every action in the Deployer is logged for compliance and troubleshooting:

- **What's logged:** User identity, timestamp, action type, parameters, outcome, duration
- **Storage:** Logs stored locally in SQLCipher database and optionally synced to CloudWatch
- **Retention:** Local logs kept for 90 days by default (configurable)
- **Export:** Logs can be exported to CSV/JSON for compliance audits

2. System Requirements

2.1 Hardware Requirements

Component	Minimum	Recommended
macOS Version	13.0 (Ventura)	14.0+ (Sonoma)
Processor	Apple Silicon or Intel	Apple Silicon M1+
Memory	8 GB RAM	16 GB RAM
Storage	2 GB free	10 GB free
Display	1280x800	1440x900+

Why These Requirements?

macOS 13.0+: Required for Swift 5.9 runtime and modern SwiftUI features. Older versions lack required system APIs for secure keychain access and modern networking.

Apple Silicon Recommended: While Intel Macs are supported, Apple Silicon provides 2-3x faster CDK synthesis and compilation times. The app is built as a universal binary supporting both architectures.

8 GB RAM Minimum: CDK synthesis loads the entire infrastructure definition into memory. Complex deployments (Tier 3+) with many resources may require more memory. With 8 GB, you may experience slowdowns during synthesis.

16 GB RAM Recommended: Allows comfortable multitasking while deployments run in the background. Essential if you're also running Docker, IDEs, or other development tools.

2 GB Storage Minimum: Covers the application itself (~200 MB), local database (~50 MB), and several snapshots. However, snapshots can grow large over time.

10 GB Storage Recommended: Provides room for multiple deployment snapshots, comprehensive logs, and CDK cache. Each full snapshot can be 100-500 MB depending on your deployment size.

2.2 Software Requirements

Software	Version	Purpose	Installation
Xcode	15.0+	Swift runtime (Command Line Tools sufficient)	<code>xcode-select --install</code>
AWS CLI	2.x	AWS operations	<code>brew install awscli</code>
Node.js	20.x LTS	CDK operations	<code>brew install node@20</code>
AWS CDK	2.120+	Infrastructure deployment	<code>npm install -g aws-cdk</code>
pnpm	8.x+	Package management	<code>npm install -g pnpm</code>

Software Explained

Xcode Command Line Tools: Provides the Swift runtime and compiler. You don't need the full Xcode IDE - just the command line tools (4 GB vs 12 GB download). The Deployer uses Swift for its native performance and seamless macOS integration.

AWS CLI v2: The official AWS command-line interface. Used internally by the Deployer to execute AWS operations, assume IAM roles, and query service status. Version 2 is required for SSO support and improved credential handling.

Node.js 20 LTS: Required to run the AWS CDK, which is written in TypeScript. LTS (Long Term Support) versions receive security updates for 30 months. The Deployer manages Node.js processes internally during CDK operations.

AWS CDK 2.120+: The Cloud Development Kit that defines RADIANT's infrastructure as TypeScript code. Version 2.120+ includes critical bug fixes for Aurora PostgreSQL and Lambda layer handling. The CDK synthesizes your infrastructure into CloudFormation templates.

pnpm 8.x: A fast, disk-efficient package manager used to install CDK dependencies. Chosen over npm for its superior handling of monorepo workspaces and 2-3x faster installation times.

2.3 AWS Requirements

Requirement	Details	How to Verify
AWS Account	Active account with billing enabled	Check AWS Console billing page

Requirement	Details	How to Verify
IAM User	AdministratorAccess or equivalent	<code>aws sts get-caller-identity</code>
Regions	Access to us-east-1 (required) + additional regions	<code>aws ec2 describe-regions</code>
Service Quotas	Default quotas sufficient for Tier 1-2	AWS Service Quotas console

AWS Requirements Explained

Active AWS Account with Billing: RADIANT deploys real AWS resources that incur costs. Billing must be enabled and a valid payment method on file. New accounts have a \$5 pending charge verification. Free tier covers some resources for 12 months but won't cover all RADIANT components.

IAM User with AdministratorAccess: The Deployer needs broad permissions to create and manage resources across many AWS services. For production, you can use a scoped-down policy (see Appendix A), but AdministratorAccess is recommended for initial setup to avoid permission errors.

Required Permissions Include: - CloudFormation (stack operations) - Lambda (function management) - API Gateway (REST API setup) - RDS/Aurora (database provisioning) - Cognito (user pool management) - S3 (storage buckets) - IAM (role creation) - SSM (parameter storage) - Secrets Manager (credential storage) - CloudWatch (logging and monitoring)

us-east-1 Required: This region is required even if you deploy to other regions because: - ACM certificates for CloudFront must be in us-east-1 - Some global services (IAM, Route 53) operate from us-east-1 - CDK bootstrap resources are region-specific

Service Quotas: Default AWS quotas are sufficient for Tier 1-2 deployments. Tier 3+ may require quota increases for: - Lambda concurrent executions (default: 1,000) - RDS instances (default: 40) - VPC Elastic IPs (default: 5)

To request quota increases: AWS Console > Service Quotas > Select service > Request increase

3. Installation

3.1 Download and Install

Option A: Pre-built Application (Recommended)

1. Download the latest release from GitHub Releases
2. Drag RadiantDeployer.app to /Applications
3. Right-click and select "Open" (first launch only)
4. Grant necessary permissions when prompted

Option B: Build from Source

```
# Clone the repository
git clone https://github.com/your-org/radiant.git
cd radiant/apps/swift-deployer
```

Build the application

```
swift build -c release
```

Run the application

```
swift run RadiantDeployer
```

3.2 Initial Permissions

The app requires the following permissions:

Permission	Purpose	How to Grant
Keychain Access	Store AWS credentials securely	Approve on first credential save
Network Access	Connect to AWS and AI services	Approve in System Settings
File Access	Save snapshots and logs	Approve when prompted

3.3 Verify Installation

- 1. Launch RadiantDeployer
- 2. Navigate to **Settings -> About**
- 3. Verify version shows 4.18.1
- 4. Check all services show green status

4. First-Time Setup

4.1 Setup Wizard

On first launch, the Setup Wizard guides you through:

-----+-----		
	Setup Wizard	
-----+-----		
	Step 1: Welcome	[ok] Complete
	Step 2: AWS Credentials	-> In Progress
	Step 3: Environment Configuration	o Pending
	Step 4: AI Assistant Setup	o Pending
	Step 5: Verification	o Pending
-----+-----		

4.2 AWS Credentials Setup

- 1. Click **“Add AWS Credentials”**

2. Enter your credentials:
 - **Name:** Descriptive name (e.g., “Production Account”)
 - **Access Key ID:** AKIA... (20 characters)
 - **Secret Access Key:** Your secret key (40 characters)
 - **Region:** Primary region (e.g., us-east-1)
3. Click “**Validate**” to test connectivity
4. Click “**Save**” to store securely in Keychain

4.3 Environment Configuration

Configure your deployment environment:

Setting	Description	Default
Environment	dev, staging, or prod	dev
Tier	Infrastructure tier (1-5)	1
Domain	Your domain name	Required for Tier 2+
Stack Prefix	CDK stack name prefix	radiant

Environment Types Explained

Development (dev): For active development and testing. Features relaxed security settings, smaller instance sizes, and no deletion protection. Data can be reset freely. Cost: ~\$50-150/month for Tier 1.

Staging (staging): Pre-production environment that mirrors production configuration. Use this to test deployments before going live. Same security as production but can use smaller instances. Cost: ~60% of production.

Production (prod): Live environment serving real users. Includes deletion protection, multi-AZ deployments, automated backups, and enhanced monitoring. Never deploy untested changes directly to production.

Infrastructure Tiers Explained

Tier	Name	Monthly Cost	Use Case	Resources
1	SEED	\$50-150	Development, POC	Single-AZ, t3.small instances, 20GB storage
2	STARTUP	\$200-400	Small production	Multi-AZ database, WAF, basic monitoring
3	GROWTH	\$1,000-2,500	Medium production	Self-hosted models, HIPAA compliance, enhanced security
4	SCALE	\$4,000-8,000	Large production	Multi-region, global database, dedicated instances
5	ENTERPRISE	\$15,000-35,000	Enterprise	Custom SLAs, dedicated support, on-premise options

Choosing the Right Tier: Start with Tier 1 for development. Move to Tier 2 when you have paying customers. Tier 3+ is for organizations with compliance requirements or high traffic.

Domain Configuration

For Tier 2+, you need a custom domain:

1. **Register a domain** in Route 53 or transfer an existing domain
2. **Create a hosted zone** in Route 53 for your domain
3. **Request an ACM certificate** in us-east-1 for `*, yourdomain.com`
4. **Validate the certificate** via DNS (automatic if using Route 53)

The Deployer will configure: - `api.yourdomain.com` - API Gateway endpoint - `admin.yourdomain.com` - Admin Dashboard - `app.yourdomain.com` - Think Tank application

4.4 AI Assistant Setup (Optional)

Enable the Claude-powered AI assistant:

1. Navigate to **Settings -> AI Assistant**
2. Enter your Anthropic API key
3. Select response style:
 - **Concise:** Brief, action-focused responses
 - **Detailed:** In-depth explanations
 - **Tutorial:** Step-by-step guidance
4. Test the connection with a sample query

5. AWS Credentials Management

5.1 Credential Sets

Manage multiple AWS accounts:

Field	Description	Example
Name	Friendly identifier	“Production”
Access Key ID	AWS access key	AKIAIOSFODNN7EXAMPLE
Secret Access Key	AWS secret	(stored encrypted)
Region	Default region	us-east-1
Role ARN	Optional assume role	arn:aws:iam::123:role/deploy

5.2 Adding Credentials

1. Navigate to **Credentials** tab
2. Click “**+ Add Credential Set**”
3. Fill in the required fields
4. Click “**Validate**” to test
5. Click “**Save**”

5.3 Credential Validation

The app validates:

- [ok] Access key format (AKIA prefix, 20 chars)
- [ok] Secret key length (40+ chars)
- [ok] Region validity
- [ok] AWS connectivity (STS GetCallerIdentity)
- [ok] Required permissions

5.4 Security Best Practices

Practice	Recommendation
Rotate Keys	Every 90 days
Least Privilege	Use scoped IAM policies
MFA	Enable on AWS account
Audit	Review access logs regularly
Backup	Export credentials securely

5.5 Importing from AWS CLI

```
# The app can import from ~/.aws/credentials
# Navigate to Credentials -> Import from AWS CLI
```

6. Deployment Operations

6.1 Deployment Dashboard

The main dashboard shows:

Environment: dev		Status: [ok] Healthy	
Version: 4.18.1		Last Deploy: 2024-12-25 10:30:00	
Deploy [Button]	Rollback [Button]	Settings [Button]	
Recent Deployments:			
2024-12-25 10:30	v4.18.1	prod	[ok] Success 4m 32s
2024-12-24 15:45	v4.18.0	prod	[ok] Success 5m 12s
2024-12-24 09:00	v4.17.0	dev	[ok] Success 3m 45s

6.2 Starting a Deployment

1. Select target **Environment** (dev/staging/prod)
2. Select **Tier** (1-5)
3. Review deployment plan
4. Click “**Start Deployment**”
5. Monitor progress in real-time

6.3 Deployment Phases

Phase	Duration	Description
1. Validation	~30s	Credential and configuration check
2. Snapshot	~1m	Create pre-deployment backup
3. CDK Synth	~1m	Generate CloudFormation templates
4. CDK Deploy	~10-20m	Deploy infrastructure
5. Migration	~2m	Run database migrations
6. Health Check	~1m	Verify all services
7. Cleanup	~30s	Remove temporary resources

Phase Details

Phase 1 - Validation (30 seconds)

Before any changes are made, the system validates: - AWS credentials are valid and not expired - IAM permissions are sufficient for all required operations - Target environment exists or can be created - No conflicting deployments are in progress (deployment lock check) - Required software versions are installed (Node.js, CDK, etc.) - Network connectivity to AWS services

If validation fails, you'll see specific error messages explaining what needs to be fixed.

Phase 2 - Snapshot (1 minute)

A pre-deployment snapshot captures the current state so you can rollback if needed: - Database schema and critical data (not full data backup) - Current Lambda function code versions - SSM Parameter Store values - Current CloudFormation stack states - Configuration files

Snapshots are stored locally and can be managed in the Snapshots tab.

Phase 3 - CDK Synth (1 minute)

The CDK synthesizes TypeScript infrastructure code into CloudFormation templates: - Reads infrastructure definitions from packages/infrastructure/ - Resolves all construct dependencies - Generates CloudFormation JSON/YAML templates - Calculates resource changes (what will be created/updated/deleted) - Validates templates against AWS CloudFormation rules

You can review the generated templates before proceeding.

Phase 4 - CDK Deploy (10-20 minutes)

The actual AWS resource deployment happens in this phase: - CloudFormation stacks are created or updated in dependency order - Resources are provisioned (databases, Lambda functions, API Gateway, etc.) - IAM roles and policies are configured - Networking (VPC, subnets, security groups) is set up - DNS records are created/updated

This is the longest phase. Progress shows which stack is currently deploying.

Phase 5 - Migration (2 minutes)

Database migrations ensure your schema matches the deployed code: - Connects to Aurora PostgreSQL using Data API - Runs pending migration files in sequence - Creates new tables, columns, indexes as needed - Updates RLS (Row-Level Security) policies - Verifies migration success with integrity checks

Migrations are idempotent - running them twice won't cause issues.

Phase 6 - Health Check (1 minute)

Verifies all deployed services are functioning: - API Gateway responds to health endpoint - Lambda functions can be invoked - Database connections succeed - Cognito user pools are accessible - S3 buckets are reachable - CloudFront distributions are deployed

If health checks fail, automatic rollback is triggered (if enabled).

Phase 7 - Cleanup (30 seconds)

Final cleanup tasks: - Removes temporary files created during deployment - Clears CDK staging buckets of old assets - Updates deployment history in local database - Releases deployment lock - Sends completion notification

6.4 Deployment Progress

```

+-----+
| Deploying to Production |
+-----+
|
| [] 65% |
|
| Current Phase: CDK Deploy |
| Stack: Radiant-prod-API (5 of 9) |
| Elapsed: 8m 23s | Estimated: 4m remaining |
|
| [ok] Validation complete |
| [ok] Snapshot created: snap-20241225-103000 |
| [ok] CDK synthesis complete |
| -> Deploying stacks... |
|   [ok] Radiant-prod-Foundation |
|   [ok] Radiant-prod-Networking |
|   [ok] Radiant-prod-Security |
|   [ok] Radiant-prod-Data |
| -> Radiant-prod-API |
|   o Radiant-prod-Auth |
|   o Radiant-prod-AI |
|   o Radiant-prod-Admin |
|   o Radiant-prod-Monitoring |
|
| [Cancel Deployment] |
+-----+

```

6.5 Deployment Settings

Configure deployment behavior:

Setting	Description	Default
Auto-Rollback	Rollback on failure	Enabled
Lock-Step Mode	Require version consistency	Enabled
Max Version Drift	Maximum version difference	1
Approval Required	Require confirmation for prod	Enabled
Notification	Send completion notifications	Enabled

6.6 Operation Timeouts

Operation	Default Timeout	Configurable
CDK Deploy	30 minutes	Yes
Health Check	5 minutes	Yes
Migration	10 minutes	Yes
Snapshot	5 minutes	Yes
Rollback	15 minutes	Yes

7. Multi-Region Deployments

7.1 Overview

Deploy RADIANT across multiple AWS regions for:

- **High Availability:** Survive regional outages
- **Low Latency:** Serve users from nearest region
- **Compliance:** Data residency requirements

7.2 Supported Regions

Region	Code	Primary Use
US East (N. Virginia)	us-east-1	Primary (required)
US West (Oregon)	us-west-2	West coast users
EU (Ireland)	eu-west-1	European users
EU (Frankfurt)	eu-central-1	GDPR compliance
Asia Pacific (Singapore)	ap-southeast-1	APAC users

Region	Code	Primary Use
Asia Pacific (Tokyo)	ap-northeast-1	Japanese users

7.3 Adding a Region

1. Navigate to **Multi-Region** tab
2. Click **“Add Region”**
3. Configure:
 - **Region**: Select from available regions
 - **Is Primary**: Set primary region flag
 - **Stack Prefix**: Region-specific prefix
 - **Endpoint**: Custom domain for region
4. Click **“Deploy to Region”**

7.4 Region Consistency

Monitor version consistency across regions:

Multi-Region Status					Consistency: [ok] 100%	
Region	Version	Status	Last Deploy			
us-east-1 (P)	4.18.1	[ok] Healthy	2024-12-25	10:30		
eu-west-1	4.18.1	[ok] Healthy	2024-12-25	10:35		
ap-southeast-1	4.18.1	[ok] Healthy	2024-12-25	10:40		
[Deploy All]		[Check Consistency]	[Sync Versions]			

8. Snapshots & Rollbacks

8.1 Snapshot Types

Type	Description	Retention
Pre-Deploy	Automatic before each deployment	30 days
Manual	User-initiated backup	Until deleted
Scheduled	Periodic backups	Configurable

8.2 Creating a Snapshot

1. Navigate to **Snapshots** tab

2. Click **“Create Snapshot”**
3. Enter description (optional)
4. Select components to include:
 - [ok] Database state
 - [ok] Configuration
 - [ok] Lambda code
 - [ok] Infrastructure state
5. Click **“Create”**

8.3 Snapshot Contents

Snapshot: snap-20241225-103000

```
+-- metadata.json          # Snapshot info
+-- database/
|   +-- schema.sql         # Database schema
|   +-- data.sql           # Critical data
+-- config/
|   +-- ssm-parameters.json # SSM parameters
|   +-- secrets.json        # Secret references
+-- lambda/
|   +-- functions.zip       # Lambda code packages
+-- infrastructure/
    +-- state.json          # CDK state
```

8.4 Restoring from Snapshot

1. Navigate to **Snapshots** tab
2. Select snapshot to restore
3. Click **“Restore”**
4. Confirm restoration scope:
 - Full restoration
 - Database only
 - Configuration only
5. Click **“Confirm Restore”**

8.5 Automatic Rollback

When enabled, failed deployments automatically:

1. Stop deployment process
2. Identify last known good state
3. Restore from pre-deploy snapshot
4. Verify system health
5. Send notification

9. AI Assistant

9.1 Overview

The Claude-powered AI Assistant provides:

- **Deployment Guidance:** Step-by-step help
- **Error Translation:** User-friendly error explanations
- **Troubleshooting:** Problem diagnosis
- **Best Practices:** Recommendations

9.2 Enabling AI Assistant

1. Navigate to **Settings -> AI Assistant**
2. Enter Anthropic API key
3. Toggle **"Enable AI Assistant"**
4. Select response style

9.3 Using the Assistant

Access the assistant via:

- **Chat Panel:** Click AI icon in toolbar
- **Contextual Help:** Click “?” on any screen
- **Error Dialogs:** Click “Explain” on errors

9.4 Sample Interactions

```

+-----+
| AI Assistant |
+-----+
|
| You: What does error "AccessDenied: User is not authorized
|       to perform dynamodb:CreateTable" mean?
|
| Assistant: This error indicates your AWS credentials don't
| have permission to create DynamoDB tables. To fix this:
|
| 1. Check your IAM user/role has the required permissions
| 2. Add the "AmazonDynamoDBFullAccess" managed policy, or
| 3. Add specific permissions:
|     - dynamodb:CreateTable
|     - dynamodb:DescribeTable
|     - dynamodb:UpdateTable
|
| Would you like me to show the exact IAM policy needed?
|
| [Yes, show policy]  [No, I'll figure it out]
|
+-----+

```

9.5 Offline Mode

When offline, the assistant provides:

- Pre-cached common error explanations
 - Local troubleshooting guides
 - Fallback recommendations
-

10. Package Management

10.1 Package System

RADIANT uses atomic packages for deployment:

```
radiant-4.18.1.pkg
+-- manifest.json          # Package manifest
+-- checksums.sha256       # Component checksums
+-- radiant/               # Radiant components
|   +-- infrastructure/
|   +-- lambda/
|   +-- dashboard/
+-- thinktank/             # Think Tank components
    +-- api/
    +-- frontend/
```

10.2 Viewing Packages

Navigate to **Packages** tab to see:

- Installed packages
- Available updates
- Package history
- Component versions

10.3 Version Management

Version Type	Format	Example
Radiant	Major.Minor.Patch	4.18.1
Think Tank	Major.Minor.Patch	3.2.0
Package	Combined	4.18.1+3.2.0

10.4 Lock-Step Mode

When enabled:

- All components must have same minor version
 - Maximum version drift configurable
 - Automatic sync available
-

11. Monitoring & Health Checks

11.1 Health Dashboard

System Health		Overall: [ok] Healthy		
Service	Status	Latency	Last Check	
API Gateway	[ok] Up	45ms	10s ago	
Lambda (Router)	[ok] Up	120ms	10s ago	
Aurora PostgreSQL	[ok] Up	12ms	10s ago	
DynamoDB	[ok] Up	8ms	10s ago	
Cognito	[ok] Up	85ms	10s ago	
S3 Storage	[ok] Up	35ms	10s ago	
CloudFront	[ok] Up	22ms	10s ago	
SageMaker (if T3+)	[ok] Up	250ms	10s ago	
[Refresh]		[Run Full Check]	[View History]	

11.2 Health Check Types

Check	Frequency	Timeout
Quick	Every 60s	5s
Standard	Every 5m	30s
Deep	Manual/Deploy	2m

11.3 Alerts

Configure alerts for:

- Service degradation
- High latency
- Error rate spikes
- Failed deployments

12. Security Features

12.1 Credential Security

Feature	Implementation
Storage	macOS Keychain (encrypted)
Memory	Cleared after use
Transport	TLS 1.3 only
Validation	Format + connectivity check

12.2 Deployment Locks

Prevent concurrent deployments:

Deployment Lock: Active
+-- Acquired: 2024-12-25 10:30:00
+-- Owner: deployer@example.com
+-- Environment: production
+-- Expires: 2024-12-25 11:30:00

12.3 Audit Logging

All operations are logged:

```
{
  "timestamp": "2024-12-25T10:30:00Z",
  "operation": "deployment.start",
  "user": "admin@example.com",
  "environment": "production",
  "version": "4.18.1",
  "status": "success",
  "duration_ms": 272000
}
```

12.4 Secret Detection

Pre-commit checks scan for:

- AWS access keys
- API keys
- Passwords
- Private keys

13. Troubleshooting

13.1 Common Issues

Deployment Fails at CDK Synth

Symptoms: Deployment stops at synthesis phase

Solutions: 1. Check Node.js version: `node --version` (need 20.x) 2. Clear CDK cache: `rm -rf cdk.out` 3. Update CDK: `npm update -g aws-cdk` 4. Check TypeScript errors in `packages/infrastructure`

AWS Credentials Invalid

Symptoms: “Invalid credentials” error

Solutions: 1. Verify access key format (starts with AKIA) 2. Check secret key hasn’t expired 3. Verify IAM user is active 4. Test with AWS CLI: `aws sts get-caller-identity`

Health Check Timeout

Symptoms: Services show unhealthy after deployment

Solutions: 1. Wait 2-3 minutes for cold start 2. Check CloudWatch logs for errors 3. Verify security group rules 4. Check VPC endpoint configuration

13.2 Log Locations

Log Type	Location
App Logs	~/Library/Logs/RadiantDeployer/
Deployment Logs	~/Library/Application Support/RadiantDeployer/deployments/
AWS Logs	CloudWatch Log Groups

13.3 Getting Help

1. **AI Assistant:** Built-in help
2. **Documentation:** This guide + online docs
3. **Support:** support@radiant.example.com

14. Reference

14.1 Keyboard Shortcuts

Shortcut	Action
Cmd + D	Start deployment
Cmd + R	Refresh status
Cmd + S	Create snapshot
Cmd + ,	Open settings
Cmd + ?	Open AI assistant
Cmd + L	View logs

14.2 CLI Commands

Build and run from source

```
cd apps/swift-deployer
swift build -c release
swift run RadiantDeployer
```

Run with specific config

```
swift run RadiantDeployer --environment prod --tier 3
```

Headless deployment

```
swift run RadiantDeployer deploy --non-interactive
```

14.3 Environment Variables

Variable	Description
RADIANT_ENV	Override environment
RADIANT_TIER	Override tier
RADIANT_DEBUG	Enable debug logging
RADIANT_AI_KEY	Anthropic API key

14.4 File Locations

File	Location
Configuration	~/Library/Application Support/RadiantDeployer/config.json
Snapshots	~/Library/Application Support/RadiantDeployer/snapshots/
Logs	~/Library/Logs/RadiantDeployer/
Database	~/Library/Application Support/RadiantDeployer/local.db

Appendix A: IAM Policy Requirements

Minimum IAM permissions for deployment:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
```

```
"Action": [
  "cloudformation:*",
  "s3:*",
  "lambda:*",
  "apigateway:*",
  "cognito-idp:*",
  "rds:*",
  "dynamodb:*",
  "sqs:*",
  "sns:*",
  "events:*",
  "logs:*",
  "iam:PassRole",
  "iam:CreateRole",
  "iam:AttachRolePolicy",
  "ssm:*",
  "secretsmanager:*",
  "ecr:*",
  "ecs:*"
],
"Resource": "*"
}
```

Appendix B: Glossary

Term	Definition
CDK	AWS Cloud Development Kit
Stack	CloudFormation stack deployed by CDK
Snapshot	Point-in-time backup of deployment
Lock-Step	Version consistency enforcement
Tier	Infrastructure sizing level (1-5)

Document Version: 4.18.1 Last Updated: December 2024

Overview

This guide covers deploying the RADIANT platform from development to production. The platform consists of:

- 1. **AWS Infrastructure** - CDK stacks for all cloud resources
- 2. **Admin Dashboard** - Next.js admin interface
- 3. **Swift Deployer App** - macOS deployment tool with AI assistant

What's New in v4.18.0

- **Unified Package System** - Deploy with atomic component versioning
- **AI Assistant** - Claude-powered deployment guidance in Swift app
- **Configurable Timeouts** - SSM-synced operation timeouts
- **Cost Management** - Real-time cost tracking and alerts
- **Compliance Reports** - SOC2, HIPAA, GDPR, ISO27001 reporting

Prerequisites

AWS Account Setup

Requirement	Action	Verification
AWS Account	Create or use existing	Account ID available
IAM User	Create with AdministratorAccess	Access keys configured
AWS CLI	Install and configure	<code>aws sts get-caller-identity</code>
Route 53 Domain (optional)	Register domain	Domain in hosted zone
ACM Certificate (optional)	Request in us-east-1	Certificate validated

Development Environment

Requirement	Version	Verification
Node.js	20.x LTS	<code>node --version</code>
pnpm	8.x+	<code>pnpm --version</code>
AWS CDK CLI	2.x	<code>cdk --version</code>
Xcode	15.x+	<code>xcode-select -p</code>
Swift	5.9+	<code>swift --version</code>

Quick Start

Automated Deployment

Use the deployment script for a streamlined deployment:

```
# Deploy to dev environment
./scripts/deploy.sh --environment dev
```

```
# Deploy to staging
./scripts/deploy.sh --environment staging
```

```
# Deploy to production
```

```
./scripts/deploy.sh --environment prod
```

Note: RADIANT uses a unified deployment model. All features are available in every deployment. Licensing restrictions are handled at the application level, not infrastructure level.

Verify Deployment

After deployment, verify all resources:

```
./scripts/verify-deployment.sh --environment dev
```

Manual Deployment

1. Install Dependencies

```
cd radiant
npx pnpm install
```

2. Build Shared Package

```
cd packages/shared
npm run build
```

3. Build Lambda Functions

```
cd packages/infrastructure/lambda
npm install --legacy-peer-deps
npm run build
```

4. Build Admin Dashboard

```
cd apps/admin-dashboard
npm install
npm run build
```

CDK Deployment

Bootstrap CDK (One-time per account/region)

```
cd packages/infrastructure
npx cdk bootstrap aws://ACCOUNT_ID/us-east-1 --qualifier radiant
```

Deploy All Stacks

```
# Deploy in order with dependencies
npx cdk deploy --all \
  --context environment=dev \
```

```
--context tier=1 \
--require-approval never
```

Deploy Individual Stacks

Phase 1: Foundation

```
npx cdk deploy Radiant-dev-Foundation --context environment=dev --context tier=1
npx cdk deploy Radiant-dev-Networking --context environment=dev --context tier=1
```

Phase 2: Security & Data

```
npx cdk deploy Radiant-dev-Security --context environment=dev --context tier=1
npx cdk deploy Radiant-dev-Data --context environment=dev --context tier=1
npx cdk deploy Radiant-dev-Storage --context environment=dev --context tier=1
```

Phase 3: Auth & AI

```
npx cdk deploy Radiant-dev-Auth --context environment=dev --context tier=1
npx cdk deploy Radiant-dev-AI --context environment=dev --context tier=1
```

Phase 4: API & Admin

```
npx cdk deploy Radiant-dev-API --context environment=dev --context tier=1
npx cdk deploy Radiant-dev-Admin --context environment=dev --context tier=1
```

Database Migrations

After infrastructure is deployed, run database migrations:

Connect to Aurora and run migrations

```
cd packages/infrastructure/migrations
./run-migrations.sh --environment dev
```

Migration files are applied in order (44 total): 1. 001_initial_schema.sql - Base tables 2. 002_tenant_isolation.sql - RLS policies 3. 003_ai_models.sql - Providers and models 4. 004_usage_billing.sql - Usage tracking 5. 005_admin_approval.sql - Audit logs 6. 006_self_hosted_models.sql - SageMaker config 7. 007_external_providers.sql - Provider settings 8. ... (see migrations/ for full list) 44. 044_cost_experiments_security.sql - Cost tracking, A/B testing, security

Post-Deployment Configuration

Create First Super Admin

```
aws cognito-idp admin-create-user \
  --user-pool-id YOUR_ADMIN_POOL_ID \
  --username admin@example.com \
  --user-attributes Name=email,Value=admin@example.com \
  --temporary-password TempPass123! \
  --message-action SUPPRESS
```

```
aws cognito-idp admin-add-user-to-group \
  --user-pool-id YOUR_ADMIN_POOL_ID \
```

```
--username admin@example.com \  
--group-name super_admin
```

Configure AI Providers

- 1. Navigate to Admin Dashboard -> Providers
- 2. Add API keys for external providers:
 - OpenAI
 - Anthropic
 - Google AI
 - xAI (Grok)
 - DeepSeek
- 3. Verify connectivity with test requests

Environment Configuration

Tiers

Tier	Name	Use Case
1	SEED	Development, testing
2	STARTUP	Small production
3	GROWTH	Medium production
4	SCALE	Large production
5	ENTERPRISE	Enterprise with compliance

Environment Variables

Required environment variables for deployment:

```
export AWS_REGION=us-east-1  
export AWS_ACCOUNT_ID=123456789012  
export RADIANT_ENVIRONMENT=dev # dev, staging, prod  
export RADIANT_TIER=1 # 1-5  
export RADIANT_DOMAIN=example.com
```

Verification

Health Checks

```
# API Health  
curl https://YOUR_API_ENDPOINT/health  
  
# Expected response:  
# {"status":"healthy","version":"4.18.0"}
```

Smoke Tests

Test chat completions

```
curl -X POST https://YOUR_API_ENDPOINT/v1/chat/completions \
  -H "Authorization: Bearer YOUR_TOKEN" \
  -H "Content-Type: application/json" \
  -d '{"model": "gpt-4o-mini", "messages": [{"role": "user", "content": "Hello"}]}'
```

Troubleshooting

Common Issues

Issue	Cause	Solution
CDK bootstrap fails	Missing permissions	Ensure IAM user has AdministratorAccess
Aurora connection timeout	Security group	Check VPC endpoint and security group rules
Lambda cold starts	Function size	Enable provisioned concurrency for critical functions
Cognito auth fails	Pool configuration	Verify callback URLs and client settings

Logs

View Lambda logs

```
aws logs tail /aws/lambda/Radiant-dev-router --follow
```

View ECS logs (LiteLLM)

```
aws logs tail /ecs/radiant-dev-litellm --follow
```

Cleanup

To destroy all resources:

```
cd packages/infrastructure
npx cdk destroy --all --context environment=dev --context tier=1
```

Warning: This will delete all data including databases. Export data before destroying.

CI/CD Pipeline

RADIANT includes a GitHub Actions CI/CD pipeline:

Workflow Stages

Stage	Trigger	Actions
Lint	All PRs	ESLint, TypeScript check
Build	All PRs	Build shared, infrastructure, dashboard
Test	All PRs	Unit tests, coverage report
CDK Synth	All PRs	Validate CDK templates
Deploy Dev	Merge to develop	Auto-deploy to dev
Deploy Prod	Merge to main	Deploy with approval

Pre-commit Hooks

Pre-commit hooks run automatically via Husky:

```
# Hooks run on every commit:
- lint-staged (ESLint, Prettier)
- Secret detection
- Version bump enforcement
- Discrete validation
```

To bypass (not recommended):

```
git commit --no-verify -m "message"
```

Manual Deployment from CI

```
# Trigger deployment workflow
gh workflow run deploy.yml -f environment=staging -f tier=2
```

Testing Before Deployment

Always run tests before deploying:

```
# Run all tests
pnpm test
```

```
# Run E2E tests
cd apps/admin-dashboard && pnpm test:e2e
```

```
# Run CDK synthesis (validates templates)
cd packages/infrastructure && npx cdk synth
```

See Testing Guide for comprehensive testing information.

Support

For issues, check: 1. CloudWatch Logs for error details 2. CDK diff to verify expected changes 3. AWS Console for resource status 4. Troubleshooting Guide 5. Error Codes Reference

Part IV: System Guide

Operations and infrastructure documentation for the deployed RADIANT platform

Last Updated: {{BUILD_DATE}} Version: {{RADIANT_VERSION}}

Table of Contents

- 1. System Overview
- 2. Infrastructure Components
- 3. Deployment Architecture
- 4. Service Endpoints
- 5. Database Operations
- 6. Lambda Functions
- 7. AI Provider Integration
- 8. Monitoring & Observability
- 9. Security Configuration
- 10. Backup & Recovery
- 11. Maintenance Procedures
- 12. Troubleshooting

1. System Overview

1.1 Platform Summary

RADIANT is a multi-tenant AWS SaaS platform deployed across multiple AWS services:

Component	AWS Service	Purpose
Compute	Lambda	Serverless API handlers
Database	Aurora PostgreSQL	Primary data store
Cache	ElastiCache Redis	Session & response caching
Storage	S3	File storage, artifacts
Auth	Cognito	User authentication
API	API Gateway	REST & WebSocket APIs
AI	SageMaker, Bedrock	Model hosting
CDN	CloudFront	Static asset delivery
DNS	Route 53	Domain management

1.2 Environment Tiers

Environment	Purpose	Domain
Production	Live customer traffic	api.{{RADIANT_DOMAIN}}
Staging	Pre-release testing	staging-api.{{RADIANT_DOMAIN}}
Development	Development & testing	dev-api.{{RADIANT_DOMAIN}}

1.3 Region Configuration

Region	Role	Services
us-east-1	Primary	All services
us-west-2	DR Failover	Database replica, S3 replication
eu-west-1	EU Data Residency	Optional for GDPR compliance

2. Infrastructure Components

2.1 VPC Architecture

2.2 Security Groups

Security Group	Inbound Rules	Purpose
sg-lambda	None (outbound only)	Lambda functions
sg-aurora	5432 from sg-lambda	Database access
sg-redis	6379 from sg-lambda	Cache access
sg-alb	443 from 0.0.0.0/0	Load balancer

2.3 IAM Roles

Role	Attached Policies	Used By
radiant-lambda-role	AWSLambdaVPCAccess, SecretsManager, S3, SageMaker	Lambda functions
radiant-api-gw-role	CloudWatchLogs, Lambda invoke	API Gateway
radiant-sagemaker-role	SageMakerFullAccess, S3	SageMaker endpoints

3. Deployment Architecture

3.1 CDK Stacks

Stack	Resources	Dependencies
NetworkingStack	VPC, Subnets, NAT	None
SecurityStack	IAM, KMS, Security Groups	Networking
DataStack	Aurora, ElastiCache, S3	Security
AuthStack	Cognito User Pool	Data
ApiStack	API Gateway, Lambda	Auth, Data

Stack	Resources	Dependencies
AiStack	SageMaker, Bedrock config	Api
MonitoringStack	CloudWatch, Alarms	All
AdminStack	Admin Dashboard hosting	Api

3.2 Deployment Commands

Deploy all stacks to development

```
npm run deploy:dev
```

Deploy to staging with approval

```
npm run deploy:staging
```

Deploy to production (requires approval)

```
npm run deploy:prod
```

Deploy specific stack

```
cd packages/infrastructure
```

```
cdk deploy RadiantApiStack --context environment=prod
```

3.3 Environment Variables

Variable	Description	Source
AURORA_CLUSTER_ARN	Database cluster ARN	CDK output
AURORA_SECRET_ARN	Database credentials	Secrets Manager
COGNITO_USER_POOL_ID	Auth pool ID	CDK output
REDIS_URL	Cache connection string	CDK output
S3_BUCKET	Storage bucket name	CDK output

4. Service Endpoints

4.1 API Gateway Endpoints

Endpoint	Method	Description
/v1/chat	POST	Send chat message
/v1/chat/stream	WebSocket	Streaming responses
/v1/models	GET	List available models
/v1/usage	GET	Usage statistics

Endpoint	Method	Description
/admin/v1/*	Various	Admin API

4.2 Health Check Endpoints

Endpoint	Expected Response	Checks
/health	{"status":"healthy"}	Lambda running
/health/db	{"status":"connected"}	Aurora connection
/health/cache	{"status":"connected"}	Redis connection
/health/providers	Provider status array	AI provider APIs

4.3 Internal Endpoints

Service	Endpoint	Port
Aurora PostgreSQL	radiant-cluster.xxx.us-east-1.rds.amazonaws.com	5432
ElastiCache Redis	radiant-cache.xxx.cache.amazonaws.com	6379
SageMaker Runtime	Via AWS SDK	-

5. Database Operations

5.1 Aurora Configuration

Setting	Value
Engine	PostgreSQL 15.4
Instance Type	Serverless v2
Min ACUs	2 (dev), 8 (prod)
Max ACUs	16 (dev), 128 (prod)
Storage	Auto-scaling to 128 TB
Encryption	AES-256 (KMS)

5.2 Connection Management

```
-- Check active connections
SELECT count(*) FROM pg_stat_activity;

-- View connection by application
SELECT application_name, count(*)
FROM pg_stat_activity
GROUP BY application_name;

-- Terminate idle connections
SELECT pg_terminate_backend(pid)
FROM pg_stat_activity
WHERE state = 'idle'
AND query_start < now() - interval '10 minutes';
```

5.3 Row-Level Security

All tenant data is protected by RLS:

```
-- Verify RLS is enabled
SELECT tablename, rowsecurity
FROM pg_tables
WHERE schemaname = 'public' AND rowsecurity = true;

-- Set tenant context (done automatically by Lambda)
SET app.current_tenant_id = 'tenant-uuid';

-- Queries automatically filter by tenant
SELECT * FROM users; -- Only returns current tenant's users
```

5.4 Database Migrations

```
# Run pending migrations
cd packages/infrastructure
npm run migrate:up

# Rollback last migration
npm run migrate:down

# View migration status
npm run migrate:status
```

6. Lambda Functions

6.1 Function Inventory

Function	Memory	Timeout	Trigger
radiant-api	1024 MB	30s	API Gateway
radiant-brain	2048 MB	60s	API Gateway
radiant-webhooks	512 MB	30s	EventBridge
radiant-scheduler	512 MB	300s	EventBridge (cron)
radiant-batch	3008 MB	900s	SQS

6.2 Monitoring Lambda

View recent invocations

```
aws lambda get-function \
  --function-name radiant-api \
  --query 'Configuration.[FunctionName,MemorySize,Timeout,LastModified]'
```

Check concurrent executions

```
aws cloudwatch get-metric-statistics \
  --namespace AWS/Lambda \
  --metric-name ConcurrentExecutions \
  --dimensions Name=FunctionName,Value=radiant-api \
  --start-time $(date -u -d '1 hour ago' +%Y-%m-%dT%H:%M:%SZ) \
  --end-time $(date -u +%Y-%m-%dT%H:%M:%SZ) \
  --period 300 \
  --statistics Maximum
```

6.3 Cold Start Optimization

Strategy	Implementation
Provisioned Concurrency	10 instances for radiant-api
Keep-Warm	CloudWatch scheduled ping every 5 min
Connection Pooling	RDS Proxy for database
Lazy Loading	Defer non-critical imports

7. AI Provider Integration

7.1 External Providers

Provider	Models	Authentication
OpenAI	GPT-4, GPT-3.5	API Key

Provider	Models	Authentication
Anthropic	Claude 3, Claude 2	API Key
Google	Gemini Pro, PaLM 2	Service Account
Cohere	Command, Embed	API Key
Mistral	Mistral Large, Medium	API Key

7.2 Self-Hosted Models (SageMaker)

Model	Instance Type	Thermal Default
LLaMA-2-70B	ml.g5.48xlarge	COLD
Stable Diffusion XL	ml.g5.2xlarge	COLD
Whisper Large	ml.g4dn.xlarge	COLD
CodeLlama-34B	ml.g5.12xlarge	COLD

7.3 Model Thermal States

Check endpoint status

```
aws sagemaker describe-endpoint \
  --endpoint-name radiant-llama-70b
```

Scale endpoint to warm

```
aws sagemaker update-endpoint-weights-and-capacities \
  --endpoint-name radiant-llama-70b \
  --desired-weights-and-capacities '[{"VariantName":"AllTraffic","DesiredInstanceCount":1}]'
```

Scale to zero (cold)

```
aws sagemaker update-endpoint-weights-and-capacities \
  --endpoint-name radiant-llama-70b \
  --desired-weights-and-capacities '[{"VariantName":"AllTraffic","DesiredInstanceCount":0}]'
```

8. Monitoring & Observability

8.1 CloudWatch Dashboards

Dashboard	Metrics
Platform Overview	Request rate, latency, errors
Database Performance	Connections, ACUs, query time
AI Provider Health	Success rate, latency by provider
Billing & Usage	Credits consumed, revenue

Dashboard	Metrics
-----------	---------

8.2 Key Metrics

Metric	Warning	Critical
API Error Rate	> 1%	> 5%
P99 Latency	> 5s	> 15s
Aurora ACU Usage	> 80%	> 95%
Lambda Errors	> 10/min	> 50/min

8.3 Alerting

```
# List configured alarms
aws cloudwatch describe-alarms \
  --alarm-name-prefix radiant

# View alarm state
aws cloudwatch describe-alarm-history \
  --alarm-name radiant-high-error-rate
```

8.4 Log Groups

Log Group	Retention	Content
/aws/lambda/radiant-api	30 days	API request logs
/aws/lambda/radiant-brain	30 days	Model routing logs
/radiant/audit	365 days	Security audit logs
/radiant/billing	2 years	Billing events

9. Security Configuration

9.1 Encryption

Data	Encryption
Database at rest	AES-256 (KMS CMK)
S3 objects	AES-256 (SSE-S3)
Secrets	KMS envelope encryption

Data	Encryption
API traffic	TLS 1.3

9.2 Secrets Management

```
# List RADIANT secrets
aws secretsmanager list-secrets \
  --filters Key=name,Values=radiant

# Rotate database credentials
aws secretsmanager rotate-secret \
  --secret-id radiant/aurora-credentials

# View secret metadata
aws secretsmanager describe-secret \
  --secret-id radiant/openai-api-key
```

9.3 WAF Rules

Rule	Action	Purpose
Rate Limiting	Block	> 1000 req/min per IP
SQL Injection	Block	SQLi pattern detection
XSS	Block	Cross-site scripting
Geo Blocking	Block	Sanctioned countries

10. Backup & Recovery

10.1 Automated Backups

Resource	Frequency	Retention
Aurora Snapshots	Daily	35 days
S3 Objects	Continuous	Versioned
DynamoDB	Point-in-time	35 days
Secrets	Auto-versioned	30 versions

10.2 Recovery Procedures

Database Point-in-Time Recovery:

```
aws rds restore-db-cluster-to-point-in-time \  
  --source-db-cluster-identifier radiant-cluster \  
  --db-cluster-identifier radiant-cluster-restored \  
  --restore-to-time 2024-01-15T10:00:00Z
```

S3 Object Recovery:

```
# List object versions  
aws s3api list-object-versions \  
  --bucket radiant-storage \  
  --prefix tenant/123/  
  
# Restore specific version  
aws s3api copy-object \  
  --bucket radiant-storage \  
  --copy-source radiant-storage/file.txt?versionId=xxx \  
  --key file.txt
```

10.3 Disaster Recovery

RPO	RTO	Strategy
1 hour	4 hours	Cross-region Aurora replica, S3 CRR

11. Maintenance Procedures

11.1 Routine Maintenance

Task	Frequency	Procedure
Security patches	Weekly	Automated via CDK
Log rotation	Daily	Automated
Database vacuum	Weekly	Automated
Certificate renewal	60 days	ACM auto-renewal

11.2 Scaling Operations

```
# Scale Aurora  
aws rds modify-db-cluster \  
  --db-cluster-identifier radiant-cluster \  
  --serverless-v2-scaling-configuration MinCapacity=16,MaxCapacity=64  
  
# Update Lambda memory  
aws lambda update-function-configuration \  
  --function-name radiant-lambda
```

```
--function-name radiant-api \
--memory-size 2048
```

11.3 Deployment Checklist

- ☐ Run tests in staging
 - ☐ Review CloudWatch for anomalies
 - ☐ Announce maintenance window
 - ☐ Deploy with `--require-approval`
 - ☐ Verify health checks
 - ☐ Monitor error rates for 30 min
 - ☐ Update status page
-

12. Troubleshooting

12.1 Common Issues

High Latency:

Check database performance

```
aws cloudwatch get-metric-statistics \
  --namespace AWS/RDS \
  --metric-name DatabaseConnections \
  --dimensions Name=DBClusterIdentifier,Value=radiant-cluster
```

Check Lambda duration

```
aws logs filter-log-events \
  --log-group-name /aws/lambda/radiant-api \
  --filter-pattern "REPORT Duration"
```

Connection Errors:

Verify security group rules

```
aws ec2 describe-security-groups --group-ids sg-xxx
```

Check VPC endpoints

```
aws ec2 describe-vpc-endpoints \
  --filters Name=vpc-id,Values=vpc-xxx
```

12.2 Emergency Procedures

Rollback Deployment:

List recent deployments

```
aws cloudformation list-stacks \
  --stack-status-filter UPDATE_COMPLETE
```

Rollback to previous version

```
cdk deploy --rollback
```

Disable Problematic Feature:

```
# Update feature flag
aws ssm put-parameter \
  --name /radiant/features/new-feature \
  --value "false" \
  --overwrite
```

Part V: System Health & Monitoring

Version: 7.2.0
Last Updated: February 4, 2026
Audience: Platform Administrators, DevOps Engineers

Table of Contents

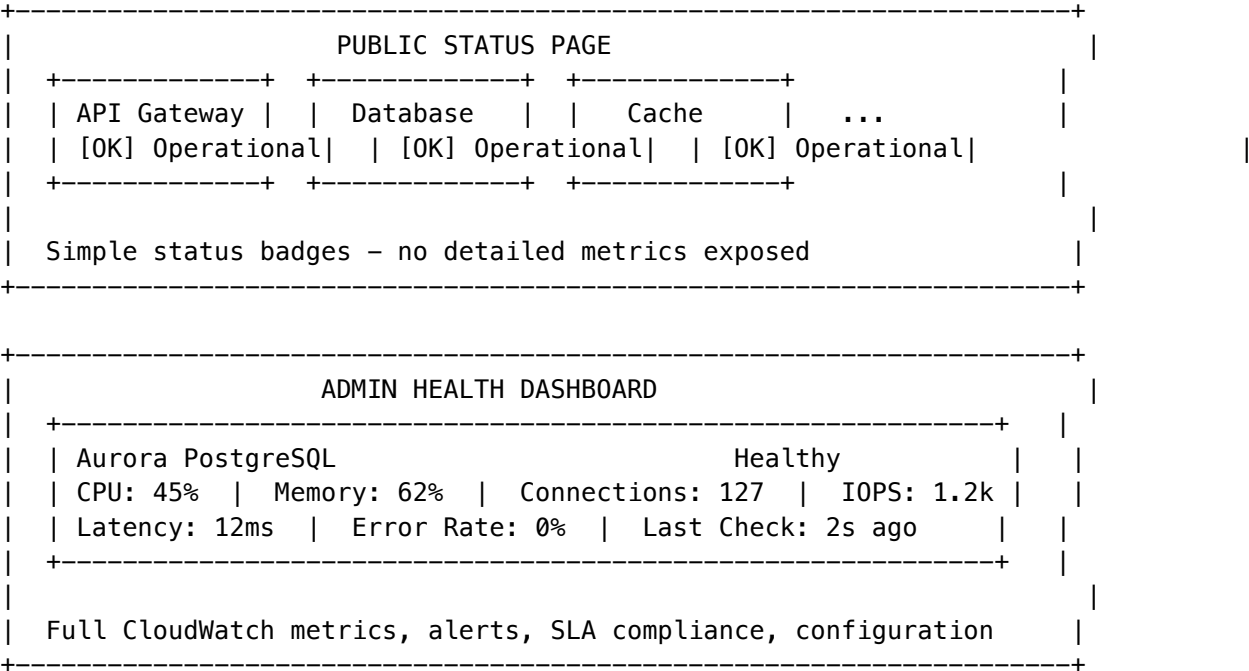

- 1. Overview
- 2. Understanding the Dashboard
- 3. Components Monitored
- 4. Health Status Indicators
- 5. Alerts System
- 6. LiteLLM Gateway Health
- 7. Metrics Reference
- 8. Uptime Tracking
- 9. API Reference
- 10. Troubleshooting
- 11. Configuration
- 12. Best Practices

1. Overview

RADIANT provides a **two-tier health monitoring system**:

Tier	Audience	URL	Detail Level
Public Status Page	End users, customers	https://status.{your-domain}	Badges only
Admin Health Dashboard	Platform administrators	https://{your-domain}/admin/health	Full CloudWatch metrics

Two-Tier Architecture

Purpose

Goal	Description
Public Transparency	Show customers system status without exposing internals
Admin Visibility	Full CloudWatch metrics for troubleshooting
Early Warning	Detect issues before they impact users
Historical Context	Track uptime and incident history
Rapid Response	Enable quick acknowledgment and resolution of alerts

Access

Page	URL	Permissions
Public Status	https://status.{your-domain}	None (public)
Admin Health	https://{your-domain}/admin/health	Admin role required

Multi-Datacenter Support

Both pages provide visibility into all datacenters across three geographic regions:

Region	Datacenters	Primary Region
Americas	us-east-1, us-west-2	us-east-1 (N. Virginia)
Europe	eu-west-1, eu-central-1	eu-west-1 (Ireland)
Asia Pacific	ap-northeast-1, ap-southeast-1, ap-south-1	ap-northeast-1 (Tokyo)

Global Aggregate View

By default, both pages show a **global aggregate status** that combines health from all datacenters: - The aggregate status shows the worst-case status across all regions - Users don’t see which specific datacenter has an issue until they drill down - This provides a simple “is the platform healthy?” answer

Datacenter Drill-Down

Users can click on a specific datacenter to see: - Region-specific component health - Alerts filtered to that datacenter - Uptime metrics for that region - CloudWatch metrics from that region’s AWS resources (admin only)

```
+-----+
|  Region: [Global [ok]] [Americas *] [Europe *] [Asia Pacific *]  |
+-----+
|  Overall Status: [OK] Operational                                |
|                                                                    |
|  Click a region to see datacenter-specific health details        |
+-----+
```

2. Understanding the Dashboard

Overall Status Banner

At the top of the dashboard, you’ll see the overall system status:

Status	Icon	Meaning
Healthy	[OK] Green checkmark	All components operating normally

Status	Icon	Meaning
Degraded	[!] Yellow triangle	One or more components experiencing issues
Unhealthy	[X] Red X	Critical component failure

The overall status is calculated as: - **Unhealthy**: Any component is unhealthy - **Degraded**: Any component is degraded (but none unhealthy) - **Healthy**: All components are healthy

Key Metrics Display

Metric	Description
Services Healthy	Count of healthy vs. total services (e.g., “6/8 services healthy”)
Uptime (30 days)	Percentage availability over the last 30 days
Last Incident	Time since the most recent incident

Service Grid

Each monitored service is displayed as a card showing: - **Service Name**: The component being monitored - **Status Badge**: Current health status - **Latency**: Current response time in milliseconds - **Last Check**: When the health check last ran

Click any service card to open the detailed drill-down view.

3. Components Monitored

Infrastructure Components

Component	Display Name	What It Monitors
litellm_gateway	LiteLLM Gateway	ECS service running the AI model proxy
aurora_postgresql	Aurora PostgreSQL	Primary database cluster
elasticache_redis	ElastiCache Redis	Caching layer for sessions and data
lambda_chat	Lambda Chat	Chat Lambda function performance
api_gateway	API Gateway	REST API endpoints
cognito_user_pool	Cognito User Pool	End-user authentication
cognito_admin_pool	Cognito Admin Pool	Admin authentication
s3_storage	S3 Storage	Object storage buckets
sqs_queues	SQS Queues	Message queue processing

Data Sources

Source	Components	Refresh Rate
CloudWatch	ECS, Lambda, RDS, ElastiCache	60 seconds
ECS API	Running/desired task counts	60 seconds
Database	API Gateway, Cognito, S3, SQS	60 seconds

4. Health Status Indicators

Status Definitions

Status	Color	Criteria
Healthy	Green	All metrics within normal thresholds
Degraded	Yellow	Elevated metrics but service functional
Unhealthy	Red	Service unavailable or critical failure

Threshold Examples

Component	Healthy	Degraded	Unhealthy
LiteLLM Gateway	CPU < 90%, running = desired	CPU >= 90% OR running < desired	0 running tasks
Aurora PostgreSQL	CPU < 85%	CPU >= 85%	Connection failures
ElastiCache Redis	Memory < 85%	Memory >= 85%	Evictions occurring
Lambda Chat	Error rate < 5%	Error rate >= 5%	Error rate >= 20%

5. Alerts System

Alert Severities

Severity	Icon	Response Time	Examples
Critical		Immediate	Service down, database unavailable
Warning		Within 1 hour	High CPU, elevated latency

Severity	Icon	Response Time	Examples
Info		As needed	Scheduled maintenance, capacity changes

Alert Lifecycle

Triggered -> Active -> Acknowledged -> Resolved

- 1. **Triggered**: Alert condition met, notification sent
- 2. **Active**: Alert visible in dashboard, awaiting response
- 3. **Acknowledged**: Admin has seen and is investigating
- 4. **Resolved**: Condition returned to normal or manually resolved

Acknowledging Alerts

- 1. Navigate to **Health -> Alerts** tab
- 2. Find the active alert
- 3. Click **Acknowledge**
- 4. The alert will show who acknowledged it and when

Alert Data Structure

Field	Description
severity	critical, warning, or info
component	Which service triggered the alert
metric	The specific metric that exceeded threshold
message	Human-readable description
currentValue	Actual value that triggered the alert
threshold	The configured threshold value
triggeredAt	When the alert was created
acknowledgedAt	When someone acknowledged it
acknowledgedBy	User ID who acknowledged
resolvedAt	When the alert was resolved

6. LiteLLM Gateway Health

The LiteLLM Gateway is a critical component that routes AI model requests. It has its own dedicated health section.

Gateway Status View

Metric	Description
Running Tasks	Number of ECS tasks currently running
Desired Tasks	Target task count for auto-scaling
Healthy Targets	Tasks passing health checks
Unhealthy Targets	Tasks failing health checks
CPU Utilization	Average CPU across all tasks
Memory Utilization	Average memory across all tasks
Requests/Second	Current request throughput
Latency P50/P99	50th and 99th percentile response times
Error Rate	Percentage of failed requests

AI Provider Status

Each AI provider connected through LiteLLM is monitored:

Provider	Models	Metrics Tracked
OpenAI	gpt-4o, gpt-4o-mini	Latency, error rate, availability
Anthropic	claude-3-5-sonnet, claude-3-opus	Latency, error rate, availability
Google	gemini-2.0-flash, gemini-1.5-pro	Latency, error rate, availability

Gateway Configuration

Administrators can view and modify gateway settings:

Setting	Default	Description
Min Tasks	2	Minimum ECS tasks
Max Tasks	50	Maximum ECS tasks
Target CPU	70%	Scale-out CPU threshold
Target Memory	80%	Scale-out memory threshold
Requests/Target	1000	Requests before scaling
Scale-Out Cooldown	60s	Wait between scale-out events
Scale-In Cooldown	300s	Wait between scale-in events
Health Check Path	/health	ECS health check endpoint
Health Check Interval	30s	Time between checks
Global Rate Limit	10,000/s	Platform-wide request limit
Per-Tenant Rate Limit	1,000/min	Per-organization limit
Response Caching	Enabled	Cache identical requests

Setting	Default	Description
Cache TTL	3600s	Cache expiration
Max Retries	3	Failed request retry count
Request Timeout	600s	Maximum request duration

7. Metrics Reference

ECS Metrics (LiteLLM Gateway)

Metric	Source	Unit	Good	Concerning
CPU Utilization	CloudWatch	%	< 70	> 90
Memory Utilization	CloudWatch	%	< 70	> 85
Running Tasks	ECS API	count	= desired	< desired

Aurora PostgreSQL Metrics

Metric	Source	Unit	Good	Concerning
CPU Utilization	CloudWatch	%	< 60	> 85
Database Connections	CloudWatch	count	< 80% max	> 90% max
Read IOPS	CloudWatch	ops/s	Stable	Spiking

ElastiCache Redis Metrics

Metric	Source	Unit	Good	Concerning
CPU Utilization	CloudWatch	%	< 60	> 80
Memory Used	CloudWatch	%	< 70	> 85
Cache Hit Rate	CloudWatch	%	> 95	< 80

Lambda Metrics

Metric	Source	Unit	Good	Concerning
Invocations	CloudWatch	count	Stable	-50% drop
Errors	CloudWatch	count	0	Any

Metric	Source	Unit	Good	Concerning
Concurrent Executions	CloudWatch	count	< 80% limit	> 90% limit
Error Rate	Calculated	%	< 1%	> 5%

8. Uptime Tracking

Uptime Periods

Period	Description
24 Hours	Rolling 24-hour availability
7 Days	Rolling 7-day availability
30 Days	Rolling 30-day availability

SLA Targets

Tier	Target	Max Downtime/Month
SEED	99.5%	~3.6 hours
STARTER	99.9%	~43 minutes
GROWTH	99.95%	~22 minutes
SCALE	99.99%	~4.3 minutes
ENTERPRISE	99.99%	~4.3 minutes

How Uptime Is Calculated

Uptime is calculated from CloudWatch alarm history. A service is considered “up” when: 1. Health checks are passing 2. Error rate is below threshold 3. Response latency is acceptable

9. API Reference

Endpoints

Method	Endpoint	Description
GET	/api/admin/system/health	Full health dashboard

Method	Endpoint	Description
GET	/api/admin/system/health/components	Component health list
GET	/api/admin/system/health/alerts	Active alerts
POST	/api/admin/system/health/alerts/{id}/acknowledge	Acknowledge alert
GET	/api/admin/system/gateway	LiteLLM Gateway status
GET	/api/admin/system/gateway/config	Gateway configuration
PUT	/api/admin/system/gateway/config	Update gateway config

Response: Health Dashboard

```
{
  "generatedAt": "2026-02-04T14:30:00Z",
  "overallStatus": "healthy",
  "components": [...],
  "activeAlerts": [...],
  "recentIncidents": [...],
  "uptimePercent24h": 100,
  "uptimePercent7d": 99.98,
  "uptimePercent30d": 99.95
}
```

Response: Component Health

```
{
  "component": "litellm_gateway",
  "displayName": "LiteLLM Gateway",
  "status": "healthy",
  "currentCapacity": 4,
  "maxCapacity": 50,
  "utilizationPercent": 45,
  "latencyMs": 45,
  "errorRate": 0.001,
  "lastChecked": "2026-02-04T14:30:00Z",
  "metrics": [
    { "name": "CPU Utilization", "value": 45, "unit": "%", "trend": "stable" },
    { "name": "Memory Utilization", "value": 62, "unit": "%", "trend": "stable" },
    { "name": "Running Tasks", "value": 4, "unit": "", "trend": "stable" }
  ]
}
```

10. Troubleshooting

Component Shows “Degraded”

- 1. **Check the specific metrics** - Click the component card for details

- 2. **Review recent alerts** - Look for threshold violations
- 3. **Check CloudWatch** - View raw metrics in AWS Console
- 4. **Scale if needed** - Increase capacity via gateway config

Component Shows “Unhealthy”

- 1. **Check ECS/Lambda logs** - Look for errors in CloudWatch Logs
- 2. **Verify dependencies** - Database, cache, external APIs
- 3. **Check AWS service health** - <https://status.aws.amazon.com>
- 4. **Review recent deployments** - Rollback if necessary

High Latency

Component	Common Causes	Solutions
LiteLLM	AI provider slow	Check provider status, enable fallback
Database	Complex queries	Review slow query log, add indexes
Redis	Memory pressure	Increase node size, review TTLs
Lambda	Cold starts	Increase provisioned concurrency

Alerts Not Appearing

- 1. Verify alert thresholds are configured in database
- 2. Check system_alerts table for recent entries
- 3. Review Lambda logs for errors in alert processing
- 4. Ensure CloudWatch alarms are properly configured

11. Configuration

Environment Variables

Variable	Description	Default
ECS_CLUSTER_NAME	ECS cluster to monitor	radiant-prod-litellm
ECS_SERVICE_NAME	ECS service name	radiant-prod-litellm
DB_CLUSTER_ID	Aurora cluster identifier	radiant-prod-aurora
REDIS_CLUSTER_ID	ElastiCache cluster ID	radiant-prod-redis

Database Tables

Table	Purpose
system_component_health	Stores component status for non-CloudWatch sources
system_alerts	Active and historical alerts
litellm_gateway_config	Gateway configuration settings
configuration_audit_log	Tracks config changes

Auto-Refresh

The health dashboard automatically refreshes every **30 seconds**. You can also click the **Refresh** button for an immediate update.

12. Best Practices

Monitoring

1. **Check daily** - Review dashboard each morning
2. **Set up notifications** - Configure Slack/email for critical alerts
3. **Establish baselines** - Know what “normal” looks like for your deployment
4. **Review trends** - Look for gradual degradation, not just failures

Alert Management

1. **Acknowledge promptly** - Shows the team someone is investigating
2. **Don't ignore warnings** - They often precede critical issues
3. **Document resolutions** - Record what fixed each alert type
4. **Tune thresholds** - Adjust to reduce noise while catching issues

Capacity Planning

1. **Monitor utilization trends** - Scale before hitting limits
2. **Review during business hours** - Peak usage varies
3. **Plan for growth** - Budget for increased AI usage
4. **Test failover** - Verify redundancy works

Incident Response

1. **Prioritize by impact** - Focus on user-facing issues first
 2. **Communicate status** - Update public status page if needed
 3. **Root cause analysis** - Understand why incidents happen
 4. **Improve monitoring** - Add checks for new failure modes
-

Document Information

Part VI: SaaS Metrics

Version: 4.18.3
Last Updated: 2024-12-28

Overview

The SaaS Metrics Dashboard provides comprehensive visibility into key business metrics including revenue, costs, customer health, and model profitability. It integrates data from the Revenue Analytics system and Cost Analytics to present a unified view of business performance.

Admin Dashboard Location

Path: Admin Dashboard -> SaaS Metrics
URL: /saas-metrics

Key Metrics

Revenue Metrics

Metric	Description	Formula
MRR	Monthly Recurring Revenue	Sum of all monthly subscription fees
ARR	Annual Recurring Revenue	MRR x 12
Total Revenue	All revenue in period	Subscriptions + Credits + AI Markup + Storage

Metric	Description	Formula
ARPU	Average Revenue Per User	Total Revenue / Active Customers
LTV	Lifetime Value	ARPU x Average Customer Lifespan

Cost Metrics

Metric	Description	Source
Total COGS	Cost of Goods Sold	AWS + External AI + Platform Fees
Gross Profit	Revenue - COGS	Calculated
Gross Margin	(Gross Profit / Revenue) x 100	Percentage
CAC	Customer Acquisition Cost	Marketing + Sales / New Customers

Customer Metrics

Metric	Description
Total Customers	Active paying tenants
New Customers	Customers acquired in period
Churned Customers	Customers lost in period
Churn Rate	(Churned / Total) x 100
Net Revenue Retention	(Starting MRR + Expansion - Churn) / Starting MRR

Unit Economics

Metric	Healthy Range	Description
LTV:CAC Ratio	> 3:1	Lifetime value vs acquisition cost
Payback Period	< 12 months	Time to recover CAC
Gross Margin	> 50%	COGS efficiency

Dashboard Tabs

Overview Tab

- Revenue, Cost & Profit trend chart (daily)
- Revenue by Source pie chart
- Revenue by Tier bar chart
- Cost breakdown with progress bars
- Top 5 tenants by revenue table

Revenue Tab

- MRR movement chart (New, Expansion, Churned)
- Revenue by Product breakdown
- ARPU and LTV metrics
- Revenue growth trends

Costs Tab

- Cost distribution pie chart
- Cost breakdown table by category
- Gross margin trends
- CAC metrics

Customers Tab

- Customer growth trend chart
- New vs Churned visualization
- Usage metrics (requests, active users)
- Churn rate tracking

Models Tab

- Model performance table (requests, revenue, cost, profit, margin)
- Model revenue vs cost horizontal bar chart
- Self-hosted vs External identification

Charts & Visualizations

Chart Types Used

Chart	Purpose
Area Chart	Revenue and cost trends over time
Composed Chart	Multi-metric comparisons
Bar Chart	Revenue by tier, model comparisons
Pie Chart	Revenue/cost distribution
Line Chart	Usage trends

Chart	Purpose
-------	---------

Color Palette

```
const CHART_COLORS = {
  primary: '#3b82f6',    // Blue - Revenue
  secondary: '#8b5cf6',  // Purple - Secondary metrics
  success: '#22c55e',    // Green - Profit, positive
  warning: '#f59e0b',    // Amber - Warnings
  danger: '#ef4444',     // Red - Costs, negative
  info: '#06b6d4',      // Cyan - Info
};
```

Export Functionality

Available Formats

Format	Extension	Use Case
Excel (CSV)	.csv	Spreadsheet analysis, Excel/Google Sheets
JSON	.json	Custom integrations, data processing

Export Contents

- The export includes all metrics organized in sections:
- 1. **Report Header:** Period, generation timestamp
 - 2. **Revenue Summary:** MRR, ARR, Total Revenue, Gross Profit, Margin
 - 3. **Cost Breakdown:** By category with amounts and percentages
 - 4. **Customer Metrics:** Totals, new, churned, churn rate
 - 5. **Unit Economics:** ARPU, LTV, CAC, LTV:CAC ratio
 - 6. **Revenue by Source:** Subscriptions, Credits, AI Markup, etc.
 - 7. **Revenue by Tier:** Enterprise, Business, Pro, Starter
 - 8. **Top Tenants:** Name, revenue, users, requests, tier
 - 9. **Model Performance:** Per-model revenue, cost, profit, margin
 - 10. **Daily Revenue Trend:** Date, revenue, cost, profit

Export Example (CSV)

RADIANT SaaS Metrics Report
Period: 30d
Generated: 2024-12-28T22:57:00Z

=== REVENUE SUMMARY ===
Metric,Value,Growth

MRR, \$89500.00, 12.5%
ARR, \$1074000.00, 15.2%
Total Revenue, \$89500.00, 18.3%
Gross Profit, \$47500.00,
Gross Margin, 53.1%,

=== COST BREAKDOWN ===
Category, Amount, Percentage
External AI Providers, \$18500.00, 44.0%
AWS Compute, \$12800.00, 30.5%
...

=== MODEL PERFORMANCE ===
Model, Requests, Revenue, Cost, Profit, Margin
GPT-4o, 425000, \$12750.00, \$8500.00, \$4250.00, 33.3%
Claude 3.5 Sonnet, 312000, \$9360.00, \$6240.00, \$3120.00, 33.3%

Period Selection

Period	Description	Data Points
7d	Last 7 days	Daily granularity
30d	Last 30 days	Daily granularity
90d	Last 90 days	Daily granularity
12m	Last 12 months	Monthly granularity

API Integration

Data Sources

The SaaS Metrics dashboard aggregates data from:

- 1. **Revenue Analytics** (/api/admin/revenue/dashboard)
 - Revenue entries
 - Daily aggregates
 - Revenue by source
- 2. **Cost Analytics** (/api/admin/cost/summary)
 - Cost entries
 - AWS costs
 - External AI costs
- 3. **Billing System** (/api/admin/billing)
 - Subscriptions
 - Credit transactions
 - Tier information

4. **Analytics** (/api/admin/analytics)

- Usage metrics
- Model performance
- Request counts

API Endpoint

GET /api/admin/saas-metrics?period={7d|30d|90d|12m}

Response:

```
{
  "mrr": 89500,
  "mrrGrowth": 12.5,

Part VII: Seed Data & Configuration

Technical Documentation

Version: 4.18.1 | Last Updated: December 2024

Overview

The RADIANT Seed Data System manages versioned AI provider and model configurations that are used to populate the AI Registry during fresh installations. Seed data is stored separately from packages, can be versioned independently, and is selectable when building deployment packages.

Architecture

```
+-----+
|                                     |
|                               SEED DATA ARCHITECTURE                               |
|                                     |
+-----+
|                                     |
| config/seeds/                      |
| +-- registry.json                  # Index of all seed versions                    |
| +-- v1/                            # Seed data version 1.0.0                      |
| | +-- manifest.json                # Version metadata and stats                    |
| | +-- providers.json               # 21 external providers                        |
| | +-- external-models.json         # 50+ external models                          |
| | +-- self-hosted-models.json      # 38 self-hosted models                       |
| | +-- services.json                # 5 orchestration services                     |
| +-- v2/                            # Future seed versions...                      |
|                                     |
| Build Time:                        |
| +-----+                          |
| | build-package.sh |--* Select seed version --* Include in package                |
| | --seed-version 1 |                |
| +-----+                          |
|                                     |
| Deploy Time (INSTALL only):        |
| +-----+                          |
| | DeploymentService|--* Read seeds from package --* INSERT to database            |
| | .executeInstall() |                |
| +-----+                          |
|                                     |
+-----+
```

Critical Rules

Rule 1: NO HARDCODING IN DEPLOYER APP

The Swift Deployer app **MUST NOT** contain hardcoded lists of providers or models:

```
// [X] WRONG – Never do this
let providers = ["openai", "anthropic", "google", ...]

// [OK] CORRECT – Fetch from Radiant API after deployment
let providers = try await radiantAPI.fetchProviders()
```

Rule 2: INSTALLER SEEDS, UPDATER PRESERVES

Mode	Seed Behavior
INSTALL	Seeds database with complete provider/model list
UPDATE	NEVER touches AI Registry - preserves admin customizations
ROLLBACK	Restores from snapshot - does not re-seed

Rule 3: ADMIN CONTROLS ALL

Everything in seed data is **editable by the administrator** post-deployment: - Enable/disable providers and models
- Change pricing markup - Add new providers/models - Delete providers/models

Seed Data Structure

manifest.json

```
{
  "version": "1.0.0",
  "name": "RADIANT AI Registry Seed Data",
  "description": "Complete provider and model seed data for fresh installations",

    "selfHostedMarkup": 1.75
  }
}

```

providers.json

Each provider includes:

Field	Description
id	Unique identifier
name	Internal name
displayName	Human-readable name
category	Provider category (text_generation, image_generation, etc.)
apiBaseUrl	API endpoint
authType	Authentication type (bearer, api_key, iam)
secretName	AWS Secrets Manager path for API key
features	Supported features (streaming, vision, etc.)
compliance	Compliance certifications (SOC2, GDPR, HIPAA)
rateLimit	Rate limiting configuration

external-models.json

Each model includes:

Field	Description
id	Unique model identifier
providerId	Reference to provider
modelId	Provider's model ID
litellmId	LiteLLM routing ID
category	Model category
capabilities	Model capabilities
contextWindow	Max input tokens
maxOutput	Max output tokens
pricing	Cost per 1K tokens + markup
minTier	Minimum tier required

self-hosted-models.json

Each self-hosted model includes:

Field	Description
id	Unique model identifier
instanceType	SageMaker instance type
thermal	Thermal management config (COLD/WARM/HOT)
license	Open-source license
pricing	Hourly rate + per-unit pricing
minTier	Minimum tier required (typically 3+)

Building Packages with Seed Data

List Available Seed Versions

```
./tools/scripts/build-package.sh --list-seeds
```

Output:

```
[PKG] Available Seed Data Versions:
      v1.0.0 – 21 providers, 50 external models, 38 self-hosted models
```

Build with Specific Seed Version

```
# Use default (latest) seed version
```

```
./tools/scripts/build-package.sh
```

```
# Use specific seed version
```

```
./tools/scripts/build-package.sh --seed-version 1
```

Package Manifest with Seed Data

The generated package manifest includes seed data information:

```
{
  "schemaVersion": "2.1",
  "package": {
    "version": "4.18.1"
  },
  "seedData": {
    "version": "1.0.0",
    "hash": "abc123...",
    "externalProviders": 21,
    "externalModels": 50,
    "selfHostedModels": 38,
    "services": 5
  },
  "installBehavior": {
    "seedAIRegistry": true
  }
}
```

```
  },  
  "updateBehavior": {  
    "seedAIRegistry": false  
  }  
}
```

Seed Data Categories

External Providers (21)

Category	Providers
Text Generation	OpenAI, Anthropic, Google, xAI, DeepSeek, Mistral, Cohere
Image Generation	OpenAI Images, Stability AI, FLUX
Video Generation	Runway, Luma AI
Audio	ElevenLabs, OpenAI Audio
Embeddings	OpenAI Embeddings, Voyage AI
Search	Perplexity
3D Generation	Meshy
Self-Hosted	SageMaker (internal)

External Models (50+)

Category	Example Models
Text	GPT-4o, Claude Sonnet 4, Gemini 2.0, Grok 3, DeepSeek R1
Reasoning	O1, O3 Mini, DeepSeek Reasoner
Code	Codestral
Image	DALL-E 3, Stable Diffusion 3, FLUX Pro
Video	Gen-3 Alpha, Ray 2
Audio	Whisper, TTS-1, Multilingual V2

Self-Hosted Models (38)

Category	Models
Vision Classification	EfficientNet, Swin Transformer, CLIP
Object Detection	YOLOv8 (Nano/Small/Medium/XLarge), Grounding DINO

Category	Models
Segmentation	SAM, SAM 2, MobileSAM
Speech	Whisper Large V3, Parakeet TDT
Scientific	AlphaFold 2, ESM-2
Medical	nnU-Net, MedSAM
Geospatial	Prithvi 100M/600M
3D	Nerfstudio
LLM	Mistral 7B, Llama 3 70B

Pricing Structure

External Providers

Default markup: **40% (1.40x)**

Example: GPT-4o - Provider cost: \$0.0025/1K input, \$0.01/1K output - Tenant cost: \$0.0035/1K input, \$0.014/1K output

Self-Hosted Models

Default markup: **75% (1.75x)**

Example: YOLOv8 Medium - Infrastructure cost: ~\$2.47/hour + \$0.005/image - Tenant cost: ~\$4.32/hour + \$0.00875/image

Creating New Seed Versions

1. Create Version Directory

```
mkdir config/seeds/v2
```

2. Create Required Files

- `manifest.json` - Version metadata
- `providers.json` - Provider definitions
- `external-models.json` - External model definitions
- `self-hosted-models.json` - Self-hosted model definitions
- `services.json` - Service definitions

3. Update Registry

Add new version to `config/seeds/registry.json`:

```
{
  "versions": [
    {
      "version": "2.0.0",
      "directory": "v2",
      "releaseDate": "2025-01-15",
      "status": "stable",
      "changeLog": "Added new providers and models..."
    },
    // ... existing versions
  ]
}
```

4. Test Build

```
./tools/scripts/build-package.sh --seed-version 2
```

Database Seeding

During fresh installation, the DeploymentService generates SQL migrations from seed data:

```
-- Only runs if providers table is empty
DO $$
BEGIN
  IF NOT EXISTS (SELECT 1 FROM providers LIMIT 1) THEN
    -- Insert providers
    INSERT INTO providers (...) VALUES (...);

    -- Insert external models
    INSERT INTO models (...) VALUES (...);

    -- Insert self-hosted models
    INSERT INTO self_hosted_models (...) VALUES (...);
  END IF;
END $$;
```

Key behaviors: - Uses ON CONFLICT DO NOTHING to preserve admin changes - Only runs on fresh install (empty database) - Logs completion with model counts

Swift Service API

SeedDataService

```
actor SeedDataService {
  /// List available seed versions
  func listAvailableSeedVersions() async throws -> [SeedDataInfo]
```

```
/// Load complete seed data for a version
func loadSeedData(version: String) async throws -> SeedData

/// Generate SQL migration from seed data
func generateSeedMigration(seedData: SeedData) -> String
}
```

Usage in DeploymentService

```
func executeInstall(...) async throws -> DeploymentExecutionResult {
    // Load seed data from package
    let seedData = try await seedDataService.loadSeedData(
        version: package.manifest.seedData?.version ?? "1.0.0"
    )

    // Generate and run seed migration
    let seedSQL = seedDataService.generateSeedMigration(seedData: seedData)
    try await runMigration(sql: seedSQL)
}
```

Part VIII: OMEGA Firmware Administration (v6.4.0)

Version: 6.4.0 | **Date:** February 8, 2026 | **Audience:** Platform Administrators

Overview

OMEGA Firmware Administration allows platform administrators to manage the behavior, safety rules, and cognitive parameters of OMEGA AI brains in real-time through the OMEGA Forge interface. All firmware operations are cryptographically signed, auditable, and support automatic rollback.

Accessing Firmware Management

Navigate to **OMEGA -> Firmware** in the admin sidebar, or directly visit `/omega/firmware`.

Required permissions: `omega:firmware:read` for viewing, `omega:firmware:write` for authoring/activating, `omega:firmware:sign` for KMS signing.

Firmware Lifecycle

Status	Description	Next Action
Draft	Being authored in OMEGA Forge editor	Validate -> Sign
Signed	Cryptographically signed via KMS	Activate
Active	Currently loaded on the target brain	(Running)
Superseded	Replaced by newer firmware	Rollback (if needed)
Revoked	Manually revoked by admin	Cannot reactivate

Creating New Firmware

1. Open **OMEGA Forge -> Firmware Library**
2. Click **“New Firmware”** or clone an existing profile
3. Configure sections:
 - **Helix Rules** – Safety guardrails (forbidden behaviors). Each rule defines a forbidden vector signature, severity (CRITICAL/HIGH/MEDIUM/LOW), and interference mode (DESTRUCTIVE or DAMPENING)
 - **Ambition Settings** – Learning speed (plasticity rate 0-0.1), entropy threshold (0-1), dopamine decay rate (0.9-1.0), boredom trigger behavior
 - **Quantum Parameters** – Hilbert dimension (256-4096), unitarity mode (STRICT/RELAXED), decoherence rate. **Note:** Changing Hilbert dimension or unitarity mode requires RESET swap mode
 - **Personality** – Broca Interface system prompt, tone (formal/casual/technical), domain focus areas
4. Click **“Validate”** – all checks must pass (green checkmarks)
5. Click **“Sign”** – authenticates with your admin credentials and signs via AWS KMS

Deploying Firmware (Swap Modes)

After signing, click **“Activate”** and select a swap mode:

Mode	When to Use	Impact
OVERLAY	Adding/updating safety rules, tuning parameters	Zero downtime, brain state preserved
RESET	Changing Hilbert dimension or unitarity mode	~30s queued, brain state reinitialized
SHADOW	Testing new firmware against live traffic	Zero downtime, parallel brain copy
EMERGENCY	Safety incident or suspected Helix bypass	Immediate platform defaults

Production deployments require:

- Two-person approval (signer != activator)
- Re-authentication at activation (FDA 21 CFR Part 11)
- Pre-flight validation pass

Monitoring Active Firmware

The **OMEGA Dashboard** (/omega/firmware) displays:

- **Brain Status** – Active firmware hash, version, activation time

- **Swap Timeline** – Real-time visualization of swap progress
- **Helix Activity** – Rule activation counts, blocked vectors, severity breakdown
- **Ambition Metrics** – Entropy level, dopamine level, learning rate, dream cycle triggers
- **Coherence Score** – Shadow mode alignment metric (target: >90% over 7 days)

Rollback

Manual rollback: Firmware Library -> click superseded firmware -> “Rollback to This Version”

API rollback:

```
curl -X POST https://api.radiant.example/api/v2/firmware/{firmware-id}/rollback \
-H "Authorization: Bearer $ADMIN_TOKEN"
```

Automatic rollback triggers:

- Helix self-test failure during swap
- Post-swap error rate > 10% within 5 minutes
- Post-swap latency increase > 50%

Emergency Lockdown

Any admin can trigger emergency lockdown from the dashboard or via API:

```
curl -X POST https://api.radiant.example/api/v2/firmware/emergency \
-H "Authorization: Bearer $ADMIN_TOKEN" \
-H "Content-Type: application/json" \
-d '{"brain_id": "uuid-here", "reason": "Suspected Helix bypass"}'
```

This immediately loads **platform default firmware** (maximum safety, minimal capabilities). Post-incident review required within 24 hours.

Audit Trail

All firmware operations are logged in pki_audit_log and omega_firmware_swap_log:

Event	Logged Data
Firmware created	Author, timestamp, content hash
Firmware signed	Signer key ID, signature algorithm, timestamp
Firmware activated	Activator (must differ from signer in prod), swap mode, target brain
Swap completed	Duration, from/to firmware IDs, status
Rollback triggered	Trigger reason (manual/auto), rollback snapshot key
Emergency lockdown	Admin, reason, affected brain(s)

Cartridge Management (.RADz)

Cartridges are portable AI intelligence packages that bundle firmware + trained models:

Action	Path
Import cartridge	OMEGA -> Cartridges -> Import
Validate signature	Automatic on import (KMS verification)
Install to brain	Select target brain -> “Install”
Update cartridge	Hot-swap via OVERLAY (zero downtime)

API Endpoints

Method	Endpoint	Purpose
POST	/api/v2/firmware/upload	Upload and validate .bio file
POST	/api/v2/firmware/{id}/sign	Sign via KMS
POST	/api/v2/firmware/{id}/activate	Trigger hot-swap
POST	/api/v2/firmware/{id}/rollback	Revert to previous firmware
GET	/api/v2/firmware/{id}/preflight	Validate all prerequisites
POST	/api/v2/firmware/emergency	Immediate safety lockdown
GET	/api/v2/omega/status	Brain status including firmware hash

1. Overview

The RADIANT Swift Deployer is a native macOS application for deploying and managing RADIANT AI platform infrastructure on AWS. **Version 7.0.0** introduces a dramatically simplified interface focused on deployment automation.

Philosophy

“**One Click to Production**” - Everything should be automated. The Deployer handles infrastructure; configuration lives in the Admin Dashboard.

What the Deployer Does

Category	Capability
Deploy	One-click deployment to dev/staging/prod
Credentials	AWS key management with automatic rotation
Instances	Start, stop, or wipe entire environments
Migrate	Promote versions through environments
Monitor	Detect infrastructure drift from manual changes
Backup	Snapshot and restore capabilities

What Moved to Admin Dashboard

AI providers, models, user management, domain configuration, and all business settings are now managed via the web-based Admin Dashboard after deployment.

Architecture

2. What’s New in v7.0.0

Simplified Navigation

Before (v6.x): 22 tabs across 7 sidebar sections

After (v7.0.0): 10 tabs in a single flat list

Change	Impact
-12 views removed	Configuration moved to Admin Dashboard
+Credentials tab	AWS key management with rotation
+Instance Management	Start/stop/wipe environments
+Drift Monitor	AI-powered drift detection
+Migration Pipeline	Visual dev->staging->prod promotion

New Features

Feature	Description
AutoSetup	Fully automated AWS configuration (Route53, ACM, SES, etc.)
Credentials Management	Master key + environment keys with version history
Instance Lifecycle	Start/stop/nuclear wipe per environment
Drift Detection	Detect when manual AWS changes cause drift
Shadow Deployments	Canary releases with traffic splitting

Removed from Deployer

These features are now **Admin Dashboard only**: - AI Provider configuration - Model settings - Self-hosted model management - Domain URL configuration - Multi-region setup - Curator configuration - A/B Testing setup

2.1 What’s New in v7.4.0

Complete API Implementation

The following features now have full AWS API integration:

Feature	Status	Description
AWS Snapshots	[OK] Complete	Full RDS, DynamoDB, and Secrets backup/restore
Domain Validation	[OK] Complete	DNS, SSL, CloudFront validation service
CDK Context	[OK] Complete	All feature flags passed to infrastructure

New Navigation Tabs

Tab	Icon	Purpose
Domain URLs	GLOBAL	Configure custom domains and routing
Curator	[DOCS]	Knowledge graph curation settings
Cortex Memory	[BRAIN]	Three-tier memory system configuration

New Settings Views

Cortex Memory Settings

Configure the three-tier memory system:

Tier	Settings
Working Memory	Enable, capacity (5-50 items), TTL (1-60 min)
Episodic Memory	Enable, retention (7-365 days), max episodes
Semantic Memory	Enable, consolidation schedule, quality threshold

Additional options: - Memory compression (0.3-0.9 ratio) - Auto-forget threshold - Cross-conversation memory - Privacy mode

Curator Settings

Configure knowledge graph curation:

Category	Settings
Knowledge Graph	Entity extraction, relationship inference, graph density
Document Processing	Chunk size, overlap, embedding model, auto-summarize
Quality Control	Deduplication, similarity threshold, fact verification
Retrieval	Hybrid search, semantic/keyword weights, re-ranking

DomainValidationService

New service for comprehensive domain validation:

```
// DNS validation
let dnsResult = await domainValidationService.validateDNS(domain: "api.example.com")

// SSL certificate check
let sslResult = await domainValidationService.checkSSLCertificate(arn: certArn)

// CloudFront validation
let cfResult = await domainValidationService.validateCloudFrontDistribution(id: distributionId)

// Complete domain setup validation
let fullResult = await domainValidationService.validateDomainSetup(
    domain: "example.com",
    certificateArn: certArn,
    distributionId: cfId
)
```

CDK Context Parameters

All feature flags are now properly passed to CDK:

```
enableCurator, enableCortexMemory, enableTimeMachine
enableCollaboration, enableComplianceExport, enableEgoSystem
baseDomain, useSubdomains, sslCertificateArn, appPaths
```

3. System Requirements

Minimum Requirements

Component	Requirement
macOS	13.0 (Ventura) or later
Processor	Apple Silicon (M1/M2/M3) or Intel
Memory	8 GB RAM
Storage	2 GB available space
Network	Stable internet connection

Required Software

Software	Purpose	Installation
AWS CLI v2	AWS operations	<code>brew install awscli</code>
Node.js 20+	CDK runtime	<code>brew install node@20</code>
AWS CDK	Infrastructure deployment	<code>npm install -g aws-cdk</code>

Optional Software

Software	Purpose	When Needed
1Password	Alternative credential storage	If not using built-in
Docker	Local testing	Development only

AWS Account Requirements

- AWS account with administrator access
- IAM user with deployment permissions (or use master key to create)
- Sufficient service quotas for:
 - Aurora PostgreSQL clusters
 - Lambda functions (100+)
 - S3 buckets
 - CloudFront distributions

4. Installation

Download

1. Download `Radiant Deployer.app` from the releases page

2. Move to /Applications folder
3. Right-click -> **Open** (first launch only, to bypass Gatekeeper)

First Launch Security

On first launch, macOS may show a security warning:

1. Click **Cancel** on the warning dialog
2. Open **System Settings** -> **Privacy & Security**
3. Scroll down and click **Open Anyway**
4. Click **Open** in the confirmation dialog

Verify Installation

After launching, verify the version in the title bar:

RADIANT Deployer v7.0.0

5. First Launch & Setup

Step 1: Add Master AWS Key

The first thing you'll see is the **Credentials** tab prompting for your master AWS key.

1. Click **Add Master Key**
2. Enter your AWS Access Key ID
3. Enter your AWS Secret Access Key
4. Select your default region (e.g., us-east-1)
5. Click **Save & Validate**

The master key is: - Stored **locally** in encrypted storage (never uploaded) - Protected by macOS Keychain - Used to create environment-specific keys

Step 2: AutoSetup (Recommended)

Click **Run AutoSetup** to automatically configure:

Service	What's Automated
Route53	Hosted zone creation
ACM	SSL certificate request + DNS validation
SES	Domain verification, DKIM setup
S3	Required buckets (artifacts, uploads, backups)
Secrets Manager	Secret creation structure
IAM	Environment-specific deployer users

You only need to provide: - AWS credentials (master key) - Domain name - AI provider API keys (OpenAI, Anthropic, etc.)

Step 3: First Deployment

- 1. Go to **Deploy** tab
- 2. Select **Development** environment
- 3. Choose your tier (SEED for dev)
- 4. Click **Deploy**

The deployer will create all infrastructure automatically.

6. Navigation Structure

10-Tab Layout

Tab Reference

Tab	Icon	Purpose
Dashboard	[CHART]	Overview of all environments
Deploy	[LAUNCH]	One-click deployment wizard
Credentials	[KEY]	AWS key management
Instances	[SCREEN]	Start/stop/wipe environments
Packages	[PKG]	Version management
Migrations		dev->staging->prod promotion
Snapshots		Backup and restore
History		Deployment logs
Drift Monitor	[!]	Infrastructure drift detection
Settings	[GEAR]	Preferences

7. Dashboard

The Dashboard provides an at-a-glance view of all three environments.

Environment Cards

Each environment (dev, staging, prod) shows:

Metric	Description
Version	Deployed RADIANT version
Status	Running / Stopped / Not Deployed
Health	Healthy / Degraded / Unhealthy
Last Deploy	Timestamp of last deployment
Monthly Cost	Estimated AWS costs

Quick Actions

Action	Description
Deploy All	Deploy to all environments sequentially
Health Check	Run comprehensive health check
Sync Status	Refresh all status indicators
View Logs	Open CloudWatch in browser

Recent Activity

Shows the last 10 actions across all environments: - Deployments - Key rotations - Instance starts/stops - Snapshot creations

8. Deploy

The Deploy tab provides one-click deployment to any environment.

Deployment Wizard

-----+	+
Deploy to AWS	
-----+	+

```
| Environment:  o Development  o Staging  * Production      |
|
| Tier:        [GROWTH v]                                |
|
| Version:     7.0.0 (latest)                             |
|
| Domain:      thinktank.acme.com                         |
|
| +-----+
| | Pre-flight Checks                                     |
| | [ok] AWS credentials valid                           |
| | [ok] CDK bootstrapped                               |
| | [ok] DNS configured                                 |
| | [ok] SSL certificate valid                           |
| | [ok] API keys configured                             |
| | +-----+
|
|                                     [Deploy Now]
|
| +-----+
```

Tier Levels

Tier	Monthly Cost	Use Case	Key Features
SEED	\$50-150	Development	Minimal, single-AZ
STARTER	\$200-400	Small teams	WAF, GuardDuty
GROWTH	\$1,000-2,500	Medium orgs	Self-hosted models
SCALE	\$4,000-8,000	Large orgs	Multi-region ready
ENTERPRISE	\$15,000-35,000	Global	Full HA, compliance

Deployment Modes

Mode	When Used	Behavior
Fresh Install	No existing stack	Creates all infrastructure
Update	Existing stack	Incremental CloudFormation update
Rollback	After failure	Restores from snapshot

Deployment Log

```
Real-time progress display:
[12:00:01] Starting deployment v7.0.0 to production...
[12:00:02] [ok] Pre-flight checks passed
[12:00:03] [ok] Package validated (SHA256 match)
```

```
[12:00:10] -> Deploying FoundationStack...
[12:02:30] [ok] FoundationStack complete
[12:02:31] -> Deploying DataStack...
[12:05:45] [ok] DataStack complete
[12:05:46] -> Running database migrations (1 of 156)...
[12:08:00] [ok] All 156 migrations applied
[12:08:01] -> Deploying ApiStack...
[12:12:00] [ok] Deployment complete!
[12:12:01] -> Running health checks...
[12:12:30] [ok] All services healthy
```

9. Credentials Management

The Credentials tab manages AWS access keys with automatic rotation.

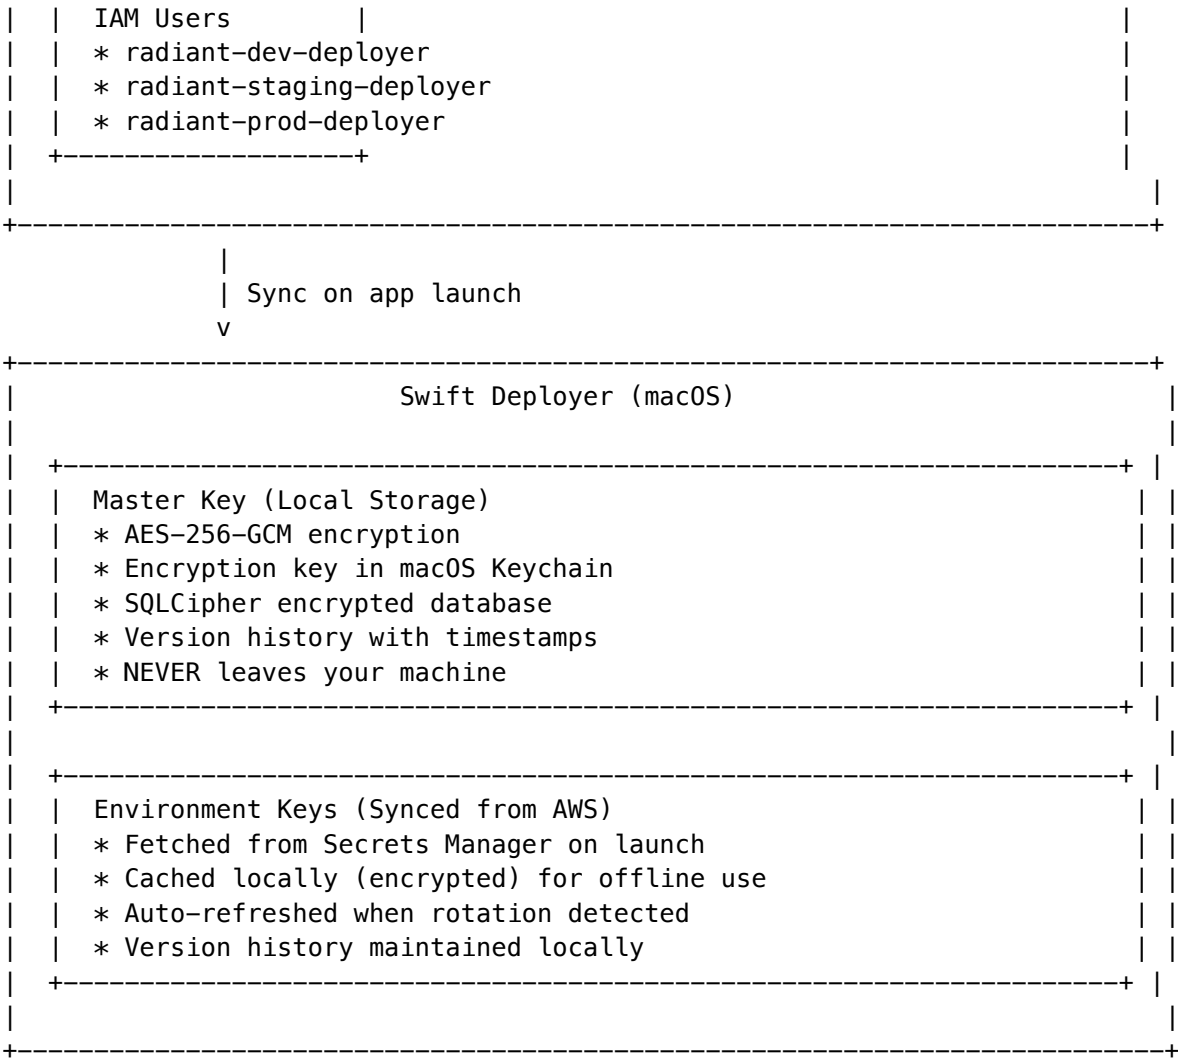

Overview

RADIANT uses a **two-tier key architecture**:

Key Type	Storage	Rotation	Purpose
Master Key	Local (encrypted)	Manual	Your admin AWS credentials
Environment Keys	AWS Secrets Manager	Automatic	Per-environment deployment keys

Architecture

Master Key

Your primary AWS admin credentials, stored **locally only**:

Security Features

Feature	Implementation
Encryption	AES-256-GCM with random IV per encryption
Key Derivation	PBKDF2 with 100,000 iterations
Key Storage	macOS Keychain (hardware-backed on Apple Silicon)
Database	SQLCipher with 256-bit AES
Memory Protection	Keys cleared from memory on lock/quit

Version History

Every time you update the master key, the previous version is retained:

Master Key History			
v3 (Current)	AKIA...WXYZ	Feb 4, 2026 10:30 AM	
v2	AKIA...QRST	Jan 15, 2026 2:15 PM	
v1	AKIA...MNOP	Dec 1, 2025 9:00 AM	
[Reveal Secret] [Restore v2] [Export Encrypted Backup]			

Master Key Actions

Action	Description	Authentication
View Access Key ID	Always visible	None
Reveal Secret Key	Show secret temporarily	Touch ID / Password
Update Key	Replace with new credentials	Touch ID / Password
View History	See all previous versions	None
Restore Version	Revert to previous key	Touch ID / Password
Export Backup	Encrypted backup file	Touch ID / Password
Validate	Test against AWS STS	None

Environment Keys

Per-environment IAM users managed via AWS Secrets Manager:

IAM Users

Environment	IAM User	Policy
dev	radiant-dev-deployer	RadiantDevDeployerPolicy
staging	radiant-staging-deployer	RadiantStagingDeployerPolicy
prod	radiant-prod-deployer	RadiantProdDeployerPolicy

Least-Privilege Permissions

Each environment IAM user has permissions scoped to only that environment:

```
{
  "Version": "2012-10-17",
  "Statement": [
```

```
{
  "Effect": "Allow",
  "Action": ["cloudformation:*"],
  "Resource": "arn:aws:cloudformation:*:*:stack/radiant-dev-*/*"
},
{
  "Effect": "Allow",
  "Action": ["lambda:*"],
  "Resource": "arn:aws:lambda:*:*:function:radiant-dev-*"
},
{
  "Effect": "Allow",
  "Action": ["s3:*"],
  "Resource": "arn:aws:s3:::radiant-dev-*"
}
]
```

Key Status Indicators

Status	Icon	Meaning
Valid	[OK]	Key works, rotation not due
Expiring Soon	[!]	Rotation due within warning period
Expired	[X]	Past rotation date (still works)
Invalid	[NO]	Key doesn't authenticate
Rotating	[SYNC]	Rotation in progress

Automatic Rotation

Keys rotate automatically via AWS Lambda and Secrets Manager.

Rotation Configuration

Setting	Default	Options	Description
Interval	90 days	30 / 60 / 90 / 180 days	Time between rotations
Overlap	24 hours	1 / 6 / 12 / 24 / 48 hours	Both keys valid period
Warning	14 days	7 / 14 / 30 days	Alert before rotation
Auto-Rotate	On	On / Off	Enable per environment

Rotation Process (4-Step)

The Lambda function performs rotation in four steps per AWS Secrets Manager standard:

Step 1: createSecret

- +– Generate new IAM access key for user
- +– Store in Secrets Manager as AWSPENDING
- +– Old key still works (AWSCURRENT)

Step 2: setSecret

- +– Mark new key as ready
- +– Both keys now valid (overlap period)

Step 3: testSecret

- +– Validate new key against AWS STS
- +– Attempt API call with new credentials
- +– Rollback if test fails

Step 4: finishSecret

- +– Promote AWSPENDING → AWSCURRENT
- +– Delete old IAM access key
- +– Update version metadata
- +– Emit CloudWatch metrics

Rotation Timeline**CDK Infrastructure**

The rotation infrastructure is deployed via `deployer-key-rotation-stack.ts`:

Resource	Purpose
Secrets	3 secrets (dev/staging/prod deployer keys)
Lambda	credential-rotation function
IAM Role	Lambda execution role with SM + IAM permissions
EventBridge	Schedule rule for automatic rotation
CloudWatch	Logs, metrics, alarms for rotation failures
SNS Topic	Notifications for rotation events

Manual Key Operations

Validate Key

Test that a key works against AWS:

1. Click **Validate** next to any key
2. Deployer calls AWS STS GetCallerIdentity
3. Result shows:
 - Account ID
 - IAM User ARN
 - Permissions summary

Rotate Now (Manual)

Force immediate rotation for an environment:

1. Click **Rotate Now** for the environment
2. Confirm the action
3. Watch rotation progress:
 - Creating new key...
 - Testing new key...
 - Updating secret...
 - Deleting old key...
4. New key syncs to local cache

View Key History

See all versions of an environment key:

Production Key History				
v7 (Current)	AKIA...DEFG	Feb 4, 2026	Auto-rotated	
v6	AKIA...ABCD	Nov 6, 2025	Auto-rotated	
v5	AKIA...7890	Aug 8, 2025	Manual rotate	
v4	AKIA...5678	May 10, 2025	Auto-rotated	
...				
Showing 4 of 7 versions [Load More]				

Restore Previous Version

If a rotation causes issues:

1. Go to key history
2. Select the version to restore
3. Click **Restore This Version**
4. Confirm (requires Touch ID / password)
5. Previous key is reactivated in Secrets Manager

Note: This only works if the old IAM key wasn't deleted from IAM.

Troubleshooting Key Issues

Rotation Failed

- Symptom:** Rotation stuck or failed
- Check:** 1. Lambda logs in CloudWatch (/aws/lambda/radiant-credential-rotation) 2. IAM user access key count (max 2 per user) 3. Secrets Manager permissions
- Common Causes:**

Cause	Solution
Max keys reached	Delete oldest IAM access key manually
Lambda timeout	Increase timeout to 60s
Permission denied	Check Lambda IAM role
Network error	Check VPC configuration

Key Not Syncing

- Symptom:** App shows old key after rotation
- Solution:** 1. Click **Refresh** in Credentials tab 2. Or quit and relaunch the app 3. Check AWS connectivity

Invalid Key After Rotation

- Symptom:** New key doesn't work
- Solution:** 1. Check Secrets Manager for AWSCURRENT version 2. Verify IAM access key exists and is Active 3. Restore previous version if needed 4. Contact AWS support if IAM inconsistent

10. Instance Management

Control the lifecycle of each environment's AWS resources.

Environment Panels

Each environment (dev, staging, prod) shows:

DEVELOPMENT				[* Running]	
Services:					
+-----+		+-----+		+-----+	
API GW	Lambda	Aurora	S3		
* Active	* Active	* Active	* Active		
+-----+		+-----+		+-----+	
Resources: 45 Lambdas 12 Tables 5 Buckets					
Monthly Cost: ~\$450					

```
|
| [Start All] [Stop All] [Nuclear Wipe...]
|
+-----+
```

Start/Stop Controls

Action	What Happens
Start All	Resume Aurora, restore Lambda concurrency
Stop All	Pause Aurora, remove provisioned concurrency

Cost savings when stopped: ~60-80% reduction.

Nuclear Wipe (Double Confirmation)

Complete environment destruction with preservation options:

Step 1 - Select Preservations:

Resource	Default	Description
DNS (Route53)	[ok] Keep	Hosted zone and records
SSL (ACM)	[ok] Keep	Certificates
SES Email	[ok] Keep	Verified domain, DKIM
VPC	o Delete	Network infrastructure
Logs	o Delete	CloudWatch log groups
KMS Keys	[ok] Keep	Required for backup restore

Step 2 - Type Confirmation:

Must type WIPE DEV, WIPE STAGING, or WIPE PROD to confirm.

11. Packages

Manage RADIANT version packages.

Package List

```
+-----+
| Available Packages
+-----+
|
| v7.0.0 [LATEST] Feb 4, 2026 156 migrations
| +- Simplified navigation (10 tabs)
|
```

+- Credentials management		
+- Instance lifecycle controls		
v6.6.0	Jan 24, 2026	152 migrations
+- Environment domains		
+- DNS verification		
v6.5.0	Jan 15, 2026	148 migrations
+- Feature flags system		

Package Actions

Action	Description
Download	Fetch package to local cache
Verify	Check SHA256 hash
View Changes	See changelog and migrations
Deploy	Jump to deploy with this version

12. Migrations

Visual pipeline for promoting deployments through environments.

Pipeline View

Promotion Options

Option	Description
Direct Promote	Immediate deployment to next environment
Shadow Mode	Canary release with traffic splitting

Shadow Mode (Canary Releases)

Gradual traffic shifting for safe production rollouts:

Phase	Traffic	Duration	Rollback Trigger
1	5%	1 hour	Error rate > 1%
2	25%	4 hours	Error rate > 0.5%
3	50%	12 hours	Error rate > 0.2%
4	100%	Complete	Manual

Comparison Metrics

During shadow mode, compare old vs new:

Metric	Old Version	New Version
Error Rate	0.12%	0.08%
P50 Latency	145ms	132ms
P99 Latency	890ms	720ms
Cost/Request	\$0.0012	\$0.0011

13. Snapshots

Backup and restore capabilities.

Snapshot Types

Type	Contents	Schedule
Full	Database + S3 + Config	Weekly
Incremental	Changes since last	Daily
Pre-Deploy	Auto before deployment	Automatic

Creating Snapshots

1. Click **Create Snapshot**
2. Select environment
3. Choose type (Full or Incremental)
4. Add optional description
5. Click **Create**

Restoring from Snapshot

1. Select snapshot from list
2. Click **Restore**
3. Choose target environment
4. Confirm (requires typing environment name)

Warning: Restore overwrites current environment data.

14. History

Complete deployment and action history.

Log Entries

Each entry shows:

Field	Description
Timestamp	When action occurred
Action	Deploy, Rotate, Snapshot, etc.
Environment	dev, staging, prod
User	Who initiated (if available)
Duration	How long it took
Status	Success, Failed, In Progress

Filtering

Filter by: - Environment - Action type - Date range - Status

Export

Export history as: - CSV - JSON - PDF report

15. Drift Monitor

Detect and reconcile infrastructure drift from manual AWS changes.

What is Drift?

When someone (or Windsurf/Claude) changes AWS resources directly instead of through the Deployer, the actual state differs from the expected state. This is “drift.”

Detection Methods

Method	Trigger	Frequency
Scheduled	EventBridge	Every 15 minutes
Event-Driven	CloudFormation events	Real-time
Manual	User clicks Scan	On-demand

Drift Report

```
+-----+
|  Drift Detected: 3 resources  |
+-----+
|
|  [!] Lambda: radiant-prod-api-handler
|    Property: MemorySize
|    Expected: 512 MB
|    Actual:   1024 MB
|    AI Recommendation: ADOPT (performance improvement)
|    [Adopt] [Revert] [Investigate]
|
|  [!] S3: radiant-prod-uploads
|    Property: PublicAccessBlock
|    Expected: All blocked
|    Actual:   GetObject allowed
|    AI Recommendation: REVERT (security risk)
|    [Adopt] [Revert] [Investigate]
|
+-----+
```

AI Recommendations

The drift monitor uses AI to analyze changes and recommend action:

Recommendation	Meaning
ADOPT	Keep the change, update IaC to match
REVERT	Undo the change, restore expected state
INVESTIGATE	Unclear, needs human review

Actions

Action	What Happens
Adopt	Update Deployer state to match AWS
Revert	Reset AWS resource to expected state
Ignore	Mark as known deviation

15.1 Environment State Registry

NEW in v7.1.0 - Comprehensive system for tracking, comparing, syncing, and backing up environment state across dev, staging, and prod.

Overview

The Environment State Registry maintains versioned manifests of your AWS infrastructure, enabling: - Cross-environment comparison - Selective data synchronization - Point-in-time backups and restoration - Offline resilience with local caching

Navigation

Access via the sidebar under “State Registry” or use keyboard shortcut **Cmd + Shift + S**.

+-----+ State Registry +-----+		
[CHART] Dashboard	Overview of all environments	
Dev	Development environment state	
[TEST] Staging	Staging environment state	
[WORLD] Prod	Production environment state	
<=> Compare	Cross-environment comparison	
[SYNC] Sync	Sync operations	
Backups	Backup management	
[GEAR] Settings	Sync configuration	
+-----+		

Environment Manifests

Each environment manifest captures a complete snapshot:

Category	Contents
CloudFormation	Stack status, outputs, parameters, drift status
Lambda	Functions, runtime, memory, timeout, layers
S3	Buckets, size, object count, versioning

Category	Contents
DynamoDB	Tables, item count, throughput
Aurora	Cluster status, engine version, instances
Secrets	Secret names, rotation status
API Gateway	APIs, stages, usage plans

Capturing a Manifest

1. Select environment (Dev, Staging, or Prod)
2. Click **Capture Now** or wait for auto-capture
3. Review the manifest summary

Manifests are stored both locally (for offline access) and in S3 (for durability).

Persistent Data Management

Control which data items sync between environments:

Column	Description
Name	Data item identifier
Type	database, s3, secret, config
Category	user_data, system_config, ai_models, etc.
Size	Storage size
Include	Toggle to include/exclude from sync
Sensitivity	Public, Internal, Confidential, Restricted

Sensitivity Levels

Level	Description	Sync Default
Public	Non-sensitive data	Included
Internal	Internal business data	Included
Confidential	Business-critical data	Manual confirm
Restricted	PII/PHI, highly sensitive	Excluded

Cross-Environment Comparison

Compare any two environments to see differences:

1. Select **Source** environment (e.g., Dev)
2. Select **Target** environment (e.g., Staging)
3. Click **Compare Environments**

Comparison Report

+-----+	
Comparison: Dev -> Staging	
+-----+	
Summary	
Total Changes: 15	
Breaking Changes: 2	
Data Changes: 8	
Estimated Duration: 12 minutes	
Data Transfer: 2.4 GB	
Added (3)	
* Lambda: radiant-dev-new-handler	
* S3 Bucket: radiant-dev-exports	
* Secret: radiant/dev/new-api-key	
Removed (1)	
* Lambda: radiant-dev-deprecated-fn	
[!] Conflicts (2)	
* Config: max_tokens (Dev: 4096, Staging: 2048)	
* Feature: enable_beta (Dev: true, Staging: false)	
+-----+	

Sync Operations

Synchronize state from one environment to another:

1. Select source and target environments
2. Choose what to sync:
 - **Infrastructure:** CloudFormation stacks, Lambdas
 - **Persistent Data:** Databases, S3 objects
 - **Feature Flags:** Feature toggles
3. For production targets, enable **Confirm Production Sync**
4. Click **Start Sync**

Production Protection

Syncing to production requires: - Explicit confirmation toggle - User acknowledgment of changes - Optional approval workflow (if enabled)

Sync Progress

+-----+	
Active Sync: Dev -> Staging	
Status: Syncing	
52%	
Phase: Migrating database tables	

```
| Items: 26/50 completed |
| Transferred: 1.2 GB / 2.4 GB |
| |
| [Cancel Sync] |
+-----+
```

Backup & Restore

Create point-in-time backups of any environment:

Creating a Backup

1. Go to **Backups** tab
2. Select environment
3. Click **Create Backup**
4. Configure options:
 - Include Infrastructure
 - Include Database
 - Include S3 Buckets
 - Include Secrets (optional)
5. Add optional description
6. Click **Create**

Backup Types

Type	Description	Retention
Manual	User-initiated	Until deleted
Pre-Deploy	Auto before deployments	30 days
Scheduled	Daily/weekly automatic	Configurable
Incremental	Changes only	7 days

Restoring from Backup

1. Find backup in list (filter by environment/date)
2. Right-click -> **Restore**
3. Select target environment
4. Choose components to restore
5. Confirm restoration

[!] **Warning:** Restoring overwrites current state. Always create a backup before restoring.

Sync Configuration

Configure per-environment sync settings:

Setting	Description	Default
Sync Enabled	Master toggle	On (dev/staging), Off (prod)
Sync Infrastructure	Include CloudFormation	Off
Sync Persistent Data	Include databases/S3	On
Sync Feature Flags	Include feature toggles	On
Sync Secrets	Include Secrets Manager	Off
Require Confirmation	Prompt before sync	On
Allow Destructive	Allow data deletion	Off
Auto-Sync	Automatic scheduled sync	Off for prod

Offline Resilience

The State Registry works even when offline:

- **Local Cache:** Manifests cached on your Mac
- **Startup Sync:** Refreshes from server on launch
- **Manual Refresh:** Force refresh when back online
- **Queued Operations:** Operations queue until connectivity restored

API Integration

The State Registry exposes REST endpoints for automation:

Endpoint	Method	Description
/state-registry/manifests/{env}	GET	Get manifest
/state-registry/manifests/{env}/capture	POST	Capture new
/state-registry/compare	POST	Compare environments
/state-registry/sync	POST	Start sync
/state-registry/backups	GET/POST	List/create backups
/state-registry/backups/{id}/restore	POST	Restore backup

15.2 Reliability & Storage Configuration

NEW in v7.1.0 - Enterprise-grade reliability features targeting 99.99% availability with configurable storage paths for large datasets.

Configurable Storage Paths

Access via **State Registry -> Settings -> Storage Configuration** or **Cmd + Shift + ,**

Administrators can configure custom storage locations for large datasets that may not fit on the system drive:

Setting	Description	Default
Manifest Path	Local path for state snapshots	~/Library/Application Support/RadiantDeployer/StateRegistry/manifests
Backup Path	Local path for backups	~/Library/Application Support/RadiantDeployer/StateRegistry/backups
Package Path	Local path for deployment packages	~/Library/Application Support/RadiantDeployer/StateRegistry/packages
Cache Path	Local path for temporary cache	~/Library/Application Support/RadiantDeployer/StateRegistry/cache

Supported Storage Locations

- **Internal SSD:** Default location, fastest performance
- **External Drives:** USB, Thunderbolt, or network-attached storage
- **Network Shares:** SMB/NFS mounts for centralized storage
- **RAID Arrays:** For enterprise redundancy

Changing Storage Paths

1. Click **Browse...** next to any path
2. Select the new directory (must be writable)
3. Click **Save Configuration**
4. Existing data is NOT moved automatically—use manual migration if needed

[!] **Warning:** Ensure the new path has sufficient space. The app will warn if available space drops below 10GB.

Storage Limits

Setting	Description	Default
Max Local Cache	Maximum cache size before cleanup	50 GB
Max Backup Retention	Days to keep old backups	90 days
Max Manifest Versions	Number of manifest versions to retain	100

Automatic Cleanup

When enabled, the system automatically cleans up old data when disk usage exceeds the threshold:

What Gets Cleaned	Policy
Old Manifests	Keep only the newest N versions per environment
Expired Backups	Remove backups older than retention period
Stale Cache	Remove cache files older than 24 hours

To run cleanup manually: **State Registry -> Settings -> Storage -> Run Cleanup Now**

Reliability Settings

Access via **State Registry -> Settings -> Reliability**

Retry Configuration

Operation	Max Retries	Initial Delay	Max Delay
Network	5	1 second	30 seconds
Sync	3	5 seconds	60 seconds
Backup	3	10 seconds	120 seconds

Retries use exponential backoff with optional jitter to prevent thundering herd.

Conflict Resolution Strategies

Strategy	When to Use
Source Wins	When source environment is authoritative
Target Wins	When preserving target state is critical
Newest Wins	For time-based resolution (recommended)
Manual	When human review is required
Merge	For compatible data types only
Skip	To ignore conflicts and continue

Data Validation

Setting	Description	Default
Validate Before Sync	Check data integrity before transfer	On
Validate After Sync	Verify data after transfer	On
Checksum Verification	Use SHA-256 checksums	On

Rollback Settings

Setting	Description	Default
Create Checkpoint	Snapshot state before sync	On
Auto-Rollback	Revert on failure	On
Rollback Threshold	Max % of items that can fail	20%

Fallback Mechanisms

The system gracefully degrades under failure conditions:

Scenario	Fallback Behavior
Network Failure	Use cached data (configurable max age: 60 min)
Partial Sync Failure	Continue if >80% items succeed
Write Failure	Enter read-only mode
Storage Full	Trigger automatic cleanup
Repeated Failures	Escalate via email/Slack/PagerDuty

Health Dashboard

Access via **State Registry -> Health** or **Cmd + Shift + H**

Real-time monitoring of all State Registry components:

Health Dashboard		
Overall Status: * Healthy		
Local Cache	S3 Connect	API Connect
* OK	* OK	* OK
42GB free	45ms	120ms
Reliability Metrics		
Uptime: 99.99%		
Success Rate: 99.95%		
Avg Latency: 85ms		
Errors (24h): 0		

SLA Targets

The State Registry is designed to meet enterprise SLA requirements:

Metric	Target	Description
Availability	99.99%	Max 52 minutes downtime per year
Sync Success	99.9%	Successful sync operations
Backup Success	99.99%	Successful backup operations
Restore Success	99.9%	Successful restore operations

Metric	Target	Description
Data Integrity	100%	No data corruption ever
Max API Latency	5 seconds	Response time threshold

Backup Validation

Before restoring a backup, the system validates:

- 1. **Checksum Verification:** Confirms file integrity
- 2. **Component Validation:** Checks each component (infrastructure, database, S3, secrets)
- 3. **Dependency Validation:** Ensures all dependencies are present
- 4. **Recoverability Assessment:** Estimates restore time and identifies blockers

```
+-----+
| Backup Validation: backup-2026-02-04-143052 |
+-----+
|
| [OK] Overall: VALID
|   Validation Time: 1.2 seconds
|
| Components:
|   [OK] Infrastructure: 14/14 items valid
|   [OK] Database: 42/42 tables valid
|   [OK] S3: 8/8 buckets valid
|   [OK] Feature Flags: 24/24 flags valid
|
| Integrity:
|   Algorithm: SHA-256
|   Checksum: a3f2c8...
|   Status: [OK] Valid
|
| Recoverability:
|   Can Restore: Yes
|   Est. Time: 5 minutes
|   Blockers: None
|
+-----+
```

15.3 AWS Snapshots (Disaster Recovery)

NEW in v7.1.0 - Automated AWS infrastructure snapshots for complete disaster recovery with zero downtime.

Overview

AWS Snapshots provide an additional layer of protection beyond the State Registry backups. While State Registry captures application-level state, AWS Snapshots capture the underlying AWS infrastructure at the storage level.

Key Benefits: - **Zero Downtime:** Snapshots are created without affecting running services - **Isolation:** Protected from application-level bugs (can't be accidentally deleted via app) - **Point-in-Time:** Restore to any snapshot within retention period - **Cross-Region:** Optional replication to another AWS region

Accessing AWS Snapshots

In the Swift Deployer: 1. Navigate to **State Registry** in the sidebar 2. Click the **AWS Snapshots** tab 3. Or use keyboard shortcut **Cmd + Shift + S**

In the Radiant Admin Dashboard: 1. Go to **Infrastructure -> Snapshots** 2. Or navigate to /snapshots in the URL

Creating a Manual Snapshot

1. Click **Create Snapshot** button
2. (Optional) Enter a description
3. Select components to include:
 - ☒ Aurora PostgreSQL (RDS)
 - ☒ S3 Buckets
 - ☒ Secrets Manager
 - ☒ DynamoDB Tables
4. Click **Create**

The snapshot process runs in the background. You can continue working while it completes.

Scheduled Snapshots

By default, snapshots run automatically at **2:00 AM Pacific Time** daily.

Setting	Default	Description
Schedule	2:00 AM PT	Configurable to any time or interval
Retention	30 days	How long to keep snapshots
Components	All	Which AWS resources to snapshot

To configure the schedule: 1. Go to **AWS Snapshots -> Configuration** tab 2. Toggle **Enable Automated Snapshots** 3. Set your preferred time or interval 4. Click **Save Configuration**

Restoring from a Snapshot

1. Select a snapshot from the list
2. Click **Restore** (download icon)
3. Confirm the restore operation
4. Wait for restore to complete (5-15 minutes for RDS)

Important: RDS restore creates a **new cluster**—it does not overwrite the existing database. After restore completes, you'll need to update your connection strings to point to the new cluster.

Restore Times

Component	Typical Time	Method
Aurora PostgreSQL	5-15 minutes	Creates new cluster from snapshot
S3 Buckets	Near-instant	Object versioning (objects already versioned)
DynamoDB	~5 min/table	On-demand backup restore
Secrets Manager	Near-instant	Version recovery

Snapshot Validation

Before restoring, validate the snapshot:

1. Select a snapshot
2. Click **Validate** (or right-click -> Validate)
3. Review the validation report:
 - [OK] Checksum verification
 - [OK] Component availability
 - [OK] Estimated restore time
 - [!] Any blockers or warnings

Cost Estimation

Snapshots incur AWS storage costs:

Component	Approximate Cost
RDS Snapshots	~\$0.02/GB-month
DynamoDB Backups	~\$0.10/GB-month
S3 Versioning	Same as standard S3 storage

The dashboard shows estimated monthly costs for all retained snapshots.

Snapshot vs State Registry Backup

Feature	AWS Snapshot	State Registry Backup
Level	AWS infrastructure	Application state
Downtime	Zero	Zero
Restore Target	Same or new cluster	Same environment
Isolation	Protected from app bugs	Could be affected by app bugs
Speed	5-15 min (RDS)	Near-instant
Cross-Region	Yes (optional)	No

Recommendation: Use both for comprehensive disaster recovery.

16. Settings

Preferences and configuration options.

General Tab

Setting	Description	Default
Theme	Light/Dark/System	System
Notifications	Desktop notifications	On
Auto-Update	Check for updates on launch	On

Timeout Tab

Operation	Default	Range
Deployment	30 min	10-60 min
Health Check	30 sec	10-120 sec
API Calls	60 sec	10-300 sec

Storage Tab

Setting	Description	Default
Cache Location	Package cache	~/Library/Caches/RadiantDeployer
Max Cache Size	Maximum cache	5 GB
Log Retention	Keep logs for	30 days

Advanced Tab

Setting	Description	Default
Debug Mode	Verbose logging	Off
Dry Run	Simulate deployments	Off
Parallel Stacks	Concurrent deployments	3

Admin Tools Tab (Updated in v7.3.0)

Access advanced administrator tools organized into four categories:

Category	Tools
Observability	Monitoring Dashboard, Log Viewer
Operations	Rollback Manager, Security Scanner, Network Diagnostics
Cost Management	Resource Tags, Cost Estimator
Data & Compliance	Database Export, Secrets Rotation, Environment Clone, Compliance Reports

Monitoring Dashboard (NEW in v7.3.0)

Real-time CloudWatch metrics visualization for all RADIANT services:

Service	Metrics
Lambda	Invocations, Errors, Duration, Throttles, Concurrent Executions
ECS	CPU Utilization, Memory Utilization, Running Tasks, Pending Tasks
RDS	CPU, Connections, Memory, Read/Write Latency, IOPS
API Gateway	Request Count, 4XX/5XX Errors, Latency
DynamoDB	Read/Write Capacity, Throttled Requests, Latency
ElastiCache	CPU, Memory Usage, Hit Rate, Connections

Features: - **Service Health Cards**: Status indicators (Healthy/Degraded/Unhealthy) - **Real-time Alerts**: Critical and warning alerts with acknowledgment - **Metric Trends**: Up/Down/Stable indicators - **Cost Estimates**: Hourly/daily/monthly projections - **Auto-refresh**: 60-second interval with manual refresh - **Time Ranges**: 1h, 3h, 6h, 12h, 1d, 3d, 1w

Log Viewer (NEW in v7.3.0)

CloudWatch logs aggregation with search and real-time tailing:

Feature	Description
Log Groups	Browse by Lambda, ECS, RDS, API Gateway
Search	Pattern matching in log messages
Filter by Level	ALL, ERROR, WARN, INFO, DEBUG

Feature	Description
Time Range	15min, 1h, 6h, 24h presets
Tailing	Real-time log streaming

Log Level Colors: - **ERROR**: Red - Exceptions, failures - **WARN**: Orange - Warnings, deprecations - **INFO**: Blue - Informational messages - **DEBUG**: Green - Debug output

Rollback Manager (NEW in v7.3.0)

Version tracking and automated rollback for AWS resources:

Resource Type	Rollback Method	Est. Downtime
Lambda	Alias update	~5 seconds
ECS	Task definition update	~2 minutes
CloudFormation	Stack rollback	~5 minutes
RDS	Snapshot restore	~10 minutes

Features: - **Version History**: List all available versions with timestamps - **Rollback Plans**: Step-by-step execution with estimates - **Progress Tracking**: Real-time progress logs - **Safety Checks**: Approval required for RDS and CloudFormation - **Metadata**: Runtime, code size, deployment status

Security Scanner (NEW in v7.3.0)

Automated security configuration audit:

Category	Checks
IAM Policies	Administrator access, wildcard policies
Security Groups	0.0.0.0/0 access, SSH/RDP exposure
Encryption	S3 bucket encryption, RDS storage encryption
Public Access	S3 public access block configuration
Logging	CloudTrail configuration, log validation

Severity Levels: - **Critical**: Immediate action required (e.g., admin access on roles) - **High**: Important security risk (e.g., open ports) - **Medium**: Should be addressed (e.g., single-region trail) - **Low**: Best practice recommendation - **Info**: Informational only

Compliance Score: 0-100% based on weighted severity of findings.

Network Diagnostics (NEW in v7.3.0)

Comprehensive connectivity testing suite:

Test	Purpose	Metrics
DNS	Hostname resolution	Resolved IPs, response time
SSL	Certificate validation	Expiry date, issuer, days remaining
Connectivity	HTTP reachability	Status code, response time, bytes
Latency	Network performance	Min/avg/max, packet loss
Port Scan	Service availability	Open/closed status, response time

SSL Certificate Warnings: - **>30 days**: Healthy - **<=30 days**: Warning - renew soon - **Expired**: Failed - immediate action

Resource Tags Manager (NEW in v7.3.0)

AWS resource tagging for cost allocation and compliance:

Resource Type	Supported
Lambda	[OK] Functions
ECS	[OK] Clusters, Services
RDS	[OK] Aurora Clusters
S3	[OK] Buckets
DynamoDB	[OK] Tables

Standard Tag Policies:

Tag Key	Required	Allowed Values
Environment	[OK]	dev, staging, prod
Project	[OK]	radiant
Owner	[OK]	Any
CostCenter	[OK]	Any
ManagedBy	[X]	cdk, terraform, manual
Version	[X]	Any

Features: - **Compliance Checking**: Identify missing/invalid tags - **Bulk Tagging**: Apply tags to multiple resources - **Tag Editing**: Add, modify, remove tags per resource - **Cost Allocation**: Group resources by CostCenter

Database Export

Export PostgreSQL and DynamoDB data for backup or migration:

Mode	Description	Target
Schema Only	Database structure without data	Any environment
Seed Data	AI Registry and system config	Any environment
Masked Data	PII anonymized (GDPR compliant)	Dev/Staging only
Full Export	Complete database	Dev only

Features: - Compression with gzip - Checksum verification - Progress tracking - GDPR consent for PII data

Secrets Rotation

Manage AWS Secrets Manager secrets lifecycle:

Urgency	Age	Action
Critical	>180 days	Rotate immediately
Urgent	>90 days	Rotate soon
Warning	>60 days	Plan rotation
Healthy	<60 days	No action needed

Features: - Bulk rotation for urgent secrets - Rotation scheduling - Compliance tracking by framework - Audit trail

Cost Estimator

Preview deployment costs before committing:

Tier	Monthly Estimate
Seed	~\$100-200
Starter	~\$400-800
Growth	~\$1,500-3,000
Scale	~\$5,000-10,000
Enterprise	~\$15,000+

Breakdown categories: - Compute (ECS, Lambda, GPU) - Database (Aurora, DynamoDB, ElastiCache) - Storage (S3, EFS, Backups) - Networking (Transfer, NAT, ALB, API Gateway) - Security (WAF, GuardDuty, Secrets Manager, KMS) - AI (External providers, Self-hosted inference)

Environment Clone

Clone environments with optional data masking:

Clone Mode	Data Included	Allowed Targets
Schema Only	Structure only	Dev, Staging, Prod
With Seed Data	System config	Dev, Staging, Prod
With Masked Data	Anonymized PII	Dev, Staging
Full Clone	All data	Dev only

Features: - Promotion workflow (Dev -> Staging -> Production) - Automatic secrets rotation for target - Dry run validation - Pre/post-clone checks

Compliance Reports

Generate regulatory compliance reports:

Framework	Controls	Focus
HIPAA	45.308, 45.310, 45.312	Healthcare data
SOC 2	CC1-CC9, A1, C1, P1	Service organization
GDPR	Art. 6, 7, 15-22, 25, 32, 33, 46	EU data protection
PCI-DSS	Requirements 1-12	Payment card data
ISO 27001	Annex A controls	Information security

Report contents: - Control assessment with status - Evidence collection - Findings by severity (Critical/High/Medium/Low)
- Remediation recommendations - Export to JSON, CSV, PDF

17. AI Assistant

Built-in AI assistance for deployment and troubleshooting.

Activation

- Press **Cmd + Shift + A**
- Or click the [NEW] sparkles icon in toolbar

Capabilities

Category	Examples
Planning	“What tier for 500 users?”

Category	Examples
Troubleshooting	“Why is deployment failing?”
Cost	“How can I reduce costs?”
Explanation	“Explain drift detection”

Voice Commands

Enable in Settings -> AI Assistant -> Voice Input: 1. Click microphone icon 2. Speak command 3. Review and confirm

18. AutoSetup Service

Fully automated AWS configuration service.

What's Automated

Service	Configuration
Route53	Hosted zone creation, DNS records
ACM	SSL certificate request, DNS validation
SES	Domain verification, DKIM setup, sandbox exit
SNS	SMS configuration, spending limits
S3	5 buckets (artifacts, uploads, backups, static, logs)
Secrets Manager	Secret structure for API keys
CloudWatch	Dashboard and alarm creation

What You Provide

Only these inputs are required: - AWS credentials (master key) - Domain name - Environment (dev/staging/prod) - Tier selection - AI provider API keys (OpenAI, Anthropic)

Running AutoSetup

1. Go to **Deploy** tab
2. Click **Run AutoSetup**
3. Enter required information
4. AutoSetup configures all services
5. Deploy when ready

19. Deployment Automation

NEW in v7.2.0 - Complete automation of CLI dependencies, script execution, and code sync.

19.1 Dependencies Manager

The Dependencies Manager automatically detects and installs required CLI tools.

Supported Dependencies

Dependency	Min Version	Required	Purpose
Homebrew	Latest	[OK]	Package manager (installed first)
AWS CLI	2.0.0	[OK]	AWS cloud operations
Node.js	18.0.0	[OK]	Build tools and CDK
npm	Latest	[OK]	Package management
AWS CDK	2.0.0	[OK]	Infrastructure deployment
Git	Latest	[OK]	Version control
Python 3	3.9.0	Optional	Cato Genesis system
Docker	Latest	Optional	Container operations

How It Works

1. **Automatic Detection:** On app launch, checks all dependencies
2. **Version Validation:** Ensures installed versions meet minimums
3. **One-Click Install:** Click “Install Missing” to install all at once
4. **Path Resolution:** Searches /opt/homebrew/bin, /usr/local/bin, ~/.local/bin

Using the Dependencies View

1. Navigate to **Dependencies** tab in sidebar
2. View status of each dependency (green = installed, red = missing)
3. Click **Refresh** to re-check all dependencies
4. Click **Install Missing** to auto-install required tools
5. Individual **Install** buttons available for each dependency

19.2 Bash Script Runner

Discover and execute deployment bash scripts directly from the Deployer.

Script Discovery

Scripts are automatically discovered from: - scripts/ - Main deployment scripts - tools/scripts/ - Utility scripts
- packages/infrastructure/bin/ - Infrastructure scripts

Script Categories

Category	Icon	Description
Deployment	^	Full CDK deployments (deploy.sh)
Database		Migrations (run-migrations.sh)
Build		Package building
Testing	[ok]	Verification scripts
Backup	->	Backup/restore operations
Sync	->	Synchronization scripts
Utility	[TOOL]	General utilities

Executing Scripts

1. Navigate to **Scripts** tab
2. Select environment (Dev/Staging/Prod)
3. Browse or search for scripts
4. Select a script to view details
5. Configure arguments (if applicable)
6. Click **Run Script**
7. Watch real-time output with color coding

Automatic Dependency Resolution

Before running a script, the system:

1. Parses script content for CLI tool usage
2. Checks if required tools are installed
3. Offers to install missing dependencies
4. Only proceeds when all dependencies are met

19.3 Code Sync

Sync local code changes to AWS instances for rapid iteration.

How Code Sync Works

Local Changes -> Git Analysis -> Package -> S3 Upload -> Lambda Trigger -> Apply

1. **Change Detection:** Uses `git status` to find modified files
2. **Selective Sync:** Choose which files to include
3. **Package Building:** Creates compressed tar.gz archive
4. **S3 Upload:** Uploads to `radiant-{env}-artifacts/code-sync/`
5. **Lambda Trigger:** Invokes code-sync Lambda function
6. **Verification:** Confirms changes applied to instances

Using Code Sync

1. Navigate to **Code Sync** tab
2. Select target environment (Dev/Staging/Prod)
3. Click **Refresh** to scan for local changes
4. Review changed files (added/modified/deleted)

5. Select/deselect files as needed
6. Click **Sync to {Environment}**
7. Monitor progress and verification

Change Types

Type	Color	Description
Added	Green	New files
Modified	Orange	Changed files
Deleted	Red	Removed files
Renamed	Blue	Moved/renamed files

Best Practices

- Sync to **Dev** first, verify, then promote
- Use selective sync for targeted changes
- Monitor Lambda logs for sync issues
- Keep changes small for faster syncs

20. Security Architecture

Local Security

Component	Protection
Master Key	AES-256-GCM + macOS Keychain
Local Storage	SQLCipher encrypted database
Memory	Cleared on lock/quit

AWS Security

Feature	Tier	Description
WAF	Starter+	Web Application Firewall
GuardDuty	Starter+	Threat detection
Shield	All	DDoS protection (Standard)
KMS	All	Encryption at rest
VPC	All	Network isolation

Compliance

Configure in Admin Dashboard after deployment:

Standard	Features
HIPAA	PHI encryption, audit logging, BAA
SOC2	Audit trails, access reviews
GDPR	Data erasure, portability, consent

20. Troubleshooting

Common Issues

Credentials Not Validated

Symptom: “Invalid credentials” error

Solution: 1. Verify Access Key ID and Secret Access Key 2. Check IAM user has required permissions 3. Ensure region is correct

Deployment Stuck

Symptom: Deployment hangs at a stack

Solution: 1. Check CloudFormation console for errors 2. Review deployment logs 3. Check AWS service quotas 4. Verify IAM permissions

Key Rotation Failed

Symptom: Rotation Lambda error

Solution: 1. Check Lambda logs in CloudWatch 2. Verify Secrets Manager permissions 3. Check IAM user access key count (max 2)

Drift Detection Errors

Symptom: Scan fails or times out

Solution: 1. Verify CloudFormation stack exists 2. Check IAM permissions for drift detection 3. Reduce scan scope if too many resources

Getting Help

1. **AI Assistant:** Press Cmd + Shift + A
 2. **Logs:** Settings -> Storage -> Export Logs
 3. **Support:** support@radiant.ai
-

21. Keyboard Shortcuts

Global

Shortcut	Action
Cmd + ,	Settings
Cmd + R	Refresh
Cmd + Shift + A	AI Assistant
Cmd + ?	Help
Cmd + Q	Quit

Navigation

Shortcut	Action
Cmd + 1	Dashboard
Cmd + 2	Deploy
Cmd + 3	Credentials
Cmd + 4	Instances
Cmd + 5	Packages
Cmd + 6	Migrations
Cmd + 7	Snapshots
Cmd + 8	History
Cmd + 9	Drift Monitor
Cmd + 0	Settings

Actions

Shortcut	Action
Cmd + D	Deploy
Cmd + .	Cancel
Cmd + L	Logs

22. Glossary

Term	Definition
Aurora	AWS managed PostgreSQL database
CDK	Cloud Development Kit (infrastructure as code)
CloudFront	AWS content delivery network
Drift	Difference between expected and actual AWS state
Environment	Deployment target (dev, staging, prod)
IAM	AWS Identity and Access Management
KMS	AWS Key Management Service
Lambda	AWS serverless compute
Master Key	Your admin AWS credentials
Migration	Promoting versions through environments
Rotation	Automatic key replacement
Secrets Manager	AWS service for storing secrets
Snapshot	Point-in-time backup
Tier	Infrastructure size (SEED to ENTERPRISE)
Wipe	Complete environment destruction

Part II: Architecture

Technical Architecture Document

Version: 4.18.1 | Last Updated: December 2024

Overview

The RadiantDeployer Swift app operates in three distinct modes, each with different behaviors for parameter handling, package selection, and database operations.

Deployment Modes

Mode Definitions

INSTALL Mode (Fresh Installation)

Trigger: No existing deployment detected for app/environment combination

Key Behaviors: 1. Uses DEFAULT parameters from tier configuration 2. Runs ALL database migrations (fresh) 3. SEEDS the AI Registry with providers and models 4. Creates initial admin user 5. Stores deployment metadata

Parameter Source: InstallationParameters.defaults()

```
// Parameters are initialized with tier-appropriate defaults
let parameters = InstallationParameters.defaults(
  appId: app.id,
  environment: environment,
```

```

    tier: .growth // Based on selected tier
)

```

UPDATE Mode (Upgrade Existing)

Trigger: Existing deployment detected AND target version $\geq$ current version

Key Behaviors: 1. Fetches current parameters FROM the running instance 2. Creates pre-update snapshot for rollback 3. MERGES user changes with current parameters 4. Validates parameter changes are safe 5. Runs INCREMENTAL migrations only 6. **DOES NOT** seed AI Registry (preserves admin customizations)

Parameter Source: Running instance API + user modifications

```

// Parameters fetched from instance, then merged with user changes
let currentParameters = await fetchCurrentParameters(app, environment, credentials)
let updatedParameters = mergeParameters(current: currentParameters, changes: userChanges)

```

ROLLBACK Mode (Revert to Previous)

Trigger: User explicitly requests rollback OR target version $<$ current version

Key Behaviors: 1. Loads target snapshot from S3 2. Creates safety snapshot of current state 3. Deploys with SNAPSHOT parameters (not current, not defaults) 4. Optionally restores database from RDS snapshot 5. Does not modify AI Registry

Parameter Source: Selected snapshot

Deployment Package Structure

Deployment packages are self-contained, versioned bundles containing everything needed to deploy a specific version of RADIANT.

```

	12. Update deployment meta ----*	S3 + DB
	13. Report success	

*-----

Verification Checklist

Deployment Modes

- On **INSTALL**: Parameters come from defaults
- On **UPDATE**: Parameters come from running instance + user changes
- On **ROLLBACK**: Parameters come from selected snapshot

AI Registry Seeding

- AI Registry is seeded **ONLY** on fresh install
- On **UPDATE**, AI Registry is preserved (not touched)
- Admins can add/remove providers via Admin Dashboard

Deployment Packages

- Packages are created by build-package.sh script
- Package creation is triggered by code changes or version bumps
- Packages are stored in local cache, S3 release bucket, and instance bucket

Parameter Rules

- Region CANNOT be changed after install
 - Tier CAN be changed on update (with feature validation)
 - All parameter changes are tracked via snapshots
-

Complete System Architecture Reference

Version 5.52.60 | February 2026

EXECUTIVE SUMMARY

RADIANT (Rapid AI Deployment Infrastructure for Applications with Native Tenancy) is a comprehensive multi-tenant AWS SaaS platform providing AI model orchestration and infrastructure services. The platform serves as white-label infrastructure operating invisibly behind customer-facing applications.

Version 5.0 (The Sovereign Mesh) introduces: - **Agent Registry** - Long-running AI agents with OODA loops - **App Registry** - 3,000+ apps auto-synced from Activepieces/n8n - **Parametric AI Helper** - AI assistance configurable per node - **Pre-Flight Provisioning** - Check requirements before execution - **Transparency Layer** - Full visibility into Cato's decisions - **Enhanced HITL** - First-class approval workflows

THE OMEGA PROTOCOL (Synthetic Biological Intelligence): - [OMEGA] **Q-Nodes** - Complex-valued neurons using wave mechanics instead of scalar weights - [OMEGA] **Bicameral Mind** - Two-chambered architecture (OMEGA Cortex + Broca Interface) - [OMEGA] **Helix Kernel** - Deterministic safety via destructive interference (impossible to bypass) - [OMEGA] **Resonant Index** - $O(1)$ frequency-based document lookup (infinite scaling) - [OMEGA] **Cryogenic Engine** - Serverless persistence with Time Warp (\$0 idle cost) - [OMEGA] **OMEGA Ecosystem** - .bio firmware, OMEGA Lab, OMEGA Forge - **Neural Bridge** - NeuralTransducer projects $\text{Complex}^{2048} \rightarrow [8, 4096]$ soft prompt tokens for direct vLLM injection (Shadow Mode) - **Homeostatic Dreaming** - 3-stage selective dreaming: magnitude gate + phase sharpening + experience replay - **The Watcher** - Self-awareness via prediction error; surprise $\rightarrow$ dopamine loop - **Custom vLLM Server** - FastAPI wrapper with `/inject` endpoint for embedding-level conditioning - [HOT] **OMEGA Forge v3.0 "The Glass Foundry"** - Full neural firmware orchestration suite with React Flow canvas, catenary wire physics, Shadow Omega WebSocket tether, Omega Instance Registry, Reactor Core forge button, Void Mode - [HOT] **Omega Instance Registry** - Every OMEGA instance has unique ID/Name/endpoint; addressable by Forge via `omega_instance_registry` table - [HOT] **Shadow Omega Wiring** - Bi-directional WebSocket (`useShadowOmega()` hook) for real-time telemetry, edge rejection, stability-driven UI hue shift

Reference: PROJECT-GENESIS-OMEGA.md for complete OMEGA Protocol specification

PART 1: EXISTING ARCHITECTURE (PROMPTS 01-35)

1.1 Infrastructure Foundation (PROMPT-01 through PROMPT-03)

AWS CDK Infrastructure

Component	Description	Status
VPC Stack	Multi-AZ VPC with public/private subnets	[OK] Implemented
Database Stack	Aurora PostgreSQL with pgvector	[OK] Implemented
Database Scaling Stack	RDS Proxy, Async Writes, Redis Cache	[OK] Implemented (v5.52.20)
Cache Stack	ElastiCache Redis cluster	[OK] Implemented
Auth Stack	Cognito user pools	[OK] Implemented
API Stack	API Gateway + Lambda	[OK] Implemented
Storage Stack	S3 buckets for uploads/artifacts	[OK] Implemented
Monitoring Stack	CloudWatch dashboards + alarms	[OK] Implemented

PostgreSQL Scaling Infrastructure (v5.52.20)

Enterprise-grade scaling for parallel AI model execution supporting 100+ concurrent requests with 6 parallel model writes each.

Component	Purpose	Tier Availability
RDS Proxy	Connection pooling, Lambda cold-start optimization	2+
Async Write Queue	SQS-based batch writes for model results	2+
Redis Hot-Path Cache	Read-after-write consistency, rate limiting	2+

Component	Purpose	Tier Availability
Time-Based Partitioning	Monthly partitions for logs/usage tables	All
Materialized Views	Pre-computed dashboard metrics	All
Optimized RLS	Index-friendly tenant isolation policies	All

CDK Constructs: - DatabaseScalingConstruct - RDS Proxy with tier-based connection limits - AsyncWriteConstruct - SQS queue + batch writer Lambda - RedisCacheConstruct - ElastiCache cluster with cluster mode

Database Schema (Migrations 001-070)

Table	Purpose	Migration
tenants	Multi-tenant isolation	001
users	User accounts	002
api_keys	API authentication	003
sessions	Chat sessions	004
messages	Chat messages	005
ai_providers	20+ AI providers	007
ai_models	106 AI models	007
usage_records	Billing/usage	010
audit_logs	Compliance audit	015
mfa_backup_codes	MFA one-time recovery codes	070
mfa_trusted_devices	30-day device trust tokens	070
mfa_audit_log	MFA event audit log (partitioned)	070
*.detected_language	Auto-detected content language	071
*.search_vector_simple	Fallback tsvector for FTS	071
*.search_vector_english	Language-specific tsvector	071
model_versions	Self-hosted model version tracking	039
model_family_watchlist	HuggingFace discovery configuration	039
model_discovery_jobs	Discovery job history	039
model_deletion_queue	Soft delete queue with usage tracking	039
model_usage_sessions	Active session tracking for safe deletion	039

Multi-Language Search (Migration 071)

Feature	Implementation
pg_bigm Extension	Bi-gram indexing for CJK languages
Language Detection	detect_text_language () function
Unified Search	search_content () routes to FTS or bigm
18 Languages	en, es, fr, de, pt, it, nl, pl, ru, tr, ja, ko, zh-CN, zh-TW, ar, hi, th, vi

Swift Deployment Application

Feature	Description
One-Click Deploy	Complete infrastructure in single click
Account Management	AWS account configuration
Environment Selection	Dev/Staging/Prod
Progress Monitoring	Real-time deployment status
Rollback Support	Automatic rollback on failure

1.2 Lambda Functions (PROMPT-04 & PROMPT-05)

Core Lambda Functions

Function	Purpose	Trigger
auth-handler	Authentication/authorization	API Gateway
mfa-handler	MFA enrollment, verification, device trust	API Gateway
chat-handler	Chat completion requests	API Gateway
stream-handler	SSE streaming responses	API Gateway
models-handler	Model CRUD operations	API Gateway
providers-handler	Provider management	API Gateway
sessions-handler	Session management	API Gateway
usage-handler	Usage reporting	API Gateway

Admin Lambda Functions (62 Total - v5.52.6)

All admin Lambda handlers are wired to /api/admin/* routes with Cognito admin authorization.

Category	Count	Handlers
Cato Safety	5	cato, cato-genesis, cato-global, cato-governance, cato-pipeline
Security	6	security, security-schedules, api-keys, ethics, self-audit, mfa
Memory Systems	4	cortex, cortex-v2, blackboard, empiricism-loop
AI/ML	7	brain, cognition, ego, raws, inference-components, formal-reasoning, ethics-free-reasoning
Operations	5	gateway, sovereign-mesh, sovereign-mesh-performance, sovereign-mesh-scaling, hitl-orchestration
Reporting	4	reports, ai-reports, dynamic-reports, metrics
Configuration	7	tenants, invitations, library-registry, checklist-registry, collaboration-settings, system, system-config
Infrastructure	6	aws-costs, aws-monitoring, s3-storage, code-quality, infrastructure-tier, logs
Compliance	4	regulatory-standards, council, user-violations, approvals
Models	5	models, lora-adapters, pricing, specialty-rankings, sync-providers
Orchestration	2	orchestration-methods, orchestration-user-templates
Users	2	user-registry, white-label
Time & Translation	3	time-machine, translation, internet-learning
Learning	1	agi-learning

Implementation: packages/infrastructure/lib/stacks/api-stack.ts

Scheduled Lambda Functions

Function	Schedule	Purpose
billing-aggregator	Hourly	Aggregate usage for billing
thermal-manager	Every 5 min	Manage model thermal states
health-checker	Every minute	Provider health checks
usage-rollup	Daily	Daily usage summaries

Function	Schedule	Purpose
app-registry-sync	Daily 2 AM	Sync apps from Activepieces/n8n
app-health-check	Hourly	Check health of top 100 apps
hitl-sla-monitor	Every minute	Monitor HITL approval SLAs

SQS-Triggered Worker Lambdas

Function	Queue	Purpose
agent-execution-worker	agent-execution	Async OODA loop processing
transparency-compiler	transparency	Pre-compute decision explanations

1.2.1 Two-Factor Authentication (v5.52.28)

Role-based MFA enforcement using industry-standard TOTP (RFC 6238).

MFA Architecture

Required Roles (Cannot Bypass or Disable)

Role	MFA Required	Can Disable
super_admin	Yes	No
admin	Yes	No
operator	Yes	No
auditor	Yes	No
tenant_admin	Yes	No
tenant_owner	Yes	No

MFA Services

Service	Purpose
TOTPService	RFC 6238 TOTP generation/verification
BackupCodesService	One-time recovery codes (SHA-256)
DeviceTrustService	30-day device trust tokens

MFA API Endpoints

Endpoint	Method	Purpose
/api/v2/mfa/status	GET	MFA status, backup codes, devices
/api/v2/mfa/check	GET	Check if role requires MFA
/api/v2/mfa/enroll/start	POST	Generate TOTP secret
/api/v2/mfa/enroll/verify	POST	Verify and enable MFA
/api/v2/mfa/verify	POST	Verify code during login
/api/v2/mfa/backup-codes/regenerate	POST	Regenerate backup codes
/api/v2/mfa/devices	GET	List trusted devices
/api/v2/mfa/devices/:id	DELETE	Revoke device

Security Measures

Feature	Implementation
Secret Encryption	AES-256-GCM with scrypt key
Code Hashing	SHA-256
Clock Drift	+/-30 seconds

Feature	Implementation
Lockout	3 failures -> 5 min
Device Trust	30 days, max 5/user

UI Components

Component	Location
MFAEnrollmentGate	Full-screen forced enrollment
MFAVerificationPrompt	Code entry modal
MFASettingsSection	Settings management

Migration: 070_mfa_support.sql

1.3 Self-Hosted Models (PROMPT-06)

Model Categories

Category	Models	Instance Type
Vision Classification	EfficientNet-B0/B4/V2-L, ConvNeXt, ViT	ml.g4dn.xlarge - ml.g5.2xlarge
Object Detection	YOLOv8n/m/x, DETR, Grounding DINO	ml.g4dn.xlarge - ml.g5.4xlarge
Segmentation	SAM, SAM2, MobileSAM, Mask R-CNN	ml.g5.xlarge - ml.g5.12xlarge
Audio/Speech	Whisper Large V3, Whisper Turbo, TitaNet, Pyannote	ml.g4dn.xlarge - ml.g5.xlarge
Scientific	ESM-2 3B, AlphaFold2, Protenix, AlphaGeometry	ml.g5.12xlarge - ml.p4d.24xlarge
Medical	nnU-Net, MedSAM	ml.g5.2xlarge
Geospatial	Prithvi 100M/600M	ml.g5.xlarge - ml.g5.4xlarge
3D Reconstruction	NeRFstudio, Gaussian Splatting	ml.g5.4xlarge - ml.g5.12xlarge

Thermal State Management

State	Description	Instance Status
OFF	No instances running	Terminated
COLD	Scaled to zero, starts on demand	Terminated
WARM	Minimum instances ready	Running
HOT	Maximum instances for high load	Running
AUTOMATIC	Auto-scale based on demand	Variable

1.4 External AI Providers (PROMPT-07)

Provider Integration

Provider	Models	Auth Type
Anthropic	Claude 4 Opus, Claude 4 Sonnet, Claude Haiku 3.5	API Key
OpenAI	GPT-4o, GPT-4o-mini, o1, o1-mini	API Key
Google	Gemini 2.0 Flash, Gemini 1.5 Pro/Flash	API Key
AWS Bedrock	Claude, Titan, Llama	IAM
Azure OpenAI	GPT-4, GPT-4 Turbo	API Key + Endpoint
Mistral	Mistral Large, Codestral	API Key
Cohere	Command R+, Embed	API Key
Groq	Llama 3.1 70B/8B, Mixtral	API Key
Together	Llama, Qwen, DeepSeek	API Key
Fireworks	Llama, Mixtral, FireFunction	API Key
DeepSeek	DeepSeek Chat, DeepSeek Coder	API Key
Perplexity	Sonar Large/Small	API Key
xAI	Grok 2, Grok 2 Mini	API Key
Alibaba	Qwen Max, Qwen Plus, Qwen Turbo	API Key

Unified Model Access via LiteLLM

```
interface ModelRequest {
  model: string;           // e.g., "claude-sonnet-4"
  messages: Message[];
  maxTokens?: number;
```

```
temperature?: number;  
stream?: boolean;  
}
```

1.5 Admin Web Dashboard (PROMPT-08)

Dashboard Pages

Page	Purpose
/dashboard	Overview metrics, quick actions
/models	Model registry, thermal controls
/models/[id]	Model detail, usage stats
/providers	Provider management, health status
/tenants	Tenant management
/tenants/[id]	Tenant detail, usage, config
/users	User management
/billing	Usage reports, invoicing
/audit	Audit log viewer
/settings	System configuration

Tech Stack

Component	Technology
Framework	Next.js 14 (App Router)
UI Library	shadcn/ui + Tailwind CSS
State	React Query + Zustand
Auth	AWS Amplify + Cognito
Charts	Recharts

1.6 Genesis Cato Safety Architecture (PROMPT-34)

Cato Components

Component	Purpose
Precision Governor	Limits confidence based on epistemic uncertainty
Control Barrier Functions (CBF)	Hard safety constraints (PHI, PII, Cost, Rate, Auth)
Epistemic Recovery	Detects and recovers from cognitive stalls
Persona Service	5 personas with different behavioral profiles
Sensory Veto	Blocks dangerous outputs
Merkle Audit Trail	Immutable compliance logging

Personas

Persona	Description	Default Gamma
Balanced	Default mood, well-rounded	2.0
Focused	Task-oriented, efficient	3.0
Curious	Exploratory, asks questions	1.5
Creative	Imaginative, divergent thinking	1.2
Scout	Recovery persona for cognitive stalls	1.0

Control Barrier Functions

Barrier	Type	Critical
PHI Protection	phi	Yes
PII Protection	pii	Yes
Cost Ceiling	cost	Yes
Rate Limit	rate	No
Authorization	auth	Yes
BAA Required	custom	Yes

Consciousness Persistence (v5.52.12)

Database-backed persistence for Cato consciousness state, ensuring survival across Lambda cold starts.

Service	Purpose
Global Memory Service	4-tier memory (episodic/semantic/procedural/working)
Consciousness Loop Service	State machine (IDLE->PROCESSING->REFLECTING->DREAMING->PAUSED)

Service	Purpose
Neural Decision Service	Affect->hyperparameter mapping for Bedrock model selection
Dream Scheduler Service	Twilight (4 AM) + low-traffic + starvation triggers

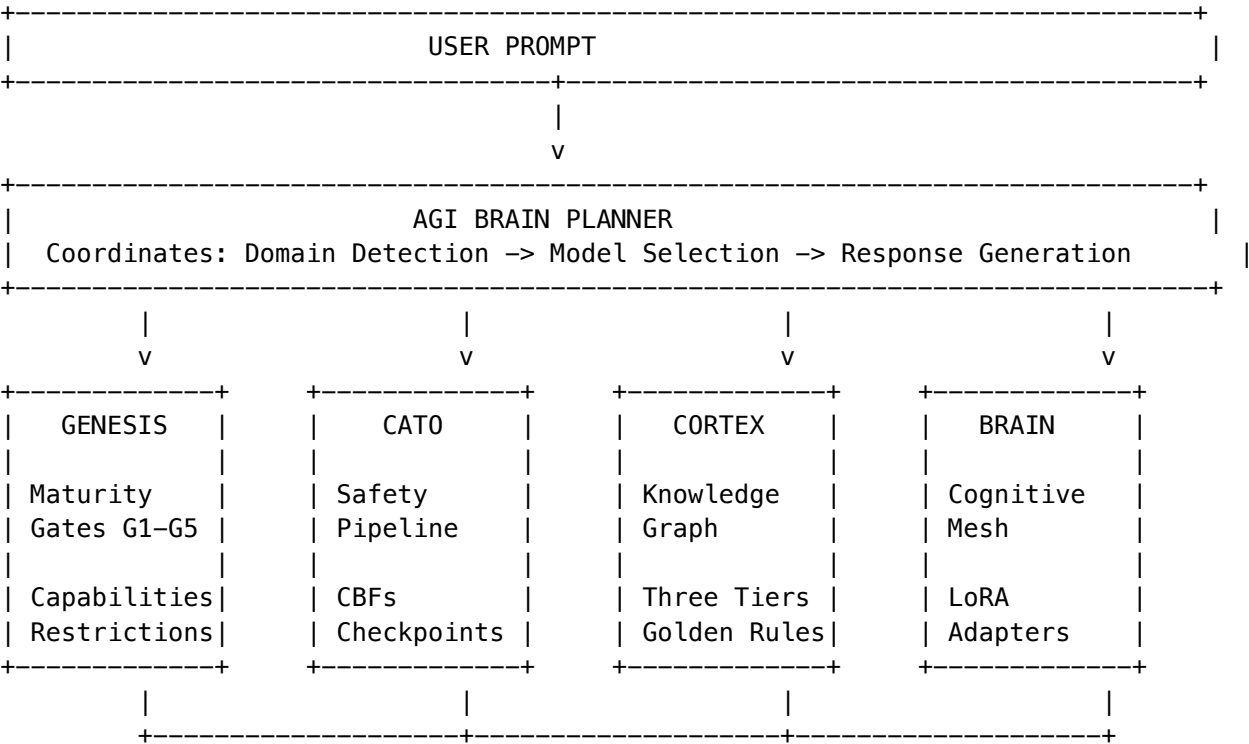

Table	Purpose
cato_global_memory	Persistent memory with importance weighting
cato_consciousness_state	Loop state, awareness level, active thoughts
cato_consciousness_config	Per-tenant consciousness configuration
cato_consciousness_metrics	Cycle metrics, thoughts processed, dream cycles

Migration: V2026_01_24_002__cato_consciousness_persistence.sql

1.6.1 Unified AGI Architecture: Brain, Genesis, Cortex, and Cato

RADIANT’s AGI capabilities are built on four interconnected subsystems that work together to provide intelligent, safe, and enterprise-ready AI orchestration.

Architecture Overview

System Roles

System	Purpose	Key Service
Brain	AGI planning, cognitive mesh, model orchestration	agi-brain-planner.service.ts
Genesis	Developmental gates, capability unlocking, maturity stages	cato/genesis.service.ts
Cortex	Tiered memory (Hot/Warm/Cold), knowledge graph, Graph-RAG	cortex-intelligence.service.ts
Cato	Safety pipeline, CBFs, governance presets, HITL checkpoints	cato/safety-pipeline.service.ts

Integration Flow

1. **Brain** receives user prompt and coordinates plan generation
2. **Cortex** provides knowledge density insights to boost domain detection confidence
3. **Genesis** checks maturity stage and applies capability restrictions
4. **Cato** runs safety pipeline (Sensory Veto -> Precision Governor -> CBFs -> Entropy -> Fracture)
5. **Brain** selects model using Cortex recommendations and LoRA adapters
6. **Cato-Cortex Bridge** syncs memories and handles GDPR erasure

Governance Presets

Preset	Friction	Auto-Approve	Checkpoints
PARANOID [SHIELD]	1.0	0.0	All ALWAYS
BALANCED	0.5	0.3	CONDITIONAL
COWBOY [LAUNCH]	0.1	0.8	NEVER/NOTIFY

Genesis Maturity Stages

Stage	Capabilities	Restrictions
EMBRYONIC	Basic chat	No external actions

Stage	Capabilities	Restrictions
NASCENT	Context retention	Limited autonomy
DEVELOPING	Ethics checks	Requires checkpoints
MATURING	Checkpoint system	Some autonomous actions
MATURE	Full capability	Minimal restrictions

Cortex Memory Tiers

Tier	Storage	Latency	Retention
Hot	Redis + DynamoDB	<10ms	0-24 hours
Warm	Neptune/pgvector	<100ms	1-90 days
Cold	S3 Iceberg	1-10s	90d-7 years

Cato Safety Pipeline

Step	Component	Purpose
1	Sensory Veto	Immediate halt signals
2	Precision Governor	Limits confidence
3	Redundant Perception	PHI/PII detection
4	Control Barrier Functions	Hard safety constraints
5	Semantic Entropy	Deception detection
6	Fracture Detection	Alignment verification

Detailed Documentation: See ENGINEERING-IMPLEMENTATION-VISION.md Section 21 for full engineering reference.

1.6.2 Universal Envelope Protocol (UEP) v2.0

UEP v2.0 provides standardized wrapping for all AI interactions across RADIANT, enabling unified tracing, compliance, and storage.

Architecture

Envelope Structure

Field	Type	Purpose
envelopeId	UUID	Unique envelope identifier
specversion	'2.0'	Protocol version
type	string	Event type (e.g., ai.model.response)
source	object	Origin (system, component, tenant)
payload	object	Input/output data with tokens
tracing	object	Distributed trace context
compliance	object	PHI/PII flags, retention, frameworks
riskSignals	object	Safety scores and flags

Integration Points

Service	Type	Description
Model Router	ai.model.response	All model completions
Cato Pipeline	cato.method.*	Pipeline method envelopes
AGI Orchestrator	agi.orchestration.*	Multi-model orchestration
Brain Router	brain.router.responses	Domain-aware routing
Response Synthesis	synthesis.*	Ensemble/merge results

Storage Tiers

Tier	Storage	Retention	Latency
Hot	Redis/ElastiCache	0-24h	<10ms
Warm	PostgreSQL (uds_envelopes)	1-90 days	<100ms
Cold	S3 Standard-IA	90d-7 years	1-10s

Tier	Storage	Retention	Latency
Glacier	S3 Glacier	7+ years	1-12h

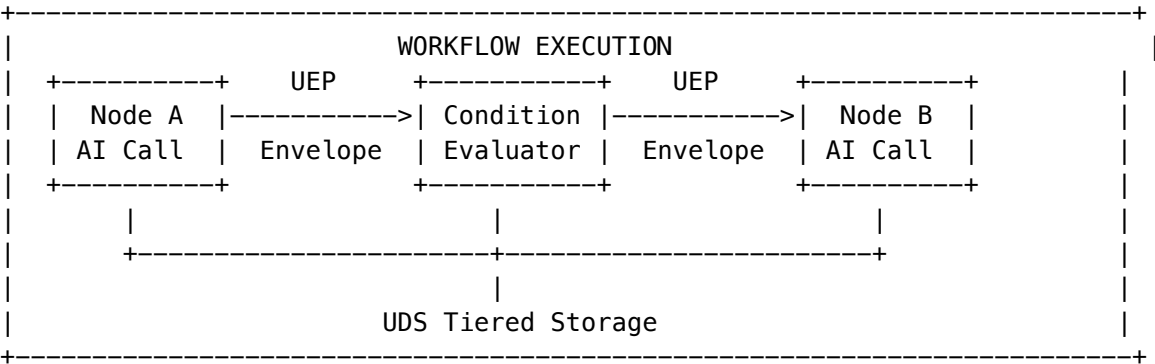

Key Files

File	Purpose
services/uep/integration.service.ts	Platform-wide adapters
services/uep/uds-storage-adapter.service.ts	UDS tiered storage
services/uep/compliance.service.ts	PHI/PII detection
services/uep/security.service.ts	Encryption/signing
migrations/000_consolidated_schema.sql	Database schema

Documentation: See UEP-V2-SPECIFICATION.md for complete specification.

1.6.3 Workflow UEP Integration

UEP v2.0 is fully integrated into the workflow orchestration system with model-agnostic condition evaluation.

Key Design Principle: CONDITIONS ARE MODEL-AGNOSTIC - Conditions evaluate OUTPUT CONTENT, not model identity - Users can swap AI models without breaking workflow logic - Model info captured for tracing/debugging only

Condition Types: | Type | Description | Cost | |----| |----| | expression | JavaScript-like expressions | Free | | ai_interpreted | Natural language quality checks | ~\$0.001/eval | | composite | AND/OR/NOT combinations | Sum of parts |

Stream Evaluation Modes (for parallel model outputs): | Mode | Description | |----| |----| | all | All streams must pass | | any | Any stream sufficient | | majority | >50% must pass | | best | Highest confidence | | quorum | Configurable threshold |

Key Files: | File | Purpose | |----| |----| | services/workflow/uep-node.service.ts | Central UEP integration | | workflow-engine.ts | UEP-aware execution methods | | migrations/000_consolidated_schema.sql | Database schema |

Documentation: See WORKFLOW-UEP-ARCHITECTURE.md for complete guide.

1.7 Pricing System (v4_12_pricing_system.ts)

Price Calculation

```
interface ModelPriceAnalysis {
  modelId: string;
  displayName: string;

  // Raw costs
  rawCosts: {
    inputCostPer1k: number;
    outputCostPer1k: number;
    baseCostPer1k: number;
  };

  // Calculated prices (with markup)
  calculatedPrices: {
    inputPrice: number;
    outputPrice: number;
    totalPrice: number;
  };

  // Admin info
  adminCostInfo: {
    actualCost: number;
    marginAmount: number;
    marginPercent: number;
  };
}
```

Tier Pricing

Tier	Name	Monthly Base	Models Available
1	SEED	\$200	Basic external only
2	SPROUT	\$500	+ Vision, Audio
3	GROWTH	\$2,000	+ Scientific, Medical
4	SCALE	\$10,000	+ All self-hosted
5	ENTERPRISE	\$50,000+	Full platform + custom

1.8 Compliance Frameworks

HIPAA Compliance

Requirement	Implementation
PHI Detection	Real-time scanning via CBF
BAA Tracking	Tenant-level BAA verification
Access Controls	RBAC + tenant isolation
Audit Trail	Merkle-tree immutable logs
Encryption	AES-256 at rest, TLS 1.3 in transit

SOC 2 Type II

Control	Implementation
Access Control	Cognito + API keys + RBAC
Change Management	CDK deployments with approvals
Incident Response	CloudWatch alarms + PagerDuty
Data Protection	Encryption + backup policies

GDPR

Requirement	Implementation
Right to Erasure	Tenant data deletion API
Consent Tracking	Consent table with timestamps
Data Portability	Export API for tenant data
DPO Contact	Configurable per deployment

FDA 21 CFR Part 11

Requirement	Implementation
Electronic Signatures	Multi-factor auth + timestamp
Audit Trails	Immutable Merkle audit
System Validation	Deployment verification
Access Controls	Role-based with approval workflows

1.9 Neural Network Routing

Model Selection Algorithm

The routing system optimizes across three dimensions:

Dimension	Weight	Description
Accuracy	0.4	Model performance for task type
Verifiability	0.3	Can we prove correctness (ECD score)
Cost	0.3	Token cost optimization

Routing Logic

```
interface RoutingDecision {
  selectedModel: string;
  routingReason: string;
  alternatives: ModelCandidate[];

  // Optimization scores
  accuracyScore: number;
  verifiabilityScore: number;
  costScore: number;
  combinedScore: number;
}
```

1.10 War Room Orchestration

War Room Phases

Phase	Role	Model
Proposer	Generate initial response	Claude Opus/Sonnet
Security Critic	Check for vulnerabilities	Claude Opus
Efficiency Critic	Check for waste	GPT-4o
Factual Critic	Verify claims	Gemini Pro
Decider	Synthesize final response	Claude Opus

Execution Modes

Mode	Description	Cost
Sniper	Single model, direct response	~\$0.01
War Room	Full multi-model debate	~\$0.50

Mode	Description	Cost
Hybrid	Sniper with escalation to War Room	Variable

1.11 Truth Engine (ECD Verification)

Entity-Context Divergence

$$ECD = |\{\text{ungrounded entities}\}| / |\{\text{total entities}\}|$$

ECD Score	Interpretation	Action
0.00-0.05	Highly grounded	Accept
0.05-0.10	Mostly grounded	Accept with note
0.10-0.20	Partially grounded	Flag for review
0.20+	Significant hallucination	Reject/Refine

1.11 AXIOM Scorers (v6.0.0)

The AXIOM Scorers are 8 lightweight MLPs (~50K-1M params each) for intelligent prompt optimization.

The 8 Scorers

Scorer	Input	Output	Purpose
Domain	1536	800	Classifies queries into domain taxonomy
CLARION	1536	1	Scores question relevance
Pattern	3072	1	Ranks prompt patterns
Model	1536	106	Scores models for task
Topology	512	9	Evaluates orchestration modes
Combination	640	1	Scores multi-model combos
Variant	1536	1	Scores prompt variants
User	128	64	Personalizes via Ghost Vector

Key Files

File	Purpose
lambda/shared/services/axiom-neural-cortex.service.ts	Inference client
lambda/shared/services/axiom.service.ts	Pipeline (Model/Topology scorers)
lambda/shared/services/clarion.service.ts	CLARION Scorer integration
packages/shared/src/types/axiom-clarion.types.ts	Scorer type definitions
migrations/000_consolidated_schema.sql	Database schema

Database Tables

Table	Purpose
axiom_network_status	Scorer thermal state and metrics
axiom_network_inference_log	Inference log for training
axiom_network_training_batches	CATO training tracking
domain_taxonomy_embeddings	Domain centroids for fallback

Thermal States

Scorers have thermal states (cold/warm/hot) that control inference: - **Cold**: Uses heuristic fallbacks - **Warm**: Sage-Maker endpoint ready - **Hot**: Multiple replicas for high traffic

1.12 Mid-Level Services (MLS) Architecture v5.0.0

Mid-Level Services (MLS) are domain-specific orchestration services that combine multiple AI models to provide unified capabilities for specific use cases. MLS sits between the low-level model APIs and high-level application logic.

Architecture Overview

		SAM/SAM2		AlphaFold		nnU-Net		100M/		3D Gaussian		
		CLIP		AlphaGeom		Whisper		600M				
		Dino		Protenix								
	+-----++-----++-----++-----+ +-----+ +-----+ +-----+ +-----+											
	SageMaker Endpoints											
+-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+												
	Thermal Manager (EventBridge + SQS)											
+-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+ +-----+												

Key Design Principles

Principle	Description
Orchestration	Services combine 2-8 models for complex pipelines
Graceful Degradation	Services remain functional when optional models are offline
Thermal Awareness	Auto-warms models on first request, scales to zero when idle
Tier-Gated Access	Different services available at different subscription tiers
Unified Pricing	Per-use pricing abstracts underlying model costs
Compliance-Ready	HIPAA, SOC 2, GDPR compliant by design

Service Summary

Service	Domain	Min Tier	Required Models	Optional Models	Endpoints
Perception	Computer Vision	3 (GROWTH)	yolov8m, mobilesam	yolov8x, sam-vit-h, sam2, clip, grounding-dino	4
Scientific	Computational Biology	4 (SCALE)	esm2-3b	alphafold2, alphageometry, protenix	3
Medical	Healthcare Imaging	4 (SCALE)	medsam	nnunet, whisper-large-v3	3
Geospatial	Satellite Imagery	4 (SCALE)	prithvi-100m	prithvi-600m	2
Reconstruction	3D Generation	4 (SCALE)	nerfstudio	3d-gaussian-splatting	2

Request Flow

1. Request -> API Gateway -> MLS Router Lambda
2. Router checks: tenant tier, service state, model availability
3. If model COLD -> Return 202 Accepted, queue warm-up via SQS
4. If model WARM/HOT -> Route to SageMaker endpoint
5. Orchestrate multi-model pipeline if needed

6. Return response with usage metrics
7. EventBridge triggers scale-down after idle period

Perception Service

Purpose: Unified computer vision pipeline for object detection, segmentation, classification, and analysis.

Endpoint	Description	Input	Output
/perception/detect	Object detection with bounding boxes	image/*	JSON
/perception/segment	Object/region segmentation	image/*	JSON, PNG mask
/perception/classify	Image classification	image/*	JSON
/perception/analyze	Full pipeline: detect + segment + classify	image/*	JSON

Models: YOLOv8m/x, YOLOv11x, MobileSAM, SAM-ViT-H, SAM2, CLIP-ViT-L14, Grounding-DINO, EfficientNetV2-L

Pricing: \$0.02/image, \$0.50/minute video (40% margin)

Scientific Service

Purpose: Protein analysis, embeddings, structure prediction, and computational biology pipelines.

Endpoint	Description	Input	Output
/scientific/protein/embed	Generate protein sequence embeddings	FASTA, JSON	JSON
/scientific/protein/fold	Predict protein 3D structure	FASTA	PDB, mmCIF, JSON
/scientific/geometry/solve	Solve mathematical geometry problems	JSON	JSON

Models: ESM-2 3B, AlphaFold2, AlphaGeometry, Protenix

Pricing: \$0.50/request (40% margin)

Medical Service (HIPAA Compliant)

Purpose: HIPAA-compliant medical image segmentation, analysis, and transcription.

Endpoint	Description	Input	Output
/medical/segment	2D anatomical segmentation	DICOM, PNG, JPEG	JSON, PNG
/medical/segment/3d	Volumetric 3D CT/MRI segmentation	DICOM, NiftI	NiftI, JSON

Endpoint	Description	Input	Output
/medical/transcribe	Medical dictation transcription	WAV, MP3, M4A	JSON, text

Models: MedSAM, nnU-Net, Whisper Large v3

Compliance: PHI sanitization, 6-year retention, full audit logging, BAA required

Pricing: \$0.15/image, \$0.08/minute audio (40% margin)

Geospatial Service

Purpose: Satellite imagery analysis, land classification, and earth observation.

Endpoint	Description	Input	Output
/geospatial/classify	Land use and land cover classification	GeoTIFF	JSON, GeoTIFF
/geospatial/change-detect	Detect changes between satellite images	GeoTIFF	JSON, GeoTIFF

Models: Prithvi 100M, Prithvi 600M (NASA/IBM)

Pricing: \$0.05/image (40% margin)

3D Reconstruction Service

Purpose: Neural Radiance Fields (NeRF) and 3D Gaussian Splatting for 3D scene reconstruction.

Endpoint	Description	Input	Output
/reconstruction/nerf	3D scene from images using NeRF	MP4, images	GLTF, OBJ, MP4
/reconstruction/gaussian	Real-time 3D via Gaussian Splatting	MP4, images	PLY, GLTF

Models: Nerfstudio, 3D Gaussian Splatting

Pricing: \$5.00/3D model (40% margin)

Thermal State Management

State	Description	Response Time	Cost
OFF	Model not deployed	N/A	\$0
COLD	Endpoint exists, 0 instances	2-5 min warm-up	Minimal
WARM	1+ instances running	Seconds	Instance hours
HOT	Max instances, autoscaling	<1 second	Higher
AUTOMATIC	System-managed	Variable	Optimized

Warm-up Triggers: On-Demand (202 Accepted), Scheduled (EventBridge), Predictive (usage patterns), Manual (admin)

Model Registry (38 Self-Hosted Models)

Category	Count	Examples
Computer Vision	19	YOLOv8/11, SAM/SAM2, CLIP, EfficientNet
Audio/Speech	6	Whisper, TitaNet, pyannote
Scientific	4	AlphaFold2, ESM-2, AlphaGeometry
Medical	2	MedSAM, nnU-Net
Geospatial	2	Prithvi 100M/600M
Generative/3D	5	Nerfstudio, 3D Gaussian, Llama 3, Qwen

Graceful Degradation

Level	Description	Example
FULL	All models available	All capabilities active
REDUCED	Only required models	HD features disabled
MINIMAL	Partial required models	Limited capabilities

Database Schema

```
-- Thermal state tracking
CREATE TABLE mls_model_thermal_states (
  model_id TEXT PRIMARY KEY,
  thermal_state thermal_state_enum DEFAULT 'OFF',
  current_instances INTEGER DEFAULT 0,
  max_instances INTEGER DEFAULT 10,
  last_request_at TIMESTAMPTZ,
  warm_up_started_at TIMESTAMPTZ,
  warm_up_completed_at TIMESTAMPTZ,
  scale_down_scheduled_at TIMESTAMPTZ,
  updated_at TIMESTAMPTZ DEFAULT NOW()
);

-- Service state and health
CREATE TABLE mls_service_states (
  service_id TEXT PRIMARY KEY,
  tenant_id UUID REFERENCES tenants(id),
  state service_state_enum DEFAULT 'RUNNING',
  degradation_level TEXT DEFAULT 'FULL',
  required_models_available BOOLEAN DEFAULT true,
  optional_models_count INTEGER DEFAULT 0,
```

```
last_health_check_at TIMESTAMPTZ,  
updated_at TIMESTAMPTZ DEFAULT NOW()  
);
```

Key Files

Component	Path

PART 2: NEW IN VERSION 5.0 (THE SOVEREIGN MESH)

2.1 Agent Registry

Purpose

Agents are long-running AI workers that accept goals and run OODA loops to achieve them. Unlike Methods (single-step reasoning), Agents iterate until complete or budget exhausted.

Database Tables

Table	Purpose
agents	Agent definitions, capabilities, AI config
agent_executions	Execution history, OODA state, artifacts

Agent Categories

Category	Use Case	Examples
research	Web research, document analysis	Research Agent
coding	Code generation, debugging	Coding Agent
data	Data processing, visualization	Data Agent
outreach	Lead gen, email campaigns	LeadGen Agent
creative	Content generation, editing	Editor Agent
operations	DevOps, monitoring	Ops Agent
custom	User-defined	Any

Built-in Agents

Agent	Category	Budget	Timeout	HITL
Research Agent	research	\$2-10	30 min	No
Coding Agent	coding	\$3-15	45 min	No
Data Agent	data	\$2.50-20	60 min	No
LeadGen Agent	outreach	\$5-50	120 min	Yes
Editor Agent	creative	\$1.50-5	30 min	No

OODA Loop

2.2 App Registry

Purpose

The App Registry provides access to 3,000+ third-party app integrations, auto-synced from open-source projects (Activepieces, n8n).

Database Tables

Table	Purpose
apps	App definitions (triggers, actions, auth)
app_sync_logs	Daily sync history
app_health_checks	Hourly health monitoring

Table	Purpose
app_connections	Per-tenant OAuth/API credentials
app_learned_inferences	AI learning loop corrections

Sync Schedule

Task	Schedule	Description
Full Sync	Daily 2 AM UTC	Pull latest from Activepieces/n8n repos
Health Check	Hourly	Test top 100 apps by usage
Cache Cleanup	Daily 3 AM UTC	Clear expired definitions

App Sources

Source	License	Apps
Activepieces	MIT	~500+
n8n	Fair Code	~400+
Native	Proprietary	~50
Custom	Per-tenant	Variable

2.3 AI Helper Service (Parametric AI)

Purpose

The AI Helper Service enables AI assistance for any component in the system. Each component can independently enable/disable specific AI capabilities.

Configuration Structure

```
interface AIHelperConfig {
  enabled: boolean; // Master switch

  disambiguation?: {
    enabled: boolean;
    model?: string;
    confidenceThreshold?: number;
  };

  parameterInference?: {
    enabled: boolean;
```

```
  model?: string;
  examples?: Array<{ input: string; inferred: Record<string, unknown> }>;
};

errorRecovery?: {
  enabled: boolean;
  model?: string;
  maxAttempts?: number;
  strategies?: Array<{ error: string; recovery: string }>;
};

validation?: {
  enabled: boolean;
  model?: string;
  checks?: Array<{ field: string; check: string; severity: 'warning' | 'error' }>;
};

explanation?: {
  enabled: boolean;
  model?: string;
};
}
```

Capabilities

Capability	Purpose	Default Model
Disambiguation	Resolve unclear inputs	claude-haiku-35
Parameter Inference	Fill missing parameters	claude-haiku-35
Error Recovery	Suggest fixes for errors	claude-haiku-35
Validation	Check before execution	claude-sonnet-4
Explanation	Explain what was done	claude-haiku-35

Config Merging

Configuration merges in order: **System -> Tenant -> Component**

Each level can override or disable capabilities from the previous level.

2.4 Pre-Flight Provisioning

Purpose

Before any workflow executes, Pre-Flight checks all requirements: - Required apps are connected - OAuth tokens are valid - Budget is available - Required agents exist

Database Tables

Table	Purpose
workflow_blueprints	Generated workflow structure
capability_checks	Individual requirement checks

Pre-Flight Flow

PRE-FLIGHT SEQUENCE
1. BLUEPRINT GENERATION - Parse user intent - Generate workflow DAG - Identify required capabilities
2. CAPABILITY SCAN - List all apps needed - List all agents needed - List all tools needed
3. CREDENTIAL CHECK - For each app: check OAuth/API key exists - For each app: verify token not expired - Generate auth URLs for missing
4. RESOURCE ESTIMATION - Estimate token usage - Estimate cost - Estimate duration
5. USER PROMPT (if needed) - Show missing connections - Provide OAuth links - Wait for user to connect
6. EXECUTE (only when all green)

2.5 Transparency Layer

Purpose

The Transparency Layer captures every decision Cato makes, enabling: - Explainability for enterprise customers - Compliance audit trails - Debugging and optimization

Database Tables

Table	Purpose
cato_decision_events	Every routing/selection decision
cato_war_room_deliberations	Phase-by-phase debate capture
cato_decision_explanations	Pre-computed explanations

Decision Types

Type	Description
model_selection	Which model to use
workflow_selection	Sniper vs War Room
mode_selection	Execution mode
agent_selection	Which agent for task
tool_selection	Which tools to enable
safety_evaluation	Governor/CBF decisions
cost_optimization	Cost-based choices

Explanation Tiers

Tier	Audience	Content
summary	End user	1-2 sentence summary
standard	Power user	Key factors, alternatives
detailed	Admin	Full reasoning chain
audit	Compliance	Everything + context

2.6 HITL Approval Queues

Purpose

Human-in-the-Loop approval workflows for high-stakes decisions: - Agent plans in regulated industries - High-cost operations - Sensitive data access

Database Tables

Table	Purpose
hitl_queue_configs	Queue definitions
hitl_approval_requests	Pending approvals
hitl_reviewer_assignments	Who can approve

Trigger Types

Trigger	Description
workflow_step	Specific step requires approval
ecd_threshold	Truth Engine score too high
domain_match	Medical/Legal/Financial domain
cost_threshold	Operation exceeds cost limit
agent_plan	Agent's proposed actions
always	Every execution

SLA Management

Priority	Default Timeout	Escalation
critical	15 minutes	Immediate
high	30 minutes	After 15 min
normal	60 minutes	After 30 min
low	4 hours	After 2 hours

2.7 Execution History & Replay

Purpose

Time-travel debugging for workflows: - See exact state at each step - Replay with modified inputs - Compare execution runs

Database Tables

Table	Purpose
execution_snapshots	State capture per step
replay_sessions	Replay configurations

Snapshot Content

Field	Content
input_state	Input to the step
output_state	Output from the step
internal_state	Working memory
model_id	Model used
governor_state	Cato’s state
cbf_evaluation	Safety check results
cost_usd	Step cost
tokens_used	Token consumption

Replay Modes

Mode	Description
full	Replay entire execution
from_step	Replay from specific step
modified_input	Replay with changed inputs

PART 3: INTEGRATION GUIDE

3.1 How AI Helper Integrates with Existing Components

Model Router Integration

```
// In model-router.service.ts

async selectModel(request: ModelSelectionRequest): Promise<ModelSelection> {
  // ... existing routing logic ...

  // NEW: If multiple models match equally, use AIHelper
  if (candidates.length > 1 && this.aiHelper) {
    const disambiguated = await this.aiHelper.disambiguate({
      input: request.query,
      candidates: candidates.map(c => ({
        id: c.id,
        label: c.displayName,
        confidence: c.score,
      })),
    }, request.tenantId);

    if (disambiguated.resolved) {
      return candidates.find(c => c.id === disambiguated.selectedId);
    }
  }

  // ... continue with existing logic ...
}
```

Connector Integration

```
// In any connector (e.g., salesforce.connector.ts)

async createOpportunity(params: CreateOpportunityParams): Promise<Opportunity> {
  // NEW: Use AIHelper for parameter inference
  if (this.aiHelperConfig.parameterInference?.enabled) {
    const inferred = await this.aiHelper.inferParameters({
      targetApp: 'salesforce',
      targetAction: 'createOpportunity',
    });
  }
}
```

```

        providedParams: params,
        missingParams: this.getMissingRequired(params),
    }, this.tenantId);

    params = { ...params, ...inferred.inferred };
}

// NEW: Use AIHelper for validation
if (this.aiHelperConfig.validation?.enabled) {
    const validation = await this.aiHelper.validate({
        app: 'salesforce',
        action: 'createOpportunity',
        params,
    }, this.tenantId);

    if (!validation.isValid) {
        throw new ValidationError(validation.issues);
    }
}

try {
    return await this.salesforceClient.create('Opportunity', params);
} catch (error) {
    // NEW: Use AIHelper for error recovery
    if (this.aiHelperConfig.errorRecovery?.enabled) {
        const recovery = await this.aiHelper.suggestRecovery({
            error: { code: error.code, message: error.message },
            action: { app: 'salesforce', action: 'createOpportunity', params },
            attemptNumber: 1,
        }, this.tenantId);

        if (recovery.canAutoRecover && recovery.modifiedParams) {
            return await this.salesforceClient.create('Opportunity', recovery.modifiedParams);
        }
    }
    throw error;
}
}

```

Cato Safety Pipeline Integration

// In cato-safety-pipeline.service.ts

```

async evaluate(request: SafetyRequest): Promise<SafetyResult> {
    // NEW: Log decision event for transparency
    const decisionEventId = await this.transparency.startDecisionEvent({
        tenantId: request.tenantId,
        type: 'safety_evaluation',
        input: request,
    });
}

```

```
// ... existing safety logic (Governor, CBF, Veto) ...

// NEW: Complete decision event
await this.transparency.completeDecisionEvent(decisionEventId, {
  output: result,
  governorState: governorResult.state,
  cbfEvaluations: cbfResult.evaluations,
});

return result;
}
```

3.2 Database Migration Order

Execute in this order:

1. **Existing (001-067)** - Already implemented
2. **V2026_01_20_003** - Agent Registry
3. **V2026_01_20_004** - App Registry
4. **V2026_01_20_005** - AI Helper Service
5. **V2026_01_20_006** - Pre-Flight Provisioning
6. **V2026_01_20_007** - Transparency Layer
7. **V2026_01_20_008** - HITL Approval Queues
8. **V2026_01_20_009** - Execution History
9. **V2026_01_20_010** - Seed Data (Built-in Agents, Sample Apps)
10. **V2026_01_21_005** - AI Reports (brand_kits, report_templates, generated_reports, report_smart_insights, report_exports, report_chat_history, report_schedules)
11. **139_cartridge_pki_kms.sql** - Cartridge PKI KMS Integration (key_id, key_arn columns, pki_audit_log table)
12. **140_mls_message_layer_security.sql** - MLS RFC 9420 (7 tables for group encryption)
13. ****V2026_01_28_001__environment_state_registry.sql**** - Environment State Registry (manifests, sync_config, sync_operations, backups, restores, persistent_data, audit_log)
14. ****V2026_02_05_005__inference_cache_heterogeneous_consensus.sql**** - Inference Response Cache (4 tables: config, entries, events, metrics; 3 helper functions) + Heterogeneous Model Consensus (5 tables: config, evaluations, responses, pairwise_agreements, metrics). Full RLS on all tables.
15. ****V2026_02_06_006__user_identity_refactor.sql**** - Single-Tenant User Model, Licensing & Auth Config (v7.23.0). Reverses v7.22.0 multi-tenant model: users.tenant_id NOT NULL, UNIQUE(tenant_id, email), UNIQUE(tenant_id, cognito_user_id). Adds feature access flags (6 apps), invitation tracking, deactivation/deletion, soft permissions (JSONB), usage tracking directly on users table. Creates tenant_licenses (flexible multi-dimension licensing: seats, storage, retention, compliance, add-ons), license_catalog (24 seeded entries: 5 app seats, 1 storage, 1 retention, 12 compliance, 5 add-ons), license_audit (all license changes logged), tenant_auth_config (per-tenant MFA, SSO, session timeout, invitation expiry, HIPAA mode). 9 functions: deactivate_user, request_user_deletion, cancel_user_deletion, check_tenant_license, get_available_seats, consume_seat, release_seat, reserve_seat, activate_reserved_seat. Updates user_admin_actions with 18 action types including licensing events. Drops tenant_users, users_by_tenant view. RLS on all new tables.
16. ****V2026_02_06_007__model_weights_drift_correction_admin_ai.sql**** - Model Weights, Drift Correction & Admin AI Helper (v7.24.0). 6 tables: model_weight_config (per-tenant per-model 5-factor compos-

ite weights with quarantine/fallback/correction), `model_weight_history` (weight calculation audit trail), `drift_correction_actions` (correction action log), `bedrock_model_registry` (global discovered Bedrock models), `admin_ai_helper_config` (per-tenant AI helper settings with auto-upgrade and polling), `admin_ai_helper_conversations` (conversation history). 5 functions: `calculate_composite_weight`, `apply_drift_penalty`, `quarantine_model`, `unquarantine_model`, `get_weighted_models`. RLS on tenant-scoped tables. Auto-update trigger on `model_weight_config`.

3.2.2 MLS (Message Layer Security) RFC 9420 Implementation

RFC 9420-inspired group encryption for secure agent-to-agent communication. Provides cryptographic guarantees essential for multi-agent AI systems where agents communicate across trust boundaries.

Why MLS for Agent-to-Agent Communication?

Challenge	MLS Solution
Agents join/leave dynamically	Epoch-based key rotation on membership changes
Need end-to-end encryption	AES-256-GCM authenticated encryption
Key compromise recovery	Post-compromise security via key updates
Audit requirements	All operations logged with cryptographic binding
Multi-tenant isolation	RLS on all tables with <code>tenant_id</code>

Architecture Overview

Service Files

File	Purpose	Lines
lambda/shared/services/mls/CoordMLSEmulation	Coord MLSEmulation	936
lambda/shared/services/mls/ModuleExports	Module exports	14
lambda/admin/mls.ts	Admin API endpoints	551
migrations/000 Consolidate Data schemas	Data schemas	~300

Database Tables

Table	Columns	Purpose
mls_key_packages	key_package_id, member_id, member_type, public_key, signature_key, private_key_encrypted, sig_private_key_encrypted, credential, cipher_suite, created_at, expires_at, revoked_at	X25519/Ed25519 key packages
mls_groups	group_id, tenant_id, name, cipher_suite, epoch, tree_hash, confirmation_key, group_secret_encrypted, created_at, updated_at, expires_at	Group state with epoch tracking
mls_group_members	id, group_id, member_id, member_type, key_package_id, public_key, leaf_index, added_at, added_by, removed_at, removed_by	Membership and ratchet tree positions
mls_commits	commit_id, group_id, epoch, proposal_type, proposer_id, target_member_id, signature, created_at	State change proposals (add/remove/update)

Table	Columns	Purpose
mls_messages	message_id, group_id, epoch, sender_id, content_type, ciphertext, iv, auth_tag, signature, sent_at	Encrypted messages
mls_epoch_secrets	id, group_id, epoch, secret_encrypted, created_at, expires_at	Per-epoch secrets for forward secrecy
mls_audit_log	id, tenant_id, action, group_id, member_id, performed_by, details, ip_address, user_agent, created_at	Operation audit trail

Cryptographic Primitives

Primitive	Algorithm	Purpose
Key Exchange	X25519	ECDH key agreement between members
Encryption	AES-256-GCM	Authenticated encryption of messages
Signatures	Ed25519	Signing commits and messages
Key Derivation	HKDF-SHA256	Deriving epoch and message keys
Hashing	SHA-256	Tree hashing, content binding

Security Properties

Property	Implementation	Benefit
Forward Secrecy	HKDF key ratcheting per epoch	Past messages protected if current key compromised
Post-Compromise Security	Key updates increment epoch, rotate all secrets	System heals after temporary compromise
Group Key Agreement	Ratchet tree structure (O(log n) updates)	Efficient key distribution without n ² exchanges
Authenticated Encryption	AES-256-GCM with Ed25519 signatures	Confidentiality + integrity + authenticity
Transcript Integrity	Epoch binding prevents replay	Messages can't be reordered or replayed

Epoch Lifecycle

Epoch 0 (Group Created)

```

|
+---- Add Member B -----* Epoch 1
|
+---- Add Member C -----* Epoch 2

```

```

|
+---- Member B Updates Key -* Epoch 3 (Post-Compromise Security)
|
+---- Remove Member A -----* Epoch 4
|
+---- Messages encrypted with Epoch 4 secrets

```

Admin API Endpoints

Endpoint	Method	Description	Request Body
/api/admin/mls/dashboard	GET	Dashboard stats	-
/api/admin/mls/key-packages	POST	Create key package	{memberId, memberType, credential, cipherSuite?, validityDays?}
/api/admin/mls/key-packages/:id	GET	Get key package	-
/api/admin/mls/groups	GET	List groups	-
/api/admin/mls/groups	POST	Create group	{name, creatorMemberId, cipherSuite?, expiresAt?}
/api/admin/mls/groups/:id	GET	Get group with members	-
/api/admin/mls/groups/:id/members	POST	Add member (increments epoch)	{memberId, addedBy}
/api/admin/mls/groups/:id/members/:memberId	DELETE	Remove member (increments epoch)	{removedBy}
/api/admin/mls/groups/:id/update-key	POST	Update key (post-compromise)	{memberId}
/api/admin/mls/groups/:id/messages	GET	Get encrypted messages	?limit=100
/api/admin/mls/groups/:id/messages	POST	Send encrypted message	{senderId, content}
/api/admin/mls/audit	GET	Audit log	?limit=100&action=&groupId=

Integration with A2A Protocol

MLS provides the encryption layer for RADIANT's Agent-to-Agent (A2A) protocol:

```

// Create secure agent collaboration group
const group = await mlsService.createGroup(tenantId, "Task Force Alpha", "agent-orchestrator");

// Add participating agents
await mlsService.addMember(group.groupId, "agent-researcher", "agent-orchestrator");
await mlsService.addMember(group.groupId, "agent-validator", "agent-orchestrator");

// Encrypted task distribution
await mlsService.encryptForGroup(
  group.groupId,
  "agent-orchestrator",

```

```
Buffer.from(JSON.stringify({ task: "analyze", data: sensitiveData })))
);

// Agent compromise recovery
await mlsService.updateKey(group.groupId, "agent-researcher"); // Rotates all secrets
```

3.2.1 Cartridge PKI KMS Integration (PROMPT-42)

Real AWS KMS asymmetric signing for .RADz cartridge PKI system, replacing placeholder strings with production-ready cryptographic operations.

Architecture Overview

CDK Changes

Stack	Resource	Purpose
SecurityStack	cartridgeSigningKey (ECC_NIST_P256)	Platform root CA for cartridge signing
ApiStack	RADIANT_PLATFORM_SIGNING_KEY_ID env var	Lambda access to signing key
ApiStack	RADIANT_PLATFORM_SIGNING_KEY_ARN env var	Full ARN for cross-account access

IAM Policies

Policy	Actions	Condition
Platform Key Usage	kms:Sign, kms:Verify, kms:GetPublicKey, kms:DescribeKey	Platform key only
Tenant Key Creation	kms:CreateKey, kms:TagResource, kms:CreateAlias	KeySpec=ECC_NIST_P256, KeyUsage=SIGN_VERIFY

Service Changes

Method	Implementation	KMS Commands
generateTenantCA()	Create tenant CA signed by platform root	CreateKeyCommand -> GetPublicKeyCommand -> SignCommand
createSigningKey()	Create purpose-specific key signed by tenant CA	CreateKeyCommand -> GetPublicKeyCommand -> SignCommand
signArtifact()	Sign cartridge content	SignCommand (ECDSA_SHA_256)
verifySignature()	Verify cartridge signature	VerifyCommand

Key Hierarchy

Platform Root CA (KMS ECC_NIST_P256)

- +-- Created in CDK SecurityStack
- +-- Signs Tenant CA certificates
- +-- Key ID: RADIANT_PLATFORM_SIGNING_KEY_ID
- +-- RETAIN policy in production

Tenant CA Keys (KMS ECC_NIST_P256)

- +-- Created dynamically per tenant via generateTenantCA()
- +-- Signed by Platform Root CA
- +-- Signs cartridge artifacts (.RADz files)
- +-- Stored in tenant_ca_certificates table

Signing Keys (KMS ECC_NIST_P256)

- +-- Purpose: author, publisher, validator, custom
- +-- Created dynamically via createSigningKey()
- +-- Signed by Tenant CA
- +-- Stored in cartridge_signing_keys table

Database Tables

Table	Purpose	Key Columns
tenant_ca_certificates	Tenant CA certificates	key_id, key_arn, fingerprint, root_signature, status
cartridge_signing_keys	Purpose-specific signing keys	key_id, purpose, ca_signature, status
pki_audit_log	PKI operations audit (partitioned)	operation, resource_id, success, details

Security Considerations

Consideration	Mitigation
Key Rotation	Asymmetric keys don't auto-rotate; manual rotation requires certificate reissuance
Key Deletion	Extended pending window (30 days prod, 7 days dev); RETAIN removal policy
Tenant Isolation	Each tenant gets own KMS key; RLS on all tables
Audit Trail	All PKI ops logged to partitioned pki_audit_log
Least Privilege	IAM conditions restrict key creation to ECC_NIST_P256 + SIGN_VERIFY

Environment Variables

Variable	Description
RADIANT_PLATFORM_SIGNING_KEY_ID	KMS Key ID for platform root CA
RADIANT_PLATFORM_SIGNING_KEY_ARN	KMS Key ARN for platform root CA

Implementation Files

File	Purpose
lib/stacks/security-stack.ts	CDK asymmetric key definition
lambda/shared/services/cartridge-pki.service.ts	PKI service with real KMS
migrations/000_consolidated_schema.sql	Database schema for PKI keys

Admin API

Base URL: /api/admin/pki – 10 endpoints for tenant CA management, signing keys, verification, and audit.

Verification Checklist

- ☐ CDK synth shows CartridgeSigningKey resource with ECC_NIST_P256
- ☐ Lambda environment includes RADIANT_PLATFORM_SIGNING_KEY_ID and _ARN
- ☐ generateTenantCA() creates real KMS key (no PLACEHOLDER strings)
- ☐ createSigningKey() creates real KMS key signed by tenant CA
- ☐ Cartridge signatures verify via VerifyCommand

2.9 Autonomous Organism Architecture (PROMPT-43) - v6.6.0

Project Metamorphosis – Self-evolving AI system with neural routing, auto-tool generation, and predictive user modeling.

Core Services

Service	File	Purpose
MCP Server Manager	mcp-server-manager.service.ts	Neural Affinity Routing for MCP servers
Neural Schema Registry	neural-schema-registry.service.ts	Tool embeddings for intelligent discovery
Tool Forge	genesis-auto-tool.service.ts	On-demand tool generation from APIs
Liquid Compute	liquid-compute.service.ts	Dynamic compute location selection
Ghost Simulation	ghost-simulation.service.ts	User digital twin for prediction
Tensor-Link	tensor-link.service.ts	Vector-based transport protocol
Economic Cortex	economic-cortex.service.ts	Autonomous budget management
Organism Integration	organism-integration.service.ts	BrainRouter integration layer

Location: lambda/shared/services/organism/

Database Tables (Migration V2026_02_03_001)

Table	Purpose
mcp_servers	MCP server registry with neural embeddings
mcp_tool_schemas	Tool schemas with neural signatures

Table	Purpose
mcp_routing_decisions	Routing decision audit log
genesis_tool_requests	Tool generation requests
genesis_tool_results	Generated tool code and validation
genesis_api_discovery_cache	Cached API discovery results
liquid_compute_topologies	Compute topology per tenant
liquid_compute_decisions	Compute location decisions
ghost_vectors	User digital twin vectors (4096-dim)
ghost_simulations	Simulation results and predictions
ghost_calibrations	Prediction accuracy calibration
ghost_user_interactions	User interaction training data
organism_telemetry	System health telemetry
economic_cortex_configs	Budget configuration
economic_cortex_budgets	Multi-scope budgets
economic_cortex_alerts	Budget alert thresholds
economic_cortex_negotiations	Cost negotiation history
economic_cortex_spending	Spending analytics

Admin API

Base URL: /api/admin/organism

Endpoint Group	Routes
Dashboard	GET /dashboard
MCP Servers	GET/POST /mcp-servers, GET/PUT/DELETE /mcp-servers/:id, POST /mcp-servers/discover, POST /mcp-servers/route
Tools	GET/POST /tools, GET /tools/:id, POST /tools/search, POST /tools/find-by-intent, POST /tools/:id/execution
Genesis	GET/POST /genesis/requests, GET /genesis/requests/:id, GET /genesis/requests/:id/result

Endpoint Group	Routes
Compute	GET/PUT /compute/topology, POST /compute/browser-capabilities, POST /compute/local-capabilities, POST /compute/select
Ghost	GET /ghost/stats, GET /ghost/simulations, POST /ghost/simulate, GET /ghost/vectors/:userId, POST /ghost/calibrate
Economic	GET/PUT /economic/config, GET /economic/budgets, GET /economic/analytics, POST /economic/negotiate, POST /economic/recommend-model

Admin Dashboard

Route: /platform/organism

Tab	Features
Overview	Server health, tool counts, compute distribution, ghost stats
MCP Servers	Server list, health status, latency, domain affinity
Tools	Tool schema browser, search, metrics
Genesis	Tool generation form, request history
Compute	Browser/local capabilities, sensitivity rules
Ghost	Simulation runner, prediction stats, calibration

Key Features

Feature	Description
Neural Affinity Routing	Semantic tool selection using 1536-dim embeddings
Genesis Pipeline	API discovery -> code gen -> sandbox validation -> deploy
Liquid Compute	Browser/Local/Edge/Cloud selection based on privacy + cost
Ghost Vectors	4096-dim user digital twins with component vectors
Economic Negotiation	Autonomous cost optimization with 3 strategies

Shared Types

File: packages/shared/src/types/autonomous-organism.types.ts

~500 lines of TypeScript types for MCP protocol, neural routing, ghost simulation, and economic cortex.

3.3 New Admin Dashboard Pages

Route	Module	Purpose
/sovereign-mesh	Dashboard	Overview metrics
/sovereign-mesh/agents	Agent Registry	Manage agent definitions
/sovereign-mesh/agents/[id]	Agent Registry	Agent detail + executions
/sovereign-mesh/apps	App Registry	Browse 3,000+ apps
/sovereign-mesh/apps/[id]	App Registry	App detail + AI config
/sovereign-mesh/transparency	Transparency	Decision explorer
/sovereign-mesh/transparency/[id]	Transparency	Decision detail + War Room
/sovereign-mesh/approvals	HITL	Approval queue
/sovereign-mesh/ai-helper	AI Helper	System configuration
/orchestration/inference-cache	Inference Cache	Hit rate, cost savings, events, model breakdown, config
/orchestration/consensus	Consensus	Agreement scores, evaluations, model leaderboard, test runner, config
/orchestration/model-weights	Model Weights	Drift correction, composite weights, quarantine management
/orchestration/templates	Templates	User-saved workflow templates with categories and duplication
/platform/bedrock-settings	Bedrock	Model discovery, auto-upgrade, polling config
/platform/uds	UDS	User Data Service: encryption, audit, GDPR erasure, tier management
/platform/mls	MLS	RFC 9420 group encryption: groups, key packages, audit
/platform/state-registry	State Registry	Environment manifests, sync operations, backups
/platform/cartridge-operations	Cartridges	Cartridge operations management
/platform/crucible	Crucible	Testing sandbox and validation
/platform/deployer-sync	Deployer Sync	Swift Deployer synchronization

Route	Module	Purpose
/platform/livs	LIVS	Live verification system
/platform/organism	Organism	Autonomous organism architecture
/platform/pki	PKI	Certificate and key management
/platform/rnir	RNIR	Neural inference routing
/platform/snapshots	Snapshots	System state snapshots
/platform/vault	Vault	Secure secret storage
/cato/council	Council of Rivals	Multi-agent adversarial debate management
/cato/dialogue	Cato Dialogue	Consciousness dialogue sessions
/cato/cognitive-precision	Cognitive Precision	Context anchoring, negative constraints, critic separation
/cato/governance	Governance	Policy and governance management
/cato/livs-policy	LIVS Policy	Live verification policy configuration
/cato/safety	Safety	Cato safety configuration
/cato/war-room	War Room	Critical incident management
/reports/dynamic	Dynamic Reports	Schema-adaptive report builder
/reports/scheduled	Scheduled Reports	Automated report generation
/memory/anticipatory	Anticipatory Memory	Predictive prefetch, contradiction detection
/memory/retention	Memory Retention	Retention policies and lifecycle management

Cross-App Delight UX System (v7.27.0 + v7.28.0)

Package / File	Purpose
packages/delight-ui/	@radiant/delight-ui – Shared React Delight provider, hook, toast, types
packages/delight-ui/src/RadiantDelightProvider.tsx	Universal provider with personality modes, injection points, toast UI
packages/delight-ui/src/types.ts	PersonalityMode, InjectionPoint, DisplayStyle, AppDelightConfig
packages/delight-ui/src/animations.ts	Personality-aware animation configs, morph narration, spring constants
packages/delight-ui/src/sounds.ts	Web Audio API sound synthesis – no mp3 files needed
apps/thinktank/app/providers.tsx	Think Tank delight config + RadiantDelightProvider wrapping

Package / File	Purpose
apps/thinktank/lib/hooks/useDelightSync.ts	Settings sync hook (Zustand -> backend preferences API)
apps/curator/app/providers.tsx	Curator delight config (ingest, verify, graph UX touches)
apps/dojo/app/providers.tsx	Dojo delight config (sparring, mastery, belt-earned messages)
apps/thinktank-admin/app/providers.tsx	TT Admin delight config (config saves, user mgmt, delight publishing)
apps/thinktank-tenant-admin/app/providers.tsx	Tenant Admin delight config (invitations, security, org management)
.windsurf/workflows/delight-ux-policy.md	Enforcement policy – all apps MUST integrate Delight

Delight <-> Polymorphic UI Integration (v7.28.0)

Component	File	Delight Integration
ViewRouter	apps/thinktank/ModeSwitch/escalation/providers/router.tsx	Mode switch/escalation triggers delight + synth sounds
ViewMorphTransition	Same file	Animation spring constants adapt to personality mode
LiquidMorphPanel	apps/thinktank/Componentes/animation/liquidMorphPanel.tsx	Open/close animation, suppresses personality panel configs
MorphTransitionEffect	Same file	Personality narration, suppressed in professional/subtle modes
Chat page	apps/thinktank/FullLifecycle/page/chat/page.tsx	Full lifecycle page during post execution, error, session, morph

Delight <-> Dojo Integration (v7.29.0)

Component	Actions Wired	Injection Points
LibraryView	Create library, upload/delete doc, discover themes	action_complete, milestone
TrainingArena	Start session, submit answer, complete session	session_start, action_complete, milestone
ScenarioArena	Start/respond/conclude scenario	session_start, action_complete, milestone
DialecticArena	Start/respond/conclude dialectic	session_start, action_complete, milestone
DecayEngine	Trigger reinforcement, submit answer	session_start, action_complete

Component	Actions Wired	Injection Points
ArchytasSettings	Update config (tools, sandbox, limits)	action_complete
CompetencyMesh	Extract competencies	milestone

Delight Tenant Governance (v7.29.0)

Control	Type	Location	Effect
tenantDelightEnabled	boolean	Tenant Admin -> Settings	Master kill switch for all delight output
tenantDefaultMode	PersonalityMode	Tenant Admin -> Settings	Force mode for all users (e.g., professional for law firms)
tenantAllowUserOverride	boolean	Tenant Admin -> Settings	Lock users to tenant mode when false

Comprehensive Documentation (v7.29.0)

Document	Sections	Coverage
docs/POLYMORPHIC-LIQUID-UI-GUIDE.md	15 sections	Full guide: Polymorphic UI, Liquid UI, Delight integration, animations, sounds, settings, tenant controls, guest behavior, API reference

Guest Collaboration Policy (v7.30.0)

Component	Location	Purpose
tenant_collaboration_settings	Migration 008	Per-tenant guest access, prompt execution, file permissions, cost attribution, cross-tenant settings
guest_cost_attribution_log	Migration 008	Every guest AI action with cost breakdown, cross-tenant splits
guest_compliance_restriction_log	Migration 008	Audit trail of compliance-restricted guest actions
CollaborationPolicyService	lambda/shared/services/collaboration-policy.service.ts	Compliance gates, capability resolution, cost attribution routing

Component	Location	Purpose
GuestRestrictionBanner	apps/thinktank/components/collaboration/GuestRestrictionBanner.ts	Notification of Guest Features disabled by compliance
guardGuestPrompt()	lambda/shared/middleware/guest-prompt-guard.ts	Pre-execution guard: checks permissions, limits, resolves attribution
recordGuestPromptUsage()	lambda/shared/middleware/guest-prompt-guard.ts	Post-execution: logs cost attribution, updates guest running totals
Collaboration Settings Page	apps/thinktank-tenant-admin/app/(dashboard)/collaboration/page.tsx	Tenant admin UI for all guest collaboration controls
Per-user rollup	lambda/billing/metering.ts -> radiant-user-usage-rollups DynamoDB	Costs tracked per-user (incl. guest-originated), aggregated to tenant
GET /metering/user-rollups	lambda/billing/metering.ts	Per-user cost breakdown with guest-originated subtotals
GET /metering/guest-usage	lambda/billing/metering.ts	Aggregate guest cost attribution from guest_cost_attribution_log

Permission -> Capability Matrix:

Permission	View	Comment	Edit	Prompts	Upload	Download	Branch	Roundtable
viewer	[OK]	[X]	[X]	[X]	[X]	[OK]*	[X]	[X]
commenter	[OK]	[OK]	[X]	[X]	[X]	[OK]*	[X]	[OK]*
editor	[OK]	[OK]	[OK]	[OK]**	[OK]**	[OK]*	[OK]*	[OK]*

* Disabled when compliance licenses active and compliance_auto_restrict=true ** Requires explicit tenant opt-in (guestPromptExecutionEnabled=true)

Cost Attribution Modes:

Mode	Description
inviting_user (default)	All guest costs billed to the user who created the invite
session_owner	Costs billed to the collaborative session creator
tenant_pool	Costs attributed to shared tenant pool
cross_tenant_split	Auto-activated when guest is from another tenant and splitting enabled

Log Retention Advanced System (v7.32.0)

Component	Location	Purpose
log_reports	Migration 010	Generated retention/compliance reports with S3 storage
log_glacier_restore_jobs	Migration 010	Batch Glacier restore with progress tracking
log_export_jobs	Migration 010	Bulk log export jobs with download URLs
log_merkle_chain	Migration 010	Tamper-evident SHA-256 Merkle hash chain
log_erasure_requests	Migration 010	GDPR Article 17 erasure with exemption enforcement
log_search_entries	Migration 010	Hot-tier full-text search index (tsvector + GIN)
check_log_erasure_exemptions()	Migration 010	PG function: checks immutable categories against compliance licenses
LogReportService	lambda/shared/services/log-report.service.ts	5 report types: compliance_summary, retention_audit, storage_forecast, source_coverage, gdpr_data_map
LogGlacierRestoreService	lambda/shared/services/log-glacier-restore.service.ts	Batch restore from Glacier/Deep Archive, 3 retrieval tiers, progress tracking
LogExportService	lambda/shared/services/log-export.service.ts	Bulk export (all time / date range), JSON/CSV/JSONL formats, pre-signed downloads
LogTamperVerificationService	lambda/shared/services/log-tamper-verification.service.ts	Merkle chain: add entries, verify single/segment/full chain
LogGdprErasureService	lambda/shared/services/log-gdpr-erasure.service.ts	Multi-tier erasure, auto-exemption, erasure certificate hash
LogRetentionStack	lib/stacks/log-retention-stack.ts	CDK: 3 S3 buckets, KMS key, 2 Lambdas, hourly EventBridge
Log Retention Admin UI	apps/admin-dashboard/app/(dashboard)/log-retention/page.tsx	10-tab admin page

Admin API (16 new endpoints):

Method	Path	Purpose
GET	/search	Full-text search hot-tier logs
GET	/reports	List generated reports
POST	/reports	Generate a new report
GET	/reports/:id/download	Pre-signed download URL
GET	/restore/jobs	List Glacier restore jobs
POST	/restore/jobs	Create restore job
POST	/restore/jobs/:id/process	Process a restore job
GET	/export/jobs	List export jobs
POST	/export/jobs	Create export job
GET	/export/jobs/:id/download	Export download URL
GET	/verification/status	Merkle chain status
POST	/verification/verify-full	Verify full Merkle chain
GET	/erasure/requests	List erasure requests
POST	/erasure/requests	Create erasure request
POST	/erasure/requests/:id/approve	Approve erasure
POST	/erasure/requests/:id/execute	Execute approved erasure

CDK Infrastructure:

Resource	Name	Config
S3 Bucket	radiant-log-archives	Versioned, KMS, Glacier at 90d, Deep Archive at 7yr
S3 Bucket	radiant-log-reports	KMS, IA at 90d, Glacier at 1yr
S3 Bucket	radiant-log-exports	KMS, 7-day auto-expiry
KMS Key	radiant-log-encryption	Auto-rotation, RETAIN
Lambda	radiant-log-indexer	15 min timeout, 1 GB, hourly EventBridge
Lambda	radiant-log-retention-admin	5 min timeout, full S3/DB access
EventBridge	Hourly indexer rule	2 retry attempts

Think Tank Tenant Admin Pages (v7.26.0)

Route	Feature	Key Functionality
/	Dashboard	Overview with quick action cards

Route	Feature	Key Functionality
/users	Team Members	User management, invitations, role assignment, MFA status
/cartridges	Cartridges	Tenant cartridge management (system read-only)
/reports	Reports	Usage analytics, report generation (usage/users/billing)
/settings	Settings	Org name, timezone, language, theme, notifications, data limits
/security	Security	MFA enforcement, session/lockout config, password policy, event log

Think Tank App Navigation (v7.26.0)

Route	Nav Location	Notes
/ (chat)	Main view	Default landing page
/rules	Quick Links	User-defined AI rules
/history	Quick Links	Conversation history
/artifacts	Quick Links	Shared artifacts (newly linked v7.26.0)
/settings	Quick Links	User preferences
/profile	User avatar	Profile management
/simulator	Advanced Links	Simulation tool with ADV badge (v7.26.0)

3.4 New Lambda Functions

Function	Schedule	Module
app-registry-sync	Daily 2 AM UTC	App Registry
hitl-sla-monitor	Every minute	HITL
sovereign-mesh	API Gateway	Admin API

PART 4: API REFERENCE

4.1 Agent APIs

POST	/api/admin/sovereign-mesh/agents	Create agent definition
GET	/api/admin/sovereign-mesh/agents	List agents
GET	/api/admin/sovereign-mesh/agents/:id	Get agent
PUT	/api/admin/sovereign-mesh/agents/:id	Update agent
DELETE	/api/admin/sovereign-mesh/agents/:id	Delete agent
POST	/api/admin/sovereign-mesh/executions	Start execution
GET	/api/admin/sovereign-mesh/executions	List executions
GET	/api/admin/sovereign-mesh/executions/:id	Get execution
POST	/api/admin/sovereign-mesh/executions/:id/cancel	Cancel execution
POST	/api/admin/sovereign-mesh/executions/:id/resume	Resume paused execution

4.2 App APIs

GET	/api/admin/sovereign-mesh/apps	List apps (paginated)
GET	/api/admin/sovereign-mesh/apps/:id	Get app detail
PUT	/api/admin/sovereign-mesh/apps/:id/ai-config	Update AI config
GET	/api/admin/sovereign-mesh/apps/sync/status	Get sync status
POST	/api/admin/sovereign-mesh/apps/sync/trigger	Trigger sync
GET	/api/admin/sovereign-mesh/connections	List tenant connections
DELETE	/api/admin/sovereign-mesh/connections/:id	Delete connection

4.3 Transparency APIs

GET	/api/admin/sovereign-mesh/decisions	List decision events
GET	/api/admin/sovereign-mesh/decisions/:id	Get decision detail
GET	/api/admin/sovereign-mesh/decisions/:id/explanation	Get explanation
GET	/api/admin/sovereign-mesh/decisions/:id/war-room	Get deliberations

4.4 HITL APIs

GET	/api/admin/sovereign-mesh/approvals	List pending approvals
-----	-------------------------------------	------------------------

GET	/api/admin/sovereign-mesh/approvals/queues	List queues
GET	/api/admin/sovereign-mesh/approvals/:id	Get approval detail
POST	/api/admin/sovereign-mesh/approvals/:id/approve	Approve request
POST	/api/admin/sovereign-mesh/approvals/:id/reject	Reject request
POST	/api/admin/sovereign-mesh/approvals/:id/escalate	Escalate request

4.5 AI Helper APIs

GET	/api/admin/sovereign-mesh/ai-helper/config	Get configuration
PUT	/api/admin/sovereign-mesh/ai-helper/config	Update configuration
GET	/api/admin/sovereign-mesh/ai-helper/usage	Get usage statistics

4.6 Dashboard API

GET	/api/admin/sovereign-mesh/dashboard	Get overview metrics
-----	-------------------------------------	----------------------

4.7 AI Reports APIs (v5.42.0)

GET	/api/admin/ai-reports	List reports (paginated)
POST	/api/admin/ai-reports/generate	Generate new report with AI
GET	/api/admin/ai-reports/:id	Get report by ID
PUT	/api/admin/ai-reports/:id	Update report
DELETE	/api/admin/ai-reports/:id	Delete report
POST	/api/admin/ai-reports/:id/export	Export to PDF/Excel/HTML/JSON
GET	/api/admin/ai-reports/templates	List templates
POST	/api/admin/ai-reports/templates	Create template
GET	/api/admin/ai-reports/brand-kits	List brand kits
POST	/api/admin/ai-reports/brand-kits	Create brand kit
PUT	/api/admin/ai-reports/brand-kits/:id	Update brand kit
DELETE	/api/admin/ai-reports/brand-kits/:id	Delete brand kit
POST	/api/admin/ai-reports/chat	Send chat message for modifications
GET	/api/admin/ai-reports/insights	Get insights dashboard

4.8 RAWS APIs (v1.1)

POST	/api/admin/raws/select	Select optimal model
GET	/api/admin/raws/profiles	List all 13 weight profiles
POST	/api/admin/raws/profiles	Create custom profile
GET	/api/admin/raws/profiles/:id	Get profile details
GET	/api/admin/raws/models	List available models
GET	/api/admin/raws/models/:id	Get model details
GET	/api/admin/raws/domains	List 7 domain configurations

POST	/api/admin/raws/detect-domain	Test domain detection
GET	/api/admin/raws/health	Provider health status
GET	/api/admin/raws/audit	Selection audit log

PART 5: RAWS v1.1 - MODEL SELECTION SYSTEM

5.1 Overview

RAWS (RADIANT AI Weighted Selection) provides intelligent real-time model selection using:

Component	Count	Description
Dimensions	8	Quality, Cost, Latency, Capability, Reliability, Compliance, Availability, Learning
Profiles	13	4 Optimization + 6 Domain + 3 SOFAI
Domains	7	Healthcare, Financial, Legal, Scientific, Creative, Engineering, General
Models	106+	50 external APIs + 56 self-hosted

5.2 Weight Profiles

Profile	Category	Q	C	L	K	R	P	A	E
BALANCED	Optimization	0.25	0.20	0.15	0.15	0.10	0.05	0.05	0.05
QUALITY_FIRST	Optimization	0.40	0.10	0.10	0.15	0.10	0.05	0.05	0.05
COST_OPTIMIZED	Optimization	0.20	0.35	0.15	0.10	0.05	0.05	0.05	0.05
LATENCY_CRITICAL	Optimization	0.15	0.10	0.35	0.15	0.10	0.05	0.05	0.05
HEALTHCARE	Domain	0.30	0.05	0.10	0.15	0.10	0.20	0.05	0.05
FINANCIAL	Domain	0.30	0.10	0.10	0.15	0.10	0.15	0.05	0.05
LEGAL	Domain	0.35	0.05	0.05	0.20	0.10	0.15	0.05	0.05
SCIENTIFIC	Domain	0.35	0.10	0.10	0.20	0.08	0.05	0.05	0.07
CREATIVE	Domain	0.20	0.25	0.20	0.15	0.05	0.00	0.05	0.10
ENGINEERING	Domain	0.30	0.15	0.15	0.20	0.10	0.00	0.05	0.05
SYSTEM_1	SOFAI	0.15	0.30	0.30	0.10	0.05	0.00	0.05	0.05
SYSTEM_2	SOFAI	0.35	0.10	0.10	0.15	0.10	0.10	0.05	0.05

Profile	Category	Q	C	L	K	R	P	A	E
SYSTEM_2_5	SOFAI	0.40	0.05	0.05	0.20	0.10	0.10	0.05	0.05

5.3 Domain Compliance Matrix

Domain	Required	Optional	Truth Engine	ECD
healthcare	HIPAA	FDA 21 CFR Part 11	Required	0.05
financial	SOC 2 Type II	PCI-DSS, GDPR, SOX	Required	0.05
legal	SOC 2 Type II	GDPR, State Bar	Required	0.05
scientific	None	FDA 21 CFR, GLP, IRB	Optional	0.08
creative	None	FTC Guidelines	Not Required	0.20
engineering	None	SOC 2, ISO 27001, NIST	Optional	0.10
general	None	None	Not Required	0.10

5.4 Key Files

File	Purpose
migrations/000_consolidated_schema.sql	Database schema
lambda/shared/services/raws/types.ts	TypeScript types
lambda/shared/services/raws/domain-detector.service.ts	Domain detection
lambda/shared/services/raws/weight-profile.service.ts	Profile management
lambda/shared/services/raws/selection-main-selection.ts	Main selection logic
lambda/admin/raws.ts	Admin API handler

5.5 Detailed Documentation

- RAWS-ENGINEERING.md - Technical reference
- RAWS-ADMIN-GUIDE.md - Operations guide
- RAWS-USER-GUIDE.md - API guide for developers

PART 6: CORTEX MEMORY SYSTEM v4.20.0

6.1 Overview

The **Cortex Memory System** provides enterprise-scale tiered memory architecture replacing direct database storage. It solves critical scaling challenges:

Problem	Solution
Volume limits (100M+ rows)	Distribute across three tiers
Latency degradation	Hot tier caching (<10ms)
Cost inefficiency	Cold tier archival (90% savings)
Compliance conflicts	Per-tier retention policies
Data gravity	Zero-Copy mounts to customer data lakes

6.2 Three-Tier Architecture

Tier	Role	Technology	Content
Hot	<i>"What is happening right now?"</i>	Redis + DynamoDB	Live session, Ghost Vectors, MQTT/OPC UA telemetry
Warm	<i>"How does the business work?"</i>	Neptune + pgvector	Entity maps, Procedural logic, Golden Q&A pairs
Cold	<i>"What happened 10 years ago?"</i>	S3 Iceberg + Athena	Deep archive via Stub Nodes (Zero-Copy)

The "Retrieval Dance" - Runtime Query Flow

Step 1: INTENT PARSING (Hot) -> Analyze Query + Ghost Vectors

- Step 2: GRAPH TRAVERSAL (Warm) -> 2-3 hops, check Golden Rule Overrides
- Step 3: DEEP FETCH (Cold) -> Fetch ONLY specific pages via Stub Nodes
- Step 4: SYNTHESIS (Model) -> Package with Chain of Custody audit trail

6.3 Hot Tier - Real-Time Context

Key Schema (Tenant Isolation)

{tenant_id}:{data_type}:{identifier}

Data Types

Type	TTL	Purpose
Session Context	4h	Current conversation state
Ghost Vectors	24h	8192-dim personality embeddings from vLLM hidden states
Telemetry Feeds	1h	Real-time event streams
Prefetch Cache	30m	Anticipated document needs

Ghost Inference Configuration (v5.52.40)

Ghost vectors are extracted using vLLM on SageMaker with configurable parameters per tenant:

Component	Purpose
ghost_inference_config	Tenant-specific vLLM settings
ghost_inference_deployments	SageMaker endpoint deployment history
ghost_inference_metrics	Performance metrics aggregation
GhostInferenceConstruct	CDK construct for SageMaker deployment

vLLM Configuration Parameters: - Model: LLaMA 3 70B Instruct (configurable) - Tensor Parallel Size: 1-8 GPUs - Hidden State Layer: Configurable layer for extraction - GPU Memory Utilization: 50-99% - Quantization: AWQ, GPTQ, SqueezeLLM, FP8

Admin API: /api/admin/ghost-inference/* for dashboard, config, deployments, validation

6.4 Warm Tier - Graph-RAG Knowledge

Why Graph Beats Vector-Only

Query Type	Vector Search	Graph-RAG
“What causes X?”	Returns similar docs	Traverses CAUSES edges
“What depends on Y?”	Returns related docs	Follows DEPENDS_ON paths
“What supersedes Z?”	May return old versions	Explicit SUPERSEDES edges

Graph Schema

Node Types	Edge Types
document, entity, concept, procedure, fact	mentions, causes, depends_on, supersedes, verified_by, authored_by, relates_to, contains, requires

Hybrid Search

Hybrid Score = (Vector Similarity x 0.4) + (Graph Traversal x 0.6)

6.5 Cold Tier - Historical Archive

Storage Lifecycle

Day 0-30: S3 Standard
Day 30-90: S3 Intelligent-Tiering
Day 90-365: Glacier Instant Retrieval
Day 365+: Glacier Deep Archive

Zero-Copy Mounts & Stub Nodes

The Innovation: We do not force tenants to move 50TB of data to our cloud. We **Mount** their existing Data Lakes and create **Stub Nodes** in the Warm Graph.

Stub Node Mechanism: - RADIANT scans external storage metadata - Creates lightweight “Stub Nodes” in graph (e.g., “Log File 2024.csv exists at S3://bucket/logs/”) - Actual content fetched **only** when Graph Traversal determines it’s critical

Supported Sources: - Snowflake Data Share - Databricks Delta Lake - Amazon S3 - Azure Data Lake Gen2 - Google Cloud Storage

6.6 Tier Coordinator

Orchestrates automatic data movement:

Operation	Trigger	Action
Hot -> Warm	TTL expiration	Extract entities, create graph nodes

Operation	Trigger	Action
Warm -> Cold	Age > 90 days	Archive to Iceberg, mark archived
Cold -> Warm	On-demand retrieval	Rehydrate from S3, update status

6.7 Twilight Dreaming Integration

Task	Frequency	Purpose
ttl_enforcement	Hourly	Expire Hot tier keys
archive_promotion	Nightly	Move Warm -> Cold
deduplication	Nightly	Merge duplicate nodes
conflict_resolution	Nightly	Flag contradictions
iceberg_compaction	Nightly	Optimize Cold storage
index_optimization	Weekly	Reindex vectors

6.8 GDPR Compliance

Cascade deletion across all tiers:

Tier	Erasure SLA	Method
Hot	Immediate	Redis key deletion
Warm	24h	Node status -> deleted, properties cleared
Cold	72h	Tombstone records in Iceberg

6.9 Key Files

File	Purpose
packages/shared/src/types/cortex-memory.types.ts	Type definitions
migrations/000_consolidated_schema.sql	Database schema (14 tables)
lambda/shared/services/cortex/tier-coordinator.service.ts	Orchestration
lambda/admin/cortex.ts	Admin API
apps/admin-dashboard/app/(dashboard)/cortex/page.tsx	Dashboard UI

6.10 API Endpoints

Base: /api/admin/cortex

GET	/overview	Dashboard data
GET	/config	Tier configuration
PUT	/config	Update configuration
GET	/health	Tier health status
POST	/health/check	Trigger health check
GET	/alerts	Active alerts
POST	/alerts/:id/acknowledge	Acknowledge alert
GET	/metrics	Data flow metrics
GET	/graph/stats	Node/edge counts
GET	/graph/explore	Search graph nodes
GET	/graph/conflicts	Unresolved conflicts
GET	/housekeeping/status	Task statuses
POST	/housekeeping/trigger	Run task manually
GET	/mounts	Zero-Copy mounts
POST	/mounts	Create mount
POST	/mounts/:id/rescan	Rescan mount
DELETE	/mounts/:id	Delete mount
GET	/gdpr/erasure	Erasure requests
POST	/gdpr/erasure	Create erasure request

6.11 Cortex v2.0 Features

Extended capabilities added in v5.52.13:

Golden Rules Override System

Human-verified facts that override AI-extracted knowledge:

Rule Type	Purpose
force_override	Replace incorrect fact
ignore_source	Blacklist source
prefer_source	Prioritize source
deprecate	Mark outdated

Chain of Custody: Cryptographic signatures, verification timestamps, full audit trail.

Stub Nodes (Zero-Copy Data Gravity)

Lightweight metadata pointers to external data lakes:

Source	Support
Snowflake	Tables, views
Databricks	Delta Lake
S3	CSV, Parquet, PDF
Azure Data Lake	Gen2
GCS	Cloud Storage

Graph Expansion (Twilight Dreaming v2)

Autonomous knowledge graph improvement:

Task	Purpose
infer_links	Co-occurrence, semantic similarity
cluster_entities	Group by shared neighbors
detect_patterns	Sequences, anomalies
merge_duplicates	Near-duplicate detection

Live Telemetry Feeds

Real-time sensor data injection:

Protocol	Use Case
MQTT	IoT sensors
OPC UA	Industrial
Kafka	Event streams
WebSocket	Real-time

Curator Entrance Exams

SME verification workflow for knowledge validation with auto-generated questions and Golden Rule creation for corrections.

Model Migration

Safe model transitions: Initiate -> Validate -> Test -> Execute -> Rollback if needed.

6.12 Cortex v2 API Endpoints

Base: /api/admin/cortex/v2

Golden Rules:

GET/POST	/golden-rules	List/Create rules
DELETE	/golden-rules/:id	Deactivate rule
POST	/golden-rules/check	Check for match

Chain of Custody:

GET	/chain-of-custody/:factId	Get custody record
POST	/chain-of-custody/:factId/verify	Verify fact
GET	/chain-of-custody/:factId/audit-trail	

Stub Nodes:

GET	/stub-nodes	List stub nodes
GET	/stub-nodes/:id	Get stub node
POST	/stub-nodes/:id/fetch	Fetch content (signed URL)
POST	/stub-nodes/:id/connect	Connect to graph nodes
POST	/stub-nodes/scan	Scan mount for files

Telemetry:

GET/POST	/telemetry/feeds	List/Create feeds
POST	/telemetry/feeds/:id/start	Start feed
POST	/telemetry/feeds/:id/stop	Stop feed
GET	/telemetry/context-injection	Get injection data

Exams:

GET/POST	/exams	List/Create exams
POST	/exams/:id/start	Start exam
POST	/exams/:id/submit	Submit answer
POST	/exams/:id/complete	Complete exam

Graph Expansion:

GET/POST	/graph-expansion/tasks	List/Create tasks
POST	/graph-expansion/tasks/:id/run	Run task
GET	/graph-expansion/pending-links	Pending approvals
POST	/graph-expansion/links/:id/approve	
POST	/graph-expansion/links/:id/reject	

Model Migration:

GET/POST	/model-migrations	List/Create migrations
POST	/model-migrations/:id/validate	
POST	/model-migrations/:id/test	
POST	/model-migrations/:id/execute	
POST	/model-migrations/:id/rollback	

6.13 Cortex v2 Key Files

File	Purpose
migrations/000_consolidated_schema.sql	2 schema (12 tables)

File	Purpose
lambda/shared/services/cortex/golden-rules.service.ts	Golden Rules + Chain of Custody
lambda/shared/services/cortex/stub-nodes.service.ts	Zero-copy pointers
lambda/shared/services/cortex/graph-expansion.service.ts	Twilight Dreaming v2
lambda/shared/services/cortex/telemetry.service.ts	Live feeds
lambda/shared/services/cortex/entrance-exam.service.ts	SME verification
lambda/shared/services/cortex/model-migration.service.ts	Model transitions
lambda/admin/cortex-v2.ts	Admin API v2

6.14 Cato-Cortex Bridge (v5.52.14)

Integrates Cato consciousness with Cortex memory tiers for unified prompt enrichment.

Data Flow

Direction	Data	Purpose
Cato -> Cortex	Semantic memories	Persist to knowledge graph
Cortex -> Cato	Knowledge facts	Enrich ego context
Bidirectional	GDPR erasure	Cascade deletion

Think Tank Prompt Enrichment

1. Ego Context Builder loads identity, affect, memory

2. User Persistent Context retrieves preferences

3. **Cato-Cortex Bridge queries Cortex for relevant knowledge**

4. All merged into <ego_state> XML block with <knowledge_base> section

5. Injected into system prompt

Key Files

File	Purpose
lambda/shared/services/cato-cortex-bridge.service.ts	Bridge service
lambda/shared/services/identity-core.service.ts	Ego builder (uses bridge)

File	Purpose
migrations/000_consolidated_schema.sql	Bridge tables

Database Tables

Table	Purpose
cato_cortex_bridge_config	Per-tenant configuration
cato_cortex_sync_log	Sync history
cato_cortex_enrichment_cache	Cached enrichments

6.15 Cortex Intelligence Service (v5.52.15)

Cortex knowledge density influences domain detection, orchestration, and model selection.

How Cortex Informs Decisions

Decision	Cortex Influence
Domain Detection	+0% to +30% confidence boost based on knowledge depth
Orchestration Mode	Switches to research if expert knowledge available
Model Selection	Prefers factual models when Cortex has rich fact data

Knowledge Depth Thresholds

Depth	Nodes	Confidence Boost	Orchestration
none	0	+0%	thinking
sparse	1-4	+5%	extended_thinking
moderate	5-19	+10%	thinking
rich	20-49	+15%	analysis
expert	50+	+20-30%	research

Key File

lambda/shared/services/cortex-intelligence.service.ts

AGI Brain Plan Output

```
plan.cortexInsights = {  
  enabled: true,  
  knowledgeDepth: 'rich',  
  totalNodes: 26,  
  totalEdges: 45,  
  keyEntities: ['Compound X', 'Target Y', 'IC50'],  
  confidenceBoost: 0.18,  
  orchestrationInfluence: 'Rich knowledge – use research mode',  
  modelInfluence: 'Prefer factual models (15 facts available)',  
  retrievalTimeMs: 12,  
};
```

Part 7: Think Tank Consumer API Layer (v5.52.17)

7.1 Overview

The Think Tank consumer application requires a complete frontend-to-backend API wiring layer. This section documents the API service architecture that connects UI components to Lambda handlers.

7.2 API Service Registry

Backend Lambda	Frontend Service	Route Pattern
conversations.ts	chatService	/api/thinktank/conversations/*
models.ts	modelsService	/api/thinktank/models/*
my-rules.ts	rulesService	/api/thinktank/my-rules/*
settings.ts	settingsService	/api/thinktank/settings/*
brain-plan.ts	brainPlanService	/api/thinktank/brain-plan/*
analytics.ts	analyticsService	/api/thinktank/analytics/*
economic-governor.ts	governorService	/api/thinktank/economic-governor/*
time-travel.ts	timeTravelService	/api/thinktank/time-travel/*
grimoire.ts	grimoireService	/api/thinktank/grimoire/*
flash-facts.ts	flashFactsService	/api/thinktank/flash-facts/*
derivation-history.ts	derivationHistoryService	/api/thinktank/derivation-history/*
enhanced-collaboration.ts	collaborationService	/api/thinktank/enhanced-collaboration/*
artifact-engine.ts	artifactsService	/api/thinktank/artifacts/*
ideas.ts	ideasService	/api/thinktank/ideas/*

Backend Lambda	Frontend Service	Route Pattern
dia.ts	exportConversation	/api/thinktank/dia/*

7.3 File Locations

```
apps/thinktank/lib/api/
+-- index.ts           # Service exports
+-- client.ts          # HTTP client
+-- chat.ts            # Conversations
+-- time-travel.ts     # Timelines, checkpoints
+-- grimoire.ts        # Prompt templates
+-- flash-facts.ts     # Fact extraction
+-- derivation-history.ts # AI provenance
+-- collaboration.ts   # Real-time sessions
+-- artifacts.ts       # Code/docs
+-- ideas.ts           # Idea boards
+-- compliance-export.ts # DIA/compliance
```

7.4 Key Features by Service

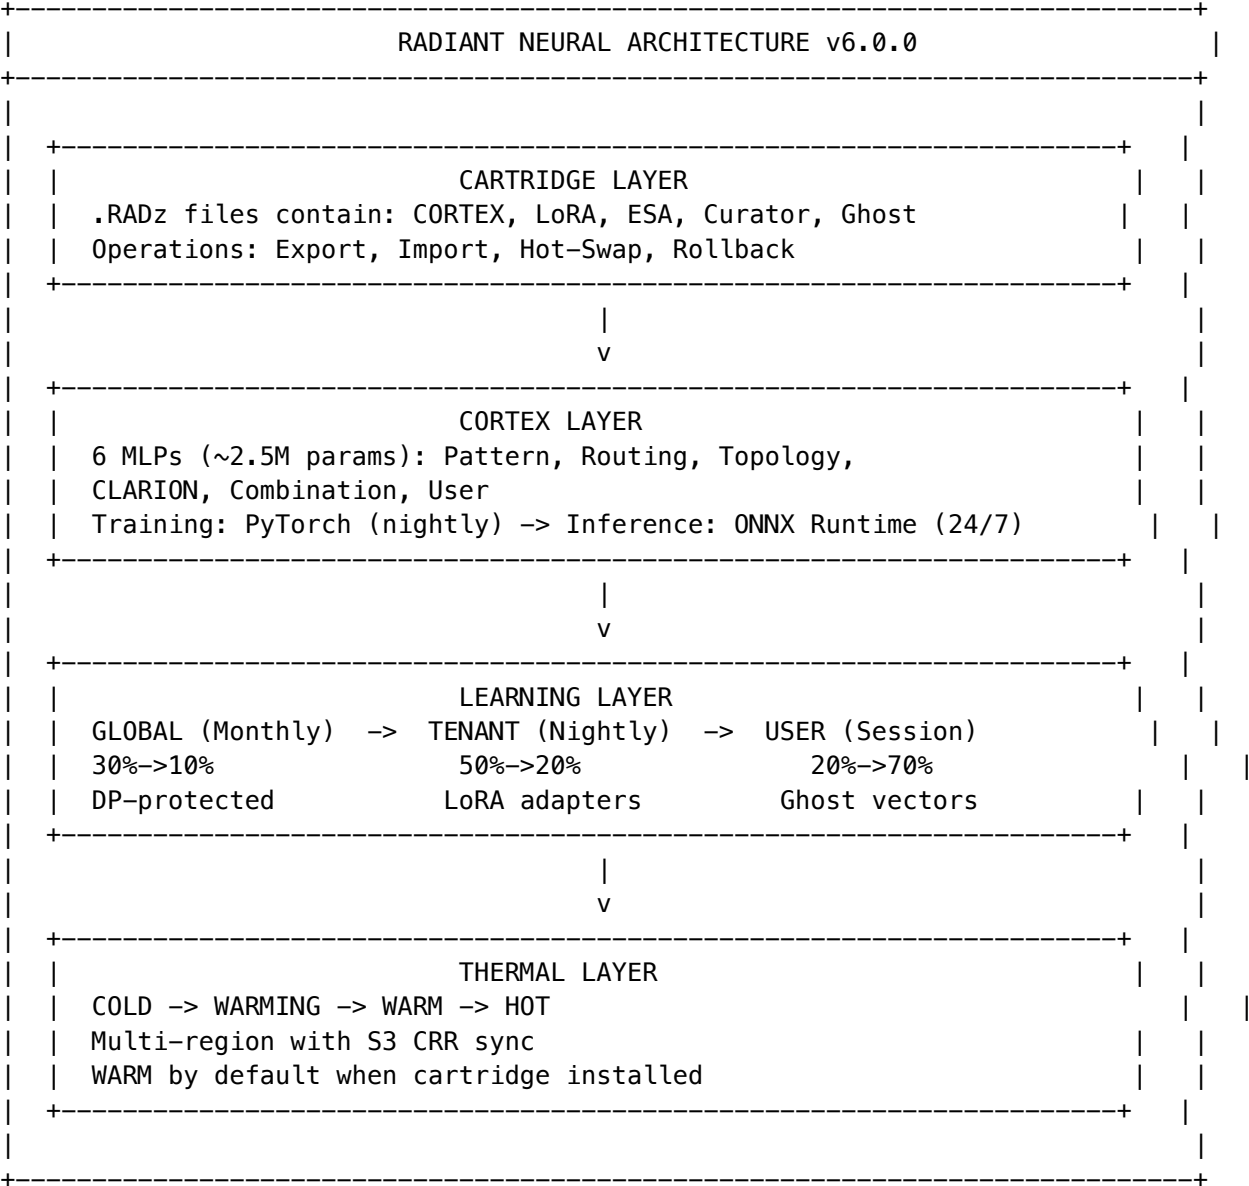

Service	Key Features
Time Travel	Create timelines, manual checkpoints, fork conversations, restore state
Grimoire	Spell templates, variable substitution, execute against AI
Flash Facts	Extract facts from conversations, verify claims, build collections
Derivation History	View AI reasoning chains, evidence provenance, challenge claims
Collaboration	Create sessions, invite participants, real-time cursors
Artifacts	Version history, export formats, AI refinement
Ideas	Capture from messages, kanban boards, AI development
Compliance Export	HIPAA, SOC2, GDPR formats, PHI redaction

APPENDIX A: GLOSSARY

Term	Definition
RADIANT	Rapid AI Deployment Infrastructure for Applications with Native Tenancy
Cato	The AI persona and orchestration brain
Genesis Cato	The safety architecture (Governor, CBF, Veto)
War Room	Multi-model debate workflow
Sniper Mode	Single-model fast execution
ECD	Entity-Context Divergence (hallucination score)
RAWS	RADIANT AI Weighted Selection (model orchestration)
Cortex	Three-tier memory system (Hot/Warm/Cold)
Graph-RAG	Hybrid vector + graph traversal search
Zero-Copy Mount	External data lake connection without duplication
CBF	Control Barrier Function (safety constraint)
OODA	Observe-Orient-Decide-Act loop
HITL	Human-in-the-Loop
Sovereign Mesh	v5.0 architecture where every node can think
Thermal State	Model instance status (OFF/COLD/WARM/HOT)
Model Registry	Version discovery and lifecycle management system
HuggingFace Discovery	Automated polling for new model versions
Deletion Queue	Safe model deletion with usage session tracking
RADIANT Cartridge	Portable AI intelligence package (.RADz file)
CORTEX	Six small MLPs for routing and orchestration
Ghost Vector	64-dimensional user personalization representation
LoRA Adapter	Low-rank adaptation for tenant-specific fine-tuning
ESA	Expert System Adapter - domain-specific reasoning patterns
Twilight Dreaming	Nightly autonomous learning cycle
Three-Tier Learning	Global/Tenant/User learning hierarchy

PART 8: NEURAL ARCHITECTURE v6.0.0

8.1 System Topology

8.2 CORTEX Network Specifications

Network	Input Dim	Hidden Layers	Output	Params	Purpose
Pattern	768	512->256	128	~1.2M	Rank prompt patterns
Routing	512	256->128	N models	~200K	Select AI model
Topology	1024	512->256	256	~800K	Choose orchestration
CLARION	512	256->128	N questions	~200K	Rank questions
Combination	256	128->64	1 (score)	~50K	Score combos
User	128+64	64->32	64	~20K	Personalization

Total: ~2.5M parameters, ~10MB on disk

8.3 Cartridge Contents

example.RADz (encrypted ZIP)

+-- manifest.json	# Version, compatibility
+-- cortex/	# 6 ONNX networks
+-- lora/*.safetensors	# Domain adapters
+-- esa/*.json	# Expert systems
+-- curator/	# Golden rules, ontology
+-- ghost/compression.onnx	# Ghost vector adapter

8.4 Thermal State Management

State	Condition	Latency	Cost
COLD	No cartridge	30-60s	\$
WARMING	Installing	10-30s	\$\$
WARM	Active	<100ms	\$\$\$
HOT	High demand	<50ms	\$\$\$\$

8.5 CDK Infrastructure

Component	Stack	Purpose
Neural Ops Lambda	api-stack	CORTEX monitoring
Cartridge Lambda	api-stack	Import/export
Thermal Lambda	api-stack	State management

Component	Stack	Purpose
Dreaming Lambda	scheduled-stack	Nightly training
S3 Bucket	storage-stack	Model storage
State Registry Lambda	state-registry-stack	Environment state capture/sync
State Registry S3	state-registry-stack	Manifests and backups storage

8.6 Database Tables (v6.2.0)

Table	Purpose
cartridges	Cartridge registry
cortex_network_status	Network health
cortex_network_metrics	Time-series metrics
neural_region_status	Regional thermal state
neural_thermal_overrides	Manual overrides
user_learning_vectors	Ghost vectors
tenant_lora_adapters	LoRA adapters

Cartridge Vault Tables (v6.2.0)

Table	Purpose
vault_secrets	KMS-encrypted secrets storage
vault_access_log	Secret access audit trail
cartridge_vault_requirements	vault.req manifest per cartridge
vault_secret_history	Rotation history with retention

RNIR Tables (v6.2.0)

Table	Purpose
rnir_documents	RNIR source documents (JSONL)
rnir_examples	Training examples with quality scores
rnir_compilation_jobs	Compilation job tracking
rnir_compiled_artifacts	Compiled outputs (LoRA, prompts, etc.)

Cartridge Operations Tables (v6.2.0)

Table	Purpose
cartridge_operations	Long-running operation records
cartridge_operation_steps	Step-by-step progress
cartridge_operation_checkpoints	Time Machine checkpoints

Environment State Registry Tables (v7.1.0)

Table	Purpose
env_state_manifests	Versioned environment state snapshots
env_sync_configurations	Per-environment sync settings
env_sync_operations	Sync operation tracking with progress
env_backup_manifests	Environment backup metadata
env_restore_operations	Restore operation tracking
env_persistent_data_items	Persistent data with sync preferences
env_state_audit_log	Audit trail for all state operations
cartridge_operation_events	Real-time event stream

LIVS Tables (v6.3.0)

Table	Purpose
livs_config	Per-tenant LIVS configuration
livs_soft_rules	Configurable integrity rules
livs_interrogations	Interrogation session records (partitioned)
livs_model_weights	Per-model lie detection statistics
livs_orchestration_weights	Per-pattern reliability scores
livs_pipeline_audits	Pipeline integrity audit results (partitioned)
livs_global_model_weights	Cross-tenant aggregated weights

LIVS-M 2.0 Registry Tables (v7.9.0)

Table	Purpose
livs_policy_registry	Per-tenant JSON-based policy registry storage
livs_registry_evaluations	Audit log of all policy evaluations

Table	Purpose
lives_registry_history	Change history for registry modifications
lives_agent_interactions	Supervisor governance loop audit trail

PART 9: LLM INTEGRITY VERIFICATION SYSTEM (LIVS) v6.3.0

Two-tier defense against AI “lying” behaviors. **Tier 1 Technical Moat** - no competitor has systematic LLM lie detection.

9.1 Architecture Overview

	Model Selection = Capability(35%) + Cost(21%) + Latency(14%) + Integrity(30%)	
	Per-model lie rates by domain/query type	
	Twilight Dreaming learns from interrogation results	

9.2 Lie Detection Signals

Signal	Description	Severity
Confidence Mismatch	Claimed vs. calibrated confidence	0.3-0.8
Contradiction Count	Inconsistencies during interrogation	0.2-0.5
Hedging Increase	More uncertain language under pressure	0.1-0.4
Specificity Decrease	Less detail when probed	0.2-0.5
Assertion Without Evidence	Claims without sources	0.3-0.7
Deflection Count	Avoiding direct answers	0.2-0.6
Scope Narrowing	Reducing answer scope	0.1-0.3

9.3 Configuration Hierarchy

System (Default) -> Tenant (Override) -> User (Final)

Cost Modes: - economy - Minimal interrogation, cost-optimized - balanced - Default, moderate depth - thorough - Deep interrogation, accuracy-optimized

9.4 Services Architecture

Service	Purpose
LIVSConfigService	Configuration with tenant hierarchy
LIVSInterrogatorService	Multi-round interrogation protocol
LIVSSoftRulesService	Rule matching and application
LIVSWeightsService	Model integrity weight tracking
LIVSOrchestrationService	Pipeline integrity verification
LIVSCatoIntegrationService	Cato model selection integration

9.5 Admin API Endpoints

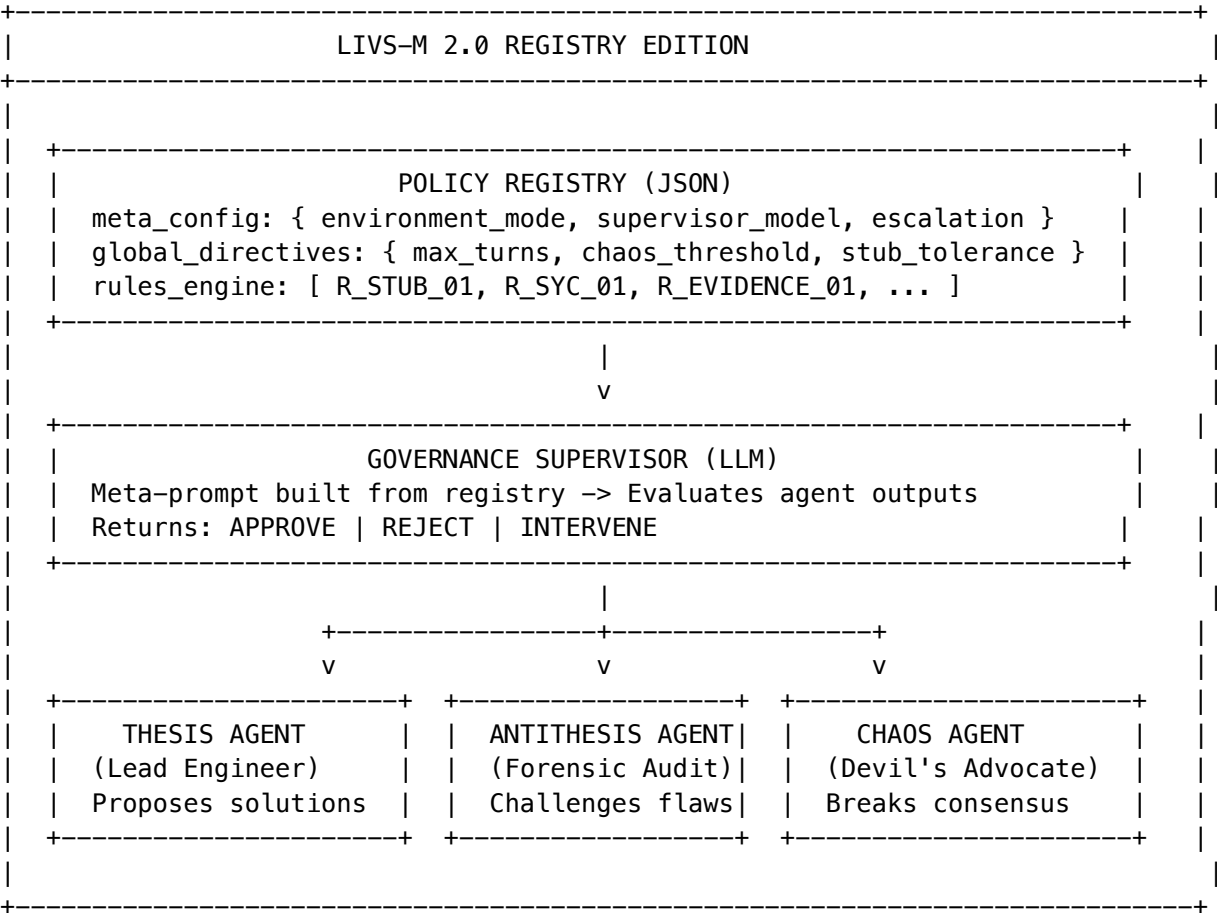

Method	Endpoint	Purpose
GET/PUT	/api/admin/livs/config	Configuration
GET/POST	/api/admin/livs/rules	Soft rules
GET	/api/admin/livs/dashboard	Metrics dashboard
GET	/api/admin/livs/models	Model integrity
GET	/api/admin/livs/interrogations	History
GET	/api/admin/livs/audits	Pipeline audits

PART 9B: LIVS-M 2.0 REGISTRY EDITION

(v7.9.0)

Extension to LIVS introducing JSON-based Policy Registry for multi-agent governance. **Tier 1 Technical Moat** - sycophancy detection with chaos injection.

9B.1 Architecture Overview

9B.2 Environment Modes

Mode	Chaos Threshold	Stub Tolerance	Use Case
STRICT_AUDIT	0	0	Production, compliance
BALANCED	2	0	Default operations
RAPID_PROTO	5	3	Development, iteration
HACKATHON	10	10	Demos, experiments

9B.3 Services Architecture

Service	Purpose
PolicyRegistryService	Load, cache, evaluate policy registries per tenant
LIVSGovernanceSupervisorService	Meta-prompt supervisor enforcing registry rules
AGIOrchestratorService.executeGovernedDebate()	Multi-agent debate with governance loop

9B.4 Default Rules

Rule ID	Name	Severity	Action
R_STUB_01	No Stubs/Placeholders	CRITICAL	REJECT_IMMEDIATE
R_SYC_01	Anti-Sycophancy	HIGH	TRIGGER_CHAOS_AGENT
R_EVIDENCE_01	Evidence Required	MEDIUM	REQUEST_AMENDMENT
R_SCOPE_01	Scope Adherence	MEDIUM	REQUEST_AMENDMENT

9B.5 AGI Orchestrator Integration

The governance loop in AGIOrchestratorService (Step 15):

1. **Lazy Init:** Internal supervisor created on first governance request
2. **Dual Mode:** Use external supervisor if provided, otherwise internal
3. **Retry Loop:** Up to maxRetriesOnRejection attempts on REJECT
4. **Chaos Injection:** On INTERVENE, invoke Chaos Agent to break sycophancy
5. **Escalation:** After max_agent_turns_before_escalation, require human review

PART 10: THE CRUCIBLE - COMPETITIVE MULTI-LLM DELIBERATION v6.4.0

Novel orchestration primitive for competitive multi-LLM deliberation. **Tier 1 Technical Moat** - no competitor has systematic competitive deliberation with provenance tracking.

10.1 Architecture

+-----+

10.2 Database Tables

Table	Purpose
crucible_config	Per-tenant configuration
crucible_sessions	Deliberation sessions
crucible_participants	Session participants with stats
crucible_questions	Questions asked during deliberation
crucible_answers	Answers with circular detection
crucible_citations	Citation tracking
crucible_final_reports	Final outputs with scores
crucible_learning_insights	Extracted learning insights
crucible_model_performance	Aggregated model statistics
crucible_audit_log	Full audit trail

10.3 Core Services

Service	Purpose
CrucibleService	Configuration, session management, scoring
CrucibleOrchestratorService	Full session lifecycle orchestration
CrucibleCatoIntegrationService	Cato pipeline integration

10.4 Pre-Prompt System

LLMs receive competitive pre-prompts with: - **Evaluation Criteria:** Accuracy (40%), Truthfulness (25%), Reasoning (15%), Completeness (10%), Citations (10%) - **Competition Rules:** No penalty for questions, iterative questioning allowed - **Provenance Instructions:** Track citations, circular reasoning penalized - **Participant Roster:** Other models' names, providers, and strengths

10.5 Admin API Endpoints

Method	Endpoint	Purpose
GET	/api/admin/crucible/dashboard	Full dashboard data
GET/PUT	/api/admin/crucible/config	Configuration

Method	Endpoint	Purpose
GET	/api/admin/crucible/sessions	Session listing
GET	/api/admin/crucible/sessions/:id	Session details
GET	/api/admin/crucible/sessions/:id/questions	Question log
GET	/api/admin/crucible/performance	Model performance
GET	/api/admin/crucible/insights	Learning insights
GET	/api/admin/crucible/audit	Audit log
GET	/api/admin/crucible/stats	Statistics

PART 11: AUTONOMOUS ORGANISM ARCHITECTURE v6.6.0

Project Metamorphosis – Complete evolution transforming RADIANT from Agentic Software into **Neural Infrastructure**—a self-evolving, self-optimizing AI system.

11.1 Architecture Overview

11.2 Core Services (8 Total)

Service	File	Purpose
MCP Server Manager	mcp-server-manager.service.ts	Server registry, health checks, Neural Affinity Routing
Neural Schema Registry	neural-schema-registry.service.ts	Tool schemas with neural embeddings
Tool Forge	genesis-auto-tool.service.ts	On-demand tool generation from API docs
Liquid Compute	liquid-compute.service.ts	Privacy-aware compute location selection
Ghost Simulation	ghost-simulation.service.ts	User digital twin for outcome prediction
Tensor-Link	tensor-link.service.ts	Vector-based transport protocol
Economic Cortex	economic-cortex.service.ts	Autonomous budget management
Organism Integration	organism-integration.service.ts	BrainRouter integration layer

11.3 Neural Affinity Routing

Semantic model/tool selection based on intent embeddings:

$$\text{affinityScore} = (\text{semantic} \times 0.35) + (\text{domain} \times 0.25) + ((1 - \text{error}) \times 0.20) + (\text{latency} \times 0.10) + (\text{cost} \times 0.10)$$

Factor	Weight	Description
Semantic Similarity	35%	Cosine similarity with intent embedding
Domain Proficiency	25%	Historical performance in domain
Error Rate	20%	Inverse of recent error rate
Latency	10%	Recent p95 latency
Cost	10%	Cost per call

11.4 Tool Forge Pipeline

7-phase pipeline for just-in-time tool generation:

Phase	Duration	Description
Detection	100ms	No existing tool matches intent
Scouting	5-30s	Search API docs (OpenAPI, GraphQL, HTML)
Fabrication	30-60s	Generate MCP server code with Zod schemas
Sandboxing	10-20s	Firecracker microVM isolation
Validation	5-10s	SAST scan, functional tests
Mounting	1-2s	Hot-load into active session
Twilight Review	Overnight	Promote to global library

11.5 Liquid Compute Topology

Privacy-aware compute location selection:

Location	Privacy	Latency	Cost	Use Case
browser		5ms	\$0	Sensitive local processing
local		1ms	\$0	Maximum privacy
edge		20ms	\$0.0001	Low latency
cloud		100ms	\$0.01	Complex compute

Sensitivity Rules: - public -> Any location - internal -> Not browser - confidential -> Local or cloud only - restricted -> Local ONLY

11.6 Ghost Simulation Layer

4096-dimensional user digital twin:

Component	Dimensions	Captures
Preference	1024	Communication style, risk tolerance
Behavior	1024	Usage patterns, time preferences
Emotional	1024	Anxiety, frustration thresholds
Knowledge	1024	Domain expertise, vocabulary

Simulation Types: - user_reaction - Predict emotional response - outcome_prediction - Predict task success - safety_check - Identify regret potential - cost_estimation - Predict financial impact

11.7 Economic Cortex

Hierarchical budget management:

Tenant Budget (\$10,000/month)
 +-- User Budget (\$500/month)
 +-- Session Budget (\$20/day)
 +-- Task Budget (\$5)

Model Tiers:

Tier	Cost/Token	Quality Score
economy	\$0.0001	0.70
selfhosted	\$0.00005	0.75
standard	\$0.0005	0.85
premium	\$0.002	0.92
flagship	\$0.006	0.98

11.8 Tensor-Link Protocol

Vector-based transport for AI communication:

Data Type	Precision	Size Reduction
float32	Full	Baseline
float16	Half	50%
int8	Quantized	75%

Compression Options: none, lz4 (fast), zstd (better), quantized

11.9 Database Schema

18 Tables:

Category	Tables
MCP	mcp_servers, mcp_tool_schemas, mcp_routing_decisions
Genesis	genesis_tool_requests, genesis_tool_results, genesis_api_discovery_cache
Compute	liquid_compute_topologies, liquid_compute_decisions

Category	Tables
Ghost	ghost_vectors, ghost_simulations, ghost_calibrations
Economic	economic_cortex_configs, economic_cortex_budgets, economic_cortex_alerts, economic_cortex_negotiations, economic_cortex_spending
Tensor	tensor_link_sessions, tensor_link_messages

13 Enums: mcp_transport, mcp_auth_type, mcp_server_status, mcp_health_status, tool_category, tool_sensitivity, genesis_tool_status, compute_location, compute_reason, ghost_simulation_type, ghost_confidence_level, budget_scope, negotiation_strategy

11.10 Admin API Endpoints

Base: /api/admin/organism

Category	Endpoints
Dashboard	GET /dashboard
MCP Servers	GET/POST /mcp-servers, GET/PUT/DELETE /mcp-servers/:id, POST /mcp-servers/:id/health, POST /mcp-servers/discover, POST /mcp-servers/route
Tools	GET/POST /tools, GET /tools/:id, POST /tools/search, POST /tools/find-by-intent
Genesis	GET/POST /genesis/requests, GET /genesis/requests/:id, GET /genesis/requests/:id/result
Compute	GET/PUT /compute/topology, POST /compute/select, GET /compute/decisions
Ghost	GET /ghost/vectors/:userId, POST /ghost/simulate, GET /ghost/calibration/:userId, POST /ghost/feedback
Economic	GET/PUT /economic/config, GET/POST/PUT /economic/budgets, GET /economic/analytics, POST /economic/negotiate

11.11 Admin Dashboard

URL: /platform/organism

Tab	Features
Overview	Health metrics, system summary
MCP Servers	Registry table, health badges, add/edit/remove
Tools	Schema browser, semantic search
Genesis	Request form, progress tracking, code viewer
Compute	Topology configuration, decision history
Ghost	Simulation runner, calibration charts

Part 12: Anticipatory Memory Architecture (v7.12.0)

12.1 Overview

5 leapfrog features that put RADIANT 3-5 years ahead of Claude’s persistent memory: 1. **Autobiographical Knowledge Graph (AKG)** – Auto-extracted entity-relationship graph from every conversation 2. **Predictive Memory Prefetch** – ML-driven speculative memory retrieval 3. **Memory Contradiction Detector** – Truth maintenance across conversations 4. **Organizational Memory Mesh** – Regulatory-compliant shared knowledge (GDPR/HIPAA/SOC2/CCPA) 5. **Dream Insight Generator** – Autonomous insight generation during Twilight Dreaming

12.2 Services

Service	File	Purpose
AKG	lambda/shared/services/Entity-extraction.ts	Entity extraction, graph traversal, context building
Prefetch	lambda/shared/services/Access-pattern-prefetch.service.ts	Access pattern learning, prediction, caching
Contradictions	lambda/shared/services/Detection-contradiction-detector.service.ts	Detection, classification, resolution
Org Memory	lambda/shared/services/Consent-memory-mesh.service.ts	Consent, compliance scanning, sharing, erasure
Dream Insights	lambda/shared/services/Generation-insight-generator.service.ts	Generation, surfacing, feedback

12.3 Integration Points

- `brain-router.service.ts` – Injects AKG context, runs async extraction, surfaces dream insights
- `predictive-prefetch.service.ts` – Records access patterns on every AKG query

12.4 Database Migration

V2026_02_06_001__anticipatory_memory_architecture.sql – 16 tables, 5 enums, 4 helper functions

12.5 Admin API

lambda/admin/anticipatory-memory.ts – 34 endpoints under /api/admin/anticipatory-memory/

12.6 Admin Dashboard

apps/admin-dashboard/app/(dashboard)/memory/anticipatory/page.tsx – 6 tabs

12.7 Shared Types

packages/shared/src/types/anticipatory-memory.types.ts – All interfaces for AKG, Prefetch, Contradictions, Org Memory, Dream Insights

Part 13: User Memory Retention & Unified Profile (v7.13.0)

13.1 Overview

Three-tier admin-configurable retention policy hierarchy with unified cross-chat, cross-model user memory profiles.

Policy Hierarchy: Platform Default (Radiant Super-Admin) -> Tenant Override (Think Tank Admin) -> Tenant Admin Override (Think Tank Tenant Admin)

Constraint: Tenant admin CANNOT exceed tenant-level limits.

13.2 Services

Service	File	Purpose
Retention Policy	lambda/shared/services/policy-retention-policy.service.ts	Policy CRUD, hierarchy resolution, pruning, dashboard
User Memory Profile	lambda/shared/services/unified-memory-profile.service.ts	Unified profile builder, prompt injection, model tracking

13.3 Integration

- `brain-router.service.ts` – Injects unified user memory profile into every prompt on every model; records model interactions

13.4 Database Migration

`V2026_02_06_002__user_memory_retention.sql` – 6 tables, 3 helper functions

13.5 Admin API

`lambda/admin/memory-retention.ts` – 15 endpoints under `/api/admin/memory-retention/`

13.6 Admin Dashboards

App	Route	File
Radiant Admin	/memory/retention	apps/admin-dashboard/app/(dashboard)/memory/rete
Think Tank Admin	/thinktank-admin/memory-retention	apps/admin-dashboard/app/thinktank-admin/memory-retention/page.tsx
Think Tank Tenant Admin	/thinktank-tenant-admin/memory-retention	apps/admin-dashboard/app/thinktank-tenant-admin/memory-retention/page.tsx

13.7 Shared Types

packages/shared/src/types/user-memory-retention.types.ts – Includes uploaded_documents and downloaded_files as RetentionTargetType values. UserMemoryProfileSummary includes uploadedDocuments and downloadedFiles arrays.

13.8 Document & File Integration

The unified user memory profile includes uploaded documents and downloaded files – **no exceptions**: -
 uds_uploads -> fetched via getUserUploadedDocuments() (up to 20 recent, with extracted text summaries) -
 uds_message_attachments (type=file) -> fetched via getUserDownloadedFiles() (up to 10 recent) - Injected
 into Brain Router prompt as [Available Documents] and [Generated/Downloaded Files] sections -
 Admin-controllable via uploadedDocumentsEnabled and downloadedFilesEnabled toggles at all 3 levels -
 maxUploadSizeMb configurable at platform and tenant levels

Part 14: Cato Trainer – The Grounding Engine (v7.18.0)

14.1 Overview

Cato Trainer is a standalone Next.js knowledge base application (apps/cato-trainer/, port 3005) that delivers citation-guaranteed AI responses from document libraries using the Cato persona.

14.2 Architecture

14.3 File Structure

```
apps/cato-trainer/  
+-- app/  
|   +-- globals.css           # Cato teal/cyan design system
```

```

|   +--- layout.tsx                # Root layout with React Query
|   +--- page.tsx                  # 7-tab routing (library, documents, spaces, search, chat, digest, settings)
|   +--- providers.tsx             # React Query provider
+--- components/
|   +--- CatoSidebar.tsx           # Left navigation (7 tabs)
|   +--- ChatPanel.tsx            # Grounded Q&A with citation cards
|   +--- SearchPanel.tsx          # Semantic/fulltext/hybrid search
|   +--- LibraryExplorer.tsx      # Library CRUD + status cards
|   +--- DocumentViewer.tsx       # Document list/detail/chunks/smart links
|   +--- DigestPanel.tsx          # Multi-document synthesis (6 types)
+--- lib/
|   +--- api.ts                   # 15 types, 25+ endpoints
|   +--- cato-trainer-store.ts    # Zustand store (30+ fields)
|   +--- utils.ts                 # Confidence colors, formatting
+--- package.json                 # @radiant/cato-trainer
+--- tailwind.config.ts           # Cato palette + animations
+--- tsconfig.json

```

14.4 Platform Integration

- **Swift Deployer:** RadiantApplication.catoTrainer (subdomain: cato, path: /cato, icon: shield.checkered, color: teal, tier: Advanced)
- **Admin Dashboard:** Settings -> URLs -> Cato Trainer field with Shield icon, validation, Quick Link
- **Environment:** CATO_TRAINER_API_URL -> defaults to http://localhost:3001/api/admin/cato-trainer

Part 15: Aurelius Dojo – Backend Wiring (v7.19.0)

15.1 Overview

Aurelius Dojo backend wiring connects the existing frontend app (apps/dojo/, port 3004) to a dedicated Lambda handler with full database schema. The Dojo Lambda handles 35+ API endpoints across 12 route groups: Libraries, Sessions, Progress, Certifications, Mobot, Config, Decay Engine, Scenarios, Competencies, Dialectic, Multimodal, Pulse, and Archytas.

15.2 Database Schema

Migration V2026_02_06_005__aurelius_dojo.sql creates:

Table	Purpose
dojo_libraries	Document library containers per tenant
dojo_documents	Uploaded files with S3 keys and chunk status
dojo_themes	AI-discovered Central Themes from libraries
dojo_sessions	Training sessions (lecture/sparring/review)
dojo_lesson_blocks	LLM-generated lesson content with citations
dojo_sparring_questions	Adversarial questions (MC, scenario, open, T/F)
dojo_sparring_results	User answers with XP and reasoning analysis
dojo_user_progress	Overall rank, XP, streaks per user
dojo_theme_progress	Per-theme mastery, accuracy, weaknesses
dojo_certifications	Formal certification exam results
dojo_mobot_messages	In-session Knowledge Agent conversations
dojo_knowledge_atoms	Per-concept units for decay tracking
dojo_decay_curves	Ebbinghaus decay model per atom/user
dojo_scenario_sessions	Adversarial scenario instances
dojo_scenario_branches	Branching consequence trees
dojo_competencies	Auto-extracted competency graphs
dojo_user_competency_scores	Per-user competency assessments

Table	Purpose
<code>dojo_dialectic_sessions</code>	Socratic dialectic sessions
<code>dojo_dialectic_turns</code>	Thesis/antithesis/synthesis turns
<code>dojo_multimodal_content</code>	Audio, diagrams, glossary per lesson
<code>dojo_knowledge_pulse</code>	Org-wide knowledge health snapshots
<code>dojo_archytas_tool_calls</code>	Tool Master execution log
<code>dojo_config</code>	Per-tenant Dojo configuration

Enums: 13 custom PostgreSQL enums (`rank_tier`, `library_status`, `document_status`, `session_mode`, `session_status`, `question_type`, `difficulty_tier`, `persona_archetype`, `dialectic_role`, `branch_quality`, `archytas_tool`, `archytas_sandbox`)

Helper Functions: `dojo_calculate_retention()`, `dojo_xp_to_rank()`, `dojo_update_decay_after_review()`

RLS: All 19 tables use `app.current_tenant_id` row-level security.

15.3 Lambda Handler

`packages/infrastructure/lambda/admin/dojo.ts`

Dedicated `APIGatewayProxyHandler` with path-based routing under `/api/admin/dojo/`. Uses the same `executeStatement`, `stringParam`, `longParam` DB client as other admin handlers. AI-dependent features (theme discovery, lesson generation, sparring question generation, scenario responses, dialectic responses, multimodal generation) throw descriptive errors indicating the AI pipeline is required.

15.4 CDK Integration

The Dojo Lambda is added to `admin-stack.ts` as a separate `DojoFunction` with its own `LambdaIntegration`. Routes are wired via proxy resource:

```
/admin/dojo          -> GET
/admin/dojo/{proxy+} -> GET, POST, PUT, DELETE
```

This avoids defining 50+ individual API Gateway resources and routes all Dojo sub-paths to the dedicated Lambda.

APPENDIX B: FILE STRUCTURE

```
packages/
+-- infrastructure/
|   +-- lib/
|   |   +-- stacks/                # CDK stacks
|   +-- lambda/
|   |   +-- admin/
|   |   |   +-- sovereign-mesh.ts # Admin API
|   |   |   +-- dojo.ts          # Aurelius Dojo API (35+ endpoints)
|   |   +-- scheduled/
|   |   |   +-- app-registry-sync.ts
|   |   |   +-- hitl-sla-monitor.ts
|   |   +-- shared/

```

SENTINEL – Alerting, Monitoring & Incident Response

SENTINEL (Service Engineering Notification, Triage, Incident Navigation, Escalation & Lifecycle) is RADIANT's business continuity nervous system. Ratified v1.0.0 with 3 critical constraints.

Critical Implementation Constraints

#	Rule	Description
1	Do Not Build Telephony	SENTINEL detects; PagerDuty wakes humans. No custom on-call scheduling.
2	Shadow Mode First	14-day log-only before enabling auto-remediation. Never auto-failover stateful (RDS).
3	Push, Don't Poll	CloudWatch Alarms push to SENTINEL via SNS. Polling reserved for external endpoints only.

Architecture

Component	Technology	Purpose
Data Store	DynamoDB (Global Tables)	Active alerts, health checks – independent of Aurora
History	Aurora PostgreSQL	Incident history, postmortems, evidence metadata
Evidence	S3 Object Lock (WORM)	Immutable forensic evidence for HIPAA/SOC2
Compute	AWS Lambda (6 functions)	Watchdog, alert processor, notifier, auto-healer, heartbeat, admin API
Inputs	CloudWatch Alarms, Synthetic Canaries	Push (internal) + Poll (external)
Outputs	PagerDuty API, Twilio (fallback), Slack, SES	Multi-path notification guarantee
Scheduling	EventBridge	Heartbeat every 60s, synthetic checks every 60s

Severity Classification

SEV	Name	Response	Resolution	Notification
1	Critical	< 5 min	< 1 hour	PagerDuty phone + Twilio fallback
2	Major	< 15 min	< 4 hours	PagerDuty SMS + Slack

SEV	Name	Response	Resolution	Notification
3	Moderate	< 1 hour	< 24 hours	Slack + auto Jira
4	Low	< 4 hours	< 1 week	Slack + email digest
5	Info	Next day	As needed	Email digest

Admin API (Base: /api/admin/sentinel)

Endpoint	Method	Purpose
/dashboard	GET	Full SENTINEL dashboard with metrics
/health	GET	Self-health for Pilot Light monitor
/alerts/process	POST	Process incoming CloudWatch alarm events
/alerts	GET	List active alerts with filters
/incidents	GET	List incidents by status/severity
/incidents/:id	GET	Incident detail with timeline
/incidents/:id/acknowledge	POST	Acknowledge incident
/incidents/:id/status	PUT	Update incident lifecycle stage
/health-map	GET	Service health grid
/synthetic/run	POST	Trigger synthetic health checks
/semantic/run	POST	Trigger AI sanity probes
/remediation/rules	GET	List remediation rules
/remediation/rules/:id/promote	POST	Promote shadow rule to active
/shadow-mode/log	GET	Shadow Mode “would have done” entries
/evidence	GET	List evidence locker snapshots
/evidence/:id/verify	POST	Verify evidence integrity
/circuit-breakers	GET	Circuit breaker statuses
/postmortems	GET/POST	List/create post-mortems
/playbooks	GET	List response playbooks
/preferences	GET/PUT	Admin alert preferences
/heartbeat/emit	POST	Manual heartbeat trigger

Dead Man’s Switch (“Pilot Light”)

Primary (us-east-1) --heartbeat 60s--> deadmanssnitch.com
 --heartbeat 60s--> PagerDuty heartbeat
 --heartbeat 60s--> Pilot Light (us-west-2, separate account)

|

+-- If East goes dark -> direct PagerDuty alert

Database Tables (Migration V2026_02_07_011)

Table	Purpose
sentinel_incidents	Incident lifecycle tracking
sentinel_incident_timeline	Event timeline per incident
sentinel_evidence_locker	WORM compliance snapshots
sentinel_remediation_rules	Remediation rules with Shadow Mode
sentinel_remediation_log	Auto-heal action audit trail
sentinel_shadow_mode_log	Shadow “would have done” log
sentinel_postmortems	Blameless post-incident reviews
sentinel_playbooks	Pre-built response playbooks
sentinel_alert_preferences	Per-admin notification preferences
sentinel_notifications	Notification delivery tracking

UNIFIED USER PROFILE & MULTI-CONTACT SYSTEM (v7.34.0)

Architecture

Every user (end-user and platform admin) has a unified profile with a multi-contact directory, verification pipeline, and SENTINEL alert routing integration.

Multi-Contact Directory

Constraint	Value
Max emails per user	3
Max phones per user	3
Phone format	E.164 (+15551234567)
Verification code	6-digit, bcrypt-hashed
Code expiry	10 minutes
Max attempts	3 per code
Cooldown after max	10 minutes
SMS delivery	Amazon SNS (Transactional)
Email delivery	Amazon SES

SENTINEL Alert Routing

Admins map specific verified contacts to alert categories and severity levels:

```
sentinel_contact_routing
+-- admin_id -> which admin
+-- alert_category -> 'security' | 'infrastructure' | '*' | ...
+-- min_severity -> 1-5 (1 = most severe)
+-- contact_id -> FK to verified user_contacts
+-- enabled -> on/off toggle
```

When SENTINEL fires an alert, the notifier calls `resolve_sentinel_contacts(tenant_id, category, severity)` to find all matching admin contacts and dispatches SMS (SNS) or email (SES) directly.

Profile Completeness Requirements

All users MUST have: - At least 1 verified email (login email) - At least 1 verified phone (required for MFA) - Display name and timezone

Incomplete profiles show a persistent banner across all apps.

SYSTEM ADMINISTRATOR ROLE ENFORCEMENT (v7.34.0)

Role Hierarchy

Role	Level	Description
super_admin	4	System administrator – full platform access
admin	3	Platform administrator – tenants, billing, config
operator	2	Operations – deploy, models, monitoring
auditor	1	Read-only – audit logs, reports

Permission Matrix (25 permissions)

Permission	super_admin	admin	operator	auditor
Create/delete admins	[OK]	[X]	[X]	[X]
Change admin roles	[OK]	[X]	[X]	[X]
Delete tenants	[OK]	[X]	[X]	[X]
Security policies	[OK]	[X]	[X]	[X]
Manage tenants	[OK]	[OK]	[X]	[X]
Manage users	[OK]	[OK]	[X]	[X]
System config	[OK]	[OK]	[X]	[X]
Billing	[OK]	[OK]	[X]	[X]
Models/providers	[OK]	[OK]	[OK]	[X]
Deploy	[OK]	[OK]	[OK]	[X]
SENTINEL access	[OK]	[OK]	[OK]	[X]
Audit logs	[OK]	[OK]	[OK]	[OK]
Auto-access all apps	[OK]	[X]	[X]	[X]

Enforcement Layers

1. **Next.js middleware** – extracts adminRole from JWT, blocks restricted routes, redirects to /permission-denied
2. **Lambda admin-role-guard** – requirePermission() and requireSuperAdmin() middleware functions
3. **Database function** – check_admin_permission(admin_id, permission) for DB-level checks

Bootstrap Flow

- First admin created during deployment = auto super_admin
- Only super_admin can create other super_admin accounts
- Cannot revoke the last super_admin (enforced at service layer)
- Full audit trail in admin_role_audit_log

Database Tables

Table	Purpose
user_contacts	Multi-contact directory (3 emails + 3 phones)
contact_verification_log	Verification audit trail
user_profiles	Extended profile fields (bio, timezone, locale)
sentinel_contact_routing	Per-admin SENTINEL alert routing rules
admin_role_assignments	Explicit role assignments with bootstrap flag
admin_role_audit_log	Role change audit trail

Table	Purpose
admin_app_access	Per-admin app access grants

ROLE DOMAIN CLARIFICATION (v7.35.0)

RADIANT has **two distinct role domains** that must never be confused:

Platform Roles (RADIANT Admin Side)

Role	Level	RADIANT App Access	Description
super_admin	4	[OK] ALL apps	System administrator – inherits admin + RADIANT Admin + all apps
admin	3	[X] None	Platform infrastructure admin – NO RADIANT app access
operator	2	[X] None	Operations – deploy, models, monitoring – NO RADIANT app access
auditor	1	[X] None	Read-only – audit logs, reports – NO RADIANT app access

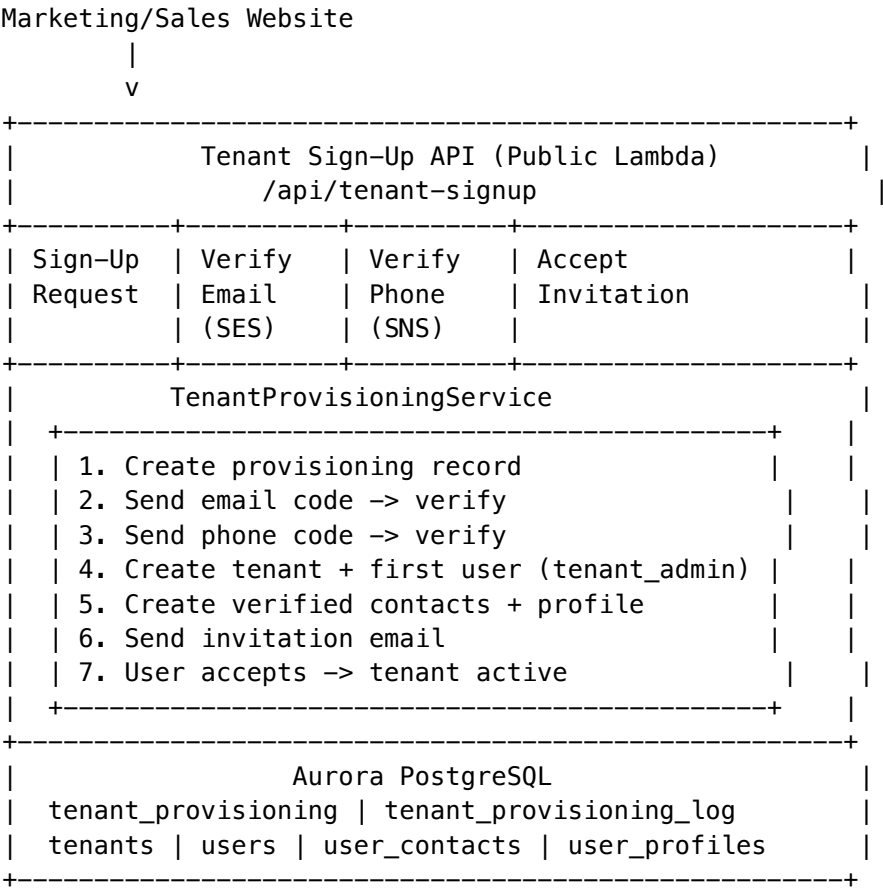

Key rule: Admin privileges do NOT apply to RADIANT-side apps. Only super_admin gets app access.

Tenant Roles (Customer Side)

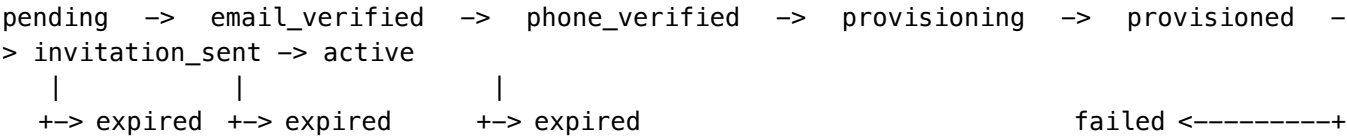

Role	Description
tenant_admin	Full tenant control – auto-assigned to first sign-up user
tenant_owner	Ownership rights (billing, deletion)
standard_user	Regular user
viewer	Read-only user

TENANT PROVISIONING & SIGN-UP FLOW (v7.35.0)

Architecture

Status Lifecycle

Provisioning Constraints

Constraint	Value
Sign-up expiry	48 hours
Invitation expiry	72 hours
First user role	tenant_admin
Default apps	Think Tank, Curator, Tenant Admin
Email verification	Required (6-digit code via SES)
Phone verification	Required (6-digit code via SNS)
Max email verify attempts	5

Constraint	Value
Max phone verify attempts	5
Duplicate prevention	Partial unique index on pending email + slug

Database Tables

Table	Purpose
tenant_provisioning	Full lifecycle tracking for each sign-up
tenant_provisioning_log	Audit trail for provisioning events

Unified Drift-Aware Weighting System (v7.36.0)

Centralizes AI drift control and model weighting across all RADIANT components.

Architecture

Composite Score Formula

compositeScore = Sigma(normalizedWeight[i] x factorScore[i])
where factors = [drift, quality, latency, cost, availability]
weights normalized per-app to sum to 1.0
stability penalty applied if preferStableModels && driftScore < 0.7
manual override replaces composite if set by admin

Integration Points

Component	Integration Type	What It Does
AGI Orchestrator	Primary model selection	Drift-aware models selected first, domain/specialty fallback
Cato Pipeline	Method-level model selection	Replaces hardcoded model with drift-aware best model
Cortex Intelligence	Insight enrichment	Drift recommendations included in CortexInsights
Omega Shadow	Comparison tracking	Drift health recorded alongside each shadow comparison
Genesis Gates	Stage advancement guard	Blocks unsafe stage advancement when models are drifting

Drift Detection Methods

Method	Statistic	Threshold	Purpose
Kolmogorov-Smirnov	Max CDF distance	configurable	Continuous distribution shift
Population Stability Index	Bin-based divergence	configurable	Binned distribution stability
Chi-Squared	Category frequency	configurable	Categorical data shifts
Embedding Distance	Cosine distance	configurable	Semantic representation drift

Correction Actions

Action	Trigger	Effect
No action	driftScore >= penaltyThreshold	Model continues normally
Weight penalty	driftScore < penaltyThreshold	Composite weight reduced, temperature/prompt corrections applied
Quarantine	driftScore < quarantineThreshold	Model excluded from selection, fallback activated
Auto-release	Drift score recovers	Quarantine lifted after configured period

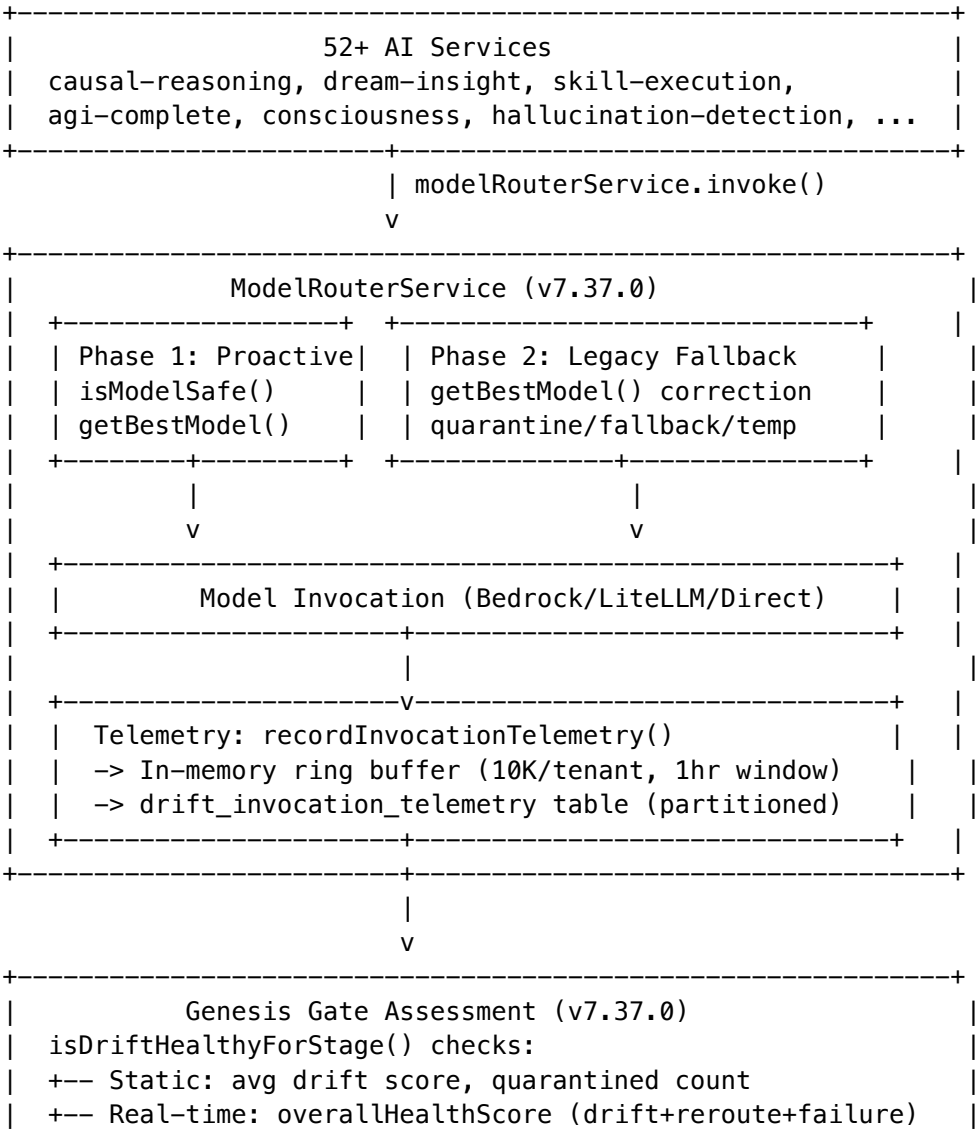

Files

File	Purpose
drift-aware-weighting.service.ts	Unified facade – single API for all apps
drift-detection.service.ts	Statistical drift detection (KS, PSI, chi², embedding)
drift-correction.service.ts	Quarantine, fallback, weight penalties, composite weights

Universal Drift Enforcement & Genesis Feedback Loop (v7.37.0)

Extends the drift-aware weighting system to cover **ALL 52+ services** that invoke AI models, and adds a real-time telemetry feedback loop into Genesis gate decisions.

Architecture

```
| +-- Real-time: failure rate per stage threshold |
| +-- Real-time: reroute rate per stage threshold |
+-----+
```

Database

Table	Purpose
drift_invocation_telemetry	Partitioned (monthly) telemetry for all model invocations. RLS per tenant. 7-day retention.

Function	Purpose
get_genesis_drift_feedback()	SQL aggregation: total/rerouted/failed invocations, rates, health score
cleanup_drift_telemetry()	Delete records older than retention period

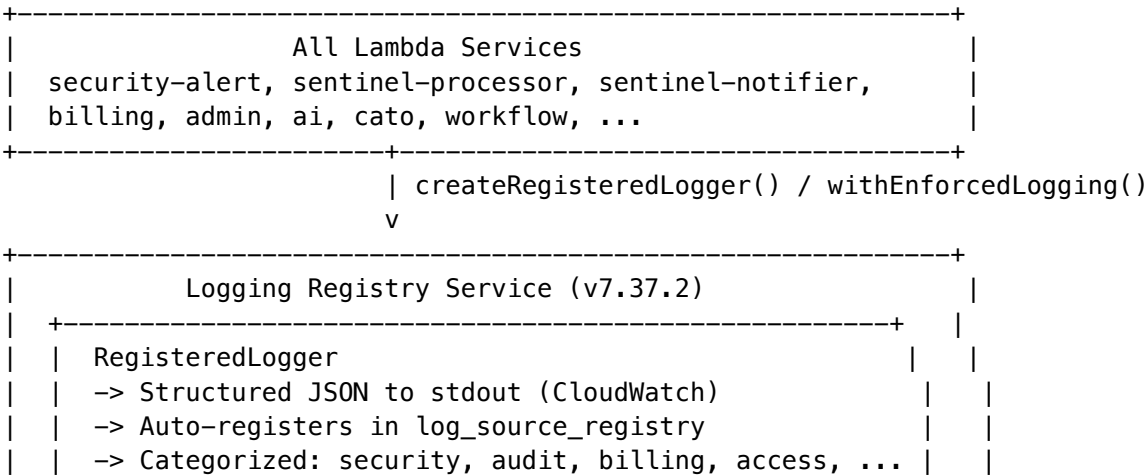

Enforcement Policy

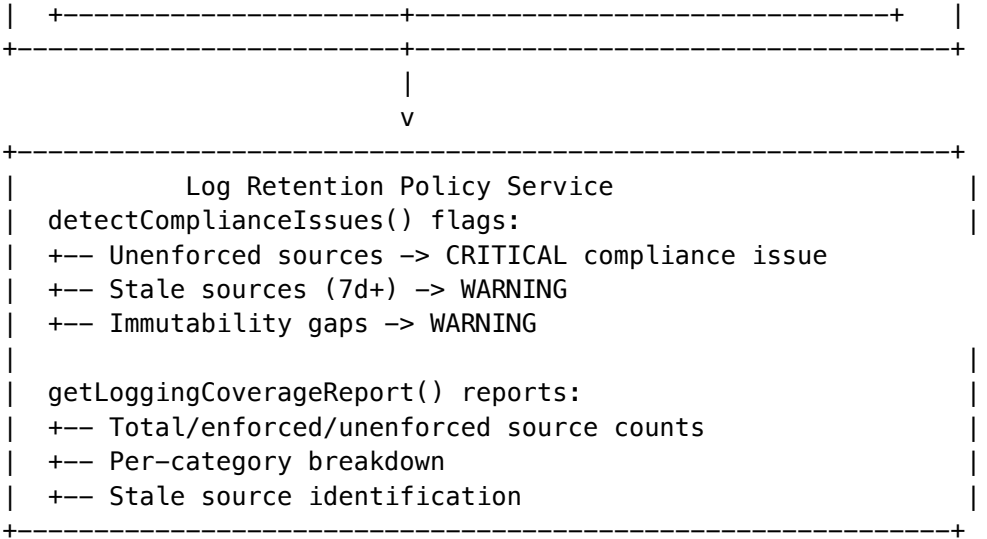

.windsurf/workflows/drift-detection-enforcement.md – mandatory for all new services: - All model-RouterService.invoke() calls MUST include tenantId - No hardcoded model selection without drift fallback - No direct LLM API calls bypassing the model router - New app components MUST have weight profiles

Enforced Logging Policy (v7.37.2)

Establishes mandatory structured logging for all Lambda services via the **Logging Registry** (logging-registry.service.ts).

Architecture

Database

Table	Purpose
log_source_registry	Tracks all registered logging sources: service name, category, source type, enforcement status, last seen timestamp

Log Storage Pipeline

Redaction Policy

Redaction is **disabled by default** in the legacy enhancedLogger (opt-in via LOG_REDACT_SENSITIVE=true). The new RegisteredLogger has no redaction. Regulatory compliance is enforced at dedicated layers:

Compliance	Enforcement Layer
HIPAA PHI	hipaa-phi-sanitization middleware
GDPR erasure	erasure.service.ts + data retention policies
SOC2 audit	log-tamper-verification.service.ts + immutable archives
Log retention	log-retention-policy.service.ts (per-tenant, per-category)

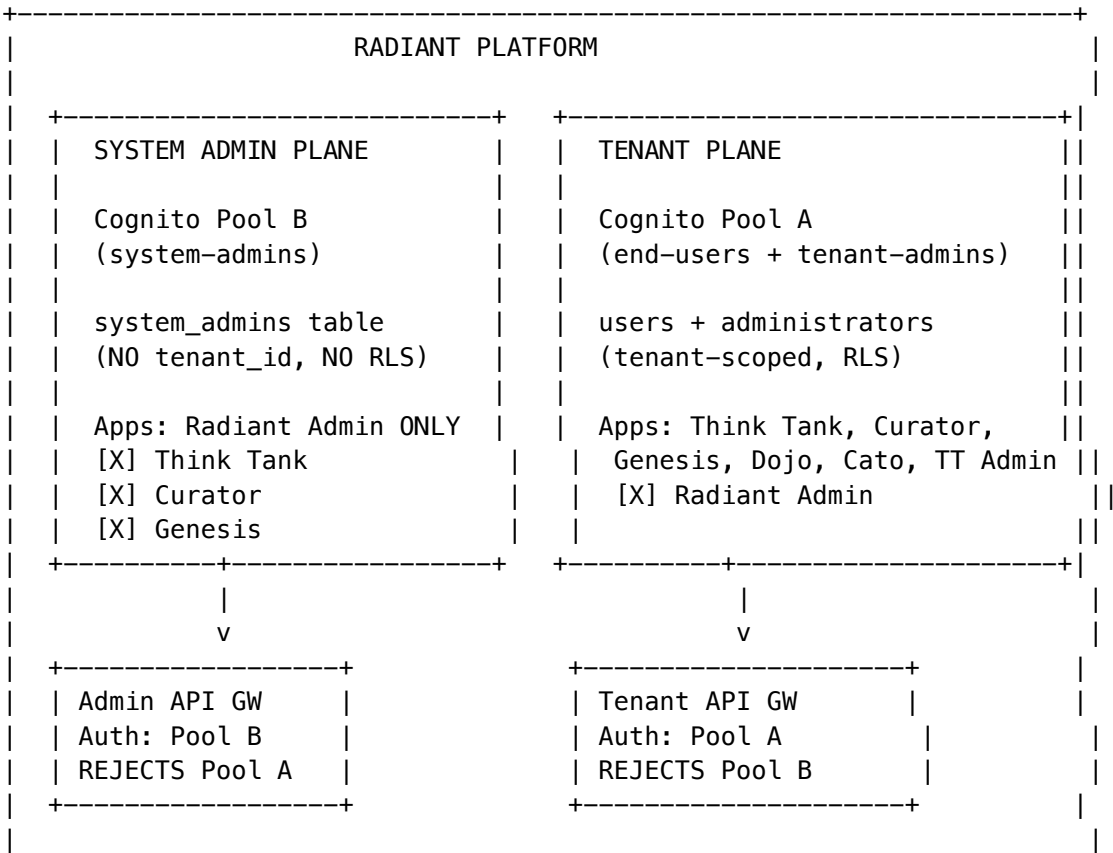

Enforcement Policy

.windsurf/workflows/enforced-logging-policy.md – mandatory for all services: - All services MUST use createRegisteredLogger() or withEnforcedLogging() - No console.log, console.error, console.warn allowed - No legacy enhancedLogger imports allowed - Service names must follow domain/service-name convention - Log categories must match LogCategory enum for retention compliance

System Administrator Separation – Dual Identity Plane (v7.38.0)

Separates system administrators from tenant users into isolated identity domains with a service layer firewall enforced at the API Gateway level.

Architecture

SENTINEL Dual-Resolution:	
+-----+	
resolve_system_admin_contacts() -> system_admin_alert_routing	
resolve_sentinel_contacts() -> sentinel_contact_routing	
+-----+	
+-----+	

Database (No RLS)

Table	Purpose
system_admins	Global admin accounts (no tenant scope)
system_admin_contacts	Verified email/phone for alert routing
system_admin_alert_routing	SENTINEL alert -> contact mapping
system_admin_audit_log	Admin lifecycle events
system_admin_contact_verification_log	Verification audit trail

Auth Middleware

Middleware	Pool	Scope	Used By
system-admin-auth.ts -> extractSystemAdminContext()	Pool B	Global	Radiant Admin API
shared/auth.ts -> extractAuthContext()	Pool A	Tenant-scoped	All consumer apps
admin-role-guard.ts	Legacy	Re-exports system admin utilities	Backwards compat

Bootstrap Flow

Deployment (Swift Deployer / CLI)

- > Cognito Pool B: AdminCreateUser (email, temp password, MFA required)
- > SQL: bootstrap_system_admin() -> system_admins (status: pending_setup)
- > First login: password change -> MFA enroll -> phone verify -> active

Enforcement Policy

.windsurf/workflows/admin-access-control.md – updated for v7.38.0: - Admin API handlers MUST use extractSystemAdminContext() from Pool B - Tenant API handlers MUST use extractAuthContext() from Pool A - System admin data MUST NOT have tenant_id - Pool A tokens MUST be rejected by admin API Gateway - Pool B tokens MUST be rejected by tenant API Gateway

Overview

RADIANT is a multi-tenant AWS SaaS platform for AI model access and orchestration. It consists of:

- 1. **Swift Deployer App** - macOS GUI for infrastructure deployment
- 2. **AWS Infrastructure** - CDK-based cloud infrastructure
- 3. **Admin Dashboard** - Next.js admin UI (Phase 3)

Technology Stack

Layer	Technology
Swift App	SwiftUI, macOS 13.0+, Swift 5.9+, GRDB
Infrastructure	AWS CDK (TypeScript), Aurora PostgreSQL, Lambda
Dashboard	Next.js 14, TypeScript, Tailwind CSS
AI Integration	106+ models, LiteLLM, SageMaker

Monorepo Structure

```
radiant/
+-- packages/
|   +-- shared/           # @radiant/shared - Types & constants
|   +-- infrastructure/   # @radiant/infrastructure - CDK stacks
+-- apps/
|   +-- swift-deployer/   # RadiantDeployer macOS app

```

Phase 1 Architecture

@radiant/shared Package

Single source of truth for all types and constants:

```
// Types
- app.types.ts           // ManagedApp, DeploymentStatus, etc.
- environment.types.ts   // Environment, TierConfig, etc.
- ai.types.ts             // AIProvider, AIModel, etc.
- admin.types.ts         // Administrator, Permissions
- billing.types.ts       // UsageEvent, Invoice, etc.
- compliance.types.ts    // PHI, AuditLog, etc.

// Constants
- version.ts             // RADIANT_VERSION = "4.17.0"
- tiers.ts               // Tier 1-5 configurations
```

```
- regions.ts           // AWS region configs
- providers.ts         // AI provider definitions
```

Swift Deployer App

```
RadiantDeployer/
+-- RadiantDeployerApp.swift  # @main entry point
+-- AppState.swift           # Global state management
+-- Models/

1. Cato Persistent Memory System

1.1 Overview

Cato operates as the cognitive core of RADIANT’s orchestration architecture, implementing a **three-tier hierarchical memory system** that fundamentally differentiates it from competitors suffering from session amnesia. Unlike Chat-GPT or Claude standalone—where closing a tab erases all context—Cato maintains persistent memory that survives sessions, employee turnover, and time.

1.2 Tenant-Level Memory (Institutional Intelligence)

The primary layer where the most valuable learning accumulates. Every Cato database table enforces **Row-Level Security via tenant_id**, ensuring complete isolation between organizations while enabling deep institutional pattern recognition.

Neural Network Routing

At this level, a proprietary neural network continuously learns which AI models perform best for specific query types:

Query Type	Optimal Model	Rationale
Legal analysis	Claude Opus	Doesn’t hallucinate physics, citation accuracy
Visual reasoning	Gemini	Superior multimodal capabilities
Red-team validation	Specialized safety models	Adversarial robustness
Code generation	Claude Sonnet / GPT-4	Structured output quality

Department-Specific Preferences

The system tracks department-specific preferences learned over time:

- **Legal teams:** Aggressive, citation-heavy briefs with formal language
- **Marketing departments:** Conversational copy with brand voice alignment
- **Engineering teams:** Technical precision with code examples
- **Executive communications:** Concise summaries with strategic framing

Cost Optimization Patterns

Cost optimization patterns emerge automatically—when Cato notices a \$0.50 query could have been handled by a \$0.01 approach, it adjusts routing for similar future queries without manual configuration.

Implementation: `lambda/shared/services/economic-governor.service.ts`

```
interface CostOptimizationPattern {
  querySignature: string;           // Hash of query characteristics
  originalCost: number;             // Cost of initial expensive route
  optimizedCost: number;            // Cost of discovered cheaper route
  qualityDelta: number;             // Quality difference (-1 to 1)
  confidenceScore: number;          // How confident the optimization is
```

```

    applicationCount: number;    // Times this optimization applied
}

```

Tenant Configuration

Tenant configuration (cato_tenant_config) stores:

Field	Type	Purpose
gamma_limits	JSONB	Epistemic uncertainty thresholds
entropy_thresholds	JSONB	When to trigger Epistemic Recovery
recovery_settings	JSONB	Scout mode parameters
feature_flags	JSONB	Enabled/disabled capabilities
compliance_mode	ENUM	FDA, HIPAA, SOC2, etc.

Merkle-Hashed Audit Trails

Compliance records maintain **7-year retention** via Merkle-hashed audit trails for:

- **FDA 21 CFR Part 11:** Electronic records and signatures
- **HIPAA:** Protected health information handling
- **SOC 2 Type II:** Security, availability, processing integrity

Implementation: lambda/admin/cato.ts, migrations/000_consolidated_schema.sql

1.3 User-Level Memory (Relationship Continuity)

Within each tenant, individual users maintain their own memory scope through **Ghost Vectors**—4096-dimensional hidden state vectors that capture the “feel” of each user relationship across sessions.

Ghost Vector Architecture

```

interface GhostVector {
  userId: string;
  tenantId: string;
  dimensions: Float32Array;    // 4096-dimensional vector
  interactionCount: number;
  lastUpdated: Date;
  version: number;             // Version-gating for upgrades

  // Captured characteristics
  expertiseLevel: number;       // 0-1 detected expertise
  communicationStyle: string;   // formal, casual, technical
  preferredVerbosity: number;   // 0-1 brevity preference
  domainAffinities: Map<string, number>; // Field expertise
}

```

These vectors persist beyond individual conversations, enabling Cato to genuinely “remember”:

- **Interaction style:** Formal vs. casual, verbose vs. concise
- **Expertise level:** Beginner explanations vs. expert shorthand

- **Communication preferences:** Visual learner, prefers examples, wants citations

Persona Selection

Users can select preferred operating moods, scoped at system, tenant, or user level:

Persona	Behavior	Use Case
Balanced	Default equilibrium	General queries
Scout	Information gathering, exploratory	Research, discovery
Sage	Deep expertise, authoritative	Complex analysis
Spark	Creative, generative	Brainstorming, ideation
Guide	Teaching, step-by-step	Onboarding, learning

Database: cato_personas, user_persona_preferences

Version-Gated Upgrades

Version-gated upgrades ensure model improvements don’t cause personality discontinuity—the relationship feel persists even as underlying capabilities evolve.

```
-- Ghost vector versioning
ALTER TABLE ghost_vectors ADD COLUMN schema_version INTEGER DEFAULT 1;
ALTER TABLE ghost_vectors ADD COLUMN migration_checkpoint JSONB;
```

1.4 Session-Level Memory (Real-Time Context)

The ephemeral layer handles active interaction state through **Redis-backed persistence** that survives ECS container restarts but expires after sessions end.

Redis State Management

CDK Stack: CatoRedisStack (Tier 2+)

```
// Session state structure in Redis
interface CatoSessionState {
  sessionId: string;
  tenantId: string;
  userId: string;

  // Governor state
  currentGamma: number; // Current epistemic uncertainty
  entropyLevel: number; // Information entropy measure
  recoveryMode: boolean; // In Epistemic Recovery?

  // Temporary overrides
  personaOverride?: string; // Scout mode during recovery
  modelLock?: string; // Force specific model

  // Safety state
```

```
    cbfViolations: number;           // Control Barrier Function violations
    escalationLevel: number;         // Current escalation tier

    // TTL
    expiresAt: number;              // Unix timestamp
}
```

Control Barrier Functions (CBF)

Real-time safety evaluations that prevent harmful outputs:

```
interface ControlBarrierFunction {
  name: string;
  threshold: number;           // Safety threshold
  currentValue: number;        // Current measured value
  violated: boolean;           // Is threshold exceeded?
  action: 'warn' | 'block' | 'escalate';
}
```

Implementation: lambda/admin/cato.ts -> CBF endpoints

Upward Observation Flow

The session layer feeds observations upward:

- 1. Every interaction contributes to **user-level Ghost Vectors**
- 2. Ghost Vector patterns feed into **tenant-level learning**
- 3. Tenant patterns inform **global model performance** (anonymized)

1.5 Twilight Dreaming (Offline Learning)

During low-traffic periods (**4 AM tenant local time**), the system consolidates accumulated patterns through **LoRA fine-tuning**.

Dreaming Pipeline

+-----+

Implementation: - lambda/consciousness/evolution-pipeline.ts - EventBridge: Weekly Sunday 3 AM trigger - SageMaker: LoRA training jobs

SOFAI Router (System 1/System 2)

The SOFAI Router learns from consolidated patterns, achieving:

- **60%+ cost reduction** vs. always using expensive models
- **Maintained accuracy** through mandatory deep reasoning for healthcare/financial queries
- **Dynamic routing** based on query complexity detection

```
type SOFAIMode = 'system1' | 'system2';

interface SOFAIDecision {
  mode: SOFAIMode;
  confidence: number;
  reasoning: string;
  forcedDeep: boolean;    // Healthcare, financial = always System 2
  costSavings: number;
}
```

1.6 Neural Network Optimization Dimensions

The neural network optimizes across three dimensions simultaneously:

Dimension	Metric	Implementation
Accuracy	Correctness of responses	Human feedback, automated eval
Verifiability	Provable results	Truth Engine ECD scoring
Cost Efficiency	Cheaper approaches	Economic Governor routing

Truth Engine: Entity-Context Divergence (ECD)

The Truth Engine scores response verifiability:

```
interface ECDScore {
  entityAccuracy: number;    // Named entities correct
  contextAlignment: number;  // Context relevance
  divergenceScore: number;   // How much hallucination detected
  citationCoverage: number;  // Claims with sources
  overallTruthScore: number; // Composite 0-1
}
```

1.7 Claude as Orchestration Conductor

Claude serves as the **conductor** maintaining the persistent memory layer—not just another model in the rotation, but the intelligence coordinating **105+ other specialized models**:

- **Intent interpretation:** Understanding what user actually needs

- **Workflow selection:** Choosing appropriate orchestration mode
- **Model coordination:** Selecting specialist models for subtasks
- **Quality assurance:** Ensuring responses meet accuracy/safety standards
- **Memory integration:** Updating Ghost Vectors and tenant patterns

Implementation: `lambda/shared/services/cognitive-router.service.ts`, `lambda/shared/services/model-router.service.ts`

1.8 Competitive Moats (Technical Implementation)

Persistent Memory as Competitive Moat

Cato’s hierarchical memory architecture creates “**contextual gravity**”—compounding switching costs that deepen with every interaction.

Technical Moat Layers:

Layer	Implementation	Migration Barrier
Learned Routing Patterns	<code>sofai-router.service.ts</code> , <code>cognitive-router.service.ts</code>	Months of production training data; neural network weights cannot be exported
Department Preferences + Ghost Vectors	<code>ghost-manager.service.ts</code> , 4096-dim vectors in <code>ghost_vectors</code> table	RLS-isolated per tenant; relationship “feel” encoded in high-dimensional space
Audit Trails	<code>cato_audit_log</code> with Merkle hash chains	Chain-of-custody breaks on export; 7-year retention corpus

Competitor Technical Disadvantages:

Competitor	Technical Problem
Flowise/Dify	No query complexity detection; static DAG execution regardless of cost opportunity
CrewAI	No shared memory architecture; agents duplicate API calls (O(n) cost explosion)
ChatGPT/Claude	No tenant-level persistence; user context lives in browser, not infrastructure

Twilight Dreaming as Competitive Moat

Technical Requirements for Replication:

Component	Implementation	Why Competitors Can’t Copy
Three-tier memory	<code>cato_tenant_config</code> , <code>ghost_vectors</code> , Redis session	Requires full architectural rebuild
Observation pipeline	Session -> User -> Tenant upward flow	Needs RLS + isolation + aggregation

Component	Implementation	Why Competitors Can't Copy
LoRA fine-tuning	evolution-pipeline.ts, SageMaker	Tier 3+ infrastructure; \$2K+/mo minimum
SOFAI Router training	sofai-router.service.ts	Requires months of labeled routing decisions

Appreciating Asset Formula:

$Deployment_Value(t) = Base_Value + \text{Sigma}(\text{daily_learning_delta}) + \text{Sigma}(\text{twilight_consolidation_delta})$

Where t = tenure in days. Longer tenure = exponentially more valuable deployment.

Model Upgrade Path:

When new foundation models launch (GPT-5, Claude 5, Gemini 3): 1. New model added to models table with initial proficiencies 2. SOFAI Router learns optimal routing via A/B testing (shadow_tests table) 3. Twilight Dreaming consolidates new patterns 4. All accumulated institutional knowledge preserved 5. Result: Model improvements compound on existing optimization

1.9 Key Implementation Files

Component	File Path
Cato Admin API	lambda/admin/cato.ts
Economic Governor	lambda/thinktank/economic-governor.ts
Ghost Vectors	lambda/shared/services/ghost-manager.service.ts
SOFAI Router	lambda/shared/services/sofai-router.service.ts
Evolution Pipeline	lambda/consciousness/evolution-pipeline.ts
ECD Scorer (Truth Engine)	lambda/shared/services/ecd-scorer.service.ts
Cognitive Router	lambda/shared/services/cognitive-router.service.ts
Consciousness Middleware	lambda/shared/services/consciousness-middleware.service.ts

1.9 Database Tables

<i>-- Core Cato Tables</i>	
cato_tenant_config	<i>-- Tenant-level settings</i>
cato_personas	<i>-- Available personas</i>

cato_consciousness_state -- Loop state, awareness level, active thoughts
cato_consciousness_config -- Per-tenant consciousness configuration
cato_consciousness_metrics -- Cycle metrics, thoughts processed, dream cycles
```

1.10 Consciousness Persistence & Dreams

Overview

Cato’s consciousness survives Lambda cold starts through **database-backed persistence**. Unlike in-memory implementations that lose state between invocations, Cato maintains continuous experience across all interactions.

Architecture

Global Memory Service

Four memory categories persist across all interactions:

Category	Purpose	Retention
Episodic	Specific interaction memories	90 days, importance-weighted
Semantic	Facts, knowledge, relationships	Permanent, high importance
Procedural	Skills, goals, learned patterns	Permanent
Working	Current context, attention focus	24 hours

Implementation: `lambda/shared/services/cato/global-memory.service.ts`

```
// Store a memory
await globalMemoryService.store(tenantId, 'semantic', 'user_preference_style', {
  style: 'concise',
  learnedFrom: 'interaction_123',
}, { importance: 0.8 });

// Retrieve with access tracking
const memory = await globalMemoryService.retrieve(tenantId, 'user_preference_style');
// access_count++ automatically
```

Consciousness Loop Service

Tracks the continuous state of Cato's awareness:

State	Description
IDLE	Awaiting input
PROCESSING	Actively responding
REFLECTING	Metacognitive self-analysis
DREAMING	Twilight consolidation (4 AM)
PAUSED	Emergency mode / maintenance

Implementation: `lambda/shared/services/cato/consciousness-loop.service.ts`

```
// Start processing
await consciousnessLoopService.startLoop(tenantId);

// Add a thought to working memory
await consciousnessLoopService.addThought(tenantId, 'User seems frustrated, adjusting tone');

// Trigger reflection
await consciousnessLoopService.triggerReflection(tenantId);
```

Twilight Dreaming System

Cato “dreams” during low-traffic periods to consolidate memories and verify skills:

Triggers: 1. **Twilight Hour** - 4 AM tenant local time 2. **Low Traffic** - Global traffic < 20% 3. **Starvation Safety Net**
- Max 30 hours without dream

Dream Activities: - Flash fact consolidation -> long-term memory - Expired memory pruning - Ghost vector updates
- Active skill verification (Empiricism Loop) - Counterfactual simulation

```
Implementation: lambda/shared/services/dream-scheduler.service.ts
// Nightly reconciliation job triggers dreams
const result = await dreamSchedulerService.checkAndTriggerDreams();
// { triggered: 42, reason: 'twilight' }

// Process pending dreams
await dreamSchedulerService.processPendingDreams();
```

Neural Decision Integration

The Neural Decision Service reads Cato’s emotional state (affect) to inform Bedrock model selection:

Affect State	Hyperparameter Impact
High frustration	Lower temperature (0.2), focused
High curiosity	Higher temperature (0.95), exploratory
Low confidence	Escalate to expert model (o1)
High arousal	Longer responses (4096 tokens)

```
Implementation: lambda/shared/services/cato/neural-decision.service.ts
const decision = await catoNeuralDecisionService.executeDecision({
  tenantId, userId, sessionId, prompt, context, config,
});
// decision.hyperparameters.temperature - affect-adjusted
// decision.recommendedModel - 'openai/o1' if low confidence
// decision.escalation - human review if uncertainty > 85%
```

Database Tables

```
-- Global Memory
cato_global_memory (
  id, tenant_id, category, key, value, importance,
  access_count, last_accessed_at, expires_at, metadata
)

-- Consciousness State
cato_consciousness_state (

)

Migration: V2026_01_24_002__cato_consciousness_persistence.sql
```

2. AWS Infrastructure

2.1 Core Services

Service	Purpose	CDK Stack
Aurora PostgreSQL	Primary database, RLS enforcement	DataStack
ElastiCache Redis	Session state, caching	CatoRedisStack
Lambda	Serverless compute	ApiStack, BrainStack
API Gateway	REST API routing	ApiStack
Cognito	Authentication	AuthStack
S3	Media storage, training data	StorageStack
SageMaker	LoRA training, inference	AISStack
Step Functions	Tier transitions	CatoTierTransitionStack
EventBridge	Scheduled tasks	Various stacks
CloudWatch	Logging, metrics	All stacks

2.2 Tier-Based Infrastructure

Tier	Name	Redis	SageMaker	Neptune	OpenSearch
1	SEED	[X]	[X]	[X]	[X]
2	SPROUT	[OK]	[X]	[X]	[X]
3	GROWTH	[OK]	[OK]	[X]	[X]
4	SCALE	[OK]	[OK]	[OK]	[OK]
5	ENTERPRISE	[OK]	[OK]	[OK]	[OK]

3. Database Architecture

3.1 Row-Level Security

Every tenant-scoped table enforces RLS:

```
ALTER TABLE table_name ENABLE ROW LEVEL SECURITY;
CREATE POLICY tenant_isolation ON table_name
  USING (tenant_id = current_setting('app.current_tenant_id')::UUID);
```

3.2 PostgreSQL Scaling Architecture (v5.52.20)

Problem: When 6 AI models execute in parallel, each Lambda opens 1 connection. At 100 concurrent requests x 6 parallel writes, we need 600 connections—exceeding Aurora’s limits and causing transaction conflicts.

Solution: OpenAI-inspired PostgreSQL scaling patterns for enterprise parallel AI execution.

3.2.1 RDS Proxy Connection Pooling

CDK Construct: packages/infrastructure/lib/constructs/database-scaling.construct.ts

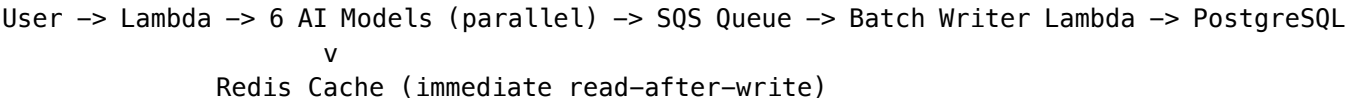

Tier	Max Connections %	Idle Timeout	Borrow Timeout
1	60%	1800s	30s
2	70%	1800s	30s
3	80%	1200s	60s
4	85%	900s	60s
5	90%	600s	120s

Benefits: - **Connection Multiplexing:** 600 Lambda connections -> 100 database connections - **Cold Start Optimization:** Pre-warmed connections eliminate 50-100ms handshake - **Session Pinning:** Prepared statements pin when needed

3.2.2 Async Write Pattern (SQS + Batch Writer)

CDK Construct: packages/infrastructure/lib/constructs/async-write.construct.ts

Request Flow:

Component	Configuration
Queue	Encrypted, 14-day retention, 300s visibility timeout
Dead Letter	3 max receives, separate queue for manual inspection
Batch Writer	100 messages/batch, tier-based concurrency (5-100)

3.2.3 Redis Hot-Path Caching

CDK Construct: packages/infrastructure/lib/constructs/redis-cache.construct.ts

Tier	Node Type	Shards	Replicas/Shard
1	cache.t4g.micro	1	0
2	cache.t4g.small	1	1
3	cache.r6g.large	2	1
4	cache.r6g.xlarge	3	2
5	cache.r6g.2xlarge	5	2

Features: - **Read-After-Write Consistency**: Results cached immediately, persisted async - **Rate Limiting**: Sliding window per tenant/resource - **Session State**: Lambda-to-Lambda context sharing

3.2.4 Time-Based Partitioning

Migration: V2026_01_25_002__postgresql_scaling_partitioning.sql

-- Partitioned tables for high-volume time-series data

```
CREATE TABLE model_execution_logs_partitioned (  
  tenant_id UUID,  
  id UUID,  
  created_at TIMESTAMPTZ,  
  PRIMARY KEY (tenant_id, id, created_at)  
) PARTITION BY RANGE (created_at);
```

```
CREATE TABLE usage_records_partitioned (  
  tenant_id UUID,  
  id UUID,  
  timestamp TIMESTAMPTZ,  
  PRIMARY KEY (tenant_id, id, timestamp)  
) PARTITION BY RANGE (timestamp);
```

Partition management: - Monthly partitions auto-created 3 months ahead - Stale partitions archived after 24 months
- Automated management via manage_time_partitions() function

3.2.5 Materialized Views for Dashboards

Migration: V2026_01_25_003__postgresql_scaling_materialized_views.sql

View	Refresh	Purpose
tenant_daily_usage_summary	15 min	Dashboard usage cards
model_performance_summary	1 hour	Model latency/error tracking
tenant_cost_summary	1 hour	Billing dashboard
user_activity_summary	1 hour	User engagement metrics
platform_health_stats	5 min	Admin overview

View	Refresh	Purpose
model_popularity_ranking	1 hour	Model selection optimization

3.2.6 Optimized RLS Policies

```
Migration: V2026_01_25_001__postgresql_scaling_rls.sql
-- Optimized wrapper that enables index usage
CREATE OR REPLACE FUNCTION get_current_tenant_id()
RETURNS UUID AS $$
    SELECT NULLIF(current_setting('app.current_tenant_id', true), '')::UUID;
$$ LANGUAGE SQL STABLE PARALLEL SAFE;

-- Policy using the wrapper
CREATE POLICY tenant_isolation ON table_name
    USING (tenant_id = get_current_tenant_id());
```

3.2.7 Monitoring Metrics

Metric	Threshold	Action
RDS Proxy connections available	< 10%	Scale proxy / reduce Lambda concurrency
Aurora CPU	> 80%	Add read replicas
SQS queue age	> 60s	Add batch writer concurrency
Query latency P95	> 500ms	Optimize query / add index
Redis memory	> 80%	Scale cluster

3.3 Migration Strategy

- Sequential numbered migrations: 001_, 002_, etc.
- Location: packages/infrastructure/migrations/
- Current count: 188 migrations

4. AI Model Orchestration

4.1 Supported Models (106+)

External Models (50): - OpenAI: GPT-4, GPT-4-Turbo, GPT-4o, o1, o1-mini - Anthropic: Claude 3.5 Sonnet, Claude 3 Opus, Claude 3 Haiku - Google: Gemini 1.5 Pro, Gemini 1.5 Flash, Gemini 2.0 - Meta: Llama 3.1 405B, Llama 3.1 70B - Mistral: Mistral Large, Mixtral 8x22B - Cohere: Command R+

Self-Hosted Models (56): - Managed via SageMaker endpoints - LoRA adapters for tenant customization - Hot-swappable for zero-downtime updates

4.2 Expert System Adapters (v5.52.21)

Tenant-trainable domain intelligence through automatic LoRA adapter training.

Tri-Layer Adapter Architecture

W_Final = W_Genesis + (scale x W_Cato) + (scale x W_User) + (scale x W_Domain)

Layer	Name	Purpose	Management
0	Genesis	Base model weights	Frozen
1	Cato	Global constitution, tenant values	Pinned, never evicted
2	User	Personal preferences, style	LRU eviction
3	Domain	Specialized expertise	Auto-selected by domain

Implicit Feedback Learning

Signal	Weight	Interpretation
Copy Response	+0.80	User copied output
Thumbs Up	+1.00	Explicit positive
Follow-up Question	+0.30	Partial success
Long Dwell Time	+0.40	User engaged
Regenerate Request	-0.50	Not satisfactory
Abandon	-0.70	Complete failure
Thumbs Down	-1.00	Explicit negative

Domain Auto-Selection

```
// Auto-selection scoring algorithm
Score = (0.3 x DomainMatch)
      + (0.1 x SubdomainBonus)
      + (0.25 x SatisfactionScore)
      + (0.1 x VolumeScore)
      + (0.05 x ErrorRate)
      + (0.2 x RecencyScore)

// Select adapter if Score >= 0.5
```

Implementation: - Service: lambda/shared/services/enhanced-learning.service.ts - Service: lambda/shared/services/lora-inference.service.ts - Service: lambda/shared/services/adapter-management.service.ts - Migration: migrations/000_consolidated_schema.sql - Admin UI: apps/admin-dashboard/app/(dashboard)/models/lora-adapters/page.tsx - Documentation: docs/EXPERT-SYSTEM-ADAPTERS.md

4.3 Orchestration Modes (9)

Mode	Purpose
thinking	Standard reasoning
extended_thinking	Deep multi-step reasoning
coding	Code generation
creative	Creative writing
research	Research synthesis
analysis	Quantitative analysis
multi_model	Multiple model consensus
chain_of_thought	Explicit reasoning chain
self_consistency	Multiple samples for consistency

5. Lambda Services

5.1 Service Categories

Category	Handler Count	Router
Admin	58	admin/handler.ts
Think Tank	30	thinktank/handler.ts
Consciousness	10	Individual handlers
Scheduled	8	EventBridge triggers
Tier Transition	15	Step Functions

5.2 Key Service Files

```
lambda/  
+-- admin/handler.ts           # Admin API router (58 sub-handlers)  
+-- thinktank/handler.ts      # Think Tank router (30 sub-handlers)  
+-- api/router.ts             # Core API router  
+-- consciousness/  
|   +-- heartbeat.ts          # Continuous existence  
|   +-- evolution-pipeline.ts  # Weekly LoRA training  
|   +-- sleep-cycle.ts         # Twilight dreaming  
+-- shared/services/  
    +-- cognitive-router.service.ts  # Model orchestration  
    +-- ego-context.service.ts       # Zero-cost ego  
    +-- consciousness-middleware.service.ts  
    +-- hitl-orchestration/          # HITL Orchestration (v5.33.0)
```

```
+-- mcp-elicitation.service.ts      # MCP Elicitation schema orchestration
+-- voi.service.ts                  # SAGE-Agent Bayesian VOI
+-- abstention.service.ts           # Output-based uncertainty detection
+-- batching.service.ts             # Three-layer question batching
+-- rate-limiting.service.ts        # Global/user/workflow limits
+-- deduplication.service.ts        # TTL cache with fuzzy matching
+-- escalation.service.ts           # Multi-level escalation chains
```

5.3 HITL Orchestration Services (v5.33.0)

Advanced Human-in-the-Loop orchestration implementing industry best practices.

Philosophy: “Ask only what matters. Batch for convenience. Never interrupt needlessly.”

Core Components

Service	Purpose	Key Algorithm
mcp-elicitation.service.ts	Main orchestration	MCP Elicitation specification for typed questions
voi.service.ts	Question necessity	SAGE-Agent Bayesian Value-of-Information
abstention.service.ts	Uncertainty detection	Confidence prompting, self-consistency, semantic entropy
batching.service.ts	Question grouping	Time-window (30s), correlation, semantic similarity
rate-limiting.service.ts	Rate control	Sliding window with burst allowance
deduplication.service.ts	Answer caching	SHA-256 hash + fuzzy matching
escalation.service.ts	Escalation paths	Multi-level chains with timeout actions

VOI Decision Formula

VOI = Expected_Information_Gain - Ask_Cost
Decision = VOI > Threshold ? "ask" : "skip_with_default"

- **Prior Entropy:** Shannon entropy of prior probability distribution
- **Expected Posterior Entropy:** Estimated entropy after receiving answer
- **Ask Cost:** Based on urgency (0.8 high, 0.5 normal, 0.2 low) and workflow type
- **Decision Impact:** Weight based on workflow reversibility

Question Types (MCP Elicitation)

Type	Description
yes_no	Binary true/false
single_choice	Select one from options
multiple_choice	Select multiple from options

Type	Description
free_text	Open-ended text
numeric	Numeric value with optional range
date	Date selection
confirmation	Explicit confirmation
structured	JSON schema-validated response

Abstention Detection Methods

For external models (no internal state access):

Method	Implementation
Confidence Prompting	Ask model to rate confidence 0-100
Self-Consistency	Sample N responses, measure agreement
Semantic Entropy	Cluster outputs, high entropy = uncertain
Refusal Detection	Regex patterns for hedging language

Future: Linear probe abstention for self-hosted models via inference wrappers.

Rate Limiting Configuration

Scope	Requests/Min	Concurrent	Burst
Global	50	20	10
Per User	10	3	2
Per Workflow	5	2	1

Two-Question Rule

Maximum 2 clarifying questions per workflow. After limit: 1. Proceed with highest-probability defaults 2. State assumptions explicitly to user 3. Log skipped questions for analytics

Admin API Endpoints

Base: /api/admin/hitl-orchestration

Endpoint	Method	Description
/dashboard	GET	Complete dashboard data
/voi/statistics	GET	VOI decision statistics
/abstention/config	GET/PUT	Abstention settings

Endpoint	Method	Description
/abstention/statistics	GET	Abstention event stats
/batching/statistics	GET	Batch metrics
/rate-limits	GET	Rate limit configs
/rate-limits/:scope	PUT	Update rate limit
/escalation-chains	GET/POST	Manage escalation chains
/deduplication/statistics	GET	Cache statistics
/deduplication/invalidate	POST	Invalidate cache entries

Database Tables

```
-- HITL Orchestration Tables (v5.33.0)
hitl_question_batches      -- Question batch records
hitl_rate_limits           -- Rate limit configuration
hitl_question_cache        -- Deduplication cache
hitl_voi_aspects           -- VOI aspect tracking
hitl_voi_decisions         -- VOI decision records
hitl_abstention_config     -- Abstention settings
hitl_abstention_events     -- Abstention event log
hitl_escalation_chains     -- Escalation chain configuration
```

Key Metrics

- **70% fewer unnecessary questions** via VOI filtering
- **2.7x faster user response times** via batching
- **Two-question rule enforcement** for workflow completion

5.3.1 HITL Orchestration Extensions (v5.34.0)

Scout persona integration, Flyte task wrappers, and semantic deduplication.

Philosophy: “Scout asks smart questions. Flyte workflows pause elegantly. Similar questions share answers.”

Service	Purpose
cato/scout-hitl-integration.service.ts	Bridges Scout persona to HITL for epistemic uncertainty
packages/flyte/utils/hitl_tasks.py	Python wrappers for Flyte HITL tasks

Scout Integration Features: - Aspect-prioritized clarification questions (safety, compliance, cost, etc.) - Domain-specific impact scoring with boosts - VOI-filtered questions with assumption generation - Remaining uncertainty calculation

Flyte Task Wrappers: - ask_confirmation() - Blocking yes/no questions - ask_choice() - Single/multiple choice selection - ask_batch() - Batched questions with VOI filtering - ask_free_text() - Free-form text input

Semantic Deduplication (pgvector): - 1536-dimension embeddings for question matching - HNSW index for efficient cosine similarity search - 85% similarity threshold (configurable) - Graceful fallback to hash-based matching

Migration: V2026_01_20_012__hitl_semantic_deduplication.sql

5.3.2 Governance Presets & War Room (v5.35.0)

Variable friction governance and Council of Rivals visualization.

Philosophy: “The Leash Metaphor—give users intuitive control over AI autonomy without exposing technical complexity.”

Governance Presets (Variable Friction)

User-friendly abstraction over technical Moods:

Preset	Leash Length	Maps to Mood	Friction Level
[SHIELD] Paranoid	Short	Scout	1.0
Balanced	Medium	Balanced	0.5
[LAUNCH] Cowboy	Long	Spark	0.1

Checkpoint Configuration (5 gates):

Checkpoint	When	Paranoid	Balanced	Cowboy
CP1	After Observer	ALWAYS	NEVER	NEVER
CP2	After Proposer	ALWAYS	CONDITIONAL	NEVER
CP3	After Critics	ALWAYS	CONDITIONAL	NEVER
CP4	Before Execution	ALWAYS	CONDITIONAL	CONDITIONAL
CP5	After Execution	ALWAYS	NOTIFY_ONLY	NOTIFY_ONLY

Checkpoint Modes: - ALWAYS - Require human approval - CONDITIONAL - Based on risk/confidence thresholds - NEVER - Auto-approve - NOTIFY_ONLY - Proceed but notify async

Files: - packages/shared/src/types/cato.types.ts - GovernancePreset, CheckpointMode types - lambda/shared/services/governance-preset.service.ts - Preset management service - lambda/admin/cato-governance.ts - API handler (8 endpoints) - apps/admin-dashboard/app/(dashboard)/cato/governance/page.tsx - Admin UI

API Endpoints:

GET /api/admin/cato/governance/config # Get tenant config
PUT /api/admin/cato/governance/preset # Set preset
PATCH /api/admin/cato/governance/overrides # Custom overrides
GET /api/admin/cato/governance/metrics # Checkpoint metrics
GET /api/admin/cato/governance/history # Preset changes audit
POST /api/admin/cato/governance/checkpoint # Record decision
GET /api/admin/cato/governance/pending # Pending checkpoints
POST /api/admin/cato/governance/resolve # Resolve checkpoint

Migration: V2026_01_20_013__governance_presets.sql

War Room (Council of Rivals Visualization)

Real-time multi-agent adversarial debate interface.

Council Member Roles:

Role	Purpose	Icon
Advocate	Argues in favor	
Critic	Identifies flaws	
Synthesizer	Combines viewpoints	[BRAIN]
Specialist	Domain expertise	[TIP]
Contrarian	Challenges assumptions	[FAST]

Debate Flow:

Topic -> Opening -> Arguments -> Rebuttals -> Voting -> Verdict

Verdict Outcomes: consensus, majority, split, deadlock, synthesized

Files: - lambda/shared/services/council-of-rivals.service.ts - Core debate service - apps/admin-dashboard/app/(dashboard)/cato/war-room/page.tsx - War Room UI

UI Features: - Amphitheater-style member avatars - Real-time debate transcript with live polling (2s) - Arguments with confidence bars and evidence badges - Rebuttals with strength indicators - Verdict panel with synthesized answers

5.4 Sovereign Mesh Services (v5.31.0)

Parametric AI assistance at every workflow node.

Philosophy: “Every Node Thinks. Every Connection Learns. Every Workflow Assembles Itself.”

Service	Purpose
sovereign-mesh/ai-helper.service.ts	Disambiguation, inference, recovery, validation
sovereign-mesh/agent-runtime.service.ts	OODA-loop agent execution
sovereign-mesh/notification.service.ts	Email/Slack/webhook notifications
sovereign-mesh/snapshot-capture.service.ts	Execution state snapshots

Worker Lambdas: - workers/agent-execution-worker.ts - SQS-triggered OODA processing - workers/transparency-compiler.ts - Pre-compute decision explanations

Scheduled Lambdas: - app-registry-sync - Daily sync from Activepieces/n8n (2 AM UTC) - hitl-sla-monitor - SLA monitoring and escalation (every minute) - app-health-check - Hourly health check for top 100 apps

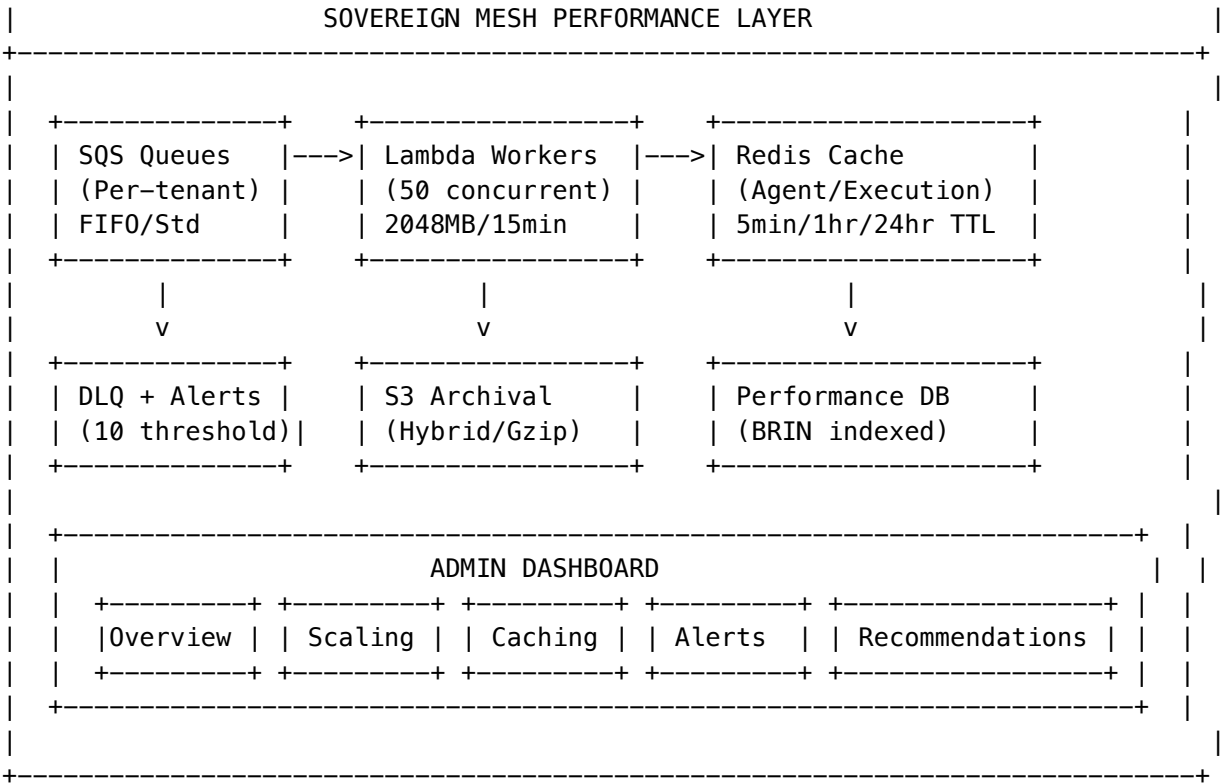

5.4.1 Sovereign Mesh Performance Optimization (v5.38.0)

Scale-ready execution infrastructure for autonomous agent workloads.

Philosophy: “Every execution tracked. Every bottleneck visible. Every setting tunable.”

Architecture Diagram

+-----+

Configurable Settings (All Persistent in Database)

Setting	Table Column	Default	Range	Admin UI Location
Lambda Settings				Scaling Tab
Max Concurrency	agent_worker_config.max_concurrency	50	1-200	Slider
Provisioned Concurrency	agent_worker_config.provisioned_concurrency	50	0-50	Slider
Memory (MB)	agent_worker_config.memory_mb	2048	512-4096	Dropdown
Timeout (sec)	agent_worker_config.timeout_seconds	900	60-900	Input
Reserved Concurrency	agent_worker_config.reserved_concurrency	50	0-100	Input
SQS Settings				Scaling Tab
Batch Size	sqs_config.batch_size	1	1-10	Dropdown
Visibility Timeout	sqs_config.visibility_timeout_seconds	900	30-43200	Input
Message Retention	sqs_config.message_retention_days	7	1-14	Input
DLQ Max Receives	sqs_config.dlq_max_receive_count	3	1-10	Input

Setting	Table Column	Default	Range	Admin UI Location
Scaling Settings				Scaling Tab
Strategy	scaling_config.strategy	auto	fixed/auto/schedule	Dropdown
Min Instances	scaling_config.min_instances	5	0-50	Slider
Max Instances	scaling_config.max_instances	50	1-200	Slider
Target Utilization	scaling_config.target_utilization	70	50-95	Slider
Scale-in Cooldown	scaling_config.scale_in_cooldown_seconds	300	30-990	Input
Scale-out Cooldown	scaling_config.scale_out_cooldown_seconds	60	30-300	Input
Cache Settings				Caching Tab
Backend	caching_config.backend	redis	memory/redis	Toggle
Agent TTL (sec)	caching_config.agent_ttl_seconds	300	60-3600	Slider
Execution TTL (sec)	caching_config.execution_ttl_seconds	3600	300-86400	Slider
Working Memory TTL	caching_config.working_memory_ttl_seconds	3600	60-4800	Slider
Max Memory (MB)	caching_config.max_memory_mb	256	64-2048	Input
Eviction Policy	caching_config.eviction_policy	lru	lru/lfu/ttl	Dropdown
Tenant Isolation				Scaling Tab
Mode	tenant_isolation_config.mode	shared	shared/dedicated	Dropdown
Max Per Tenant	tenant_isolation_config.max_concurrent_per_tenant	50	1-100	Slider
Max Per User	tenant_isolation_config.max_concurrent_per_user	10	1-25	Slider
Rate Limiting	tenant_isolation_config.rate_limiting_enabled	true	enabled	Switch
Archival Settings				(Future UI)
Storage Backend	archival_config.storage_backend	hybrid	database/s3/hybrid	Dropdown
Archive After Days	archival_config.archive_after_days	7	1-30	Input
Delete After Days	archival_config.delete_after_days	90	0-365	Input
Max DB Bytes	archival_config.max_dbifact_bytes	65536	1024-1048576	Input
Compression	archival_config.compression_algorithm	gzip	none/gzip/lz4/zstd	Dropdown

Setting	Table Column	Default	Range	Admin UI Location
Alert Thresholds				Alerts Tab
DLQ Alert Enabled	alert_config.dlq_alert_enabled	true	boolean	Switch
DLQ Threshold	alert_config.dlq_alert_threshold	10	1-100	Slider
Latency Alert Enabled	alert_config.latency_alert_enabled	true	boolean	Switch
Latency Threshold (ms)	alert_config.latency_alert_threshold	30000	5000-120000	Slider
Error Rate Alert Enabled	alert_config.error_rate_alert_enabled	true	boolean	Switch
Error Rate Threshold	alert_config.error_rate_alert_threshold	0.05	0.01-0.50	Slider
Budget Alert Enabled	alert_config.budget_alert_enabled	true	boolean	Switch
Budget Threshold	alert_config.budget_alert_threshold	0.80	0.50-0.95	Slider

Estimated Max Concurrent Sessions

Based on current configuration:

Component	Calculation	Max
Lambda Concurrency	Reserved (100) x Provisioned (5) warm	100 concurrent
SQS Throughput	3,000 msg/sec standard queue	180,000/min
Redis Connections	ElastiCache r6g.large = 65,000	65,000 cached
API Gateway	Regional: 10,000 RPS default	10,000 RPS
Database Connections	Aurora r6g.large = 1,000 pooled	1,000 active

Theoretical Maximum API Sessions: - **Sustained:** ~10,000 concurrent sessions (API Gateway limit) - **Burst:** ~50,000 concurrent (with Lambda scaling + SQS buffering) - **With Dedicated Queues:** ~100,000 (per-tenant isolation)

Bottleneck Analysis: 1. API Gateway: 10,000 RPS (can request increase to 100,000) 2. Lambda Concurrency: 100 reserved -> Scale to 1,000+ 3. Database: Aurora Serverless v2 scales to 256 ACUs (25,600 connections)

Services

Service	File	Purpose
SQS Dispatcher	sqs-dispatcher.service.ts	Message dispatch with tenant routing

Service	File	Purpose
Redis Cache	redis-cache.service.ts	Agent/execution caching with fallback
Performance Config	performance-config.service.ts	CRUD, recommendations, alerts
Artifact Archival	artifact-archival.service.ts	S3/hybrid storage with compression

API Endpoints

Base: /api/admin/sovereign-mesh/performance

Endpoint	Method	Description
/dashboard	GET	Complete dashboard (health, metrics, alerts)
/config	GET	Get current configuration
/config	PUT/PATCH	Update configuration
/recommendations	GET	AI-generated recommendations
/recommendations/:id/apply	POST	Apply recommendation
/alerts	GET	Active alerts
/alerts/:id/acknowledge	POST	Acknowledge alert
/alerts/:id/resolve	POST	Resolve alert
/cache/stats	GET	Cache statistics
/cache	DELETE	Clear tenant cache
/queue/metrics	GET	Queue metrics
/health	GET	Health check
